In Palestine Pelagius lived unmolested and revered, until in 415 Orosius, a Spanish priest, came from Augustine to warn Jerome against him The result was that in June of that year Pelagius was cited by Jerome before John, bishop of Jerusalem, and charged with holding that man may be without sin, if only he desires it This prosecution broke down, and in December of the same year Pelagius was summoned before a synod of fourteen bishops at Diospolis (Lydda) The proceedings, being conducted in various languages and by means of interpreters, lacked certainty, and justified Jerome's application to the synod of the epithet "miserable." But there is no doubt that Pelagius repudiated the assertion of Coelestius, that the divine grace and help consists only in free will, and in the giving of the law and instruction; at the same time he affirmed that a man is able, if he likes, to live without sin and keep the commandments of God, inasmuch as God gives him this ability. The synod was satisfied with these statements, and pronounced Pelagius to be in agreement with Catholic teaching Pelagius naturally plumed himself on his acquittal, and provoked Augustine to give a detailed account of the synod, in which he shows that the language used by Pelagius was ambiguous, but that, being interpreted by his previous written statements, it involved a denial of what the Church understood by *grace* and by man's dependence on it The North African Church as a whole resented the decisions of Diospolis, and in 418 Zosimus, bishop of Rome, was prompted to draw up a circular inviting the bishops of Christendom to subscribe to a condemnation of Pelagian opinions Nineteen Italian bishops refused, among them Julian of Eclanum in Apulia, a man of good birth, approved sanctity and great capacity, who now became the recognized leader of the movement But not even his acuteness and zeal could redeem a cause which was rendered hopeless when the Eastern Church (Ephesus, 431) confirmed the decision of the West Pelagius himself disappears after 420; Coelestius was at Constantinople seeking the aid of Nestorius in 428

The first principle of Pelagianism is a theory which affirms the freedom of the will, in the sense that in each volition and at each moment of life, no matter what the previous career of the individual has been, the will is in equipoise, able to choose good or evil We are born characterless (non pleni), and with no bias towards good or evil (ut sine virtute, ita et sine vitio). It follows that we are uninjured by the sin of Adam, save in so far as the evil example of our predecessors misleads and influences us (non propagine sed exemplo). There is, in fact, no such thing as original sin, sin being a thing of will and not of nature; for if it could be of nature our sin would be chargeable on God the creator. This will, capable of good as of evil, being the natural endowment of man, is found in the heathen as well as in the Christian, and the heathen may therefore perfectly keep such law as they know But, if all men have this natural ability to do and to be all that is required for perfect righteousness, what becomes of grace, of the aid of the Holy Spirit, and, in a word, of Christianity? Pelagius appears to have confused the denial of original *sin* (in the sense of inherited *guilt*) with the denial of inherited nature or disposition of any kind. Hence he vacillates considerably in his use of the word "grace." In his most careful statements he appears to allow to grace everything but the initial determining movement towards salvation. He ascribed to the unassisted human will power to accept and use the proffered salvation of Christ. It was at this point his departure from the Catholic creed could be made apparent: Pelagius maintains, expressly and by implication, that it is the human will which takes the initiative, and is the determining factor in the salvation of the individual; while the Church maintains that it is the divine will that takes the initiative by renewing and enabling the human will to accept and use the aid or grace offered. This was the position most strongly contested by Augustine (*q.v.*). The result was the rise of Semipelagianism, which was an attempt to hold a middle course between the harshness of Augustinianism and the obvious errors of Pelagianism It appeared simultaneously in North Africa and in southern Gaul. In the former Church, which naturally desired to adhere to the views of its own great theologian, the monks of Adrumetum found themselves either sunk to the verge of despair or provoked to licentiousness by his predestinarian teaching. When this was reported to Augustine he wrote two elaborate treatises to show that when God ordains the end He also ordains the means, and if any man is ordained to life eternal he is thereby ordained to holiness and zealous effort. But meanwhile some of the monks themselves had struck out a *via media* which ascribed to God sovereign grace and yet left intact man's responsibility. A similar scheme was adopted by Cassian of Marseilles (hence Semipelagians are often spoken of as *Massilians*), and was afterwards ably advocated by Vincent of Lerins and Faustus of Rhegium. The differentia of Semipelagianism is the tenet that in regeneration and all that results from it, the divine and the human will are co-operating (synergistic) coefficient factors Pelagius was familiar with the Greek language and theology, and frequented Rufinus, upholder of Greek theology.

PELARGONIUM, a genus of plants belonging to the geranium family (Geraniaceae, *q v*) and including most of the cultivated ornamentals known as "geraniums" There are 250 species, chiefly South African. (*See* GERANIUM)

PELASGIANS. Various traditions were current among the Greeks with regard to the pre-Greek inhabitants of their country. They were inclined to call all these by the general name of Pelasgians, although they recognized Carians and Leleges as distinct The Dorians claimed that the Ionians were Pelasgian or at least mainly so, and that they themselves were true Greeks The inhabitants of Attica, who were regarded as Ionian, boasted that they were autochthonous, the original inhabitants of the land.

In the Homeric poems Pelasgians appear as allies of Troy. They appear to be settled in south-eastern Thrace close to the Hellespont in a district called Larissa (*Il*, ii 840–843, x. 429). Some suppose that the Larissa here mentioned is the town of that name in Thessaly, but the catalogue of ships, in which the passage occurs, appears to follow a definite geographical order. Larissa stands between the Hellespont and Thrace. The Iliad also refers to the district of Argos near Mt. Othrys in Thessaly as Pelasgic, and also uses the same epithet in a famous passage of the Zeus of Dodona (*Il.*, ii. 681–684, xvi. 233-235). In the *Odyssey* Pelasgians appear in Crete (*Od* xvii. 175–177). Hesiod refers to Dodona as "seat of Pelasgians," while Hecataeus refers to Pelasgus as king of Thessaly. To Aeschylus and Sophocles Argos in the Peloponnese is the Pelasgian land Herodotus knows of actual Pelasgians at Placie and Scylace on the Asiatic coast of the Hellespont as well as near Creston on the Strymon. The islands of Lemnos and Imbros had also, he informs us, a Pelasgian population, conquered by Athens at the close of the 6th century. Apart from these actual instances of Pelasgians, both Herodotus

and Thucydides appear to regard any survival from pre-Greek times as Pelasgic. A well-known example of this is the prehistoric wall of the Athenian acropolis, anciently regarded and still commonly referred to as Pelasgian, and the epithet spread to all similar prehistoric masonry, especially that built of large blocks, in any part of Greece.

It has been held that the common Greek tradition arose from a misunderstanding, particularly perhaps by Hesiod and Hecataeus, of the two passages in the *Iliad* in which the Zeus of Dodona and the Thessalian Argos are referred to as Pelasgic. Where Homer used a general epithet meaning "remotely ancient," later writers have wrongly concluded that he referred specifically to actual Pelasgians as inhabitants of these places. If this is so, the problem is merely thrown farther back, for an explanation is needed of how the epithet Pelasgic had attained the general meaning of "ancient" by the time of the composition of the Homeric poems. To certain people at a certain period "Pelasgic" must have been a specific epithet. The Pelasgians must have been regarded either as very ancient people or as former inhabitants of the land. Much turns upon the meaning of the epithet Pelasgic as applied in the *Iliad* to the Zeus of Dodona. Zeus is the last one would expect to be referred to as Pelasgic, for of all the gods' names his is most certainly Greek. The simplest explanation is perhaps that there existed at Dodona a very ancient pre-Greek or pre-Achaean shrine occupied by Greeks who attached to the deity the name of their own god Zeus.

All instances of actual Pelasgians from Homer to Herodotus point to their being a northern people. Thrace, Epirus and Thessaly are their homes. It is certain that there were pre-Achaean inhabitants of Greece. The simplest view now held is that Greek-speaking peoples broke down into Greece from the north in three successive waves, Ionian, Achaean and Dorian, subduing a previous "Helladic" population and setting up, after the second invasion (*i.e.,* of Achaeans), the Mycenean civilization in the Peloponnese. If this is the simplest view, it does not solve all problems and it does not as yet rest upon a certain foundation of fact. An early stratum of population in Greece was in close touch with Anatolia. A large number of Greek place-names point to the conclusion that Greece was colonized from Anatolia. By whom we do not know, and we are also ignorant of what language these early people spoke. It is also possible that the Achaeans themselves were in Asia Minor before they were in Greece and that they brought thither the Anatolian place-names. It is no more than tradition that connects such early people with the Pelasgians.

The name Pelasgi which almost certainly stands for Pelak-skoi or Pelag-Skoi has been connected with πέλαγος, "the sea," and the people consequently regarded as sea-faring. The connection is not very convincing. It has also been related to the name of the semi-Illyrian Pelagones of Macedonia, and it is possible, though unproven, that the names do represent the same stem. Possibly the Pelasgians were no more than Vlachs, or Wallachian shepherds, who in classical as in modern times have been in the habit of wandering in large numbers down into Greece. The name is perhaps no more than Velak-ski. If this were so, it would account for their being dotted over various regions in Thrace and the north and also, if their habits were the same at the dawn of history as afterwards, of their being an ancient and integral part of Greek tradition and life. G. Serdi describes as "Pelasgian" one branch of the Mediterranean or Eur-African race.

PELECYPODA, a name, now replaced by Lamellibranchia (*q.v.*), for the bivalve Mollusca (*q.v.*).

PELEUS, in Greek legend, king of the Myrmidones of Phthia in Thessaly, son of Aeacus, king of Aegina, and usually brother of Telamon. The two, having killed Telamon's third son Phocus, were banished. Peleus took refuge in Phthia with his uncle Eurytion, who purified him from the guilt of murder and gave him his daughter Antigone to wife and a third of the kingdom as her dowry. Having accidentally killed his father-in-law at the Calydonian boar-hunt, Peleus was again obliged to flee, this time to Iolcus, where he was purified by Acastus (*q.v.*). The most famous event in the life of Peleus was his marriage with the sea-goddess Thetis (*q.v.*). Peleus survived both his son Achilles and his grandson Neoptolemus, and was carried away by Thetis to dwell for ever among the Nereids.

PELEW ISLANDS: *see* Pacific Islands.

PELHAM, the name of an English family, derived from Pelham in Hertfordshire, which was owned by a certain Walter de Pelham under Edward I., and is alleged to have been in the possession of the same family before the Norman conquest. The family dignities included the barony of Pelham of Laughton (1706–1768), the earldom of Clare (1714–1768), the dukedom of Newcastle (1715–1768), the barony of Pelham of Stanmer from 1762, the earldom of Chichester from 1801 and the earldom of Yarborough from 1837.

In the reign of Queen Elizabeth Sir William Pelham (*c.* 1530–1587), third son of Sir William Pelham (d. 1538) of Laughton, Sussex, became lord justice of Ireland. After much service abroad he was sent to Ireland in 1579, when he was knighted by Sir William Drury, the lord justice. Drury died in October, and Pelham was provisionally made his successor, an appointment subsequently confirmed by Elizabeth. Elizabeth protested strongly against Pelham's action in proclaiming Gerald Fitzgerald, 15th earl of Desmond, a traitor, though his action was soon justified by the sack of Youghal by Desmond. Thomas Butler, 10th earl of Ormonde, was entrusted with the campaign in Munster, but Pelham joined him in February 1580. The English generals laid waste northern Kerry, and proceeded to besiege Carrigafoyle Castle, which they stormed, giving no quarter to man, woman or child. Other strongholds submitted on learning the fate of Carrigafoyle. Pelham vainly sought for help from the gentry of the county, who sympathized with Desmond, and were only brought to submission by a series of "drives." After the arrival of the new deputy, Lord Grey of Wilton, Pelham returned to England. Leicester desired his services in the Netherlands, but it was only after much persuasion that Elizabeth set him free to join the army by accepting a mortgage on his estates as security for his liabilities. Pelham was wounded at Doesburg in 1586, and accompanied Leicester to England in 1587. He died at Flushing on Nov. 24, 1587.

From Sir William are descended the Pelhams of Brocklesby, Lincolnshire, earls of Yarborough (cr. 1837). From Sir Nicholas Pelham, elder brother of William, were descended the Dukes of Newcastle (*q.v.*). Among the other distinguished members of this family were Thomas Pelham, earl of Chichester (1728–1805), who held many offices under George III.; Henry Pelham (*q.v.*), George Pelham (1766–1827), bishop successively of Bristol, Exeter and Lincoln; Thomas Pelham, 2nd earl of Chichester (1756–1826), who held office under Pitt and Addington.

See Lower, *Pelham Family* (1873).

PELHAM, HENRY (1696–1754), prime minister of England, younger brother of Thomas Holles Pelham, duke of Newcastle, was born in 1696. He was a younger son of Thomas, 1st Baron Pelham of Laughton (1650–1712; cr. 1706) and of Lady Grace Holles, daughter of the 3rd earl of Clare. He was educated by a private tutor and at Christ Church, Oxford, which he entered in July 1710. In 1717 he entered parliament for Seaford, Sussex. Through strong family influence and the recommendation of Walpole he was chosen in 1721 a lord of the treasury. The following year he was returned for Sussex county. In 1724 he became secretary for war, exchanging this office in 1730 for the more lucrative one of paymaster of the forces. He supported Walpole on the question of the excise, and in 1743 a union of parties resulted in the formation of an administration in which Pelham was prime minister, with the office of chan-

cellor of the exchequer; his brother, the duke of Newcastle, was very powerful in the cabinet, and there were occasional disputes between them. Being strongly in favour of peace, Pelham carried on the war with indifferent success. The king, thwarted in his favourite schemes, made overtures in 1746 to Lord Bath, but his purpose was upset by the resignation of the two Pelhams (Henry and Newcastle), who, however, at the king's request, resumed office. Pelham remained prime minister till his death on March 6, 1754, when his brother succeeded him. His very defects were among the chief elements of Pelham's success, for one with a strong personality, moderate self-respect, or high conceptions of statesmanship could not have restrained the discordant elements of the cabinet for any length of time.

See W. Coxe, *Memoirs of the Life of Henry Pelham* (2 vols., 1829).

PELHAM, HENRY FRANCIS (1846–1907), English scholar and historian, was born at Bergh Apton, Norfolk, on Sept. 19, 1846, son of John Thomas Pelham (1811–1894), bishop of Norwich, third son of the 2nd earl of Chichester. He was educated at Harrow, under Butler and Westcott, and at Trinity college, Oxford, where he took a first class in *litterae humaniores* in 1869. He was a tutor of Exeter college from 1869 to 1890, taking over the teaching of ancient history from C. W. Boase. In 1887 he became university reader in ancient history and, two years later, Camden professor. He became curator of the Bodleian library in 1892, and in 1897 president of Trinity college. He was also an honorary fellow of Exeter, a fellow of the British Academy and of other learned societies, and a governor of Harrow school. His chief contribution to ancient history was his article on Roman history in the 9th edition of the *Encyclopædia Britannica* (1886), which was republished with additions as the *Outlines of Roman History* (1890). His university lectures were full of original research and learning. He married, in 1873, Laura Priscilla, daughter of Sir Edward North Buxton. He died on Feb. 13, 1907.

Apart from the *Outlines* he published only *The Imperial Domains and the Colonate* (1890), *The Roman Frontier System* (1895) and articles in periodicals of which the most important was an article in the *Quarterly Review* on the early Caesars (April 1905). Many of these articles were published in collected form after his death by Professor F. Haverfield (*Essays on Roman History,* 1911).

PELICAN, a large fish-eating water-fowl, remarkable for the big extensible skin-pouch between the flexible rami of the lower jaw of its long, weak bill. The common pelican (*Pelecanus onocrotalus*) inhabits south-east Europe, south-west Asia and north-east Africa. It haunts the margins of large lakes and rivers, where fish are plentiful; and companies may be seen in a shallow bay, stretched out in a long line, fishing. The nest is on the ground among the reeds; the two white eggs, with chalky shells, hatch into greyish-brown plumaged young. The adult, except for the black primaries, is white, tinged with pink and, on the head, yellow. A larger eastern species, *P. crispus,* has a crest of curled feathers. Two humeri of pelicans have been found in the English fens and probably belong to this species. There are two American forms, whose methods of feeding and plumage are quite different, *P. occidentalis,* the brown pelican, individually seeking its prey from the air, is marine; *P. erythrorhynchos,* the white pelican, often combining in companies to drive fish into the shallows. In summer it haunts fresh-water. Remarkable ceremonies of courtship and relieving guard at the nest occur. (*See* F. Chapman, *Camps and Cruises of an Ornithologist.*) Allied species occur in south Asia and in Africa. It may be mentioned that the legend of the pelican feeding (and revivifying) its young with the blood from its own breast is entirely unfounded.

AUSTRALIAN PELICAN, DISTINGUISHED FROM THE ORDINARY PELICAN BY ITS BLACK TAIL AND WING-COVERTS

PELION, a mountain in Thessaly in the district of Magnesia, between Volo and the east coast (mod. Plessidi, 5,340 ft.). In Greek mythology, the giants piled it on Ossa to scale Olympus, the abode of the gods. It was the home of the centaurs, especially of Chiron, who in a cave near its summit educated many youthful heroes. On its summit at an altar of Zeus Actaeus, a festival was held in the dog-days, by worshippers clad in skins.

PÉLISSIER, AIMABLE JEAN JACQUES (1794–1864), duke of Malakoff, marshal of France, was born on Nov. 6, 1794, at Maromme (Seine Inférieure). His early service was mainly in Algeria. The severity of his conduct in suffocating a whole Arab tribe in the Dahra or Dahna caves, near Mustaganem, where they had taken refuge (June 18, 1845), awakened such indignation in Europe that Marshal Soult, the minister of war, publicly expressed his regret; but Marshal Bugeaud, the governor-general of Algeria, gave it his approval, and secured for Pélissier the rank of general of brigade, which he held till 1850, when he was promoted general of division. On May 16, 1855, he succeeded Canrobert as commander-in-chief of the French forces before Sevastopol. (*See* CRIMEAN WAR.) His perseverance was crowned with success in the storming of the Malakoff on Sept. 8. On the 12th he was promoted marshal. On his return to Paris he was named senator, created duke of Malakoff (July 22, 1856), and rewarded with a grant of 100,000 francs per annum. From March 1858 to May 1859 he was French ambassador in London, being recalled to take command of the army of observation on the Rhine. In the same year he became grand chancellor of the Legion of Honour. In 1860 he was appointed governor-general of Algeria, and he died there on May 22, 1864.

See Marbaud, *Le Maréchal Pélissier* (1863); Castille, *Portraits historiques,* 2nd series (1859).

PELL, JOHN (1610–1685), English mathematician, was born on March 1, 1610, at Southwick in Sussex, where his father was minister. He was educated at Steyning, and entered Trinity College, Cambridge, at the age of thirteen. Pell was professor of mathematics at Amsterdam (1643–46) and at Breda (1646–52). He was Cromwell's agent in Switzerland for some years. After the Restoration he took orders and held a living in Essex. He studied mainly algebra and Diophantine analysis. He introduced the sign $\div$ into England; and the indeterminate equation $ax^2+1=y^2$ bears his name although his connection with it consists simply of the publication of solutions of it in his edition of *Brounker's Translation of Rhonius's Algebra* (1668). He died on Dec. 12, 1685, in London in great poverty.

PELLA, the capital of ancient Macedonia, about 32 m. N.W. of Salonika, at the village Neochori (Turkish Yeni-keui). The seat of government was transferred hither from Edessa by Philip II., and his son Alexander was born here. Under Hadrian it was still of some importance. Scanty remains are visible and neighbouring springs are known as the "baths of Pel."

PELLAGRA, the name given to a chronic disease of comparatively modern recognition. For some time it was supposed to be practically confined to the peasantry in parts of Italy (particularly Lombardy), France, the Asturias, Rumania and Corfu. But it has been identified in various outlying parts of the British Empire (Barbadoes, India) and in both Lower and Upper Egypt; also among the Zulus and Basutos. In the United States sporadic cases had been observed up to 1906, but since then numerous cases have been reported. Probably the disease is even more widely spread through the world. The indications usually begin in spring, decline towards autumn, and recur with increasing intensity and permanence in the spring seasons following. A peasant who is acquiring the malady feels unfit for work, suffers from headaches, giddiness, singing in the ears, a burning of the skin, especially in the hands and feet, and diarrhoea. An erysipelatoid rash appears on the skin, the red or livid spots being tense and painful, especially where directly exposed to the sun. About July or August of the first season these symptoms disappear, the spots on the skin remaining rough and dry. The spring attack of the year following will probably be more severe and more likely to leave traces behind it; with each successive year the patient becomes more like a mummy, his skin shrivelled and sallow, or even black at certain

spots, his angles protruding, muscles wasted, movements slow and languid, and sensibility diminished.

Meanwhile there are more special symptoms relating to the nervous system, including drooping of the eyelid, dilatation of the pupil, and other disorders of vision, together with symptoms relating to the digestive system, such as a red and dry tongue, a burning feeling in the mouth, pain on swallowing, and diarrhoea. Ultimately there is profound disorganization of the nervous system with melancholy, imbecility, and a curious mummified condition of body. After death a general tissue degeneration is observed. The condition is believed to be diabetic in origin, possibly due to vitamin deficiency. It has been produced experimentally by withholding fresh meat, eggs and milk from the diet and has been observed to occur secondarily in disease of the stomach interfering with nutrition. Consequent on these experiences minor forms of the disease have been recognized, and it may well be that in these forms the disease is more common than was supposed.

See G. D. Head, Arch. Int. Med., 1924, 34, 93; W. L. Bender, Jn. Amer. Med. Assn. 1925, 84, 1250.

PELLICANUS, CONRAD (1478–1556), German humanist, whose original name was Kürsner, was born at Ruffach, Alsace, on Jan. 8, 1478. He studied at Heidelberg and at Tübingen, where he became a favourite pupil of the guardian of the Minorite convent there, Paulus Scriptoris, and began the study of Hebrew. He had no teacher and no grammar; but Paulus Scriptoris brought him a huge codex of the prophets borne on his own shoulders all the way from Mainz. He learned the letters from the transcription of a few verses in the *Star of the Messiah* of Petrus Niger, and, with a subsequent hint or two from Reuchlin, who also lent him the grammar of Moses Ḳimḥī, made his way through the Bible for himself with the help of Jerome's Latin. In 1501 he composed the first Hebrew grammar in the European tongue. It was printed in 1503, and afterwards included in Reysch's *Margarita philosophica*. The chief fruit of his Hebrew studies is the vast commentary on the Bible (Zürich, 7 vols., 1532–39).

Pellicanus was ordained priest in 1501, and continued to serve his order at Ruffach, Pforzheim and Basel till 1526. At Basel he did much laborious work for Froben's editions. He abandoned his habit on receiving through Zwingli a call to Zürich as professor of Greek and Hebrew. He died on April 6, 1556.

Pellicanus's Latin autobiography (*Chronicon C.P.R.* ed. Riggenbach, 1877) is one of the most interesting documents of the period. *See* also Emil Silberstein, *Conrad Pellicanus; ein Beitrag zur Geschichte des Studiums der hebr. Sprache* (1900).

PELLICO, SILVIO (1788–1854), Italian dramatist, was born at Saluzzo, Piedmont, on June 24, 1788. At the age of ten he composed a tragedy under the inspiration of Caesarotti's translation of Ossian. His tragedy *Francesca da Rimini*, was brought out with success by Carlotta Marchionni at Milan in 1818 (Eng. trs. 1915). The representation of his next tragedy *Eufemio da Messina*, was forbidden. Pellico attempted to weaken the hold of the Austrian despotism by indirect educational means. He acted as secretary to the powerful literary executive which gathered about Counts Porro and Confalonieri, the management of the *Conciliatore*, which appeared in 1818–19 as the organ of the association, resting largely upon him. In 1820 Pellico was arrested on the charge of carbonarism and after his removal to the Piombi at Venice in 1821, he composed several *Cantiche* and the tragedies *Ester d'Engaddi* (Eng. trs. 1836) and *Iginia d'Asti*. The sentence of death pronounced on him in Feb. 1822 was commuted to fifteen years *carcere duro*, and in the following April he was placed in the Spielberg at Brünn. Here he composed the tragedy *Leoniero da Dertona*, for the preservation of which he was compelled to rely on his memory. After his release in 1830 *Ester* was played at Turin in 1831, but immediately suppressed. In 1832 appeared his *Tre nuovi tragedie*, and the famous *Le Mie prigioni* (Eng. trs. 1915), an account of his sufferings in prison. In 1834 the Marchesa di Barolo, the reformer of the Turin prisons, bestowed on him a yearly pension of 1200 francs and in 1838 gave him a home in her palace. His tragedy *Tommaso Moro* appeared in 1833 and his *Opere* in 1837. He died on Jan. 31, 1854. The simple and naïve egotism of *Le Mie prigioni* established his fame.

See Piero Maroncelli, *Addizioni alle mie prigioni* (1834); G. Briano *Della Vita e delle Opere di S. Pellico* (1854); P. Giuria: *S. Pellico e il suo tempo* (1854) and A. Gustarelli: *La Vita, "Le Mie Prigioni" e di Pellico. Saggio Biografico-critico* (Florence 1917).

PELLISSON, PAUL (1624–1693), French author, was born at Béziers on Oct. 30, 1624. In 1653 he published a *Relation contenant l'histoire de l'académie française*. He was rewarded by a promise of the next vacant place and by permission to attend their meetings. In 1657 Pellisson became secretary to the minister of finance, Nicolas Fouquet, and when in 1661 the minister was arrested, his secretary was imprisoned in the Bastille. Pellisson stood by Fouquet, in whose defence he issued in 1661, *Discours au roi, par un de ses fidèles sujets sur le procès de M. de Fouquet*, and *Seconde défense de M. Fouquet*. Pellisson was released in 1666. He became historiographer to the king, and wrote a fragmentary *Histoire de Louis XIV.*, covering the years 1660 to 1670. In 1670 he was converted to Catholicism and obtained rich ecclesiastical preferment. He died on Feb. 7, 1693. He was very intimate with Mlle. de Scudéry, in whose novels he figures as Herminius and Acante.

See Sainte-Beuve, *Causeries du lundi*, vol. xiv.; and F. L. Marcon, *Étude sur la vie et les œuvres de Pellisson* (1859).

PELLITORY, a small hairy perennial herb which grows on old walls, hedgebanks and similar localities in the British Isles and is known botanically as *Parietaria officinalis*. It has a short woody rootstock from which spring erect or spreading stems 1 to 2 ft. long, bearing slender leafy branches, and axillary clusters of small green flowers. It belongs to the nettle family (*Urticaceae*), and is nearly allied to the nettle, *Urtica*, but its hairs do not sting. A similar species, *P. pennsylvanica*, is widely distributed in North America.

PELLOUX, LUIGI (1839–1924), Italian general and politician, was born on March 1, 1839, at Laroche (Haute-Savoie) of Italian parents. Entering the army as lieutenant of artillery in 1857, he fought at Custozza (1866) and at the siege of Rome (1870). He was minister of war in the Rudini and Giolitti cabinets of 1891–1893, and in the Rudini cabinet of 1896, and was appointed senator. In May 1897 he secured the adoption of the Army Reform Bill, fixing Italian military expenditure at a maximum of £9,560,000 a year, but in December of that year he was defeated in the Chamber on the question of the promotion of officers. Resigning office, he was in May 1898 sent as royal commissioner to Bari, where, without recourse to martial law, he restored public order. General Pelloux succeeded Rudini as prime minister in 1896, resigned in 1899, but again took office to repress the revolutionary elements in southern Italy. His new cabinet was military and conservative, and Pelloux was forced to resign office after the general election in June. In 1901 he was appointed to the command of the Turin army. He died on Oct. 26, 1924.

PELOPIDAS (d. 364 B.C.), Theban statesman and general. In 385 B.C. he served in a Theban contingent sent to the support of the Spartans at Mantineia, where he was saved, when dangerously wounded, by Epameinondas (*q.v.*). Upon the seizure of the Theban citadel by the Spartans (383 or 382) he fled to Athens, and took the lead in a conspiracy to liberate Thebes. In 379 his party surprised and killed their chief political opponents, and roused the people against the Spartan garrison, which surrendered to an army gathered by Pelopidas. In this and subsequent years he was elected *boeotarch*, and about 375 he routed a much larger Spartan force at Tegyra (near Orchomenus). This victory he owed mainly to the valour of the Sacred Band, a picked body of 300 infantry. At the battle of Leuctra (371) he contributed greatly to the success of Epameinondas's new tactics by the rapidity with which he made the Sacred Band close with the Spartans. In 370 he accompanied his friend Epameinondas as *boeotarch* into Peloponnesus. On their return both generals were unsuccessfully accused of having retained their command beyond the legal term. In 369, in response to a petition of the Thessalians, Pelopidas was sent with an army against Alexander, tyrant of Pherae. After driving Alexander out, he passed into Macedonia and arbitrated between two claimants to the throne. In order to secure the influence of Thebes, he brought home hostages, includ-

ing the king's brother, afterwards Philip II., the conqueror of Greece. Next year Pelopidas was again called upon to interfere in Macedonia, but, being deserted by his mercenaries, was compelled to make an agreement with Ptolemaeus of Alorus. On his return through Thessaly he was seized by Alexander of Pherae, and two expeditions from Thebes were needed to secure his release. In 367 Pelopidas went on an embassy to the Persian king and induced him to prescribe a settlement of Greece according to the wishes of the Thebans. In 364 he received another appeal from the Thessalian towns against Alexander of Pherae. Though an eclipse of the sun prevented his bringing with him more than a handful of troops, he overthrew the tyrant's far superior force on the ridge of Cynoscephalae; but wishing to slay Alexander with his own hand, he was cut down by the tyrant's guards.

PELOPONNESIAN WAR, THE, was the great war waged towards the end of the 5th century B.C. by Sparta and the other members of the Peloponnesian Confederacy upon Athens and the Athenian empire. The cities of the Boeotian Confederacy under Theban leadership were Sparta's allies from the first. Syracuse and other Sicilian cities gave active help in the last part of the war. Argos, her hands tied by a treaty with Sparta, remained neutral during the first ten years, but, as a democracy, was benevolently inclined towards Athens. Persia at first held aloof, waiting her opportunity to reassert her dominion over the Greek cities of the Asiatic seaboard which Athens had liberated and added to her own empire. Athens, indubitably unpopular with many members of her empire, found small sympathy beyond its limits. Her maritime supremacy however held the malcontents firmly in check. As the war progressed, the whole Greek world became divided practically into two hostile groups, and both sides resented neutrality bitterly, as the cruel fate of Melos in 416 B.C. showed. The war began on April 4, 431 B.C., by a Theban attempt to surprise Plataea, Athens' ally and outpost on the northern base of Cithaeron. It ended on April 25, 404 B.C., when Athens capitulated. Thus it lasted 27 years, and Thucydides, writing its history after its close, definitely regards it as a single war, though a peace concluded between Athens and Sparta on April 11, 421 B.C., lasted technically some seven years. During these years there was heavy fighting in the Peloponnese in which Spartan and Athenian troops were engaged on opposite sides, and Thucydides' view is so far justified. The war divides into three main sections: (1) The "First" or "Archidamian" War, 431–421 B.C.; (2) The "Sicilian" War, 421–413 B.C.; (3) The "Later" or "Ionian" or "Decelean" War, 412–404 B.C.

CAUSE OF THE WAR

The true cause of the war was Sparta's fear of the growth of the power of Athens. This is Thucydides' own final judgment. The whole history of the rise and power of the Athenian empire in the 50 preceding years justifies this view, though the immediate occasions of the war concerned Corinth, Sparta's chief naval ally, rather than Sparta. Since the peace of 445 B.C. Pericles had consolidated Athenian resources, made Athens' navy incomparable, concluded, in 433 B.C., a defensive alliance with the strong naval power Corcyra (Corinth's most bitter enemy), and renewed alliances with Rhegium and Leontini in the West. The very food supply of the Peloponnese from Sicily was endangered. In the Aegean, Athens could always enforce a monopoly of seaborne trade. To this extent the Peloponnesian War was a "Trade War," and on this ground chiefly Corinth appealed to Sparta to take up arms. The appeal was backed by Megara, well-nigh ruined by Pericles' economic boycott (he hoping thereby to compel her once more to join Athens), and by Aegina, reluctant member of the Athenian empire, heavily taxed, and claiming as a right established by treaty that Home Rule which Athens refused her. But had not Sparta herself been eager for war, peace would have lasted. She was but waiting the opportunity, which came when Athens was temporarily embarrassed by the revolt of her subject-ally Potidaea in Chalcidice in the spring of 432 B.C. The rebel city held out until the winter of 430 B.C. and its blockade meant a constant drain upon Athenian military and naval resources. Sparta seized the chance. Confident of speedy victory, she refused the offer of arbitration upon all disputed questions made her by Pericles, though the peace of 445 B.C. bound her to accept it. The ultimatum despatched to Athens was tantamount to the destruction of the prestige if not of the actual existence of the Athenian empire. At Pericles' urging the Athenian people stood firm and Sparta declared war. She had a bad conscience but a good war-cry, liberation of the Hellenes from Athenian despotism.

THE FIRST YEARS, 431–427 B.C.

In a war between the chief military and the chief naval power in Greece a decisive issue was unlikely to come speedily. Sparta relied on the old traditional strategy of Greek warfare. She hoped by invading Attica and devastating the crops to induce such war-weariness in the Athenians as to make them sue for peace, unless they could be provoked first to fight the one pitched battle which must end the war. In the numbers, as in the discipline and efficiency of the troops, Athens was markedly inferior to the Peloponnesian-Boeotian levy. The flaw in this strategy was that Athens, unlike other Greek cities, could not be starved into submission. For her food supply she was independent of the produce of Attic soil. The old king of Sparta, Archidamus, realized this, and warned his folk that the war would be bequeathed to their children. But the Spartans were confident of speedy victory.

Upon this confidence Pericles based his own strategy. He was fighting for the *status quo ante bellum,* for the survival, not for the aggrandisement, of the empire. To the enemy's "Strategy of Annihilation" he opposed his own "Strategy of Exhaustion" which should give the foe no opportunity of any success in battle. Upon invasion by the enemy the country-folk took refuge within the walls of the "linked-fortress" Athens-Peiraeus. So Athens became "an island," impregnable to attack. The great fleet should secure the empire against disaffection within and attack without, and, offensively, was to raid the Peloponnesian coast. Meanwhile every spring and autumn the Athenian land army should waste the Megarid when the Peloponnesians were busy with their own crops at home, and compel Megara to renew her former alliance with Athens. All access from the Peloponnese by land into Attica would then be denied the enemy, and the dangerous Boeotian army on the north, invaluable allies to a Spartan force in Attica, would not dare cross the Cithaeron-Parnes range unsupported. So the baffled enemy should offer acceptable terms of peace.

This Periclean strategy also had elements of grave weakness, quickly revealed, mainly psychological. The Athenian temper proved unequal to the strain. The Spartans, though disappointed of their hopes, stuck doggedly to the war. Then chance struck Athens a heavy blow. In June 430 B.C. plague, imported by merchant vessels from Egypt or Libya, seized on the city, and the crowding of the refugees within the walls in the glaring summer heat spread the infection horribly. No adequate provision of housing or sanitation had been made. Reinforcements sent to the army blockading Potidaea carried the pestilence on the troopships, and here too the mortality was great. No other Greek city of any importance suffered. The devastation of the fields and the ravages of the plague overcame Athens' will to endure, despite all Pericles' noble oratory. There were as yet no compensatory successes. Megara, though starving, refused to submit. The naval raids round Peloponnese, one conducted on a great scale by Pericles himself, were futile pinpricks. Sparta cared nothing for them. It was Athens which first became "exhausted," thanks to the Periclean strategy. Even her great financial superiority at the beginning of the war began rapidly to vanish. Pericles, in fact, in framing his strategy, had been too fearful of the "casualty-list," always a matter of grave peril to any statesman in a Greek democracy. And, himself an admiral of repute, he had been curiously blind to the opportunities afforded an army, even admittedly inferior, by co-operation with a powerful fleet to harass and distract the enemy. A strong expeditionary force based on Cythera, which should have been seized at once (actually the island was taken first—and uselessly—in June 424 B.C.) would at least have kept Peloponnesian armies out of Attica, and have

encouraged Athenian hopes. Pericles flung away the strategical chance offered him in the proper use of naval predominance.

As early as August 430 B.C. Athens sent a peace embassy to Sparta. It was fruitless, and the war continued. In the following winter Potidaea capitulated, and next year two remarkable naval victories at Chalcis and Naupactus at the mouth of the Corinthian Gulf, won by Phormio, the Nelson of Athens, further cheered the Athenians. In September 429 B.C. Pericles died, and when in the June following, Mitylene, chief city of Lesbos, revolted, the very truth of the dead statesman's main contention, that Athens' maritime empire was unassailable, seemed questionable. It was however soon triumphantly vindicated. The Spartan admiral Alcidas, sent a year later to redeem a promise of help to the rebels, was a coward and fled back home after a hurried raid on Ionia at a mere glimpse of two Athenian warships. Mitylene surrendered at discretion in July 427 B.C. The city was cruelly punished, though more mercy was shown than pleased an Athenian politician then coming into prominence, Cleon "the tanner," *bête noire* of the playwright Aristophanes. In August 427 B.C. Plataea at last surrendered, when its tiny garrison was on the brink of perishing of hunger. At the insistence of their Theban enemies the Plataeans were slaughtered in cold blood and their city was utterly destroyed. Corcyra was finally secured for Athens by its democratic faction amid scenes of unspeakable barbarity, consummated in 426 B.C. by a ferocious massacre. But the whole war languished and drew near to stalemate.

ATHENS' "SECOND STRATEGY," 426–421 B.C.

At last, in 426 B.C., Athens bestirred herself, under direction of Cleon and of Demosthenes, the latter her best tactician in the war. The new leaders, though always hampered by the wealthy and influential Nicias, trusted chief and representative of the *bourgeoisie*, initiated a strategy of offence far more vigorous than the Periclean. Sicily, Boeotia, the Peloponnese itself, were all to be spheres of Athenian activity. To meet the cost, Cleon in 425 B.C. largely increased the tribute imposed on all members of the empire, in many cases up to or even beyond 50%. In June 426 B.C. Demosthenes with a handful of Athenian troops proceeded to Acarnania, ostensibly to consolidate Athenian influence in the district at the expense of Ambracia, Sparta's chief ally there. His real hopes were centred upon an invasion of Boeotia by way of Phocis in co-operation with the main Athenian army which, under Nicias, was to invade by way of Tanagra on the south-east and threaten Thebes directly. The plan was a dismal failure. Demosthenes with his large army of local levies without any real stiffening by Athenian hoplites was trapped in the heart of the forests of Aetolia at Aegitium at the very outset of his enterprise, and his whole force was cut to pieces by the natives. He himself barely escaped with his life to the Athenian base at Naupactus, whence he did not dare to return to Athens to become the scapegoat of the people's indignation. Nicias won an insignificant victory at Tanagra and then withdrew. Sparta entered on vigorous reprisals. A large army under Eurylochus marched from Delphi, threatened Naupactus (which Demosthenes secured just in time), and laid siege eventually to Amphilochian Argos, Athens' ally on the Ambraciot gulf. Then Demosthenes redeemed his reputation. Two brilliant victories, those of Olpae and Idomene, won by tactical devices novel in the humdrum warfare of the time, finally destroyed all Peloponnesian and Ambraciot influence in the entire district and shattered Spartan honour. Though Acarnanians and Ambraciots henceforward observed the war from a distance, the way was henceforth clear for Athenian ships to Sicily, and Demosthenes returned in triumph to Athens.

Next year, 425 B.C., Athens, thanks to Demosthenes and Cleon, achieved the "crowning mercy" of Sphacteria. A fleet *en route* for Sicily put in to Navarino bay and Demosthenes built and himself garrisoned a rude fort here on Pylos promontory. The angry Spartans came down upon him by land and sea. He beat off the assault on the fort, and the Athenian fleet returning on his summons from its slow voyage to the north penned up the Spartan navy in the bay and cut off a Spartan force landed on the island of Sphacteria from all hope of rescue. A temporary armistice secured to Athens the peaceful surrender of the hostile fleet, which she refused to return when negotiations were broken off. So Sparta for a dozen years ceased to have a fleet in being. The blockade of the island was protracted, and the approach of winter seemed likely to secure the escape of the garrison. Cleon, appointed general upon Nicias' pusillanimous, even malignant, resignation, brought Demosthenes needful reinforcements, and the latter, landing at last in overwhelming numbers on Sphacteria, overcame the Spartans' heroic resistance and brought the remnant of survivors, 292 in all, alive as prisoners to Athens. The moral effect of their surrender was prodigious throughout the Greek world. Not until the victory of Mantinea seven years later did Sparta wipe out the disgrace. Strategically the effect was to safeguard Attica from all invasion, so long as Spartan prisoners were in Athens' dungeons. Sparta now in her turn sued for peace, which Cleon refused.

Then came the black year, 424 B.C. All the Athenians' main offensive schemes miscarried. In the spring a congress held at Gela, persuaded by the Syracusan statesman Hermocrates, decided to adopt the "Monroe doctrine" of Sicily for the Sicilians, and the Athenian admirals had no choice but to return home, where they were heavily punished for a quite unavoidable failure. In the summer the renewed plan of a converging attack on Boeotia, this time from three sides, resulted in November in a crushing defeat of the main Athenian army at Delium, inflicted by the resolution and tactical ability of the Theban Pagondas. His device of a deepened wing and his skilful use of cavalry for shock tactics anticipated the coming renown of the Theban army under Epaminondas. Meanwhile an attempt to capture Megara by treachery had been frustrated when on the very point of success by the sudden dash to the city's rescue by Sparta's greatest soldier Brasidas, and only Megara's port Nisaea remained in Athenian hands. Then Brasidas completed the discomfiture of the Athenian "Second Offensive." Marching at top speed through Boeotia and Thessaly he appeared in the early winter in Chalcidice, the Achilles-heel of the Athenian empire, offering liberty and protection to cities revolting against the tyrant Athens. Amphipolis quickly surrendered herself, and the historian Thucydides, then in naval command in the north Aegean, arrived in hot haste from Thasos only in time to save Eion at the Strymon's mouth. Cleon's vengeance punished him unjustly with 20 years' exile. Athens sought to check Brasidas' triumphant progress by concluding a truce, the "Truce of Laches," in April 423 B.C., with Sparta, whose only anxiety was to recover the prisoners of Sphacteria. Brasidas paid no heed, taking Scione and Mende defiantly. The indignant Athenians hurried reinforcements to what was now the only scene of active war. Nicias recovered Mende this year, and in 422 B C. Cleon hoped to end the matter. To carelessness in a reconnaissance outside Amphipolis he added cowardice. Brasidas sallied from the city, routed the enemy, and Cleon himself was slain. But the Spartan, like Wolfe, fell in the moment of victory. So the two great advocates of bitter war unexpectedly perished, and Nicias was able, on April 11, 421 B.C., to conclude with Sparta that peace, called after his own name, which he hoped would end the Peloponnesian War for all time.

PEACE AND WAR, 421–417 B.C.

There followed a period of uneasy peace between the Greek cities; of alliances projected, spoilt, effected; of recriminations and of diplomatic *finesse*, much of it wasted, all of it suspicious. Corinth and Boeotia refused stoutly to be parties to the Peace of Nicias. Neither Sparta nor Athens fulfilled its conditions, though the latter did surrender her Spartan prisoners in good faith. But she retained Pylos and Nisaea when Sparta professed her inability to render up Amphipolis. And when, in July 420 B.C., a new Quadruple Alliance of Athens, Argos, Mantinea and Elis confronted a Spartan-Boeotian Alliance, the already moribund peace was doomed. This new democratic League was the work of one man at Athens, Nicias' political rival Alcibiades. Like Disraeli entering on a public career about the age of 30, like him a man of brilliant talents and unbounded ambition, he too in-

curred the undying distrust, even hatred, of the "respectable" majority of his fellow-citizens. Though henceforward to the end of the war Alcibiades' personality dominates Athenian life and politics, his unquestioned oratorical and military abilities could not surmount finally this handicap, and the party-animosity which he provoked was the final cause of Athens' downfall. This is Thucydides' own certain judgment.

Athens' "Third Offensive Strategy" was in idea her best. Thanks to her new Peloponnesian allies she now threatened Sparta at home and made her rival stake her very existence upon the fortunes of a single fight. Then, to her salvation, Sparta discovered in her King Agis the second of her great soldiers, one remarkable alike for strategical and for tactical ability. Taking the initiative, Agis assembled a powerful army at Phlius by a masterly piece of night-marching and descended from the north upon Argos. His Boeotian contingent failed him at the critical moment, and, forced to extricate the remainder from peril as best he could, he concluded a much misunderstood treaty with the enemy. A few months later Argos, at Alcibiades' insistence, denounced the treaty, and the allies, though including only a miserably inadequate Athenian contingent and weakened further by the selfish absence of the Eleans, threatened Tegea. Agis hastened to the rescue, and the resulting battle of Mantinea in August 418 B.C. was so striking a Spartan victory that by this, the greatest land battle of the war, Sparta redeemed her lost reputation. Argos henceforward ceased to count. That the Third Athenian Strategy was so disastrous a failure was largely due to the blind folly of Alcibiades' political enemies, through whom he himself was not elected general in this the decisive year of its trial.

THE EXPEDITION AGAINST SYRACUSE, 416–413 B.C.

One hope only of bold offence now remained for Athens. In 416 B.C., on an appeal for help made by Egesta, Alcibiades advocated vigorous intervention again in Sicily. To conquer Syracuse, subdue the whole island, crush Carthage, and then return with triumphant prestige and added forces to finish the war at home was a strategy which might seem to promise a great, even if a temporary success, and did in fact come within an ace of succeeding at Syracuse itself. The expedition to Sicily was no error of judgment, and the glamour of the west which cast its spell over the vigorous youth of Athens was no false gleam. In vain Nicias urged the dreary alternative of continued operations in Chalcidice. Expedition after expedition had been sent there in 419–417 B.C. and all had been dolefully futile. Only in the west could Athens win the war. The expedition was voted with enthusiasm. On May 22, 415 B.C., the Hermae busts in Athens' streets were mysteriously mutilated. Despite the omen the great armada sailed in June, under three generals of equal authority, Alcibiades the author, Nicias the resolute opponent of the plan, and Lamachus, a straightforward soldier. Hardly had it reached western waters when Alcibiades was recalled to stand his trial at Athens for sacrilege. He had in vain demanded a trial before he sailed. In his absence his enemies played upon the religious credulity of the pious and upon the general dread of oligarchic plots. Alcibiades' own adherents were with him on shipboard. At Athens a death sentence awaited him. He eluded his escort and fled, furious, to Sparta.

Some progress at first was made in Sicily. A preliminary landing at Dascon in Syracuse Great Harbour in November 415 B.C. resulted in a useless Athenian victory. But in April 414 B.C. the whole fleet and army moved from Catana on Syracuse, and the Athenians began to encompass the city with a wall on the landward side while the fleet blocked the harbour approaches. But presently everything went wrong. Lamachus was killed, the fleet was heavily defeated, supplies ran short, a Spartan commander-in-chief, Gylippus, sent at Alcibiades' prompting, arrived to stiffen the Syracusan defence, and the circumvallation was stopped by a cross-wall. In response to Nicias' pitiful despatches Athens sent out Demosthenes with a second armada of 73 vessels. On his arrival, in July 413 B.C., he led an attack by night on the cross-wall. It was ruinously defeated. Nicias still dallied and refused Demosthenes' urgent entreaty to leave Syracuse. At last he had consented, after criminal delay, when, on August 27, an eclipse of the moon worked on the men's superstitious fears and Nicias bowed to the soothsayers' mandate to remain. The Syracusans under Hermocrates and Gylippus seized the unexpected chance. The Athenian fleet was penned up in the Great Harbour by a boom across its mouth, and, in a final desperate engagement, was heavily worsted. The Athenians, abandoning the ships, struck inland for the hills, then, their road here blocked by the enemy, turned south again in two divisions. The rear, under Demosthenes, was surrounded on Sept. 14 in the olive-yard of Polyzelus and surrendered. The van, under Nicias, struggled on for two more days until, cut off on the banks of the river Assinarus, the survivors of a bloody massacre surrendered also. The two captured generals were put to death, against Hermocrates' pleading, in cold blood. Many prisoners perished in the horrors of the quarries at Syracuse. Scarcely a man returned to Athens. The great armada was annihilated. Thucydides' story of this disaster remains the masterpiece of Greek historical writing. In its stark simplicity, sombre majesty, and tragic intensity, his narrative has never been surpassed.

ATHENS' RECOVERY, 412–408 B.C.

The whole Greek world now expected Athens' immediate downfall. Sparta, who had resumed war officially in August 414 B.C., had the disposal of a fleet of equal or superior strength, with naval reinforcements added from the west. Athens' own best mariners were dead. Her treasury was practically empty. In March 413 B.C. King Agis at Alcibiades' suggestion had occupied Decelea and kept her in a state of semi-blockade, and 20,000 of her slaves deserted to the king. The cities of her empire fell away from her in a series of revolts in 412–411 B.C. Persia now for the first time intervened actively in the war, and Sparta seemed able to count on the support of Tissaphernes, satrap of Sardis. Finally there was a successful conspiracy in Athens herself against the utterly discredited democracy, and the oligarchic extremists, Antiphon, Peisander and Phrynichus, seizing the power in June 411 B.C., opened secret and treasonable negotiations with the enemy. Two men saved Athens in this extremity. At home the "Moderate" leader Theramenes frustrated and crushed the extremists and established the "Constitution of the Five Thousand," which guarded the city and maintained the struggle. Alcibiades meanwhile had fled from Sparta to Sardis and by his charm so prevailed upon Tissaphernes that the satrap's aid to Sparta in gold was niggardly and in ships was nil. The Athenian navy, strongly democratic in sympathy, recalled Alcibiades to command at Samos, its base, and at Theramenes' urging the people in the city confirmed the election. Athens once more had a powerful fleet in being, but it was her last, and could not with safety be divided, however strenuously reinforced. The last stages of the war are purely naval.

Presently operations shifted to the Hellespont, where a victory won by the Athenian commanders Thrasybulus and Thrasylus over the Spartan Mindarus at Cynossema in Sept. 411 B.C., if far from decisive, at least restored Athenian confidence, though all hopes of Persian support had by this time been proved fallacious. At this point Thucydides' narrative breaks off short, and Xenophon, an inferior and dull, though an honest and trustworthy writer, takes up the tale. But in March 410 B.C. Alcibiades and his colleagues won so crushing a victory over the hostile navy and its supporting Persian army on land at Cyzicus in the Sea of Marmora that the Athenians were once again indisputable masters of the sea and Sparta actually suggested peace. The newly restored democracy under the demagogue Cleophon's guidance let slip the opportunity. Next year Alcibiades recaptured rebel Byzantium, cleared the Bosporus, secured Athens' corn supply, and so on June 16, 408 B.C., was able to make a triumphal entry into Athens after seven years' absence. He received a rapturous welcome, though there were many who cherished bitter ill-will against him secretly; was appointed general with autocratic powers; and so left to rejoin the fleet, now once again at Samos. He never saw his city again.

ATHENS' DOWNFALL, 407–404 B.C.

Sparta at last discovered a great admiral in Lysander. Coming to his naval base at Ephesus in the autumn of 408 B.C. he built up a large well-equipped fleet, assisted by the new satrap, Prince Cyrus, second son of the Persian king, who co-operated enthusiastically with the Spartan, placing Persia's illimitable resources and his own private purse at the latter's command. Persian vacillation thus ended, the only flaw in Sparta's naval organization was the rule forbidding the same man to hold the admiral's office in two consecutive years. In 407 B.C. Lysander resisted steadily all Alcibiades' efforts to entice him out to battle. Then that weakness, shortage of supplies, which hampered all Athenian operations in the "Ionian War," compelled Alcibiades to divide his fleet. He himself sailed north to plunder enemy coast towns, leaving in observation at Notium a squadron under one Antiochus, a good seaman and an old friend from boyhood, with strict orders not to offer battle. During his superior's absence at hostile Cyme Antiochus challenged Lysander insultingly to combat. The latter sallied out of harbour and routed him. Alcibiades returned and renewed the blockade of the foe, but the mischief was done. His personal enemies at Athens persuaded the people to dismiss him from his command. He withdrew quietly to a castle on the Hellespont, and a new board of generals next year replaced him.

Lysander, too, was superseded by Callicratidas, a brave and energetic officer. The latter, overcoming all hindrances placed in his way by Lysander and Cyrus, blockaded the Athenian Conon in Mitylene harbour. A large Athenian fleet, raised with desperate energy, sailed from Peiraeus to this general's succour. At the resulting battle of Arginusae in August 406 B.C. the fleets engaged were the largest hitherto seen on both sides in the war, but the tactics were nearly as clumsy as in the days before Phormio. Callicratidas was defeated heavily and he himself was drowned. Again Sparta offered peace. Again Cleophon, in drunken madness, secured its rejection. The very victory was marred by a failure, due in part only to heavy weather, to rescue many hundred drowning Athenian sailors from sinking or waterlogged ships. The generals were recalled to Athens. Six who obeyed were put on trial and, illegally condemned *en bloc,* were executed, Theramenes, whom they had tried to make their scapegoat, being largely responsible for their doom. By their removal he may have hoped to achieve Alcibiades' recall even at the eleventh hour. In this he failed. The new generals of 405 B.C. were, with one exception, Alcibiades' political opponents.

These proceeding to Ionia, moved the entire fleet up to the open roadstead of Aegospotami in the Hellespont. Lysander lay opposite in security at Abydos. In vain Alcibiades rode down to warn his compatriots of their perilous position. Insults rewarded this, the last of his many efforts to save his city. By a clever *ruse de guerre* Lysander in Sept. 405 B.C. captured the whole of the opposing fleet without a blow and "in one single hour brought the longest of wars to an end." Only Conon and some 20 Athenian ships escaped. So Athens lost her fleet and, with it, the war, thanks to incompetence and political partisanship combined. With slow deliberation Lysander sailed upon the city and blockaded Peiraeus. King Pausanias lay with his army outside the walls. After six terrible months of slow starvation Theramenes secured terms from Sparta tolerable compared with the utter destruction of the city demanded by Corinth and Thebes. On April 25, 404 B.C., Athens capitulated, and the Spartans marched in. Her long walls were pulled down to the merry sound of flutes. Her empire was dissolved. Samos, alone defiant, was taken. The oligarchy of the "Thirty Tyrants" was established at Athens, and Critias, its chief, presently secured the judicial murder of Theramenes in the city and the assassination of Alcibiades at Phrygian Melissa. "Liberty returned to Hellas." The Peloponnesian War was ended.

With the war the greatest, if not the happiest days of Athens' history are ended. Her political pre-eminence passes away. Interest centres rather on Thebes and Macedon in the 4th, on Achaea and Sparta in the 3rd century. Hence it is that the Peloponnesian War enjoys such importance in world-history. Apart from this, it is the genius of Thucydides which has raised to the rank of a world-epic, almost of a world-tragedy, a struggle which has seemed to some little better than a petty quarrel of ancient days.

PELOPONNESUS ("Island of Pelops"), the ancient (and modern Greek official) name for the part of Greece south of the Isthmus of Corinth. In mediaeval times it was called the Morea, from its resemblance to a mulberry-leaf in shape.

PELOPS, in Greek legend, the grandson of Zeus, son of Tantalus and Dione, and brother of Niobe. His father's home was on Mt. Sipylus in Asia Minor. Tantalus one day served up to the gods his own son Pelops, boiled and cut in pieces. The gods detected the crime, and none of them would touch the food except Demeter, who, distracted by the loss of her daughter Persephone, ate of the shoulder. The gods restored Pelops to life, and the shoulder consumed by Demeter was replaced by one of ivory. Poseidon carried Pelops off to Olympus, where he dwelt with the gods, till, from his father's sins, he was cast out from heaven. Then, taking much wealth with him, he went to Pisa in Elis and won Hippodameia by the treachery of Myrtilus (*cf.* OENOMAUS). When Myrtilus claimed his promised reward, Pelops flung him into the sea near Geraestus in Euboea, and from his dying curse sprang the woes of the house of Pelops. Among the sons of Pelops by Hippodameia were Atreus, Thyestes and Chrysippus. Pelops is closely connected with Olympia. A mound there was supposed (falsely) to be his tomb; his sacrifice was an important part of the festival; he is said to have celebrated the Games "more notably than any man before him" (Paus. v., 8, 2). It is likely that his family is of the eastern branch of the Achaeans known from Hittite records to have existed in Asia Minor in early times.

PELOTA, a Spanish word meaning ball. It is also used to denote various ball games whose traditional home is in the Basque provinces of France and Spain, but which are played regularly or occasionally in many places, *e.g.,* Madrid, Barcelona. Buenos Aires, Havana, etc. In the Basque country these games are the national pastime and every town and village has a court or courts.

PELOTAS, a city of the State of Rio Grande do Sul, Brazil, on the left bank of the São Gonçalo river near its entrance into the Lagôa dos Patos, about 30 m. N.W. of the city of Rio Grande. Area of *municipio* 1,037 sq.m.; pop. (1920) 82,294. The Rio Grande-Bagé railway communicates with the city of Rio Grande, and with the railways extending to Bagé, Cacequy, Santa Maria, Passo Fundo, Uruguayana and Porto Alegre. The São Gonçalo river is the outlet of Lagôa Mirim, and Pelotas is therefore connected with the inland water routes. The city is built on an open grassy plain (*campo*) little above the level of the lake (28 ft. above sea-level). Pelotas is the centre of the *xarque* (jerked beef) industry of Rio Grande do Sul. In its outskirts and the surrounding country are an immense number of *xarqueadas* (slaughter-houses), with large open yards where the dressed beef, lightly salted, is exposed to the sun and air. There are many factories or packing-houses where the by-products are prepared for market. Pelotas became a *villa* in 1830 and a city in 1835.

PELTASTS, properly, ancient Greek soldiers, carrying a light shield (πέλτη) instead of the heavier shield (ὅπλον), carried by the Hoplites. They were light infantry and were

recruited originally from Thracian mercenaries. After Iphicrates made them an efficient fighting force the term peltasts was applied to all light infantry (*cf.* Xen. *Hell.* iv., 4, 16 and 5, 12).

PELTIER, JEAN CHARLES ATHANASE (1785–1845), French physicist, born at Ham (Somme), found that heat is absorbed or liberated at the junction of two dissimilar metals in a circuit carrying an electric current. This is known as the "Peltier effect" (*see* ELECTRICITY: *Thermoelectricity*). Peltier died in Paris on Oct. 27, 1845.

PELUSIUM, an ancient city and port of Egypt, now represented by two large mounds close to the coast and the edge of the desert, 20 m. E. of Port Said. It lay in the marshes at the mouth of the most easterly (Pelusiac) branch of the Nile, which has long since been silted up, and was the key of the land towards Syria and a strong fortress, which, from the Persian invasion at least, played a great part in all wars between Egypt and the East.

PEMBA, an island in the Indian ocean off the east coast of Africa, forming part of the sultanate of Zanzibar. Pemba lies 30 m. N.N.E. of Zanzibar island between 4° 80′ and 5° 30′ S., and 39° 35′ and 39° 50′ E. It is some 40 m. long and 10 across at its broadest part, and has an area of 380 sq.m. It is of coral origin. From its luxuriant vegetation it gets its Arabic name of Al-huthera—"The Green." The average rainfall is 83 inches a year; the mean temperature about 80° F. Pop. (1924) 87,649. Most of the inhabitants are of Bantu stock and are known as Wapemba. The land is chiefly owned by Arab proprietors, who work their plantations with Swahili labour, and with negroes from the mainland. Up to 1897 the labourers were slaves. The great majority of the plantations are devoted to cloves, the number of plantations of coco-nut palms being comparatively small. The preponderance of clove plantations dates from a cyclone which in 1872 destroyed nearly all the clove-trees in the island of Zanzibar. Thereupon, to benefit from the great rise in the price of cloves, the Pemba planters cut down their palms and planted cloves. The Llandolphia rubber-vine is indigenous, and since 1906 Ceara rubber-trees have been planted. Rubber is a minor export. Rice, the chief of Pemba's imports, could be grown. Shaki-Shaki, the capital and the centre of trade, is centrally situated at the head of a shallow tidal creek partly blocked by dense growths of mangroves. Mkoani is on the south-west coast, Kishi-Kashi on the north-west coast; at the last-named port there is a deep and well-sheltered harbour. (*See* also ZANZIBAR.)

PEMBROKE, EARLS OF. The title of earl of Pembroke has been held successively by several English families, the jurisdiction and dignity of a palatine earldom being originally attached to it. The first creation dates from 1138, when the earldom of Pembroke was conferred by King Stephen on Gilbert de Clare (d. 1148), son of Gilbert Fitz-Richard, who possessed the lordship of Strigul (Estrighoiel, in *Domesday Book*), the modern Chepstow, and who, after the battle of Lincoln (1141), in which he took part, joined the party of the empress Matilda, and married Henry I.'s mistress, Isabel, daughter of Robert de Beaumont, earl of Leicester. For his son Richard, 2nd earl and for William Marshal, earl of Pembroke, who succeeded to the title through his marriage with Isabel, Richard's daughter and heiress, *see* separate articles.

Marshal's eldest son, WILLIAM MARSHAL (d. 1231), 2nd earl of Pembroke of this line, passed some years in warfare in Wales and in Ireland, where he was justiciar from 1224 to 1226; he also served Henry III. in France. His second wife was the king's sister, Eleanor, afterwards the wife of Simon de Montfort, but he left no children. His brother RICHARD MARSHAL (d. 1234), 3rd earl, came to the front as the leader of the baronial party, and the chief antagonist of the foreign friends of Henry III. Fearing treachery he refused to visit the king at Gloucester in Aug. 1233, and Henry declared him a traitor. He crossed to Ireland, where Peter des Roches had instigated his enemies to attack him, and in April 1234 he was overpowered and wounded, and died a prisoner. His brother GILBERT (d. 1241), who became the 4th earl, was a friend and ally of Richard, earl of Cornwall. When another brother, ANSELM, the 6th earl, died in Dec. 1245, the male descendants of the great earl marshal became extinct. The extensive family possessions were now divided among Anselm's five sisters and their descendants, the earldom of Pembroke reverting to the Crown.

The next holder of the lands of the earldom of Pembroke, WILLIAM DE VALENCE (d. 1296), a younger son of Hugh de Lusignan, count of La Marche, by his marriage with Isabella of Angoulême (d. 1246), widow of the English king John, was born at Valence, near Lusignan. In 1247 William and his brothers, Guy and Aymer, crossed over to England at the invitation of their half-brother, Henry III., who arranged a marriage between William and Joan de Munchensi (d. 1307) a grand-daughter of William Marshal, 1st earl of Pembroke. He was hated as one of the most prominent of the rapacious foreigners. He quarrelled with Simon de Montfort, refused to comply with the provisions of Oxford, and took refuge in Wolvesey castle at Winchester, where he was besieged and compelled to surrender and leave the country. In 1259 he and Earl Simon were formally reconciled in Paris, and in 1261 he was again in England. He fought for Henry at the battle of Lewes, and then, after a stay in France, he landed in Pembrokeshire, and took part in 1265 in the siege of Gloucester and the battle of Evesham. After the royalist victory he was restored to his estates and accompanied Prince Edward, afterwards Edward I., to Palestine. He died at Bayonne on June 13, 1296, and was buried in Westminster abbey.

His eldest surviving son, AYMER (*c.* 1265–1324), fought at Bannockburn; in 1317, when returning to England from Rome, he was taken prisoner and was kept in Germany until a large ransom was paid. In 1318 he again took a conspicuous part in making peace between Edward and his nobles, and in 1322 assisted at the formal condemnation of Earl Thomas of Lancaster, and received some of his lands. His wife, Mary de Chatillon, was the founder of Pembroke college, Cambridge.

In 1339 LAURENCE, LORD HASTINGS (d. 1348), a great-grandson of William de Valence, having inherited through the female line a portion of the estates of the Valence earls of Pembroke was created, or recognized as, earl of Pembroke. His son JOHN (d. 1376) married Margaret Plantagenet, daughter of King Edward III., and on the death without issue of his grandson in 1389 the earldom of Pembroke reverted again to the Crown, while the barony of Hastings was dormant till 1840.

In 1414 HUMPHREY PLANTAGENET, fourth son of King Henry IV., was created duke of Gloucester and earl of Pembroke for life, these titles being subsequently made hereditary, with a reversion as regards the earldom of Pembroke, in default of heirs to Humphrey, to WILLIAM DE LA POLE, earl of Suffolk. Accordingly, on the death of Humphrey, without issue, in 1447 this nobleman became earl of Pembroke. He was beheaded in 1450 and his titles were forfeited. In 1453 the title was given to SIR JASPER TUDOR, half-brother of King Henry VI. Sir Jasper being a Lancastrian, his title was forfeited during the predominance of the house of York, but was restored on the accession of Henry VII. On his death without heirs in 1495, his title became extinct.

During his attainder Sir Jasper was taken prisoner by SIR WILLIAM HERBERT (d. 1469), a Yorkist, who had been raised to the peerage as Baron Herbert by Edward IV., and for this service Lord Herbert was created earl of Pembroke in 1468. His son William (d. 1491) received the earldom of Huntingdon in lieu of that of Pembroke, which he surrendered to Edward IV., who thereupon conferred it (1479) on his son EDWARD, PRINCE OF WALES; and when this prince succeeded to the throne as Edward V., the earldom of Pembroke merged in the Crown. ANNE BOLEYN, a few months previous to her marriage with Henry VIII., was created marchioness of Pembroke in 1532.

The title of earl of Pembroke was next revived in favour of SIR WILLIAM HERBERT (*c.* 1501–1570), whose father, Richard was an illegitimate son of the 1st earl of Pembroke of the house of Herbert. He had married Anne Parr, sister of Henry VIII.'s sixth wife, and was created earl in 1551. The title has since been held by his descendants.

His elder son HENRY (*c.* 1534–1601), who succeeded as 2nd earl, was president of Wales from 1586 until his death. He married in 1577 MARY SIDNEY, the famous countess of Pembroke

(*c.* 1561–1621), third daughter of Sir Henry Sidney and his wife Mary Dudley. Sir Philip Sidney, her eldest brother, wrote the *Countess of Pembroke's Arcadia* for her pleasure. The two also worked at a metrical edition of the Psalms. On his death she made herself his literary executor, correcting the unauthorized editions of the *Arcadia* and of his poems, which appeared in 1590 and 1591. Spenser dedicated his *Ruines of Time* to her, and refers to her as Urania in *Colin Clout's come home againe;* in Spenser's *Astrophel* she is "Clorinda" In 1599 Queen Elizabeth was her guest at Wilton, and the countess composed for the occasion a pastoral dialogue in praise of Astraea

The Countess's other works include· *A Discourse of Life and Death,* translated from the French of Plessis du Mornay (1593), and *Antoine* (1592), a version of a tragedy of Robert Garnier.

William Herbert, 3rd earl of Pembroke (1580–1630), son of the 2nd earl, was a conspicuous figure in the society of his time and at the court of James I. He was lord chamberlain of the royal household (1615 to 1625) and lord steward (1626 to 1630). He was chancellor of the University of Oxford in 1624 when Thomas Tesdale and Richard Wightwick refounded Broadgates Hall and named it Pembroke college in his honour. By some Shakespearian commentators Pembroke has been identified with the "Mr. W. H" referred to as "the onlie begetter" of Shakespeare's sonnets in the dedication by Thomas Thorpe, the owner of the published ms, while his mistress, Mary Fitton (*q v.*), has been identified with the "dark lady" of the sonnets (*See* Shakespeare, William.) He and his brother Philip are the "incomparable pair of brethren" to whom the first folio of Shakespeare is inscribed The earl left no sons when he died in London on April 10, 1630.

His brother, Philip Herbert, the 4th earl (1584–1650), was for some years the chief favourite of James I In 1605 the king created him earl of Montgomery and Baron Herbert of Shurland, and since 1630, when he succeeded to the earldom of Pembroke, the head of the Herbert family has carried the double title of earl of Pembroke and Montgomery. Charles I, made him lord chamberlain in 1626 and frequently visited him at Wilton He worked to bring about peace between the king and the Scots in 1639 and 1640, but when in the latter year the quarrel between Charles and the English parliament was renewed, he deserted the king who soon deprived him of his office of chamberlain Trusted by the popular party, Pembroke was made governor of the Isle of Wight, and he was one of the representatives of the parliament on several occasions, notably during the negotiations at Uxbridge in 1645 and at Newport in 1648, and when the Scots surrendered Charles in 1647 In 1649, although a peer, he was elected and took his seat in the House of Commons as member for Berkshire.

His eldest surviving son, Philip (1621–1669), became 5th earl of Pembroke, and 2nd earl of Montgomery; he was twice married, and was succeeded in turn by three of his sons, of whom Thomas, the 8th earl (*c.* 1656–1733), was a person of note during the reigns of William III and Anne

His son Henry, the 9th earl (*c* 1689–1750), was a soldier, but was better known as the "architect earl" He was largely responsible for the erection of Westminster Bridge The title descended directly to Henry, 10th earl (1734–1794), a soldier, who wrote the *Method of Breaking Horses* (1762); George Augustus, 11th earl (1759–1827), an ambassador extraordinary to Vienna in 1807; and Robert Henry, 12th earl (1791–1862), who died without issue George Robert Charles, the 13th earl (1850–1895), was a grandson of the 11th earl and a son of Baron Herbert of Lea (*q v*), whose second son Sidney 14th earl (1853–1913), inherited all the family titles at his brother's death Sidney's son Reginald Herbert (b 1880) succeeded his father as 15th earl in 1913.

See G. T. Clark, *The Earls, Earldom and Castle of Pembroke* (Tenby, 1880); J R. Planché, "The Earls of Strigul" in vol x. of the *Proceedings of the British Archaeological Association* (1855); and G. E. C(okayne), *Complete Peerage*, vol. vi. (1895).

PEMBROKE, RICHARD DE CLARE, 2nd Earl of (d. 1176), commonly known as "Strongbow," son of Gilbert de Clare, the first earl, succeeded to his father's estates in 1148, but had forfeited or lost them by 1168. In that year Dermot, king of Leinster, driven out of his kingdom by Roderick, king of Connaught, came to solicit help from Henry II He secured the services of Earl Richard, promising him the hand of his daughter Eva and the succession to Leinster. The earl crossed over in person (1170), took both Waterford and Dublin, and was married to Eva. But Henry II., jealous of this success, ordered all the troops to return by Easter 1171. In May Dermot died; this was the signal of a general rising, and Richard barely managed to keep Roderick of Connaught out of Dublin. Immediately afterwards he hurried to England to solicit help from Henry II., and surrendered to him all his lands and castles Henry crossed over in Oct. 1172; he stayed in Ireland six months, and put his own men into nearly all the important places, Richard keeping only Kildare. In 1173 Richard went in person to France to help Henry II, and was present at Verneuil, being reinstated in Leinster as a reward. In 1174 he advanced into Connaught and was severely defeated, but fortunately Raymond le Gros re-established his supremacy in Leinster. Early in 1176 Richard died, just as Raymond had taken Limerick for him As he had no male issue his daughter, Isabel, became countess of Pembroke in her own right, and the title was borne by her husband, Sir William Marshal (*See* below) Strongbow was the statesman, as the Fitzgeralds were the soldiers, of the conquest He was buried in the cathedral church of Dublin, where his effigy and that of his wife are still preserved.

See Giraldus Cambrensis, *Expugnatio hibernica;* and the *Song of Dermot*, ed G H. Orpen (1892).

PEMBROKE, WILLIAM MARSHAL, 1st Earl of (? – 1219), English statesman, second son of John le Maréchal, by Sibylle, the sister of Patrick, earl of Salisbury, succeeded to the title through his marriage with Isabel, daughter of Richard, 2nd earl of Pembroke (*q v*). In 1170 he was admitted to the household of Prince Henry, the heir-apparent, and remained there until the death of his young patron (1183) He undertook a pilgrimage to the Holy Land, where he served as a crusader with distinction for two years Although he had abetted the prince in rebellion he was pardoned by Henry II and admitted to the royal service about 1188. In 1189 he covered the flight of Henry II. from Le Mans to Chinon, and, in a skirmish, unhorsed the undutiful Richard Coeur de Lion None the less Richard, on his accession, promoted Marshal and confirmed the old king's licence for his marriage with the heiress of Strigul and Pembroke. This match gave Marshal the rank of an earl, with great estates in Wales and Ireland, and he was included in the council of regency which the king appointed on his departure for the third crusade (1190). He took the side of Prince John when the latter expelled the justiciar, William Longchamp, from the kingdom, but in 1193 he joined with the loyalists in making war upon the prince. Richard allowed him to succeed his brother, John Marshal, in the hereditary marshalship, and on his death-bed designated him as custodian of Rouen and of the royal treasure during the interregnum.

Though he quarrelled more than once with John, Marshal was one of the few English laymen who clung to the royal side through the Barons' War He was one of John's executors, and was subsequently elected regent of the king and kingdom by the royalist barons in 1216 He prosecuted the war against Prince Louis and the rebels with remarkable energy In the battle of Lincoln (May 1217) he charged and fought at the head of the young king's army, and he was preparing to besiege Louis in London when the war was terminated by the naval victory of Hubert de Burgh in the straits of Dover He was criticized for the generosity of the terms he accorded to Louis and the rebels (Sept. 1217); but his desire for an expeditious settlement was dictated by sound statesmanship Self-restraint and compromise were the key-notes of Marshal's policy. Both before and after the peace of 1217 he reissued Magna Carta He fell ill early in the year 1219, and died on May 14, at his manor of Caversham near Reading. He was succeeded in the regency by Hubert de Burgh, in his earldom by his five sons in succession.

See the metrical French life, *Histoire de Guillaume le Maréchal*

(ed. P. Meyer, 3 vols., 1891–1901); G. J. Turner, "Minority of Henry III." (*Trans. Royal Hist. Soc.*, new series, vol. xviii., pp. 245–295); and W. Stubbs, *Constitutional History*, chs. xii. and xiv. (Oxford, 1896–97).

PEMBROKE, a town of Ontario, Canada, capital of Renfrew county, 74 m. W.N.W., of Ottawa by rail on the south shore of Allumette lake, an expansion of the Ottawa river, and on the Canadian Pacific and Canadian National railways. Pop. (1921) 8,875. It is the seat of a Roman Catholic bishopric, an important centre in the lumber trade.

PEMBROKE, municipal borough and county town of Pembrokeshire, Wales. Pop. (1921) (together with Pembroke Dock) 15,472. It is a walled town on a creek of Milford Haven, and consists of a long street running from the station on the east to the mediaeval castle on the west. A stone fortress seems to have been built here by Arnulf de Montgomery about 1090, and in the 12th and 13th centuries the castle was enlarged by the Earls palatine of Pembroke who made it their chief seat. The circular vaulted keep built by William Marshall (*c.* 1200) is 75 ft. high with walls 7 ft. thick. The Great Hall is built over the "Wogan," a natural subterranean passage giving access to the harbour. As capital of the Palatinate, and the nearest port for Ireland, Pembroke was one of the most important fortified sites of the west. Facing the castle are the remains of Monkton Priory founded by Arnulf de Montgomery in 1098 for Benedictine monks as a cell of Sées in Normandy, but given to St. Albans in 1473. The town grew around the castle and was first incorporated by Henry I. in 1109, and again by Richard de Clare in 1154, and its privileges were later confirmed and extended. With the Act of Union (England and Wales) 1536 the county Palatine of Pembroke was abolished and in 1835 the corporation of Pembroke town was remodelled. At the outbreak of the Civil War the castle was garrisoned for the Parliament by the Mayor John Poyer, but in 1647 he declared for the king. Cromwell himself besieged the castle which fell and Poyer was executed. The new town that grew around the government dockyard, established in 1814, is known as *Pembroke Dock*. The dockyard was closed down in 1926.

PEMBROKESHIRE (*Sir Benfro, Dyfed*), the most westerly county of South Wales, bounded north-east by Cardigan, east by Carmarthen, south by the Bristol Channel, and west and northwest by St. Bride's bay and Cardigan bay of St. George's Channel. The coastline is much indented and over 140 m. in length. Area (administrative county) 393,003 acres. Pop. (1921) 91,978.

Geology.—The region falls naturally into an upland northern section of older rocks, and a lowland southern section of somewhat newer rocks. In the north the rocks range from pre-Cambrian near St. Davids to the Ordovician and Silurian, forming the mass of the Preseli hills which reach 1,760 ft. in Preseli Top. The general strike of the beds is south-west to north-east. From the Carmarthenshire border westward the rocks of the northern section of the county become older and older,—Silurian, Ordovician (Arenig, Llandeilo and Bala beds) Cambrian (Lingula Flags and Treinadoc beds) and finally pre-Cambrian granitic (Dimetian) and volcanic (Pebedian) rocks near St. Davids. As the rocks get older to the west so the elevation of the hills becomes reduced and the Preseli finger out to sea forming numerous headlands, islands and bays. The rocks of the north and west are interspersed with igneous material such as the gabbros and diabases of Strumble Head, Fishguard, Llanwnda and Preseli; diorites north-west of St. Davids, bostonites and porphyrites about Abercastle and the basaltic laccolite of Pen Caer, besides various contemporaneous acid lavas and tuffs. The Ordovician and Silurian rocks extend southward to the neighbourhood of Narberth and Haverfordwest, where Arenig, Llandeilo, Bala and Llandovery beds are recorded. Silver-bearing lead has been mined at Llanfyrnach. The southern plain is open to the sea and may be looked upon geologically as a continuation westwards of the south Wales coalfield, with associated Lower Carboniferous, Old Red Sandstone and narrow belts of Silurian rocks, the whole having been considerably folded and faulted, producing a general north-west to south-east strike. The coal measures, highly inclined and anthracitic, stretch across from Carmarthen bay to the shore of St. Bride's bay; they are bordered on the north and south-east by the Millstone Grits, Carboniferous Limestone series and Old Red Sandstone. On account of the folding the limestone appears again farther south at Pembroke, Caldy island and St. Gowan's Head; most of the remaining ground about Milford Haven being occupied by Old Red Sandstone with infolded strips of Silurian. There has been much general subsidence of the coastline and the lower sections of many of the valleys have been drowned. The submerged lower reaches of the eastern and western Cleddan form Milford Haven. There are submerged forests in the vicinity Amroth.

History and Early Settlement.—The outstanding feature of the early history of Pembrokeshire is its importance in Megalithic times. The north-west section of the county (including the southern slopes of the Preseli hills) is especially rich in Megalithic remains—dolmens, alignments, standing stones and stone circles. There are similar remains in the southern half of the county but they are not nearly so marked, as a group, as in the north-western district. This wealth of Megalithic remains suggests that northwest Pembrokeshire had cultural relations with many of the northwest coastal promontories of Europe in the days when metal was beginning to be known in the west. The interest of the stone circle culture in Pembrokeshire was increased when it was shown that the stones forming the inner circle at Stonehenge were derived from rocks in Pembrokeshire (*see* H. H. Thomas "The Source of the Stones of Stonehenge," *Antiquaries Jour.* vol. iii., 1923). There are well preserved dolmens at Longhouse near Mattery, Pentre, Evan, Nevern and near Moylgrove. The stone circle known as Parc-y-Marw near Fishguard is well preserved.

The county does not show a wealth of Bronze Age objects though isolated finds fringe, as it were, the megalithic area. The number of hill-top camps, presumably of Romano-British type and date, is important, especially guarding ways in from the coast, though actual Roman influence in the county is very slight. Castell Flemish on the south-west slopes of the Preseli was probably a military site. It is probable that the hill-top camps continued to be occupied through the post-Roman centuries as the county suffered badly from raiders from over the sea. In Pembrokeshire, as in Ireland, the native cultures lived on uninterrupted by Roman influences, and Pembrokeshire was apparently invaded by the Irish Deisi about A.D. 270. In the early centuries of our era the county maintained its contacts with Ireland and Brittany and became a great centre of Celtic Christianity. Memorials of this period remain in the numerous church dedications and in the beautiful Celtic crosses such as those of Carew, Penally and Nevern. Stones with Ogham inscriptions have been found at Caldy, Bridell, St. Dogmells, Cilgerran and other places. The route that had linked Ireland, Pembrokeshire, Cornwall, Brittany and north-west Spain in Megalithic times became the route of the Celtic saints and, in the middle ages, an important pilgrim's way to the shrine of Santiago da Compostella (north-west Spain) (*see* A. Hartwell Jones, *Y Cymmrodor*, 1912). In a sheltered valley, at a focus of roads from a number of little landing places on the north-west coast of Pembrokeshire, there grew up the great cathedral of St. Davids (*q.v.*), soon to become itself a centre of pilgrimage, and at the landing places were built chapels for the pilgrims. St. Non's and St. Patrick's are probably very early.

Pembrokeshire was known to the Welsh in these early times as Dyfed. On the death of Rhodri Mawr in 877, Dyfed fell nominally under the sway of the princes of Deheubarth, or south Wales; their hold was never very secure, nor were they able to protect the coast towns from the Scandinavian pirates. This is shown by the large number of Scandinavian place names that are found in the coastal districts, especially near the south coast. In 1092 Arnulf de Montgomeri, son of Roger, earl of Shrewsbury, did homage to the king for the Welsh lands of Dyfed. With the building of Pembroke castle, the Normans began to spread over southern Dyfed; whilst Martin de Tours, landing in Fishguard bay and building the castle of Newport at Trêfdraeth, won for himself the extensive lordship of Kemes (Cemmaes) between the river Teifi and the Preseli mountains. Flemish settlers were

planted in the hundred of Rhôs, or Roose, in or about the years 1106, 1108 and 1111 with the approval of Henry I., and again in 1156 under Henry II. The castles of Haverfordwest and Tenby were erected to protect these aliens, and despite the fierce attacks of the Welsh princes their domain grew and their district became known as "Little England beyond Wales." In 1138 Gilbert de Clare was created earl of Pembroke with the full powers of an earl palatine in Dyfed.

Examination of the mediaeval record shows a marked contrast between the *Englishery* of the south with its compact villages and cultivation, and the *Welshery* of the north with its scattered farms and tribal groups. The south was better populated than the north and maintained a closer contact with the affairs of the English plain. It was also the Norman stronghold and the south of the county has long been famous for its mediaeval castles. The finest examples are to be observed at Pembroke; Manorbier, built in the 12th century and interesting as the birthplace and home of Giraldus Cambrensis; Carew, exhibiting many interesting features of both Norman and Tudor architecture; and Picton. Other castles are the keep of Haverfordwest and the ruined fortresses at Narberth, Tenby, Newport, Wiston, Benton, Upton and Cilgerran. There are remains of monastic houses at Tenby and Pembroke, but the most important religious communities were the priory of the Augustinian friars at Haverfordwest and the abbey of the Benedictines at St. Dogmells. The latter, founded by Martin de Tours in the 11th century, owned the priories of Pill and Caldy. Considerable ruins of the abbey exist near the left bank of the Teifi about 1 m. below Cardigan. Of the ancient preceptory of the Knights of St. John at Slebech scarcely a trace remains, but of the college of St. Mary at St. Davids founded by Bishop Houghton in 1377, the shell of the chapel survives.

Interesting examples of mediaeval domestic architecture are the ruins of the former episcopal mansions at Llawhaden, St. Davids and Lamphey, the two latter of which were erected by Bishop Gower between the years 1328–47. The cathedral at St. Davids is, of course, the greatest ecclesiastical monument in the county as well as in the principality. The nave dates largely from 1180–98 and the building was continued into the 13th century. Bishop Gower (1328–47) altered the windows and lifted the roofs of the aisles. Bishop Vaughan (1509–22) built a beautiful chapel with fan-vaulting and increased the height of the tower. The Rood Screen (14th cent.), the mediaeval bishop's throne, the pardon screen, and the stall for the king as a prebend of the cathedral are noteworthy features. St. Mary's, Haverfordwest, is of the 13th century, altered in the 15th.

By the Act of Union (27 Henry VIII.), the king abolished all special jurisdiction in Pembrokeshire. Some parts of the county were for the king in the 17th century, though the influence of the parliament grew as the castles of Tenby and Haverfordwest fell to their arms. In February 1797 some French frigates appeared off Fishguard Bay, but the crews surrendered.

Climate, Occupations and Communications.—The south of the county has more sunshine and less rain than any other region in Wales although it is open to the south-west winds. The chief industry is agriculture, wherein stock-raising is preferred to the growing of cereals. Of cattle the long-horned, black Castlemartin breed is conspicuous. The 19th century saw the establishment of the naval dockyard at Pembroke (Paterchurch) and the building of docks and quays at Neyland and Milford. The closing of the Pembroke Dockyard soon after the war of 1914–18 has seriously affected employment in south Pembrokeshire. The improvements during the early part of the 20th century at Fishguard in the north of the county have made it an important packet station for Ireland, though the attempt to make it a port of call for ocean going liners has failed. The south Wales coalfield extends into south Pembroke, and coal is worked at Saundersfoot, Begelly, Templeton, Kilgetty and other places.

The south Wales branch of the G.W. railway enters Pembrokeshire from the east near Clynderwen Junction, whence the main line leads to Fishguard Harbour. Other lines proceed to Neyland and Milford Haven by way of Haverfordwest, and a branch line from Clynderwen to Goodwick joins the main line at Letterston. The Whitland-Cardigan branch traverses the north-east by way of Crymmych and Cilgerran. Another line running south-west from Whitland proceeds by way of Narberth and Tenby to Pembroke Dock.

Administration.—Municipal boroughs are Pembroke, Haverfordwest (also a county of itself) and Tenby. The hamlet of Bridgend and a part of St. Dogmell's parish are included within the municipal limits of Cardigan. Newport (Trêfdraeth), once the chief town of the barony of Kemes, or Cemmaes, still possesses a mayor and corporation under a charter granted in 1215 by Sir Nicholas Marteine, lord of Kemes, whose hereditary representative still nominates the mayor and aldermen. Milford Haven, Narberth and Fishguard are urban districts. Pembrokeshire lies in the South Wales circuit. By the act of 1918 the county returns one member to parliament. Ecclesiastically, it contains 153 parishes and lies wholly in the diocese of St. Davids.

See R. Fenton, *A Historical Tour through Pembrokeshire* (1810); E. Laws, *History of Little England beyond Wales* (1888); Basil Jones and E. A. Freeman, *History and Antiquities of St. David's* (1856), etc. Ancient Monuments Commission Report, *Pembrokeshire* (1925).

PEMMICAN. A North American Indian (Cree) word for a meat prepared in such a way as to contain the greatest amount of nourishment in the most compact form. As made by the Indians it was composed of the lean parts of the meat, dried in the sun, and pounded or shredded and mixed into a paste with melted fat. It is flavoured with acid berries. If kept dry it will keep for an indefinite time, and is thus particularly serviceable in arctic or other explorations.

PEMPHIGUS, a skin disease, in which large blebs appear, on a red base, containing a clear or yellowish fluid; the blebs occasion much irritation, and when they burst leave raw ulcerated surfaces. The disease is principally known in unhealthy or neglected children. A variety of the malady *pemphigus foliaceus*, affects the whole body, and gradually proves fatal. Pemphigus of an acute septicaemic type may occur in butchers or those who handle hides. In chronic pemphigus, streptococci have been found in the blebs, and improvement has followed injection of a vaccine of streptococci.

PEN, an instrument for writing or for forming lines with an ink or other coloured fluid (Lat. *penna*, a feather, pen). The earliest writing implement was probably the stilus (Gr. γραφίς), a pointed bodkin of metal, bone or ivory, used for producing incised or engraved letters on boxwood tablets covered with wax. The calamus (Gr. κάλαμος) or arundo, the hollow tubular stalk of grasses growing in marshy lands, was the true ancient representative of the modern pen; hollow joints of bamboo were similarly employed. An early specific allusion to the quill pen occurs in the 7th century writings of St. Isidore of Seville, but there is no reason to assume that it was not in use at a still more remote date. The quills still occasionally employed among Western communities as writing instruments are obtained principally from the wings of the goose (*see* FEATHER). In 1809 Joseph Bramah devised and patented a machine for cutting up the quill into separate nibs by dividing the barrel into three or even four parts, and cutting these transversely into "two, three, four and some into five lengths." Bramah's invention first familiarized the public with the appearance and use of the nib slipped into a holder. But a more distinct advance was effected in 1822, when J. I. Hawkins and S. Mordan patented the application of horn and tortoise-shell to the formation of pen-nibs, the points of which were rendered durable by small pieces of diamond, ruby or other very hard substance, or by lapping a small piece of thin sheet gold over the end of the tortoise-shell.

Metal Pens.—Metallic pens, though not unknown in classical times—a bronze pen found at Pompeii is in the Naples museum—were little used until the 19th century and did not become common till near the middle of that century. It is recorded that a Birmingham split-ring manufacturer, Samuel Harrison, made a steel pen for Dr. Joseph Priestley in 1780. Steel pens made and sold in London by a certain Wise in 1803 were in the form of a tube or barrel, the edges of which met to form the slit, while the sides were cut away as in the case of an ordinary quill. Their

price was about five shillings each, and as they were hard, stiff and unsatisfactory instruments they were not in great demand. To John Mitchell probably belongs the credit of introducing machine-made pens, about 1822, and James Perry is believed to have been the first maker of steel slip pens. In 1828 Josiah Mason, who had been associated with Samuel Harrison in the manufacture of split rings, saw Perry's pens on sale in Birmingham, and after examining them saw his way both to improve and to cheapen the process of making them. He therefore put himself in communication with Perry, and the result was that he began to make barrel pens for him in 1828 and slip pens in 1829. Perry, who did much to popularize the steel pen and bring it into general use, in his patent of 1830 sought to obtain greater flexibility by forming a central hole between the points and the shoulders and by cutting one or more lateral slits on each side of the central slit; and in 1831 an improvement, which consisted in forming elongated points on the nibs of the pens, was described by Joseph Gillott.

The metal used consists of rolled sheets of cast steel of the finest quality made from Swedish charcoal iron. These sheets, after being cut into strips of suitable width, annealed in a muffle-furnace and pickled in a bath of dilute sulphuric acid to free the surface from oxidized scale, are rolled between steel rollers till they are reduced to ribbons of an even thickness, about $\frac{1}{180}$ inch. From these ribbons the pen blanks are next punched out, and then, after being embossed with the name of the maker or other marks, are pierced with the central perforation and the side or shoulder slits by which flexibility is obtained. After another annealing, the blanks, which up to this point are flat, are "raised" or rounded between dies into the familiar semi-cylindrical shape. The next process is to harden and temper them by heating them in iron boxes in a muffle-furnace, plunging them in oil, and then heating them over a fire in a rotating cylindrical vessel till their surfaces attain the dull-blue tint characteristic of spring-steel elasticity. Subsequently they are "scoured" in a bath of dilute acid, and polished in a revolving cylinder. The grinding of the points with emery follows, and then the central slit is cut by the aid of two very fine-edged cutters. Finally, the pens are again polished, are coloured by being heated over a fire in a revolving cylinder, and in some cases are coated with a varnish of shellac dissolved in alcohol. Birmingham was the first home of the steel-pen industry, and continues its principal centre. The manufacture on a large scale was begun in the United States about 1860 at Camden, N.J.

Metals other than steel have frequently been suggested by inventors, those most commonly proposed being gold, silver, zinc, German silver, aluminium and aluminium bronze. The latest development, introduced in 1926, is the manufacture of pens made from stainless steel. These pens are unaffected by the acids in all inks and are impervious to extreme climatic conditions.

Various devices have been adopted in order to increase the time for which a pen can be used without a fresh supply of ink. For these, *see* FOUNTAIN PEN.

PENALTY: *see* DAMAGES.

PENANCE, strictly, repentance of sins. Thus in the Douai version of the New Testament the Greek word μετάνοια is rendered "penance," where the Authorized Version has "repentance." The two words, similar in their derivation and original sense, have however come to be symbolical of conflicting views of the essence of repentance, arising out of the controversy as to the respective merits of "faith" and "good works." The Reformers, upholding the doctrine of justification by faith, held that repentance consisted in a change of the whole moral attitude of the mind and soul (ἐπιστρέφεσθαι, Matt. xiii. 15; Luke xxii. 32), and that the Divine forgiveness followed true repentance and confession to God without any reparation of "works." In the Roman Catholic Church the sacrament of penance consists of three parts: *contritio, confessio, satisfactio. Contritio* is in fact repentance as Protestant theologians understand it, *i.e.*, sorrow for sin arising from love of God; but "reconciliation" can not follow such contrition without the other parts of the sacrament, which form part of it. The word "penance," applied to the whole sacrament, is also used of the works of satisfaction imposed by the priest on the penitent, *i.e.*, the temporal punishment (*poena*). (*See* CONFESSION.)

PENANG, the town and island which, after Singapore, form the most important part of the British crown colony of Straits Settlements. The island is situated in 5° 24′ N. and 100° 21′ E., and distant about 2½ m. from the west coast of the Malay peninsula. It is about 15½ m. long by 10½ m. wide at its broadest point. Its area is 108 square miles. The town, which is built on a promontory nearest to the mainland, is largely occupied by Chinese and Tamils, though the Malays are also well represented. Behind the town, Penang hill rises to a height of 2,428 ft., and upon it are built several government and private bungalows and a hotel. There is a fine hill-railway. The town possesses European clubs, a racecourse, and golf links. Coconuts are grown along the seashore, and rice is cultivated at Balek Pulau and in the interior. Penang has an excellent harbour, but has suffered from its proximity to Singapore.

Since 1867 Penang has been under the administrative control of a resident councillor who is responsible to the governor of the Straits. He is aided by officers of the Malayan Civil Service. Unofficial members of the legislative council of the colony, which holds its sittings in Singapore, are appointed, with the sanction of the secretary of state for the colonies, to represent Penang. Their term of office is for three years. The official name of the island is Prince of Wales island and that of the town is Georgetown.

The population of the whole settlement of Penang at the census of 1921 was 304,335; population of municipality, 123,069 in 1921.

The number of ships which entered and left the port of Penang during 1926 was 6,217 with an aggregate tonnage of 11,408,303. Of these 4,497 were British with an aggregate tonnage of 7,412,642. There are no port dues.

Penang was founded on July 17, 1786, having been ceded to the East India Company by the sultan of Kedah in 1785 by an agreement with Captain Light. It was then almost uninhabited, and was made a penal settlement. In 1805 Penang was made a separate presidency, and when in 1826 Singapore and Malacca were incorporated with it, Penang continued to be the seat of government. In 1837 Singapore was made the capital of the Settlements. In 1867 the Straits Settlements were created a Crown colony, in which Penang and Malacca were included.

PENARTH, an urban district and seaport, suburb of Cardiff, Glamorganshire, Wales, situated on rising ground on the south side of the mouth of the Ely opposite Cardiff. Pop. (1921) 17,104. With modern additions the length of the tidal harbour is 13,000 ft. with a total frontage, Penarth and Cardiff sides, of 15,000 ft. The average width at high water for the first reach of the river is 600 ft., length 4,000 ft., area 55 acres. The Windsor double slipways between Penarth and Cardiff take vessels 350 ft. and of 3,500 gross tonnage. Penarth mainly exports coal although the tonnage has fallen considerably since 1921 due to the depression following the World War. Timber, pulp, iron ore are imported. The G. W. R. Co. owns the docks. Penarth is a seaside resort.

PENATES, Roman gods of the store-room, properly *di penates* (Lat. *penus*). This was, in old times, beside the *atrium*, the room which served as kitchen, parlour, and bedroom in one; but in later times was in the back part of the house. In private cult they were associated with Vesta (*q.v.*), if indeed Vesta is not to be accounted one of them (*see* Servius on Virgil, *Aen.* xi. 211), and the *lares* (*q.v.*). A little offering of food was made at each meal on such occasions as birthdays, marriages, and safe returns from journeys, the images were crowned and offerings made to them of cakes, honey, wine, incense, and sometimes a pig (*see* ROMAN RELIGION). As each family had its own penates, so the State, as a collection of families, had its public penates. The other towns of Latium had their public penates as well as Rome. The sanctuary of the whole Latin league was at Lavinium. To the penates at Lavinium the Roman priests brought yearly offerings, and the Roman consuls, praetors, and dictators sacrificed both when they entered on and when they laid down their office. To them, too, the generals sacrificed before departing for their province. Alba Longa had also its ancient penates, and the Romans maintained the worship on the Alban

FRENCH AND ENGLISH PENCIL DRAWINGS

1. Drawing in "plumbago," with some wash work, of Sir Bevil Grenville, dated 1636, by Peter Oliver (1594–1648), English. 2. Drawing in "plumbago" of Charles II., by David Loggan (1635–1700). 3. Drawing of Mary, daughter of the 1st Marquis of Lothian, by David Paton (fl. 1650–1700), English. 4. Drawing in "plumbago" on vellum of Elizabeth, Viscountess Tracy, by Thomas Forster (fl. 1695–1712), English. 5. Portrait of Edward Manot, by Edgar Degas (1834–1917), French. 6. Landscape by Thomas Gainsborough (1727–88), English. 7. Study by Alphonse Legros (1837–1911), French. 8. Portrait of an Unknown Man, by J. A. D. Ingres (1780–1867), French

mount long after the destruction of Alba Longa. The penates had a temple of their own at Rome. It was on the Velia near the Forum, perhaps on the site of the church of SS. Cosma e Damiano (*see* P. B. Whitehead in *Amer. Journ. Archae.* xxxi. p. 1 *et seq.*, 1927). In this and many other temples the penates were represented by two images of youths seated holding spears.

The origin and nature of the *penates publici* was a subject of much discussion to the Romans themselves. They were traced to the mysterious worship of Samothrace; Dardanus, it was said, took the penates from Samothrace to Troy, and after the destruction of Troy, Aeneas brought them to Italy and established them at Lavinium. From Lavinium Ascanius carried the worship to Alba Longa, and from Alba Longa it was brought to Rome. Others said they were the great gods to whom we owe breath, body, and reason, viz., Jupiter representing the middle æther, Juno the lowest air and the earth, and Minerva the highest æther, to whom some added Mercury as the god of speech (Servius, on *Aen.* ii. 296; Macrobius, *Sat.* iii. 4, 8; Arnobius, *Adv. Nat.* iii. 40). Others identified them with Apollo and Neptune. The so-called Etruscan penates were said to be Ceres, Pales, and Fortuna, to whom others added *Genius Iovialis* (Servius on *Aen.* ii. 325; Arnob. *loc. cit.*). Martianus Capella places the penates in the first of his 16 celestial regions.

See G. Wissowa, *Gesammelte Abhandlungen*, p. 95 *et. seq.* (*Hermes*, xxii. p. 29 *et seq.*); and in Roscher's *Lexikon* (*s.v.*); R. Thulin, *Die Götter des Martianus Capella.*

PENCIL, a name originally applied to a small, fine pointed brush used in painting, and still employed to denote the finer camel's-hair and sable brushes used by artists (Lat. *penicillus*, brush; literally, little tail), but now commonly signifying a solid rod of marking material used for writing and drawing, either encased in wood or enclosed in some form of holder.

It has been asserted that a manuscript of Theophilus shows signs of having been ruled with a black-lead pencil; but the first distinct allusion to a pencil occurs in the treatise on fossils by Conrad Gesner of Zurich (1565) who describes an article for writing formed of wood and a piece of lead, or as he believed, an artificial composition called by some *stimmi anglicanum* (English antimony). The famous Borrowdale mine in Cumberland having been discovered about that time, it is probable that we have here the first allusion to that great find of graphite. While the supply of the Cumberland mine lasted, the material for English pencils consisted simply of the native graphite as taken from the mine.

Strenuous efforts were made, however, to render manufacturers independent of the Cumberland mine, whose supplies showed signs of exhaustion. In Nuremberg, where the great business of the family Faber (*q.v.*) was established in 1760, pencils were made from pulverized graphite cemented into solid blocks by means of gums, resins, glue, sulphur and similar adhesives, but none of these preparations yielded useful pencils. In 1795 N. J. Conté first produced pencils made of graphite which had been ground with certain clays, pressed into sticks and fired in a kiln. This method forms the basis of manufacture of all modern pencils.

Manufacture of Pencils.—Graphite (*q.v.*) and selected clays are mixed together in proportions determined by experiment and research. The materials are mixed in water and ground in heavy mills. Here is determined quality and degree; the quality by the selection of material and the intensity of grinding; the degree by the proportions of clay and graphite. After grinding, the mass is transferred to a specially prepared filter press and subjected to intense pressure, usually hydraulic, to squeeze out surplus moisture and obtain close texture. The mass so made, of a very firm consistency and just plastic, is inserted into heavy power-driven presses to be forced through an aperture of the desired diameter and shape, whence there exudes a thin, still plastic, string-like strip which is laid on boards to dry. After drying, the leads are sealed in crucible boxes and fired in kilns to a suitable heat to vitrify the clay; the temperature varies from 600° to 1,200° C.

Cedar for Pencils.—Cedar wood is found in many countries, but the fine aromatic, soft, straight-grained wood most suitable for the manufacture of pencils (*Juniperus virginiana*) comes from the United States. Wood of similar class is grown in large quantities in the parallel belt of Africa, particularly in Kenya, but the Kenya wood is harder, heavier, and inferior to the American variety. Owing to the steady exhaustion of cedar wood from Virginia, Californian Incense Cedar was introduced to the industry about 1900 and is now largely used for the cheaper grades of pencils.

The slats of cedar require careful maturing to prevent warp. They are cut into various widths according to the size and growth of the log, but where possible they are produced wide enough to enable seven pencils to be manufactured simultaneously. The slats are planed and grooved in such a manner that when the two planed surfaces are brought together the grooves form either a round or other aperture which correctly embraces the lead. The surfaces are glued and the boards are clamped in piles, to be subsequently transferred to automatic shaping machines where they are reduced to single pencils, by appropriate machine tools.

The manufacture of "leads" for coloured pencils varies from the method used for the graphite pencils, the basis being kaolin blended with suitable waxes and gums, which are ground together with the necessary colour to obtain the tint required. The firing process is eliminated.

"Copying" pencils used to be constructed on the same lines, with a substitution of aniline dye as the colouring matter. About 1898 improvements were made in copying pencils by blending graphite and aniline dye together. (F. P. Do.)

PENCIL DRAWING. A pencil drawing is one made by a piece of graphite sharpened into a fine point, and held in a porte-crayon, and the term is usually applied to a drawing made with this material upon vellum or parchment. The greatest masters of this particular art were Dutchmen, and the best productions were those of the 17th century. In a great many instances it is quite certain that the extremely elaborate plumbago (graphite) drawings done by Dutch artists were intended for the purpose of engravings, and of several of them, this can be proved by putting the finished engraving by the side of the elaborate plumbago drawing. Considering the clumsiness of the material, it is amazing that the artists elaborated such exceedingly delicate and beautiful work as many of these plumbago drawings exhibit. It seems almost certain that they must have been drawn under a lens, and it is clear that the artist possessed a steady hand to a very unusual degree.

One of the earliest workers in plumbago was Simon van de Pass (1595?–1647) whose pencil drawings were almost certainly either for reproduction on silver tablets or counters or for engraved plates. Abraham Blooteling, the Dutch engraver, executed a very few portraits, but they appear to have been only first sketches, from which eventually he made larger ones, and from these engraved his plates. He was followed by the man who is perhaps the greatest exponent of the art of drawing in plumbago, David Loggan (1635–1700), a pupil of Van de Pass, and a man well known for his long series of engravings representing the colleges of Oxford and Cambridge. He executed portraits with the utmost dexterity, and with marvellous minuteness, the lines representing the intricacies of a lace ruffle, or the curls of a wig, being unusually perfect. Better known is William Faithorne (*q.v.*).

Next in eminence and skill comes Thomas Forster (*fl.* 1695–1712). He was one of the greatest draughtsmen in this particular form of portraiture. Forster was responsible for a few prints, but examples of them are of the utmost rarity. His work can be studied with advantage in the Holburne Museum at Bath, at Welbeck Abbey, or at the Victoria and Albert Museum, London.

There are two other Englishmen who should be mentioned, Robert and George White, father and son. The former (1645–1704) was a pupil of David Loggan (who originally came from Danzig); he was a prolific engraver, most of whose drawings in plumbago on vellum were evidently executed for the purpose of engraving. George White, his son (1684–1732) was taught by his father, and finished some of his father's plates.

Reference must also be made to the use of plumbago by the painters of miniatures in colour. Hilliard used plumbago for preparing designs for jewels and for seals, Isaac and Peter Oliver for sketches in portraiture. A draughtsman in plumbago whose works are exceedingly scarce was David Paton, who worked in

1670. Then there were early engravers, such as George Glover (d. 1618) and Thomas Cecill (*fl.* 1630), who executed plumbago drawings, evidently studies for engravings. Of Glover's work the only known signed example is in the writer's collection. The work of Jonathan Richardson (1665–1745) and also the work of his son must be alluded to, but it is believed that, by their time, the graphite had been enclosed in a wooden rod, and that therefore the drawings may more naturally be called pencil drawings.

Draughtsmen in Indian ink have prepared portraits on very much the same lines. Among them were the two Fabers (1660?–1721 and 1695?–1756) in Holland, the elder having been born at The Hague, as he himself stated on his portrait which was in Vertue's collection. Of the two the son was the greater artist, although both of them were responsible for many very fine portraits drawn in Indian ink, as a rule circular, often set within lined borders and frequently adorned with coats of arms and inscriptions, equally minute and wonderful. Another able worker in Indian ink was a Swede, Charles Bancks (*c.* 1748), and another, a Swiss, Joseph Werner, born 1637, who made his drawings upon brown paper, and in some cases heightened the work with touches of white paint. Amongst other exponents of this art are the following: Thomas Worlidge (1700–1766), F. Steele (*c.* 1714), W. Robins (*c.* 1730), G. A. Wolfgang (1692–1775).

PENCILS IN ART

Architectural draftsmen, renderers, engineering draftsmen and artists find lead pencils indispensable in their work. Hard, medium and soft pencils are necessary with every pencil artist, and he must make his own selection to fit his own needs. The uses of the various degrees of hardness are shown in the following table:—

Perspective and Object Drawing	Grades 3B to HB
Nature Drawing	Grades 3B to H
Pose Drawing	Grades 3B to B
Scientific Drawings	Grades HB to 9H
Mechanical and Architectural Drawing	Grades HB to 3H
Lettering	Grades 2B to H
Commercial Art	Grades 3B to HB
Artists' Sketching	Grades 6B to 3H
Architectural Renderings	Grades 4B to 3H
Engineering Drawings	Grades HB to 9H
Commercial Drafting and Design	Grades HB to 9H

Broadly speaking, a soft pencil is used for dark tones and a hard pencil is used for light tones. A very soft pencil will produce a light tone, but the quality is not as fine, and a fuzzy appearance is likely to occur instead of the easy, flowing quality of a hard lead. The pressure can be determined only by constant practice, and both hard and soft pencils, as well as various qualities of paper, should be used by the young artist.

(*See* also DRAWING, ENGINEERING; DRAWING, ANATOMICAL; RENDERING, ARCHITECTURAL; PEN-DRAWING; CARTOON; ILLUSTRATION.) (J. LEC.)

PENCK, ALBRECHT (1858–), German geographer, was born at Reuditz, near Leipzig, on Sept. 25, 1858. He studied at Leipzig and afterwards taught in Munich. He was a professor at Vienna from 1885 to 1906 when he removed to Berlin. His chief work in Berlin was the extension of the marine museum and the geographical institute of the university, of which he became director. During a long series of travels in different parts of the world Penck made special studies in connection with the Ice Age and the formation of glaciers in the Tertiary and Diluvial periods, and also some outstanding contributions to scientific knowledge in the sphere of hydrography. Before the World War he acted for a time as professor at Columbia university, New York City. In the field of practical geography Penck did valuable work in promoting the production of a map of the earth on a scale of 1:1,000,000 (*see* MAP).

His publications include *Die Vergletscherung der deutschen Alpen* (1882); *Die Donau* (1891); *Morphologie der Erdoberfläche* (2 vols., 1894); *Die Alpen im Eiszeitalter,* with E. Brückner (3 vols., 1901–09).

PENDA, king of Mercia (d. 654 or 655), son of Pybba, probably came to the throne in 626, but it is doubtful whether he actually became king of Mercia until 633, the year of the defeat and death of Edwin of Northumbria. According to the Anglo-Saxon Chronicle he was eighty years old at his death, but the energy of his administration and the evidence with regard to the ages of his children and relatives render it almost impossible. In 628 the Chronicle records a battle between him and the West Saxons at Cirencester in that year. In 633 Penda and Ceadwalla overthrew Edwin at Hatfield Chase; but after the defeat of the Welsh king Oswald at "Hefenfelth" in 634, Mercia seems to have been for a time subject to Northumbria. In 642 Penda slew Oswald at a place called Maerfeld. He was continually raiding Northumbria and once almost succeeded in reducing Bamborough. He drove Cenwalh of Wessex, who had divorced his sister, from his throne. In 654 he attacked the East Angles, and slew their king Anna. (*See* EAST ANGLIA.) In 654 or 655 he invaded Northumbria in spite of the attempts of Oswio to buy him off, and was defeated and slain on the banks of the "Winwaed." In the reign of Penda the districts corresponding to Cheshire, Shropshire and Herefordshire were probably acquired, and he established his son Peada as a dependent prince in Middle Anglia. Although a pagan, he allowed his daughter Cyneburg to marry Alchfrith, the son of Oswio, and it was in his reign that Christianity was introduced into Middle Anglia by his son Peada.

See Bede, *Hist. Eccl.* (ed. C. Plummer, Oxford, 1896); *Anglo-Saxon Chronicle* (ed. Earle and Plummer, Oxford, 1899).

PENDENTIVE, in architecture, a triangular segment of a spherical surface, filling in the upper corners of a square, rectangular or polygonal room, in order to form, at the top, a circular support for a dome. Its intersections with the walls against which it abuts are semi-circles, and are usually carried by arches. The problem of supporting a dome over a square or polygonal hall was of continually growing importance to the late imperial Roman builders. This they attempted to solve, either by corbelling out the corners, projecting each course of masonry slightly over the one below, or by throwing across the corner diagonal arches or niches, which are known as squinches (*q.v.*). An early approximation of the pendentive form occurs in a domed room in one of the side buildings of the baths of Caracalla (A.D. 217). This form, however, was obtained by corbelling, whereas the true pendentive is built like a portion of a dome with radiating joints, and it remained for the Byzantine architects to recognize the possibilities of the form and give it definitive development. One of the earliest examples is also one of the largest—that of the great church of S. Sophia at Constantinople (begun 532). Pendentives occur commonly in the domed Romanesque churches of Aquitania in France, as in S. Front at Perigueux (begun 1120). They occur spasmodically in Romanesque work in Italy. During the Renaissance the development of domed churches gave great importance to the pendentive. Owing to Byzantine influence, pendentives are frequent in Mohammedan architecture, often decorated with stalactite ornament, or sometimes, as in Persia, with delicate ribbing. A vaulting form in which the curve of the pendentive and dome is continuous, without a break, is known as a pendentive dome. (*See* BYZANTINE AND ROMANESQUE ARCHITECTURE; DOME.)

PENDER, SIR JOHN (1816–1896), British cable pioneer, was born in the Vale of Leven, Scotland, on Sept. 10, 1816. His name is chiefly known in connection with submarine cables, of which on the commercial side he was promoter. He was one of the 345 contributors who each risked a thousand pounds in the Transatlantic Cable in 1857, and when the Atlantic Telegraph Company was ruined by the loss of the 1865 cable he formed the Anglo-American Telegraph Company to continue the work. Subsequently he fostered cable enterprise in all parts of the world, and at the time of his death, which occurred at Footscray Place, Kent, on July 7, 1896, he controlled companies having a capital of 15 millions sterling and owning 73,640 nautical miles of cables. He represented Wick Burghs in parliament from 1872 to 1885 and from 1892 to 1896. He became G.C.M.G. in 1892.

PENDLETON, EDMUND (1721–1803), American lawyer and statesman, was born in Caroline county, Va., on Sept. 9, 1721. In 1774 he became president of the Virginia provincial convention and in 1776, as president, he drew up the instructions to the Vir-

EXAMPLES OF PEN DRAWING AND ITS PROTOTYPES

1. "Jewish Captives," a bas-relief in simple outline on the palace wall of Sardanapalus in ancient Nineveh (*c.* 668–628 B.C.)
2. Page from a 14th century Italian manuscript with border; combined pen and brush lettering
3. "St. Catherine" by Albrecht Dürer (1471–1528), German painter and etcher
4. "The Unfaithful Servant" by Rembrandt van Rijn (1606–74). Dutch
5. Title page of Old Testament from the Luther Bible, 1524, drawn and designed by Erhard Schoen, printed at Nürnberg by Friedrich Peypus
6. "Don Quixote Tied to the Window," an illustration drawn by Daniel Vierge for Thomas Shelton's translation of Cervantes' "Don Quixote," 1906
7. "Venus Lamenting the death of Adonis" by Luca Cambiasi (1527–85), signed with his monogram, L. C. Italian
8. "The Crucifixion" by G. Aristide Sartorio (1861–). Contemporary. Italian
9. "Mr. Pip loses his way." From the "Education of Mr. Pip," 1898, by Charles Dana Gibson, American
10. "Enter Mistress Ann Page with wine," from the "Comedies of Shakespeare" series, 1896, by Edwin Austin Abbey (1852–1911). American
11. "The House of Rimmon" by Franklin Booth, American, contemporary

ginia members of Congress directing them to advocate the independence of the American colonies. In the same year he was chosen the first speaker of the House of Delegates. With Jefferson and Chancellor George Wythe he drew up a new law code for Virginia. He was president of the court of chancery from 1777 to 1788, and was president of the Virginia court of appeals from 1779 until his death at Richmond, Va., on Oct. 23, 1803.

PENDLETON, GEORGE HUNT (1825–1889), American lawyer and legislator, was born in Cincinnati, O., on July 25, 1825. He was educated at the University of Heidelberg, studied law, was admitted to the bar, and began to practise at Cincinnati. He was a member of the Ohio Senate in 1854 and 1855, and from 1857 to 1865 was a Democratic member of the national House of Representatives, in which he opposed the war policy of Lincoln. In 1864 he was the Democratic candidate for Vice-President. After leaving Congress he became one of the earliest champions of the "Ohio idea" (which he is said to have originated), demanding that the government should pay the principal of its 5-20 year 6% bonds in the "greenback" currency instead of in coin. The agricultural classes of the west regarded this as a means of relief, and Pendleton became their recognized leader and a candidate for the Democratic nomination to the Presidency in 1868, but he failed to receive the requisite two-thirds majority. In 1869 he was the Democratic candidate for governor of Ohio, but was defeated by Rutherford B. Hayes. For the next ten years he devoted himself to the practice of law and to the supervision of the Kentucky Railroad Company, of which he had become president in 1869. From 1879 to 1885 he was a Democratic member of the United States Senate, and introduced the so-called Pendleton Act of 1883 for reforming the civil service, hostility to which lost him his seat in 1885. He was minister to Germany from 1885 to the summer of 1889, and died at Brussels on Nov. 24, 1889.

PENDLETON, a city of north-eastern Oregon, U.S.A., on the Umatilla river, at an altitude of 1,070 ft., 220 m. E. of Portland; the county seat of Umatilla county. It is on the Oregon Trail and the Oregon-Washington highway, and is served by the Northern Pacific and the Union Pacific railways and motor-coach lines. Pop. (1920) 7,387 (89% native white); 1928 local estimate 8,000. The city lies in the midst of vast tracts of wheatlands, cultivated by large-scale methods, and considered one of the highest yielding sections in the north-west. The county produces annually 6,000,000 bu. of grain, 1,500,000 lb. of wool, 175,000 tons of hay, and fruits, live stock, dairy products and poultry to the value of over $4,000,000. Pendleton is the principal distributing centre for this region, and has important manufacturing industries, including flour, woollen and planing mills, a large packing plant and factories making roofing material, weeders and harness and saddles. Its retail trading area has a radius of 40 miles. The assessed valuation of property in 1927 was $7,200,000. Pendleton is the seat of the Eastern Oregon Hospital for the Insane and of a summer session conducted by the State normal school. The Umatilla Indian Reservation lies a few miles east of the city. Pendleton was founded in 1869 and was incorporated as a city in 1880.

PEN DRAWING. The art of line drawing is perhaps the oldest of the graphic arts. The Greeks seem to have considered drawing and writing as essentially the same process, since they used the same word for both. This points to the early identity of the two arts when drawing was a kind of writing and when such writing as men had learned to practise was essentially what we should call drawing, though of a crude and simple kind.

Materials.—The earliest pens were made of the bamboo reed, the hollow stalk of the calamus, or other wood with the end frayed or pulped. Greek and Roman scribes at a later time used reeds cut to a point and slit like the modern pen; copper pens of the same type, of Roman manufacture, are to be found in museums to-day. This pen possibly antedated the common use of the quill pen made from the wing feather of the goose. Ink, in its earliest form, was made from soot and charcoal mixed with gum; there were also vegetable stains and berry juices. In China the invention of ink is credited to Tien-Tcheu who lived between 2697 B.C. and 2597 B.C. One of the oldest books known, the maxims of that ancient Egyptian ruler Ptah-hotep, dating from beyond the 25th century B.C., shows the use of red and black inks. The development of these mediums, however, was not toward a graphic art, but rather toward the written word, of history and literature, devoid of design or pictorial embellishment. (*See* INK.)

For paper, the barks of trees (especially lime trees), papyrus, linen and the prepared skins of calf or sheep, as well as vellum and parchment, were used. Finally the use of parchment replaced that of papyrus because of its susceptibility to ready erasures, its two usable sides and its thinness. The old scroll and the triptych of wax gave way to the codex with its leaves of vellum. With this convenient form under his hand the scribe for once became the artist and his pen found a facility which brought forth some of the most treasured contributions to the graphic arts; these are the hand-lettered, illuminated books which began to appear a little later than the 4th century and reached their greatest beauty during the following two or three centuries.

The basis of the many beautiful designs in these books is the pen line, with flat tones of colour and applications of burnished gold. With the invention of printing, which began with Gutenberg, with the first printed date of 1454, and the development of means of reproducing the line drawing, the art of the book continued. This was, in fact, the beginning of pen and ink art and, incidentally, of illustration, which is that art that accompanies the written word and adorns the printed page.

Development.—The art of pen and ink, as we know it, began with outline drawing as practised by Villard de Honnecourt and others in the Gothic period. The Florentine masters of the early Renaissance such as Pollaiuolo and Botticelli excelled in the rendering of form; shapes were well defined by means of a continuous and rhythmic outline, and Leonardo da Vinci combined the well defined outline with delicate shading in parallel lines. Michelangelo modelled the muscles in detail by numerous little crosslines and his outline is not continuous; Raphael excelled in sureness of line and in the suggestion of form by the simplest means; in north Italy Pisanello, by delicate pen strokes, rendered the texture of things such as the hairy furs of animals; the Caraccis and the Bolognese school developed a pictorial style by the close study of nature and the practice of engraving; Guercino's and Barocci's brilliant studies were highly prized though not free from mannerism. This pictorial style reached its height in the drawings of two Flemings, Rubens and Vandyck, who were deeply impressed with Italian art. Their drawings are inspired by a very robust reality in which the visible surface of things is observed in detail; their style is curiously informal. The deliberate, ordered calligraphy of the earlier northern engravers, of Dürer, Schongauer, Lucas and Leyden, is replaced by a fluent literal draughtsmanship where colour and tone are suggested by cross-hatching or washes.

Rembrandt is the greatest exponent of the pen and wash technique. He relied mainly on delicately toned washes for the rendering of light and shade in his expressive drawings. Other followers of this method, each in his distinctive style, were Claude de Lorraine with his fine pen-drawings of Italian landscapes, Nicolas Poussin with his careful preliminary studies for composition, and Tiepolo with his sketchy technique. Many more draughtsmen might be mentioned, their drawings pretended no detached place as works of art, and no strict adherence to the limitations of the pen was observed. It was with the development of process reproduction at the beginning of the 19th century that pen and ink art as a separate art came into being.

Technique.—Three main divisions appear in the method of the pen and ink drawing, which have been vaguely mentioned in speaking of the drawings of Rembrandt, da Vinci and Rubens. The first of these deals with sheer line or draughtsmanship with slight or strong allowance toward tone; the second deals with tone conception, as of the colourist, with much or little allowance toward line; and the third deals with line and tone or colour equally estimated and treated consciously as in design. Upon closer study, however, these general methods fall into six more specific divisions: (1) The outline or open drawing, in which much or little may be included. The range of this method may run from the

fragmentary or the compact line, of the manner of Holbein, to the manner of Heinrich Kley, who plays so continuously upon outline, even upon the outlines of the inner bones of animals and men, that tone finally appears. (2) Outline with shadow massings in slow or fast line tone, as in the case of much of Vierge's work and that of Charles Keene and of Griggs. In this method much is made of the two-tone effect with white the strong value; it may reach the other extreme, wherein the low tone becomes a brush black, dominating the whole drawing with the white high-lights arising out of it constituting the structure of the picture, as in the work of Sartorio, the Italian. (3) Outline, freely or otherwise done, with the introduction of local colour, arbitrarily and more or less flatly applied This typifies much of the work of Phil May and of Charles Dana Gibson (4) An approach to form and colour with or without outline, suggested by loose and delicate strokes of the pen, wherein form and colour emerge delicately from the white paper This is well seen in the work of Abbey and of Norman Lindsay of Australia. (5) The same method as the above with a more positive introduction of local colour and textures and, by reason of more general or background tone, a decided localization of white with touches of flat black This is seen in the pen work of Fortuny and of Casanova. (9) The method that belongs to the decorator or ornamentist, of men like Crane and Beardsley. It is the flat presentation with a main viewpoint not toward reality and truth but toward romance and formalism, with the slow conscious line and tone laid in with intent for surface design and beauty.

All pen and ink drawing will be found to touch upon these few methods, with variations in effect and technique. Technique is like handwriting, while it may be cultivated, it soon becomes the sign of an inner sense and feeling back of the hand. The artist with the pen, observing objective life, whether it be primarily structural or tonal, or both, and with pen to paper, interpreting the feel of the contact there, comes naturally to the line that is his own; and in his tones, where the artist with the brush might escape confession or lose expression, the artist with pen and ink puts on expression and meaning over and above the main content of his work. Thus in the work of Thomas Fogarty, in the touch and play of his pen, may be perceived a fine gentility and a sense of relationships that are rich and subtle; while in the drawings of J. Coll, one feels the strong dramatic gesture and sees the subjective qualities. In like manner, in the pen drawings of Marold and Meissonier, neither of whom seemed to feel or to stress the line greatly but strove for full tone by fine cross-hatchings, lightly stroked surfaces and values semi-stippled with whites apparently scratched with a knife, is observed a sureness determined, it seems, by an allegiance to things academic The decorative drawings of Garth Jones have a classic and mural bigness, with a free and bold yet conscious line, while the decorative works of T. M. Cleland are executed as if by a master craftsman with a hand expert at the laying in of ebony and gold.

The work of the author of this article is characterized by partial or full tone with line made use of not so much for the presentation of form in drawing as to designate the movement and stir of things not seen but felt, as of the wind and the movements in sensation of distances and height. The line and its direction are employed also to present, through the effect of broken colour, the qualities of depth and solidity and a visual activity in tone or a compositional treatment of tone areas.

Present-day Uses.—Considerably less pen and ink art is found in the weekly and monthly popular periodicals of the United States and Great Britain since the advent of the half-tone process reproduction Behind this, of course, is the aim of editors to meet only the desires of the readers who seek only a photographic presentation of fact; the half-tone printed on coated paper suggests this reality. However, many of the high-class magazines continue the use of the pen and ink drawing, seeking always to improve the quality of illustration, and laying special emphasis on decorative values. In England the most distinguished pen and ink artists are often associated with *Punch* Outside the periodical field, where they are used for both illustrative and decorative purposes, pen and ink drawings are widely used in textbooks and encyclopaedias. (*See* also ILLUSTRATION; PENCIL DRAWING; LINE ENGRAVING.)

PENELOPE (Gr. pĕn-ĕl-ŏ-pā; angl. pĕn-ĕl′ŏ-pē), in the *Odyssey*, the wife of Odysseus (*q.v.*), and daughter of Icarius of Sparta and the nymph Periboea. During the course of the long absence of her husband after the fall of Troy many chieftains of Ithaca and the islands round about became her suitors; and, to rid herself of their importunities she bade them wait till she had woven a winding-sheet for old Laërtes, the father of Odysseus But every night she undid the piece which she had woven by day. This she did for three years, till her maids revealed the secret. She was relieved by the arrival of Odysseus. In the *Telegonia*, she married Telegonus, the son of Odysseus and Circe, after he had killed his father, and dwelt with him in the island of Aeala or in the Islands of the Blest. Probably quite distinct from her is an Arcadian Penelope, mother of Pan (*q v*).

PENGELLY, WILLIAM (1812–94), English geologist and anthropologist, was born at East Looe in Cornwall on Jan 12, 1812, the son of the captain of a small coasting vessel. He began life as a sailor, after an elementary education in his native village, but in 1828 he abandoned a seafaring life. He had developed a passion for learning, and about 1836 he removed to Torquay and started a school, in 1846 he became a private tutor in mathematics and natural science. Geology had in early years attracted his attention, but it was not until he was about 30 years of age that he began seriously to cultivate the study In 1837 he was instrumental in the reorganization of the Torquay Mechanics' Institute, in 1844 mainly owing to his energy the Torquay Natural History Society was founded and in 1862 he assisted in founding the Devonshire Association for the Advancement of Literature, Science and Art Meanwhile he had been occupied in collecting fossils from many parts of Devon and Cornwall, and in 1860 the Baroness Burdett-Coutts acquired and presented them to the Oxford Museum, where they form "The Pengelly Collection." The same lady provided funds to enable him to investigate the lignites and clays of Bovey Tracey, in conjunction with Dr Oswald Heer, who undertook the determination of the plant remains Their report was published by the Royal Society (1862), and Pengelly was elected F R S. in 1863 He aided in the investigations of the Brixham bone-cavern from its discovery in 1858, the full report being issued in 1873; and he was the main explorer of Kent's Hole Torquay, and from 1864 for more than 15 years he examined and recorded the exact position of the numerous organic remains that were disinterred during a systematic investigation of this cave His observations assisted in establishing the important fact of the contemporaneity of Palaeolithic man with various Pleistocene mammalia, such as the mammoth, cave-bear, etc He was awarded the Lyell medal by the Geological Society of London in 1886 He died at Torquay on March 16, 1894.

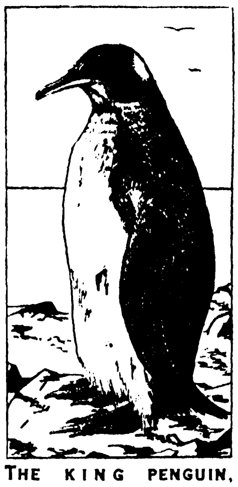
See *Memoir of William Pengelly*, ed by his daughter Hester Pengelly with a summary of his scientific work by T. G. Bonney (1897).

PENGÖ, the name of the new monetary unit of Hungary, adopted by the currency law of 1925. The pengo is divided into 100 filler. One pengo is equal to 0·0359388 pound sterling or 0·1748985 dollar. *See* HUNGARY.

PENGUIN, the name originally given to the garefowl (*q.v.*) but now applied to the flightless sea-birds forming the family *Sphenicidae*. The wings lack quills and are incapable of flexure though they move freely at the shoulder-joint. In the water the birds use them as paddles, and on land they are employed for fighting and, in some species, in walking. The plumage consists of small scale-like feathers and the three metatarsals are imperfectly united. Penguins feed on fish and crustacea; they have few enemies, the leopard-seal or sea-leopard (*q v.*) and McCormick's skua (*Megalestris maccormickii*) being perhaps the worst, though man is even more serious as a foe when he has easy access to a "rookery." The penguins belong to the southern hemisphere, none extending farther north than the Galapagos islands, while the

majority do not reach the tropics. They breed in immense "rookeries," often in the most desolate parts of Antarctica. Two white eggs (one in the case of the Emperor penguin) are laid in a rough nest on the ground and the young penguin is at first clad in down. The young are helpless, needing care for an unusually long time.

The largest forms are the Emperor (*Aptenodytes fosteri*) and King (*A. longirostris*) penguins. The former breeds in the height of the Antarctic winter in order that the young may be fully fledged before the next winter. The brooding instinct is so strong that birds may brood lumps of ice. The young birds are in many species cared for communally and not only by their parents. Many penguins progress on ice either by walking upright or flat on their bellies, kicking with their legs. The little Adélie penguin (*Pygosceles adeliae*) may breed several miles from the sea; it may continue to brood though completely covered with snow. It is very playful, and takes "joy-rides" on pieces of floating ice. The birds have interesting mutual courtship and greeting ceremonies. The genus *Endyptes* comprises the "Rock-hoppers." About 14 species altogether are known. For an account of this peculiar group *See* Levick's *Antarctic Penguins.*



THE KING PENGUIN, SECOND LARGEST IN SIZE OF ITS FAMILY

PENINGTON, ISAAC (1616–1679), eldest son of Sir Isaac Penington was one of the most notable of the 17th-century Quakers. In 1661 Penington was imprisoned for refusing to take the oath of allegiance, and on several subsequent occasions he passed long periods in Reading and Aylesbury gaols. He died on Oct. 8, 1679. Edward Penington (1667–1711), son of Isaac Penington, emigrated to Pennsylvania, where he founded a family. Isaac Penington's stepdaughter, Gulielma Springett, married William Penn.

See Maria Webb, *The Penns and Peningtons of the 17th Century* (1867); Willem Sewel, *History of the Quakers* (6th ed., 2 vols., London, 1834).

PENINSULAR AND ORIENTAL STEAM NAVIGATION COMPANY. This British steamship company, familiarly known as the "P. & O.," was founded by Messrs. Willcox & Anderson, a firm of London shipowners as the "Peninsular Service" in 1834, changing its name in 1840. In 1842 the company embarked upon a mail contract service to India.

The route via Suez to India and Australia was for many years known as "the overland route." Caravans numbering more than 3,000 camels were needed to transport the cargo and mails of a single steamer between Suez and Cairo, but the merchandise carried—indigo, tea, silk and precious metals—was of a kind and value to make this expensive form of transport practicable.

The opening of the Suez Canal in 1870 synchronised with the practical adoption of the compound engine as the motive power of the mercantile marine; the elaborate organisation built up by the company for its overland route became almost valueless, and its fleet was, at the same time, rendered practically obsolete. The directors consequently revised the company's financial resources to create a new fleet, despite reduced, and at one time vanished, profit. Their difficulties were not lessened by the refusal of the post office to allow the mails to be transported through the canal. While their rivals were reaping the full advantage of the new waterway, they were forced to continue the transit of mails by land between Alexandria and Suez; and this objection was not finally overcome until the year 1888.

The quarter of a century which followed was a period of continuous advance in the character and dimensions of the P. & O. steamers. The steamers, "Naldera" and "Narkunda," marked another leap in size. They were projected in 1913, but the war prevented their being brought into normal service until the spring of 1920. These vessels are of 16,000 tons. In 1914 there was a fusion of the P. & O. and British India companies, and Sir Thomas Sutherland, after thirty-four years' occupancy of the presidential chair, was succeeded by Lord Inchcape as chairman of the joint boards of the two companies.

The P. & O. lost 17 steamers in the war, and these have all been replaced by larger vessels. The total tonnage of the P. & O. fleet at Jan. 1, 1928, was 572,333 tons gross. The paid-up capital of the company is over £7,600,000 and debenture stock has been issued to the extent of nearly £8,500,000. (L. C. M.)

PENINSULAR WAR (1808–1814). This term is applied to the operations conducted by the British, Spanish and Portuguese armies against the French in the Iberian Peninsula during the years above noted. The British make the most of it first, because they were, with one or two trifling exceptions, their only successful military operations in the whole period 1794–1814; secondly, because they justly raised British military reputation to the highest point; and thirdly, because they contributed very materially to the exhaustion of France and the downfall of Napoleon.

The immediate cause of the war was Napoleon's endeavor, since he was powerless at sea, to reduce England to submission by starving her trade. With this object he had on Nov. 21, 1806, issued his Berlin decrees, ordering all Continental ports to be closed to British subjects. The next thing was to enforce those decrees. The situation seemed so formidable in England that the British ministers thought seriously of abandoning all effort to trade with the Old World, and of seeking new markets in Spanish America. England had but two friends in Europe: Sweden and Portugal. Napoleon left it to Russia to deal with Sweden, and resolved to take Portugal in hand himself. In Aug. 1807 he called upon her to comply with his decrees, and being answered by a protest, overawed the weak king of Spain, Charles IV., and his corrupt minister, Godoy, into granting free passage for French troops through Spain to Portugal. Moreover, by a secret treaty signed at Fontainebleau, on Oct. 27, 1807, it was agreed that Spanish troops should assist the French, that Portugal should be divided between France and Spain, and that a principality should be carved out of it for Godoy. But already on Oct. 19, 30,000 bad French troops under Gen. Junot had crossed the Spanish frontier; and, under eager orders from Napoleon, these hastened their march upon Lisbon. After long and painful vacillation between the demands of England and France the Portuguese regent fled to Brazil with the Portuguese fleet; and Junot, with an army reduced by haste and hardship to a mob of undisciplined, half-starved and half-armed stragglers, occupied Lisbon.

Next, Napoleon turned his designs against Spain herself. First he persuaded the king to send 15,000 of his best soldiers to help the French in the Baltic. Next he massed French troops upon the Spanish frontier, the treaty of Fontainebleau allowing him to send 40,000 men through Spain to the support of Junot. In Jan. 1808 he ordered from 70,000 to 80,000 men to cross the marches; in February and March the fortresses of San Sebastian, Pamplona, Figueras and Barcelona were treacherously occupied; by the middle of March there were over 90,000 French troops in Spain, and on the 26th Murat occupied Madrid as Napoleon's vice-gerent and commander-in-chief. The Spaniards, after a first outbreak of rage against Godoy and the king, accepted the situation in mute stupefaction. King Charles IV. abdicated in favour of his son Ferdinand, who threw himself abjectly upon Napoleon's mercy; but Napoleon, setting Ferdinand aside, resolved to substitute for him his own brother Joseph. Murat intimidated his Spanish council at Madrid into requesting, on May 13, that Joseph might reign over them; but meanwhile the Spaniards had realized that they were subjected to France and on May 2 had risen in revolt.

The insurrection at Madrid was ruthlessly quelled by Murat; but the movement spread like wildfire. In province after province a "junta," or committee of administration, was appointed. Troops were levied; armies were formed; some 100,000 men were collected in different parts of Spain, all alike brave and enthusiastic, but without arms, discipline, organization or commanders. Portugal likewise rose in revolt; and Junot, cut off by the Spanish insurgents from the French armies in Spain, withdrew the whole of his force into Lisbon. The Spanish province of Asturias sent emissaries to England to ask for help, and meanwhile the governor of Gibraltar, Sir Hew Dalrymple, offered such aid as could be

given by British ships and by a force of 5,000 men under Gen. Brent Spencer, awaiting orders in Gibraltar harbour.

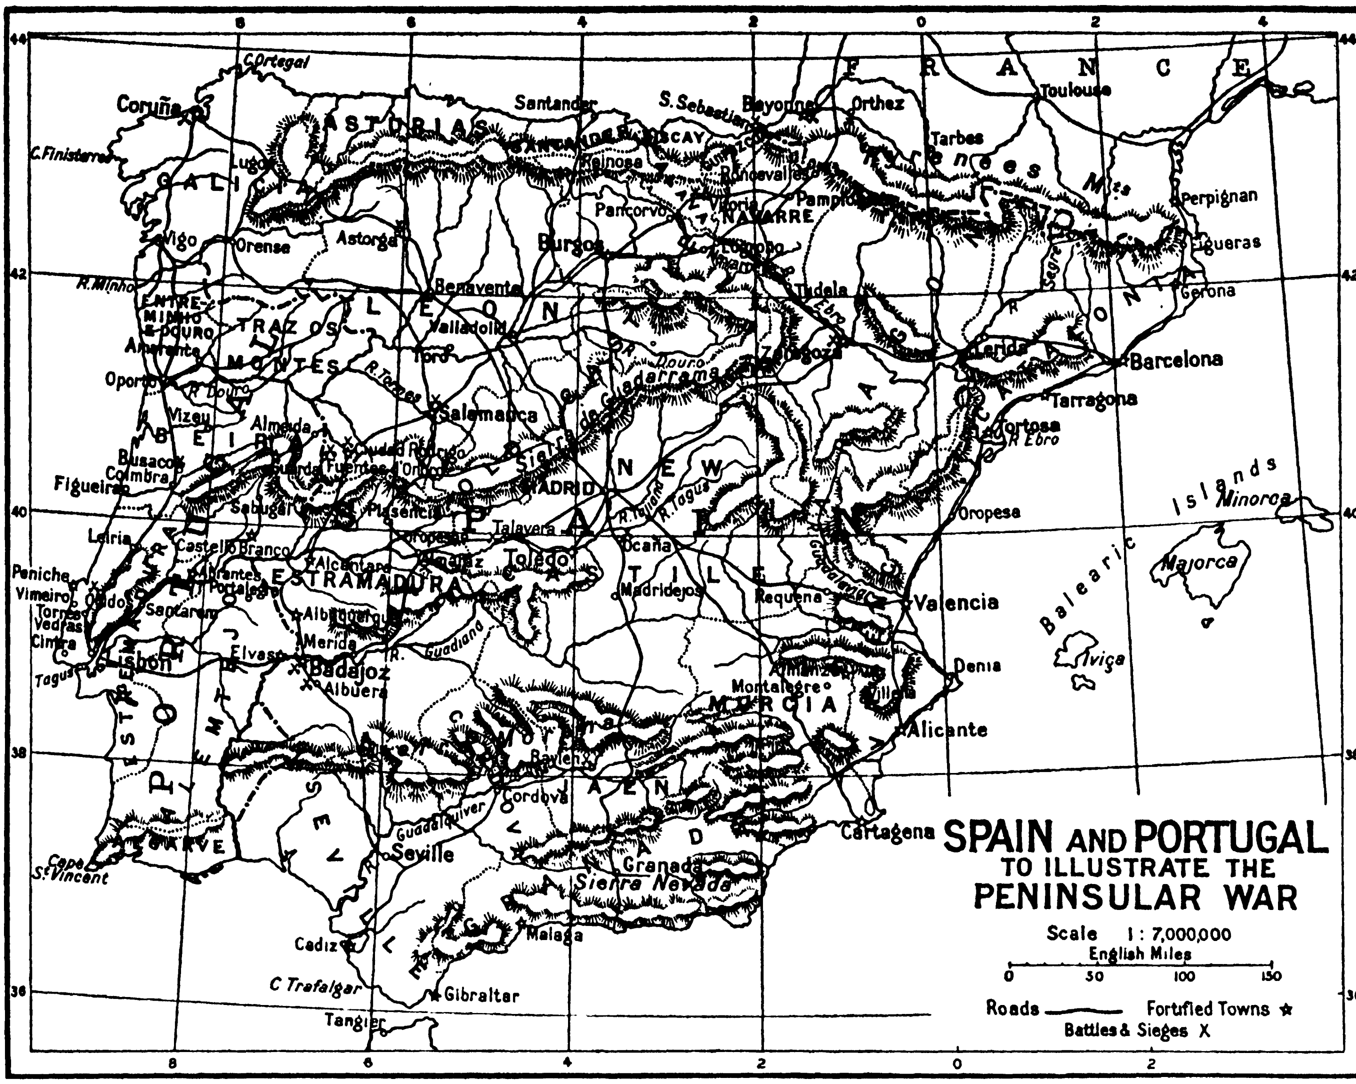
Napoleon took action against the Spaniards at once. Their most formidable force lay in Andalusia, on his front, and in Galicia on his right flank; and he judged it further most important to secure the ports on the east coast and to seize the fortress of Zaragoza, as a link of union between his forces in Catalonia and in central Spain. He accordingly detached Gen. Dupont with 20,000 men towards Andalusia, Moncey with 9,000 more to advance along the east coast, and Lefebvre-Desnouettes with 4,000 more to deal with Zaragoza, while Gen. Merle with a smaller column was ordered to restore order on the northern coast. All except Merle failed. On the east coast not only Valencia but Gerona repulsed French attacks; Zaragoza defended itself with desperate tenacity; and Dupont, thanks in part to useful demonstrations made by Spencer's force on the coast, so mismanaged his operations that on July 23 he was forced at Baylen, to capitulate with 18,000 men. Had not the Spanish army of Galicia, under Gen. Blake imprudently accepted battle and been totally defeated at Medina de Rio Seco by Bessières (July 14), practically the whole of Napoleon's operations would have been fruitless.

The Campaign in Portugal, 1808.—Meanwhile the British Government had in June decided to comply with the Spanish appeal for help. Not many troops were available, for 12,000 had been sent under Sir John Moore upon a hopeless enterprise to Sweden. However, between 10,000 and 11,000 men were embarked under Sir Arthur Wellesley. He was empowered to add Spencer's force to these; and his first objective was to be the Tagus. His information was that Junot had but 20,000 men in all, of which at least 6,000 were at a distance from Lisbon, so he landed without hesitation on Aug. 1 at the mouth of the Mondego. Thence moving south he drove back an advanced French division under Gen. Delaborde at Roliça (Aug. 17) and took up a position at Vimeiro to cover the landing of reinforcements, which were waiting off the coast to join him. Further reinforcements were on their way, including Moore's 12,000 men; but, since Moore, who was senior to Wellesley, had offended the Government by returning from Sweden, two officers, Sir Harry Burrard and Sir Hew Dalrymple, had been specially appointed to keep Moore out of the chief command. Burrard appeared off the coast on the 20th; and on the 21st Junot with 13,000 men attacked Wellesley, who had 17,000, at Vimeiro, and was hopelessly worsted. Left to himself Wellesley would have captured Junot and his whole army, but Burrard interposed; and before Burrard had held command 24 hours, Dalrymple appeared to supersede him. Though an excellent administrator, Dalrymple was inexperienced and nervous in the field. He would not follow up the beaten French; and ultimately Junot and his army were sent back to France by sea under the Convention of Cintra (Aug. 31). The Ministry made Dalrymple the scapegoat for the mistakes, mainly its own, which had led to the convention; but at least Lisbon had been secured as a base for future operations.

The British Government decided to prosecute the advantage gained. The Spaniards had driven the French behind the line of the Ebro; and four Spanish armies, so-called, under four different commanders, each of them jealous and unskilled, with no commander-in-chief, were ranged along the river from Tudela to Reinosa, talking big of expelling the enemy from Spain. A space in this line was left for the English, and in September the British Government resolved that it should be filled with 40,000 British troops. Although Sir Harry Burrard had been expressly appointed to exclude Sir John Moore from the chief command, it was now determined to supersede Burrard by Moore, a decision which Burrard received not only with obedience, but in an ideal spirit of loyalty and patriotism. But meanwhile, upon the news of the disaster of Baylen, Napoleon had ordered 80,000 men to march into Spain; and early in September he organized the army of Spain into six corps and a reserve, with a total strength of 200,000 men. By the end of October he had not far short of 120,000 effective men on the Ebro; on Nov. 6 he took personal command. The Spaniards likewise had been reinforced by the transport of 9,000 out of Romana's 15,000 men from the Baltic to Santander by the British fleet; but nothing could give strength to ill-organized and half-disciplined levies. On Oct. 29 one Spanish army was dispersed at Zornosa. On Nov. 10 another was utterly routed at Gamonal, on the 11th and 13th another underwent the same fate at Espinosa and Reinosa; and on the 23rd yet another army was signally defeated at Tudela. Briefly, the Spanish army of the left had ceased to exist, and those of the centre and right had been broken and routed. The way to Madrid was open and on Dec. 4 the capital was occupied by the French.

Sir John Moore's Campaign of 1808–09.—Meanwhile Moore, much hampered by want of transport and money, had set his troops in motion at the end of October. He had actually with him about 22,000 men, but a further body of some 18,000 more under Sir David Baird was under orders to sail from England to Corunna; and Moore decided that, with the Spanish armies lying between him and the enemy, he might safely effect his junction with Baird by land. While, therefore, he himself moved north-east upon Ciudad Rodrigo and Salamanca, Baird was to strike south-eastward from Corunna, and meet him at Valladolid, or even farther to the east. Owing to the lack of roads, however, Moore was obliged to send the cavalry and artillery under Sir John Hope by the valley of the Guadiana, to move eastward through Talavera to Madrid, and thence north-westward through the Escorial pass of the Guadarrama—a very considerable detour. On his march northward Moore received only disquieting news of the Spanish dispositions, and upon reaching Salamanca on Nov. 14 he heard definitely that the Spaniards had been routed at Zornosa, and that the French were advancing on Valladolid. Plainly, it was madness to think of advancing farther to effect his junction with Baird, and he therefore halted and wrote to inform the Government that the plan of campaign which they had prescribed for him was visionary, that the Spaniards themselves had no definite plans, and that it was impossible for him to get any authority in Spain to take any notice of his presence.

Baird, meanwhile, had reached Corunna with his infantry on Oct. 13, but had found his arrival anything but welcome to the junta of Galicia. However, by Nov. 13 the whole of his cavalry had also joined him, and by the 22nd he had reached Astorga. There he received news of the rout of the Spaniards at Zornosa and Espinosa, not from any Spanish source—for the Spaniards ignored his existence—but from his own intelligence-officers; and he made up his mind to retreat. On the 28th Moore at Salamanca heard of the defeat of the Spanish right at Tudela, and at once decided to retire upon Portugal. He therefore sent orders to Hope, who was already across the Guadarrama, to hasten to him with all speed, and to Baird to fall back to Corunna and join him at Lisbon by sea. Baird began his retirement at once; and Hope, by a forced march by way of Avila, Fontiveros, Peñeranda and Alba de Tormes, regained touch with Moore on Dec. 4. Urgent messages now reached Moore from Frere, the British minister at Madrid, to make an effort to save the capital, which was preparing for a desperate resistance; and Moore, though distrustful, countermanded his orders to Baird, and bade him return to Astorga. On the 9th he learned of the fall of Madrid; and he now resolved to make a dash upon the French communications at Burgos. On the 13th he moved his headquarters from Salamanca north-eastward to Alaejos, where, by great good fortune, an intercepted despatch from Berthier, Napoleon's chief of staff, to Soult, gave him the key to the French dispositions and showed that Soult's corps, little over 20,000 strong, lay isolated on the Carrion some 90m. to north-east of him. Incidentally, he learned that the French in Spain now numbered 250,000, but, though fully alive to the risk, he resolved to advance and strike at Soult. Moving northward he joined hands with Baird at Mayorga on Dec. 17, his advanced parties more than once brushing against the French on the way, and marched upon Sahagun, where, on the 21st, his cavalry fought a brilliant little action against the French horse. On the 23rd he had made all his preparations for falling upon Soult on the morrow, when intelligence reached him that the French under the emperor in person were moving against him in great force. Thereupon he gave orders for immediate retreat. He had been expecting that he would have to "run for it" and



now the time was come.

Napoleon had been fully convinced that the British had withdrawn into Portugal and could hardly give credence to Moore's audacity. He realized it, however, on Dec. 19, and taking 42,000 men in hand himself, and entrusting as many more to Junot and Soult, he flew to the pursuit, hoping to make an end of Moore by a great enveloping movement. Moore retired upon Corunna; but the emperor could never overtake him, and on Jan. 1, 1809, he made over the chase to Soult. The discipline of the British began to fail very early in some regiments, but Moore hustled them on, fighting many petty rearguard actions on the way, and after much hardship in crossing the mountains of Galicia, on Jan. 11, brought his army, sadly thinned indeed but safe, to Corunna. The transports having been delayed in their arrival by foul winds, he was obliged to take up a position to cover his embarkation. The ships arrived on the 14th; and on the 16th Soult, with 20,000 men and 40 guns, attacked Moore with 15,000 men and nine light cannon. Soult was repulsed, but Moore was mortally hurt; Baird was disabled by a severe wound; and it fell to Gen. Hope to re-embark the troops and bring them safely to England. The result of the campaign seemed to be a failure; but Moore had dislocated the whole of Napoleon's plans and, moreover, had caused him to scatter his troops far too widely over the surface of the Peninsula, with fatal consequences.

Campaign in Portugal and Spain, 1809.—Austria was preparing again to take up arms against Napoleon; and the question was where England should act in her support. Moore had quite correctly declared the Portuguese frontier to be indefensible. Wellesley, who was now consulted, opined that, if the Portuguese army and militia were reorganized and 20,000 British were added to them, the French would need 100,000 men to conquer Portugal, and that if the Spaniards continued to resist, the French could not spare so many. The cabinet resolved to make its main effort on the Scheldt; and only with great difficulty Castlereagh persuaded them to send Wellesley out to the Peninsula and to give him 26,000 men. Wellesley reached the Tagus at the end of April. He found that Soult, after his march to Corunna, had invaded Portugal and taken Oporto; that Ney, who had also joined in the chase of Moore, was subjugating Galicia and that Marshal Victor was lying at Merida within 40m. of the eastern Portuguese frontier, threatening invasion by the line of the Tagus. The Spaniards had not done well during the winter. Gen. St. Cyr had beaten them badly in Catalonia, and the army of the centre had sustained defeats at Ucles (Jan. 12), Ciudad Real (Feb. 18) and Medellin (March 28). There was nothing to stop Soult except some disheartened Portuguese levies, nor to check Victor except the demoralized army of Gen. Cuesta, which had just been beaten at Medellin. However, both Soult and Victor were stationary; their headquarters were 200m. apart; and, although they were supposed to be acting in concert, they were not in communication with each other. Gen. Beresford and other British officers had by this time brought 15,000 Portuguese troops into a fairly efficient condition; and with these and 25,000 British, Wellesley, on May 7, advanced northward against Soult. The marshal, suspecting nothing, had scattered his troops in considerable depth to south and north of Oporto, and Wellesley tried to cut off the southern detachments, but failed. He crossed the Douro just above Oporto, however, under Soult's very nose, and catching the French army by surprise drove it away as a mere disorderly mob, which would have been destroyed but for the timidity of Gen. Murray, one of Wellesley's

divisional commanders. Following Soult, Wellesley drove him north through a miserable country; and only by desperate marches and after desperate perils did the marshal finally make his way to Lugo, having lost 6,000 men and the whole of his artillery. He owed his safety mainly to the fact that Wellesley had, on the 18th, been obliged to abandon the pursuit, having received news that Victor was in motion on the Tagus.

Victor's movement proved to be nothing but a reconnaissance in force, designed to obtain intelligence of Soult; and King Joseph at Madrid, having learned, not from Soult but from Paris, of the mishaps which had befallen that marshal, recalled Victor up the Tagus to Talavera. Soult, having called upon Ney at Lugo to re-equip his army, the two commanders and their respective armies had quarrelled violently, with the result that joint operations planned between them against the Galician insurgents came quite to nought, and the French were driven out of Galicia for ever. Rather by accident than design Ney and Soult drifted southward; and by the beginning of July their corps, as also that of Mortier, some 50,000 men in all, were assembled at Astorga, Benavente and Valladolid within 50m. of the valley of the Tagus. Joseph had in and near Madrid 27,000 men, and Victor's corps numbered about 23,000; so that he was in a position at short notice to concentrate at this time 100,000 men in that valley. Such was the situation when Wellesley, having returned to Abrantes from northern Portugal, proposed that he, with 23,000 British, and Cuesta with as many Spaniards, should march on Madrid by way of the Tagus. The supreme Government of Spain eagerly accepted the suggestion, undertaking to provide everything; and, quite unconscious of the storm that was gathering before him, Wellesley marched (June 27) to join Cuesta at Plasencia. On July 17 the two armies advanced. The march was one long story of wrangling and distress. Cuesta was old, infirm, incompetent and obstinate. His army was without order or discipline; and no measures had been taken for transport and supply. Victor fell back before the allies till reinforced by Joseph to a strength of 46,000 men; then the allies fell back in turn, the Spaniards turning their retreat into a flight. With much difficulty Wellesley stopped the panic and took up a position at Talavera (July 27). Victor attacked the key of the position on the same night and was repulsed; and renewing the onslaught in force on the next day was again repelled with a loss of 7,000 men and 17 guns. Wellesley himself had lost 5,000 men, but being reinforced by the Light Brigade on the 29th, was eager to advance. Cuesta fortunately refused, and on Aug. 1 Soult came down the pass of Baños, which Cuesta, in spite of Wellesley's urgent entreaties, had declined to defend, into the valley of the Tagus. Wellesley, awaking to his danger, abandoned his wounded, crossed the river by the bridge of Arzobispo, and led his starving army back to Portugal by way of Badajoz. Though the preoccupation of Napoleon with the Austrian war justified Wellesley in making an extraordinary effort, he had taken an unwarrantable risk. He had been warned that the Spanish troops were worthless and their supply system chaotic; and he had disregarded the warning. Having now learned his lesson, he resolved to have nothing to do with the Spaniards in the future. However, for his victories he was created Viscount Wellington.

Campaign of 1810–11.—During the winter Wellington thought matters out. The Spaniards, untaught by experience, embarked on a new winter campaign which resulted in the total defeat of Cuesta's successor, Areizaga, at Ocaña, (Nov. 19). But out of this evil came good. Soult and Joseph, from sheer cupidity, invaded Andalusia, failed from carelessness to master Cadiz and found themselves set down to the siege of a place which, without a naval force, was impregnable. Wellington gladly spared a few troops, which were made up from England to 8,000, to aid in the defence of Cadiz. The more troops squandered by the French in useless enterprises, the better for him. But the situation was serious. Napoleon had reduced Austria to submission at Wagram and would doubtless use every available soldier to master the Peninsula in 1810. Yet Wellington, so long as he had Lisbon, saw his way to thwart him. The French had three things against them. First, the sea was not open to them. Secondly, the Spanish population was to a man against them, and though the Spanish armies were valueless, the people were always cutting off stragglers and small parties, insomuch that a letter could not be sent by the French with a smaller escort than 25 men. Thirdly, the French armies always lived on the country. Wellington reasoned somewhat in this fashion: "I have to encounter 300,000 men with 40,000. I must train the Portuguese army with the help of English officers so as to make my 40,000 into 50,000." This task he committed to Beresford. "The French," he argued next, "live on the country and therefore cannot stay long in one place. I have the sea to furnish me with all that I want; and if I organize my service for feeding my army perfectly, I can go when I please and stay where I wish as long as I wish." So he set himself to organize an efficient service for transport and supply. "But," he went on, "everything depends on my base on the sea, Lisbon, and I must make Lisbon impregnable." He did so by throwing up the fortified lines of Torres Vedras, 25m. north of the city. "Now," he argued, "if I have 50,000 men the French must bring 60,000 to beat me. The removal of 60,000 men must weaken them in some part of Spain, and there the Spaniards will make trouble. If they advance against me, I shall retire before them, accepting battle if they give me a favourable opportunity, for the missile action of my lines is superior to the shock-action of their columns; but, if not, retreating steadily till I reach my fortified lines. They cannot wait long before them, because they live on the country and will exhaust it. They *must* retreat in time, through territory which they have already eaten up, and I, carrying my food with me, can pursue them and cause them heavy loss. I can go on playing this game as long as they like. I *must* win in the end. The only trouble is that, though the natural access for the French to Portugal is from the north-east, by way of Salamanca and Almeida, they can enter it also from the east by the line of the Tagus, so that I must divide my force to secure both routes. If they advance by both routes in strength, it may be awkward; but that is unlikely. The way by the Guadiana, south of the Tagus, is luckily sealed up for the present by the Spanish fortress of Badajoz. But even if driven from Portugal, I can land my army at Cadiz and play the same game there. I *must* win in the end, and the more certainly because the French generals are always quarrelling among themselves, and pay no obedience to King Joseph, their nominal commander."

And so it came about. Napoleon gave Masséna the command of 65,000 men as the army of Portugal, and Soult the command of as many as the army of Andalusia. Wellington with 18,000 British and 14,000 Portuguese awaited Masséna near Almeida, leaving Gen. Hill with about 20,000 men, mostly Portuguese, to guard the route by the Tagus. Masséna first besieged and captured Ciudad Rodrigo, which barred his way (July 10), and then pushed his advanced troops across the frontier. Gen. Craufurd with the Light Division engaged these most unnecessarily on the Coa (July 23), happily without serious mishap, though the odds against him were four to one. Then Masséna advanced, and Wellington retreated steadily before him. At Bussaco, having summoned Hill to him, Wellesley offered battle with 50,000 men in a very strong position. Masséna accepted it (Sept. 27) and was repulsed with 4,600 casualties, whereas Wellington's did not exceed 1,250. Then the retreat began again, and Wellington entered the lines of Torres Vedras (Oct. 10). Masséna lingered before them for a month, till compelled by want of subsistence to retire 30m. to Santarem. Here he waited with persistence, for it was expected that the British Ministry would fall and be supplanted by the Whigs, who would certainly withdraw the British army from the Peninsula. It was an anxious time for Wellington, for in Jan. 1811, Soult appeared with another army before Badajoz, and the Spanish army on the spot offered battle, which Wellington had begged that it would on no account do, and was, of course, beaten. Wellington detached Beresford with ten British battalions and some Portuguese to watch Soult; and at last, on March 5, Masséna began to retreat. Wellington followed him up with 44,000 men, but was obliged immediately to send 8,000 of them to Beresford, since Badajoz had (March 10) been treacherously surrendered to Soult. With the remainder he con-

tinued his pursuit; and by April 8 Masséna had recrossed the Portuguese frontier on his way to Salamanca, with his army in rags, starved and demoralized. The campaign had cost him 25,000 men killed, captured, or dead from sickness.

Campaign of 1811.—Meanwhile Sir Thomas Graham and the Spaniards had fallen upon the besiegers of Cadiz, and the British had fought a brilliant action against them at Barrosa (March 5). Thereupon Soult hurried back from Badajoz to Andalusia; and Wellington, reinforcing Beresford, set him down to beleaguer Badajoz (April 22), with the option of fighting Soult or refusing battle as soon as the marshal should march back, as he certainly would, to relieve the fortress. He then returned to his own army, which had stopped its pursuit of Masséna on the Portuguese frontier, and was now covering the blockade of Almeida. Masséna advanced from Salamanca to relieve it, and Wellington offered him battle (May 3) at Fuentes de Oñoro, just across the Spanish frontier. Masséna assailed the village on the 3rd and was repulsed with 650 casualties, Wellington's not exceeding 250. On the 5th Masséna made a general attack; and then, as Wellington said, "if Boney had been there, we should have been beat" But, though Wellington's position was defective, the steadiness of his troops enabled him to hold his own His casualties were 1,530, Masséna's 2,200; and on the 7th Masséna retreated to Salamanca, leaving Almeida to its fate. The fortress was presently abandoned and blown up by the French, the garrison, to Wellington's great vexation, escaping Masséna was shortly afterwards recalled and replaced by Marmont; but Wellington always considered Masséna the ablest of all the French generals with whom he had to do in the Peninsula.

Meanwhile, for want of proper artillery, Beresford's siege of Badajoz had not prospered Soult with 24,000 men and 50 guns returned from Andalusia to its relief in May, and on the 16th Beresford, with 8,000 British and 21,000 Spaniards, engaged him at Albuera. Beresford mismanaged the action and would have lost it but for one of his staff, Capt Henry Hardinge. He was saved by the steadiness of his British troops, who suffered 4,000 casualties The Spaniards lost 3,000 and Soult 8,000 The marshal retired, and all was safe for the present; but Wellington, with his little force, had actually fought two general actions on the two main lines of entry into Portugal—a very severe strain upon his strength.

He now (May 29) re-opened the siege of Badajoz with bad Portuguese cannon, for, living in almost daily dread of orders to evacuate the Peninsula, he had all this time kept his own siege-train on its ships in Lisbon harbour. On June 10 the prospective junction of Marmont with Soult obliged him to raise the siege and withdraw his troops, 37,000 British and 17,000 Portuguese, to the Caia, a little to west of Badajoz. Soult and Marmont having joined forces at Merida (June 17) advanced against him with nearly 60,000 men, but decided to leave him alone The two marshals then quarrelled; and Soult returned (June 28) to Andalusia, leaving troops which raised Marmont's strength to 43,000 men On July 13 Marmont withdrew to the valley of the Tagus Wellington then landed his siege-train, and moved north to the blockade of Ciudad Rodrigo, leaving the bulk of his force under Graham and Hill to protect the eastern frontier Marmont, collecting 58,000 men, marched to its relief, and Wellington, calling up troops which gave him a strength of 30,000 British and 16,000 Portuguese, raised the blockade and awaited him. On Sept. 25 Marmont made a reconnaissance in force which brought on a lively little combat at El Bodon, but he was afraid to go farther, and on Oct 1 retired to his cantonments on the Tagus. The campaign ended by a spring of Gen. Hill upon an isolated French detachment at Arroyo Molinos, to the north-east of Merida, when 2,000 French were killed or captured at a cost of 100 British casualties (Oct. 28).

Campaign of 1812.—Throughout the perilous year 1811, when Wellington had borne the brunt of the attack of the armies both of Portugal and Andalusia, the Spaniards had accomplished very little. But their armies had now been in large measure replaced by guerrilla-bands of irregulars, frequently under very able leaders, which made the task of holding Spain in subjection more difficult to the French than ever. To paralyse one of these chiefs, Ballesteros, in the south, Soult (Dec 1811) directed an attack upon one of his principal bases, Tarifa, which was repelled with trifling loss to the little garrison, half Spanish, half English, but cost the French 500 casualties. And now Napoleon, intent on the invasion of Russia, decided that he would draw upon Marmont's army to subdue the eastern provinces and Andalusia thoroughly, and then turn all his strength upon Portugal Wellington for his part had planned the capture of Ciudad Rodrigo, so as to close the north-eastern gate of Portugal; and on Jan. 8 he invested the place, battered a breach and on the 19th stormed it out of hand, with no more than 500 casualties, before Marmont could even assemble troops to save it. Marmont was left gasping with dismay. Ciudad Rodrigo, with a garrison of 5,000 raw Spaniards, had defied Marshal Ney for 25 days, and Wellington had snatched it from a French garrison in 12 days. Wellington then dispersed his troops innocently into cantonments, as did Marmont, being unable to keep them concentrated for want of supplies. On Feb 16 Wellington advanced to the siege of Badajoz, stationing Hill at Merida to cover the operation from the east. Ground was broken on March 17, a breach was battered, and on April 5 the place was taken by escalade, the storming parties having failed in their assault. The capture of Badajoz cost Wellington 5,000 casualties, and for 48 hours the troops were out of all control; but the gain was great, for he had captured the French siege-train at Ciudad Rodrigo and their pontoon-train at Badajoz He then detached Hill to destroy the French bridge of boats over the Tagus at Almaraz (May 17), thereby reducing Soult and Marmont to the bridge of Toledo for communication between their armies, and then leaving Hill at Merida with 22,000 men to parry any movement of Soult, he advanced (June 13) with 28,000 British and 15,000 Portuguese against Marmont at Salamanca. The marshal fell back to the Douro till, being reinforced, he took the offensive (July 16) and manoeuvred against Wellington's communications On more than one day the two armies raced each other in two parallel columns, only a few hundred yards apart, ready to wheel into line and engage at any moment. At last on July 22 Marmont made a false movement, leaving his left wing in isolation, and Wellington sprang upon him instantly and inflicted a crushing defeat. He had 50,000 men, including Spaniards, and 60 guns; Marmont had 47,000 and 78 guns The French losses were 14,000 men, 20 guns and two eagles; Wellington's casualties were 5,000 The French retreated north-east upon Burgos, and Wellington, having entered Madrid in triumph (Aug. 12) invested Burgos. The siege was most unskilfully conducted; and Wellington was obliged to raise it (Sept 22) upon the advance of the French against him in force from all parts of Spain. With difficulty he gained time for Hill to join him as he retreated, and on Nov 11, with 68,000 British, Portuguese and Spaniards, he offered battle to 90,000 French on the field of Salamanca. The French declined the challenge; and Wellington pursued his retirement, with some suffering to his troops but little molestation from the enemy, to Ciudad Rodrigo, where the campaign came to an end (Nov. 19) His losses in the retreat were 9,000, but foreign critics count it his greatest achievement The advance on Madrid was no doubt a mistake; but the campaign had been brilliant It had cost him 20,000 men; but it had cost the French 40,000 and some hundreds of guns, and lastly it had cleared the French out of all Spain south of the Tagus

Campaign of 1813.—The new year found Wellington an earl and a marquis, and Napoleon the poorer by some 400,000 men lost in the snows of Russia. The emperor was fain to draw many troops from the Peninsula, and of those that remained the unfortunate King Joseph had less control than ever. The *cortes* of Spain, on the other hand, had nominated Wellington commander-in-chief of their armies, of which a contingent, 20,000 strong, was under his immediate orders for the coming campaign. Furthermore, in 1812 the British Government had landed some 9,000 troops from the Mediterranean on the east coast of Spain —a sphere beyond the reach of Wellington—and these, with the addition of 20,000 Spanish troops in English pay, seemed likely to give trouble to the French in that quarter. Their commander,

however, Sir John Murray, the general who had failed Wellington on the Douro in 1809, was a feeble creature of whom little could be expected. He succeeded in repelling an attack by Gen. Suchet at Castalla (April 12) and with a little enterprise might have turned his success to great account. His army, though composed of five different nations, was 17,000 strong, whereas Suchet had at most 15,000; and Suchet's casualties in the action numbered 1,000 against Murray's 500. But Murray allowed the opportunity to slip; and a subsequent operation which he undertook against Tarragona was so disgracefully mismanaged that it brought Murray to a court-martial.

This, however, was only a minor incident in the Peninsular operations. In the main field Wellington marched from Portugal with a full strength of about 100,000 men, 47,000 of them British and the remainder Spanish and Portuguese. The Spanish guerrilla-leaders were so active and so formidable in Biscay and Navarre that they found full employment for no fewer than four French divisions under Gen. Clausel. Thus weakened, the French army could make no stand on the Douro, but fell back north-eastward, abandoning Burgos, to the line of the Ebro. Wellington forced it to retire by turning its northern flank; and Joseph, with Marshal Jourdan for his adviser, decided to fight a delaying action in the basin south of Vittoria, to cover his further retreat. He had only 50,000 men, for Clausel, in spite of repeated orders, had not joined him; whereas Wellington had 72,000; and had Wellington's orders been followed few of the French would have escaped. As things fell out Joseph got away with the loss of all his artillery, 150 pieces, and every scrap of baggage, but of no more than 7,000 men, Wellington's casualties being 5,000. The French retreated over the Pyrenees into France, and Wellington, having pursued them as far as Pamplona, decided to abandon the chase. It was essential to master the fortresses of Pamplona and San Sebastian before he could advance farther, and until these should fall he occupied the main western passes of the Pyrenees on a front of about 50m. south-eastward from San Sebastian. Pamplona was blockaded by the Spaniards, and the siege of San Sebastian, a tiny fortress, was entrusted to Sir Thomas Graham with one British division and one Portuguese brigade.

Meanwhile Napoleon had displaced Joseph, sending Soult to take command of all the troops that had retreated from Spain. The marshal arrived on July 13, and having received fresh artillery and restored, more or less, the organization and discipline of his 70,000 men, he on July 20 launched a great counter-attack along the three main valleys of the Pyrenees which lead to Pamplona. He met with some initial success, for Wellington's divisional generals were always rather helpless unless their commander-in-chief was at hand; but Soult's plans were not fulfilled as he had intended, and it was rather by accident than design that on July 26 he found himself at Sorauren, facing 16,000 of Wellington's troops with 30,000 of his own men. He attacked, but was repulsed with heavy loss, and Wellington then taking the offensive in his turn drove the French back after six days' fighting, as a mere demoralized mob, to their former position on the northern slopes of the Pyrenees. Soult admitted a loss of 13,000 men, whereas Wellington's did not exceed 7,000.

In the course of these operations the first assault on San Sebastian was delivered on July 25, and repulsed with a loss of 400 men. Want of ammunition then compelled the turning of the leaguer into a blockade till Aug. 22, when the siege was renewed; and on the 31st the place was successfully stormed though at great cost of life. First and last the casualties at San Sebastian were over 3,700. On the day of the storm Soult made a final effort to save the fortress, but was beaten back with a loss of 3,800, the casualties of the allies being 2,600. The brunt of the two days' fighting fell upon the Spaniards, whose losses exceeded 1,600. Soult now resolved to stand on the defensive and fortified lines of excessive extent to the south of the Bidassoa. These Wellington attacked on Oct. 7, and carried with little difficulty after three days' combat, wherein both sides lost about 1,600 men. Soult then began to fortify another position a little to the northward on the Nivelle, and Wellington, bringing his troops forward to the high ground to north of the Bidassoa, halted till the fall of Pamplona should allow him to advance farther.

He was not quite happy notwithstanding all his successes. His relations with the Spanish Government were such that he had resigned his command of the Spanish armies (Oct. 9), and with the Portuguese Government they were little better. It was clear to him that, in case of a reverse, retreat into Spain would be out of the question. Moreover, though Napoleon's star was already on the wane, Wellington as yet knew only that he was standing up to his enemies in Germany; and it was always possible that he might win a great victory, come to terms with them, as his custom was, and return to launch all his forces against his foes in the Pyrenees. Moreover, on the east coast of Spain the latest British commander, Lord William Bentinck, had contrived to sustain at Ordal a reverse at the hands of Suchet (Sept. 13). However, on Oct. 25, Pamplona fell, and on Nov. 10 Wellington attacked Soult's position on the Nivelle and carried it, capturing 69 guns; the casualties, 4,300, being about the same on both sides. He was now fairly established on the plains of France, and recognized that it was vital to him to have the population on his side. He could by this time count upon the good behaviour of his own troops towards the inhabitants; but the Spaniards had suffered too much at the hands of the French and could not be kept from maltreating them. "With 40,000 Spaniards I don't know where I should stop," he wrote at this time, "but if they plunder they will ruin all." Reluctantly and regretfully he sent most of them back to Spain.

On Dec. 8 came the great news that Napoleon had been utterly overthrown at Leipzig, with orders that Wellington was to press the invasion of France. Thrown back from the Nivelle, Soult had entrenched himself on the river Nive, south of Bayonne, and here Wellington attacked him on Dec. 9. The operations lasted five days, Soult counter-attacking without success on the 10th and 11th, and were greatly complicated by the sudden rise and fall of the rivers, fed by the glaciers of the Pyrenees. Owing to the destruction of a bridge by a flood Soult was able to attack with 30,000 men and 30 guns a force of 14,000 men and 14 guns under Gen. Hill, which stood in isolation about St. Pierre (Dec. 13), but after a very severe action he was repulsed, his losses being 3,000 and the British 1,700. The casualties on the French side for the five days were 5,600 and of the allies 5,000.

Soult then withdrew to a position on the Adour; and meanwhile the European situation again gave Wellington anxiety. The allies after their victory at Leipzig had all fallen at variance with each other, and their military plans seemed to Wellington to be insane. Napoleon, moreover, was negotiating for the detachment of Spain from the side of the allies, in order to withdraw Suchet's troops thence. On this latter point Wellington's mind was soon set at ease (Jan. 9, 1814) through the rejection of Napoleon's overtures by the Spanish Government; but his misgivings as to the military projects of the allies were justified. However, after much delay through bad weather, by a series of skilful movements (Feb. 17–24, 1814) he manoeuvred Soult out of his position on the Adour, crossed the river—500 yards wide—on a bridge of most ingenious construction, and thus forced Soult into the open. Leaving Sir John Hope to invest Bayonne and the strong garrison installed there by Soult, Wellington followed the marshal in his retreat eastward, overtook him at Orthez (Feb. 27), and with 34,000 men against 37,000, drove him off with a loss of 4,000 killed, wounded and prisoners, his own casualties being just under 2,000. Soult continued his retirement eastward with Wellington in close pursuit, till days of heavy rain brought the British to a standstill, and contact was lost between the two armies (March 3). Wellington took the opportunity to occupy Bordeaux as his new base on the sea, but Soult hurried his troops as a disorderly mob towards Toulon, not halting till he reached Tarbes (March 8). Then at last he realized that his enemies were stationary some 35m. to the north-west of him, and on March 13 he moved up to Wellington's outposts as if to attack, but thought better of it and on the 16th moved away slowly to southward. He had orders from Napoleon to keep his field of action as near as possible to the Pyrenees, and endeavoured thus to fulfil them. For all that he knew the emperor would yet hold his own.

These had in fact been most critical days farther north. The Prussians had given Napoleon an opportunity, and he had struck at them a succession of telling blows. Austrians, Prussians and Russians alike were terrified, for all that they outnumbered him by three to one, and staggered back in dismay. Matters remained in doubt till March 25, when Napoleon resolved to manoeuvre against the rear and communications of the allies, and they in turn plucked up courage to ignore him and continue their march to Paris.

On March 18 Wellington, with a force raised to nearly 50,000 men by the arrival of a contingent of Spaniards, resumed his pursuit of Soult and on the 19th was constantly engaged with his rearguard. On the 20th Soult fought a useless little combat at Tarbes, which only delayed his retreat to no purpose, and compelled him to take the longer of two roads to his next point, Toulouse. Wellington followed the shorter road, and Soult, in order to anticipate him, was compelled to hurry his wretched troops on with a speed which reduced them to a rabble. Nevertheless Wellington moved on slowly and cautiously. For one thing the rain was incessant, but even more disturbing was a report which had reached him that Napoleon had fallen back to Orléans. This might mean that he intended to join Soult and raise all southern France against the British and their allies, which would be a serious matter indeed. Not till the 26th did he come up before Toulouse, unaware, of course, that on the previous day Napoleon's doom had been sealed.

The position taken up by Soult was very strong, and could not soon be approached without preparatory operations of extreme delicacy. But, having a beaten army before him, Wellington took every imaginable liberty, and finally attacked on April 10 in a most primitive and hazardous fashion. His casualties, 4,000 men, were twice as great as Soult's, and the French later were inclined to claim the fight as a victory. But Soult knew better and, evacuating Toulouse on the 12th, continued his retreat. On that day news reached Wellington of the fall of Napoleon. He at once informed Soult, but, through no fault of the marshal, the garrison of Bayonne made a sortie on the night of the 14th, which cost them 900 and the allies 800 casualties. This was the last blood shed. On the 18th an agreement for the suspension of arms was signed and the Peninsular War was over.

The heroes of the war were, whatever the British may think, the Spaniards. It is true that their provisional Government was inefficient, their improvised armies of little military value, and their most prominent commanders, such as Cuesta, Castaños and La Romana, incompetent. Their heads were turned by their initial success at Baylen, when they had to do with a frightened man, and they were always trying to repeat Baylen with raw levies under unskilled leaders. There were, moreover, endless jealousies between rival authorities, provinces and commanders. But the spirit of the nation as a whole was beyond praise, and was quickened by a savage hatred of the French. Every French straggler's throat was cut and small bodies of men were destroyed without mercy. The French tried to quell this spirit by reprisals —burning villages and shooting villagers—but the Spaniards retorted in kind, and before the close of 1808 both sides had exhausted their powers of terror, the French by burning Spaniards alive in their houses, the Spaniards by sawing a captured French general asunder. But the losses thus inflicted upon the French were very formidable. Marbot reckoned the average number of deaths of French soldiers, from all causes, from the beginning to the end of the war as 100 daily. From the year 1812 the guerrilla-leaders took matters very much out of the hands of the regular military commanders, and proved to be much more efficient than the regular generals. These leaders were drawn from all classes—one of the best was a priest—and, as their followings swelled to three, four and even five thousand men of all three arms, they became most dangerous opponents. Their knowledge of the country in the wild mountainous districts which they preferred gave them enormous advantages over their enemies, while if closely pressed they could disperse for the time and reassemble when the peril was over. Their quality varied very greatly. Some were composed of every description of desperate adventurer, not excluding British and French deserters, and were rather wild. Others were under far stricter restraint. At least one was subjected to discipline as stern as that of Cromwell's Ironsides, and began every day with mass. Taken altogether they wrought great things for the liberation of their country, and were perhaps the best expression of the national will to victory. But the sufferings of Spain from French oppression and extortion and from the ravages of war were terrible. They were the source of many of her troubles during the 19th century, and she has not yet, perhaps, recovered from the effects of those awful years. But she has good right to be proud of her *Guerra de Independencia*.

In Portugal likewise the national spirit was admirable. There is no more frugal, patient, docile, industrious man than the Portuguese peasant, and with British officers in the higher regimental ranks to superintend his training, he made an excellent soldier. When he failed, as at one moment he did, it was owing to his Government's neglect of him; but when, in response to British protests, that fault was amended, the Portuguese soldier speedily recovered himself. The Portuguese are still proud of a phrase written by Wellington from the Pyrenees in 1813, in which he described their countrymen as "the fighting-cocks of the army." It must be added, that when once the French had been driven across the Pyrenees, the Portuguese began to manifest considerable jealousy of the British officers in their army, and that Wellington's efforts to obtain some of his old Portuguese regiments for the campaign of Waterloo failed completely. Still this was, perhaps, no more than natural. The Portuguese, like the Spaniards, suffered terribly from the war and still suffer from it. They have, however, retained two things British—their rule of the road and their bugle-calls.

The fact, nevertheless, remains that, without the little British army under the command of Wellington, Spaniards and Portuguese could hardly have worked out their deliverance. At first, as has been seen, Wellington did not realize all the difficulties of the problem set him; but after the experience of 1809 he was under no illusions, and there and then thought out the solution. His first task, however, was to train his own troops, for the army had no regular administrative services in those days and indeed was subject to three different departments—the cavalry and infantry under the commander-in-chief and War Office, the artillery and engineers under the Board of Ordnance, and supply and transport under the Treasury. The last named was that which gave him most trouble, for the Treasury's commissaries, even after 14 years of war, had little experience of the needs of an army in the field; and on landing on the Mondego in 1808 he was obliged to draw up for them a complete table for the hiring and organization of transport. Roads in Portugal hardly permitted the use of wheeled vehicles; and he was obliged later to form his transport entirely of pack-mules, which he gradually brought up to a perfect system.

As has been seen, this formed an essential part of his plan for getting the better of the French, but it was also the principal means to the great end of discipline. Soldiers regularly fed had no excuse for helping themselves, and no commander was more keenly alive than Wellington to the demoralizing effects of marauding, nor more resolute to check it. Unfortunately the House of Commons, in defiance of all military opinion, had insisted in 1805 in altering the procedure of regimental courts martial, with the result that for a long time these courts were ineffective for enforcing discipline. It was the uncertainty of punishment which allowed the men to get out of hand in the retreats from Talavera and from Burgos, and after the assaults on Ciudad Rodrigo, Badajoz and San Sebastian; and indeed it was not until Wellington in 1812 imported a lawyer to help him through the intricacies of the new procedure that discipline began to improve. The establishment of a corps of military police—the first of its kind in the British army—materially contributed towards the same object, with the result that the behaviour of the British troops in France was exemplary. Thus it came about that the French peasants sold their produce and their cattle to the English commissaries, while Soult and their own countrymen went away empty. Thus also it was that at the conclusion of the war a British division marched

almost the whole length of France without a single complaint of any French inhabitant against a British soldier.

In addition to the transport and supply service, Wellington gradually trained a staff of extreme efficiency with an intelligence department of great excellence. He had, of course, the advantage of fighting in a country where every inhabitant was eager to give information to him and to withhold it from his enemy, but none the less the work of his intelligence officers was most remarkable. In other respects his staff required much training from him, but improved steadily; and, in fact, during the fighting in the Pyrenees in 1813–14, the chief of the staff (who bore the title of quartermaster-general) did not hesitate to give orders (and very good orders) on his own initiative. When the army latterly swelled to some 100,000 men of all nations it was divided, practically, into three corps of which one was under Wellington's immediate command; and the staff proved itself perfectly competent to handle it. This training of the army and staff was perhaps the most remarkable achievement of Wellington, carried out amid a thousand distractions from both civil and military authorities in Spain and Portugal and under the disadvantage of a permanent dearth of specie. The exchange in the Peninsula was at a discount of 25% against the British, and hence the payments, whether to Spanish muleteers or to English private soldiers, were generally six months at least in arrear. Nevertheless Wellington kept the force together somehow, and it is no exaggeration to say that the Peninsular army, including the King's German legion with the British, was the most effective military machine, for its size, in Europe. It must be added that, with the help of Sir James McGrigor, the father of British military hygiene, Wellington brought the organization and working of the medical service to a pitch of perfection till then unapproached in any European army. Nor was he less careful of his animals than of his men. He was a good horse-master and knew that horses are not machines.

In the matter of tactics, when occupying a defensive position he always hid away his troops on the reverse side of a hill, a practice which was confined to him and which was one reason for the cautiousness of the French generals, in the later stages of the war, in offensive movements against him. His habit of meeting French columns with English lines is too well known to need more than mere mention, though no other army in Europe ventured to imitate either of these peculiarities. In respect of artillery his resources, as compared with those of the French, were of somewhat mixed value. The heaviest of the French field-guns—the 12-pounders, called by Napoleon his "pretty girls"—were of greater range and calibre than any of the English field-pieces. But, on the other hand, the English had the advantage of the spherical case-shot invented by Maj. Shrapnel, which practically enabled the English gunners to rain grape-shot upon an enemy at the then enormous ranges of 800, 1,000 and even 1,200 yards. Shrapnel shell first came by its own in the Peninsular War and contributed more powerfully to its successful issue than is generally recognized.

Wellington's system of conducting a siege is almost contemptuously dismissed by Continental critics; and he practically admitted that he relied too much upon the methods which he had found successful in India. But if military engineering did not shine in his army, the topographical work and the civil engineering performed by the staff corps (the quartermaster-general's engineers as opposed to those of the master-general of the ordnance) was very remarkable indeed; their feats of bridging were notable; and they designed and constructed the first suspension-bridge in military history.

To come last to the French, their misfortunes were due mainly to the injustice of their cause, to the fact that sea-transport was denied to them, to their dependence upon the invaded country not only for subsistence but for money, to the jealousy and cupidity of their generals, and to Napoleon's great blunder in endeavouring to control the operations from a distance instead of appointing a commander-in-chief upon the spot and insisting that he should be obeyed. No attempt was made to conciliate the Spaniards and much was done to exasperate them, with the result that the invaders were loathed beyond human bounds. The closing of the sea compelled the transport of all stores of war to be made by land, which was a great strain, and every French infantry soldier had to march into Spain on his feet, which signified great wear and tear of shoes and clothing, with countless casualties from fatigue and sickness. Subsistence upon the country again frequently meant that the stronger men took such food as was to be obtained, while the weaker went empty and died of starvation. Moreover, when one year's harvest in some district had been consumed, Wellington could count that his enemy was food-bound, so to speak, till next harvest and could take liberties accordingly. Again for want of a commander-in-chief the French operations were ill-concerted and executed with ill-will. Every French general wished to be independent and many of them thought only of filling their pockets. Soldiers were often employed by them in herding merino-sheep instead of in their legitimate business; and the example set in high places was only too faithfully imitated by subordinate officers. High commanders, again, set the example of taking women into the field. Junot carried a mistress with him to Vimeiro; Masséna took with him the wife of one of his officers throughout the campaign of 1810. This evil reached such a pitch that a French officer captured at Vittoria said bluntly to an English officer, "O! sir, you are an army; we are a travelling brothel (*un bordel ambulant*)." From all these causes discipline suffered; the morale of the French troops deteriorated; and by 1812 every French commander was afraid to meet the British. As Napoleon drew more and more of his soldiers from the Peninsula to make good his losses in Russia, the quality of Soult's force sank lower and lower. This naturally reacted upon the officers; and the French historian, Capt. Vidal de Lablache, contrasts eloquently the co-operation of the British divisional commanders with each other against the sulky helplessness of many of their French peers. By the end of 1813 the French army in southern France had become almost contemptible. The more honour to Soult, its commander, and to his officers and men that they strove at least to fight on to the end.

PENITENTIAL, a manual used by priests of the Catholic Church for guidance in assigning the penance due to sins. Such manuals played a large rôle in the early middle ages; they were mainly composed of canons drawn from various councils and of *dicta* from writings of some of the fathers. Disciplinary regulations in Christian communities are referred to from the very borders of the apostolic age, and a system of careful oversight of those admitted to the mysteries developed steadily as the membership grew and dangers of contamination with the outside world increased. The treatment of the lapsed produced what has frequently been called the first penitential, the *libellus* in which, according to Cyprian (*Ep.* 51), the decrees of the African synods of 251 and 255 were embodied for the guidance of the clergy in dealing with their repentant and returning flocks. This manual, which has been lost, was evidently not similar to the code-like compilations of the 8th century, and it is somewhat misleading to speak of it as a penitential. Certain patristic letters had acquired almost the force of decretals; the most important were the three letters of St. Basil of Caesarea (d. 379) to Bishop Amphilochius of Iconium containing over eighty headings.

Three things tended to develop these rules into something like a system of penitential law. These were the development of auricular confession and private penance; the extension of the penitential jurisdiction among the clergy owing to the growth of a parochial priesthood; and the necessity of adapting the penance to the primitive ideas of law prevailing among the newly converted barbarians, especially the idea of compensation by the *wergild*. In Ireland in the middle of the 5th century appeared the "canons of St. Patrick." In the first half of the next century these were followed by others, notably those of St. Finian (d. 552). At the same time the Celtic British Church produced the penitentials of St. David of Menevia (d. 544) and of Gildas (d. 583) in addition to synodal legislation. These furnished the material to Columban (d. 615) for his *Liber de poenitentia* and his monastic rule, which had a great influence upon the continent of Europe. The Anglo-Saxon Church was later than the Irish, but under Theodore of Tarsus (d. 690), archbishop of Canterbury, the practice then in force was made the basis of the most important of all penitentials. The *Poenitentiale Theodori* became the authority in the Church's treatment of sinners for the next four centuries. (*See* Haddan and Stubbs's *Councils and Ecclesiastical Documents relating to Great Britain and Ireland*, iii. 173 *seq.*) A *Poenitentiale Commeani* (St. Cumian), dating apparently from the early 8th century, was the third main source of Frankish penitentials. Bishop Halitgar was commissioned (in 829) by Ebo of Reims to prepare a definitive edition; he used among his other materials, a so-called *poenitentiale romanum*, which was really of Frankish origin. The canons printed by David Wilkins in his *Concilia* (1737) as being by Ecgbert of York (d. 766) are largely a translation into Anglo-Saxon of three books of Halitgar's penitentials. In 841 Hrabanus Maurus undertook a new *Liber poenitentium* and wrote a long letter on the subject to Heribald of Auxerre about 853. Then followed the treatise of Regino of Prum in 906, and finally the collection made by Burchard, bishop of Worms, between 1012 and 1023. The codification of the canon law by Gratian and the change in the sacramental position of penance in the 12th century closed the history of penitentials.

Bibliography.—In addition to the works mentioned above the one important work on the penitentials was L. W. H. Wasserschleben's epoch-making study and collection of texts, *Die Buszordnungen der abendländischen Kirche nebst einer rechtsgeschichtlichen Einleitung* (Halle, 1851). *See* articles in Wetzer and Welte's *Kirchenlexikon*, Hauck's *Realencyklopädie*, and Haddan and Stubbs's *Councils*. *See* also Seebasz in *Zeitschrift für Kirchengeschichte*, xviii. 58. PENMARC'H, a village of western France in the department of Finistère, 18 m. S.W. of Quimper by road. Pop. (1926) 823. At the end of the peninsula on which it stands are fortified remains of a town important from the 14th to the 16th centuries, which included Penmarc'h, St. Guénolé and Kerity. The Newfoundland fisheries and the pillage by La Fontenelle in 1595 because of its cod-banks, caused its decline. The Gothic church of St. Nonna (early 16th century) at Penmarc'h, the church of St. Guénolé and the church of Kerity (15th century) are of interest. The coast is very dangerous. There are numerous megalithic monuments in the vicinity.

PENN, WILLIAM (1621–1670), British admiral, son of Giles Penn, merchant and seaman of Bristol, served his apprenticeship at sea with his father. In the first Civil War he fought on the side of the parliament, and was in command of a ship in the squadron maintained against the king in the Irish seas. In 1648 he was arrested, probably on suspicion of being in correspondence with the king, and sent to London, but was soon released, and sent back as rear admiral in the "Assurance" (32). After 1650 he was employed in the Ocean, and in the Mediterranean in pursuit of the Royalists under Prince Rupert. When the first Dutch War broke out Penn was appointed vice-admiral to Blake, and was present at the battle of Sept. 28, off the Kentish Knock. In the three days' battle off Portland, February 1653, he commanded the Blue squadron, and he also served with distinction in the final battles of the war in June and July. He sat on the commission of admirals and generals at sea, who exercised the military command of the fleet, as well as on the board of management. In 1654 he offered to carry the fleet over to the king, but in October he commanded the expedition to the West Indies sent out by Cromwell, which conquered Jamaica. He was not responsible for the shameful repulse at San Domingo, which was due to a panic among the troops. On their return he and his military colleague Venables were sent to the Tower. When released he retired to the estate he had received in Ireland.

He continued in communication with the Royalists, and in 1660 had a rather obscure share in the Restoration. He was reappointed commissioner of the navy by the king, and in the second Dutch War served as "great captain commander" or captain of the fleet, with the duke of York (afterwards King James II.) at the battle of Lowestoft (June 3, 1665). Penn died on Sept. 16, 1670, and he was buried in the church of St. Mary Redcliffe, Bristol. His portrait by Lely is in the Painted Hall at Greenwich. By his wife Margaret Jasper, he was the father of William Penn, the founder of Pennsylvania. Penn was one of the authors of the first code of tactics provided for the navy; it was the base of the "Duke of York's Sailing and Fighting Instructions," which continued for long to supply the orthodox tactical creed of the navy.

See the *Memorials of the Professional Life and Times of Sir William Penn*, by Granville Penn.

PENN, WILLIAM (1644–1718), English Quaker and founder of Pennsylvania, son of Admiral Sir William Penn (1621–1670) and Margaret Jasper, a Dutch lady, was born at Tower Hill, London, on Oct. 14, 1644. During his father's absence at sea he lived at Wanstead in Essex, and went to school at Chigwell close by, in which places he was brought under strong Puritan influences. Like many children of sensitive temperament, he had times of spiritual excitement; when about twelve he was "suddenly surprised with an inward comfort, and, as he thought, an external glory in the room, which gave rise to religious emotions, during which he had the strongest conviction of the being of a God, and that the soul of man was capable of enjoying communication with Him." Upon the death of Cromwell, Penn's father, who had served the Protector because there was no other career open, remained with his family on the Irish estates which Cromwell had given him. On the resignation of Richard Cromwell he at once declared for the king and went to the court in Holland, where he was received into favour and knighted; and at the elections for the convention parliament he was returned for Weymouth. Meanwhile young Penn studied under a private tutor on Tower Hill until, in October 1660, he was entered as a gentleman commoner at Christ Church. He appears in the same year to have contributed to the *Threnodia*, a collection of elegies on the young duke of Gloucester.

The rigour with which the Anglican statutes were revived, and the Puritan heads of colleges supplanted, roused the spirit of

resistance at Oxford to the uttermost. With this spirit Penn, who was on familiar terms with John Owen (1616–1683), and who had already fallen under the influence of Thomas Loe the Quaker, then at Oxford, actively sympathized. He and others refused to attend chapel and church service, and were fined in consequence. There is no doubt that in January 1662 his father was anxious to remove him to Cambridge, and consulted Pepys on the subject; and in later years he speaks of being "banished" from the college, of being whipped, beaten and turned out of doors on his return to his father, in the anger of the latter at his avowed Quakerism. A reconciliation was effected; and Penn was sent to France to forget this folly. He appears to have entered into the gaieties of the court of Louis XIV., and to have become acquainted with Robert Spencer, afterwards earl of Sunderland, and with Dorothy Sidney. Somewhat later he placed himself under the tuition of Moses Amyraut, president of the Protestant college of Saumur, and the exponent of liberal Calvinism, from whom he gained the patristic knowledge which is so prominent in his controversial writings. He afterwards travelled in Italy, returning to England in August 1664, with "a great deal, if not too much, of the vanity of the French garb and affected manner of speech and gait."[1]

Until the outbreak of the plague Penn was a student of Lincoln's Inn. For a few days also he served on the staff of his father—now great captain commander—and was by him sent back in April 1665 to Charles with despatches. Returning after the naval victory off Lowestoft in June, Admiral Penn found that his son had again become settled in seriousness and Quakerism. The admiral sent him in February 1666 with introductions to Ormonde's court in Ireland, and to manage his estate in Cork. When the mutiny broke out in Carrickfergus Penn volunteered for service, and acted under Arran, with the result that in May 1666 Ormonde offered him his father's company of foot, but, for some unexplained reason, the admiral demurred to this arrangement. It was at this time that the well-known portrait was painted of the great Quaker in a suit of armour; and it was at this time, too, that the conversion, begun when he was a boy by Thomas Loe in Ireland, was completed at the same place by the same agency.

On Sept. 3, 1667, Penn attended a meeting of Quakers in Cork, at which he assisted to expel a soldier who had disturbed the meeting. He was in consequence, with others present, sent to prison by the magistrates. From prison he wrote to Lord Orrery, the president of Munster, a letter, in which he first publicly makes a claim for perfect freedom of conscience. He was immediately released, and at once returned to his father in London, with the distinctive marks of Quakerism strong upon him. Penn now became a minister of the denomination, and at once entered upon controversy with two tracts, *Truth Exalted* and *The Guide Mistaken*. He appealed, not unsuccessfully, to Buckingham, who on Clarendon's fall was posing as the protector of the Dissenters, to use his efforts to procure parliamentary toleration.

Penn's first public discussion was with Thomas Vincent, a London Presbyterian minister, who had reflected on the "damnable" doctrines of the Quakers. The discussion, which had turned chiefly upon the doctrine of the Trinity, ended uselessly, and Penn at once published *The Sandy Foundation Shaken,* a tract of ability sufficient to excite Pepys's astonishment, in which orthodox views were so offensively attacked that Penn was placed in the Tower, where he remained for nearly nine months. The imputations upon his opinions and good citizenship, made as well by Dissenters as by the Church, he repelled in *Innocency with her Open Face,* in which he asserts his full belief in the divinity of Christ, the atonement, and justification through faith, though insisting on the necessity of good works. He now published the most important of his books, *No Cross, No Crown,* which contained an able defence of the Quaker doctrines and practices, and a scathing attack on the loose and unchristian lives of the clergy. While completely refusing to recant Penn addressed a letter to Arlington in July 1669, in which, on grounds of religious freedom, he asked him to interfere. He was almost at once set at liberty.

An informal reconciliation now took place with his father, and Penn was again sent on family business to Ireland. At the desire of his father, whose health was fast failing, Penn returned to London in 1670. Having found the usual place of meeting in Gracechurch Street closed by soldiers, Penn, as a protest, preached to the people in the open street. With William Mead he was at once arrested and indicted at the Old Bailey on Sept. 1, for preaching to an unlawful, seditious and riotous assembly, which had met together with force and arms. The Conventicle Act not touching their case, the trial which followed, and which may be read at length in Penn's *People's Ancient and Just Liberties Asserted,* was a notable one in the history of trial by jury. With extreme courage and skill Penn exposed the illegality of the prosecution, while the jury, for the first time, asserted the right of juries to decide in opposition to the ruling of the court. They brought in a verdict declaring Penn and Mead "guilty of speaking in Gracechurch Street," but refused to add "to an unlawful assembly"; then, as the pressure upon them increased, they first acquitted Mead, while returning their original verdict upon Penn, and then, when that verdict was not admitted, returned their final answer "not guilty" for both. The court fined the jurymen 40 marks each for their contumacy, and, in default of payment, imprisoned them, whereupon they vindicated and established for ever the right they had claimed in an action (known as Bushell's case from the name of one of the jurymen) before the court of common pleas, when all twelve judges unanimously declared their imprisonment illegal.

Penn himself had been fined for not removing his hat in court, had been imprisoned on his refusal to pay, and had earnestly requested his family not to pay for him. The fine, however, was settled anonymously, and he was released in time to be present at his father's death on Sept. 16, 1670, at the early age of forty-nine. Penn now found himself in possession of a fortune of £1,500 a year, and a claim on the Crown for £16,000, lent to Charles II. by his father. Upon his release Penn at once plunged into controversy, challenging a Baptist minister named Jeremiah Ives, at High Wycombe, to a public dispute and, according to the Quaker account, easily defeating him. Hearing at Oxford that students who attended Friends' meeting were rigorously used, he wrote a vehement and abusive remonstrance to the vice-chancellor in defence of religious freedom. This found still more remarkable expression in the *Seasonable Caveat against Popery* (Jan. 1671).

In the beginning of 1671 Penn was again arrested for preaching in Wheeler Street meeting-house by Sir J. Robinson, the lieutenant of the Tower, formerly lord mayor. Legal proof being wanting of any breach of the Conventicle Act, and the Oxford or Five Mile Act also proving inapplicable, Robinson, who had some special cause of enmity against Penn, urged upon him the oath of allegiance. This, of course, the Quaker would not take, and consequently was imprisoned for six months. During this imprisonment Penn wrote several works, the most important being *The Great Case of Liberty of Conscience* (Feb 1671), a noble defence of complete toleration. Upon his release he started upon a missionary journey through Holland and Germany; at Emden he founded a Quaker society, and established an intimate friendship with the princess palatine Elizabeth.

Upon his return home in the spring of 1672 Penn married Gulielma Springett, daughter of Mary Pennington by her first husband, Sir William Springett. She appears to have been equally remarkable for beauty, devotion to her husband, and firmness to the religious principles which she had adopted when little more than a child. Penn now settled at Rickmansworth, Hertfordshire, and gave himself up to controversial writing. To this year, 1672, belong the *Treatise on Oaths* and *England's Present Interest Considered.* In the year 1673 Penn secured the release of George Fox, addressed the Quakers in Holland and Germany, carried on public controversies with Thomas Hicks, a Baptist, and John Faldo, an Independent, and published his treatise on the *Christian Quaker and his Divine Testimony Vindicated,* the *Discourse of the General Rule of Faith and Practice, Reasons against Railing* (in answer to Hicks), *Counterfeit Christianity Detected,* and a *Just Rebuke to One-and-twenty Learned Divines* (an answer to Faldo and to the publication entitled *Quakerism no Christianity*). His last public controversy was in 1675 with Richard Baxter, in which, of course, each party claimed the victory.

[1]Pepys, August 30, 1664.

At this point Penn's connection with America begins. For the proceedings by which Penn acquired a large proprietary interest in New Jersey *see* NEW JERSEY: *History*. For the new colony Penn drew up a constitution, under the title of "Concessions." Great care is taken to make this constitution "as near as may be conveniently to the primitive, ancient and fundamental laws of the nation of England." But a democratic element is introduced, and the new principle of perfect religious freedom stands in the first place (ch. xvi.). With regard to the liberty of the subject, no one might be condemned in life, liberty or estate, except by a jury of twelve, and the right of challenging was granted to the uttermost (ch. xvii.). Imprisonment for debt was not abolished (as Dixon states), but was reduced to a minimum (ch. xviii.), while theft was punished by twofold restitution either in value or in labour to that amount (ch. xxviii.). The provisions of ch. xix. deserve special notice. All causes were to go before three justices, with a jury. "They, the said justices, shall pronounce such judgment as they shall receive from, and be directed by, the said twelve men, in whom only the judgment resides, and not otherwise. And in case of their neglect and refusal, that then one of the twelve, by consent of the rest, pronounce their own judgment as the justices should have done." The justices and constables, moreover, were elected by the people, the former for two years only (ch. xli.). Suitors might plead in person, and the courts were public (ch. xxii.). Questions between Indians and settlers were to be arranged by a mixed jury (ch. xxv.). An assembly was to meet yearly, consisting of a hundred persons, chosen by the inhabitants, freeholders and proprietors, one for each division of the province. The election was to be by ballot, and each member was to receive a shilling a day from his division, "that thereby he may be known to be the servant of the people." The executive power was to be in the hands of ten commissioners[1] chosen by the assembly. Such a constitution soon attracted large numbers of Quakers to West Jersey.

It was shortly before these occurrences that Penn inherited through his wife the estate of Worminghurst in Sussex, whither he removed from Rickmansworth. He now (July 25, 1677) undertook a second missionary journey to the continent along with George Fox, Robert Barclay and George Keith. He visited particularly Rotterdam and all the Holland towns, renewed his intimacy with the princess Elizabeth at Herwerden, and, under considerable privations, travelled through Hanover, Germany, the lower Rhine and the electorate of Brandenburg, returning by Bremen and The Hague. It is worthy of recollection that the Germantown (Philadelphia) settlers from Kirchheim, one of the places which responded in an especial degree to Penn's teaching, are noted as the first who declared it wrong for Christians to hold slaves. Penn reached England again on Oct. 24. He tried to gain the insertion in the bill for the relief of Protestant Dissenters of a clause enabling Friends to affirm instead of taking the oath, and twice addressed the House of Commons' committee with considerable eloquence and effect. The bill, however, fell to the ground at the sudden prorogation.

In 1678 the popish terror came to a head, and to calm and guide Friends in the prevailing excitement Penn wrote his *Epistle to the Children of Light in this Generation*. A far more important publication was *An Address to Protestants of all Persuasions*, by William Penn, Protestant, in 1679; a powerful exposition of the doctrine of pure tolerance and a protest against the enforcement of opinions as articles of faith. This was succeeded, at the general election which followed the dissolution of the pensionary parliament, by *England's Great Interest in the Choice of this New Parliament*, in which he insisted on the following points: the discovery and punishment of the plot, the impeachment of corrupt ministers and councillors, the punishment of "pensioners," the enactment of frequent parliaments, security from popery and slavery, and ease for Protestant Dissenters. Next came *One Project for the Good of England*, perhaps the most pungent of all his political writings. But he was not merely active with his pen. He was at this time in close intimacy with Algernon Sidney, who stood successively for Guildford and Bramber. In each case, owing in a great degree to Penn's eager advocacy, Sidney was elected, only to have his elections annulled by court influence. Toleration for Dissenters seemed as far off as ever.

[1]Penn's letter of the 26th of August 1676 says twelve, and Clarkson has followed this; but the Concessions, which were not assented to by the inhabitants until the 3rd of March 1676–1677, say ten.

Penn now again turned his thoughts to America. In repayment of the debt mentioned above he now asked from the Crown, at a council held on the 24th of June 1680, for "a tract of land in America north of Maryland, bounded on the east by the Delaware, on the west limited as Maryland (*i.e.* by New Jersey), northward as far as plantable"; this latter limit Penn explained to be "three degrees northwards." This formed a tract of 300 m. by 160, of extreme fertility, mineral wealth and richness of all kinds. Disputes with James, duke of York, and with Lord Baltimore, who had rights over Maryland, delayed the matter until March 14, 1681, when the grant received the royal signature, and Penn was made master of the province of Pennsylvania. His own account of the name is that he suggested "Sylvania," that the king added the "Penn" in honour of his father, and that, although he strenuously objected and even tried to bribe the secretaries, he could not get the name altered. It should be added that early in 1682 Carteret, grandson of the original proprietor, transferred his rights in East Jersey to Penn and eleven associates, who soon afterwards conveyed one-half of their interest to the earl of Perth and eleven others. It is uncertain to what extent Penn retained his interest in West and East Jersey, and when it ceased. The two provinces were united under one governor in 1699, and Penn was a proprietor in 1700. In 1702 the government of New Jersey was surrendered to the Crown.

By the charter for Pennsylvania Penn was made proprietary of the province. He was supreme governor; he had the power of making laws with the advice, assent and approbation of the freemen, of appointing officers, and of granting pardons. The laws were to contain nothing contrary to English law, with a saving to the Crown and the privy council in the case of appeals. Parliament was to be supreme in all questions of trade and commerce; the right to levy taxes and customs was reserved to England; an agent to represent Penn was to reside in London; neglect on the part of Penn was to lead to the passing of the government to the Crown (which event actually took place in 1692); no correspondence might be carried on with countries at war with Great Britain. The importunity of the bishop of London extorted the right to appoint Anglican ministers, should twenty members of the colony desire it, thus securing the very thing which Penn was anxious to avoid—the recognition of the principle of an establishment.

He negotiated with James and Lord Baltimore with the view, ultimately successful, of freeing the mouth of the Delaware, wrote to the Indians in conciliatory terms, and encouraged the formation of companies to work the infant colony both in England and Germany, especially the "Free Society of Traders in Pennsylvania," to whom he sold 20,000 acres, absolutely refusing, however, to grant any monopolies. In July he drew up a body of "conditions and concessions." This constitution, savouring strongly of Harrington's *Oceana*, was framed, it is said, in consultation with Sidney, but the statement is doubtful. Until the council of seventy-two (chosen by universal suffrage every three years, twenty-four retiring each year), and the assembly (chosen annually) were duly elected, a body of provisional laws was added.

It was in the midst of this extreme activity that Penn was made a Fellow of the Royal Society. Leaving his family behind him, Penn sailed with a hundred comrades from Deal in the "Welcome" on Sept. 1, 1682. His *Last Farewell to England* and his letter to his wife and children contain a beautiful expression of his pious and manly nature. He landed at New Castle on the Delaware on Oct 27, his company having lost one-third of their number by small-pox during the voyage. After receiving formal possession, and having visited New York, Penn ascended the Delaware to the Swedish settlement of Upland, to which he gave the name of Chester. The assembly at once met, and on the 7th of December passed the "Great Law of Pennsylvania." The idea which informs this law is that Pennsylvania was to be a Christian state on a Quaker model. Philadelphia was now founded, and within

two years contained 300 houses and a population of 2,500. At the same time an act was passed, uniting under the same government the territories which had been granted by feoffment by James in 1682. Realistic and entirely imaginative accounts (*cf.* Dixon, p. 270), inspired chiefly by Benjamin West's picture, have been given of the treaty which there seems no doubt Penn actually made in November 1683 with the Indians. His connection with them was one of the most successful parts of his management, and he gained at once and retained through life their intense affection.

Penn now wrote an account of Pennsylvania from his own observation for the "Free Society of Traders," in which he shows considerable power of artistic description Tales of violent persecution of the Quakers, and the necessity of settling disputes, which had arisen with Lord Baltimore, his neighbour in Maryland, brought Penn back to England (Oct 2, 1684) after an absence of two years. In the spring of 1683 he had modified the original charter at the desire of the assembly, but without at all altering its democratic character He was, in reference to this alteration, charged with selfish and deceitful dealing by the assembly.

Within five months Charles II died, and Penn found himself at once in a position of great influence. Penn now took up his abode at Kensington in Holland House, so as to be near the court. His influence there was great enough to secure the pardon of John Locke, who had been dismissed from Oxford by Charles, and of 1,200 Quakers who were in prison. At this time he wrote a further account of Pennsylvania, a pamphlet in defence of Buckingham's essay in favour of toleration, in which he is supposed to have had some share, and his *Persuasive to Moderation to Dissenting Christians,* very similar in tone to the *One Project for the Good of England.* When Monmouth's rebellion was suppressed he appears to have done his best to mitigate the horrors of the western commission, opposing Jeffreys to the uttermost (Burnet iii. 66; Dalrymple i. 282.) Macaulay has accused Penn of being concerned in some of the worst actions of the court at this time His complete refutation by Forster, Paget, Dixon and others renders it unnecessary to do more than allude to the cases of the Maids of Taunton, Alderman Kiffin, and Magdalen College (Oxford)

In 1686, when making a third missionary journey to Holland and Germany, Penn was charged by James with an informal mission to the prince of Orange to endeavour to gain his assent to the removal of religious tests He gained no satisfaction either from the prince or from Burnet, who disliked him On his return he went on a preaching mission through England His position with James was undoubtedly a compromising one, and it is not strange that, wishing to tolerate Papists, he should, in the prevailing temper of England, be once more accused of being a Jesuit. In 1687 James published the Declaration of Indulgence, and Penn probably drew up the address of thanks on the part of the Quakers It fully reflects his views, which are further ably put in the pamphlet *Good Advice to the Church of England, Roman Catholics and Protestant Dissenters,* in which he showed the wisdom and duty of repealing the Test Acts and Penal Laws. At the Revolution he behaved with courage He was one of the few friends of the king who remained in London, and, when twice summoned before the council, spoke boldly in his behalf. He admitted that James had asked him to come to him in France; but at the same time he asserted his perfect loyalty During the absence of William in 1690 he was proclaimed by Mary as a dangerous person, but no evidence of treason was forthcoming It was now that he lost by death two of his dearest friends, Robert Barclay and George Fox It was at the funeral of the latter that, upon the information of the notorious informer William Fuller (1670–1717?), an attempt was made to arrest him, but he had just left the ground; the fact that no further steps were then taken shows how little the government believed in his guilt. He now lived in retirement in London, though his address was perfectly well known to his friends in the council. In 1691, again on Fuller's evidence, a proclamation was issued for the arrest of Penn and two others as being concerned in Preston's plot. In 1692 he began to write again, both on questions of Quaker discipline and in defence of the sect *Just Measures in an Epistle of Peace and Love, The New Athenians* (in reply to the attacks of the *Athenian Mercury*), and *A Key opening the Way to every Capacity* are the principal publications of this year.

Meantime matters had been going badly in Pennsylvania. Penn had, in 1686, been obliged to make changes in the composition of the executive body, though in 1689 it reverted to the original constitution; the legislative bodies had quarrelled; and Penn could not gain his rents. The chief difficulty in Pennsylvania was the dispute between the province—*i.e.,* the country given to Penn by the charter—and the "territories," or the lands granted to him by the duke of York by feoffment in August 1682, which were under the same government but had differing interests. The difficulties which Quaker principles placed in the way of arming the colony—a matter of grave importance in the existing European complications—fought most hardly against Penn's power. On Oct. 21, 1692 an order of council was issued depriving Penn of the governorship of Pennsylvania and giving it to Colonel Benjamin Fletcher, the governor of New York To this blow were added the illness of his wife and a fresh accusation of treasonable correspondence with James. In his enforced retirement he wrote the most devotional and most charming of his works—the collection of maxims of conduct and religion entitled *The Fruits of Solitude.* In December, thanks to the efforts of his friends at court, among whom were Buckingham, Somers, Rochester, and Henry Sidney, he received an intimation that no further steps would be taken against him. The accusation, however, had been public, and he insisted on the withdrawal being equally public. He was therefore heard in full council before the king, and honourably acquitted of all charges of treason. It was now that he wrote an *Essay towards the Present and Future Peace of Europe,* in which he puts forth the idea of a great court of arbitration, a principle which he had already carried out in Pennsylvania.

In 1694 (Feb. 23) his wife Gulielma died, leaving two sons, Springett and William, and a daughter Letitia, afterwards married to William Aubrey Two other daughters, Mary and Hannah, died in infancy. He consoled himself by writing his *Account of the Rise and Progress of the People called Quakers.* The coldness and suspicion with which he had been regarded by his own denomination had now ceased, and he was once more regarded by the Quaker body as their leader. About the same time (Aug 20) he was restored to the governorship of Pennsylvania; and he promised to supply money and men for the defence of the frontiers. In 1695 he went on another preaching mission in the west, and in March 1696 he formed a second marriage, with Hannah Callowhill, his son Springett dying five weeks later. In this year he wrote his work *On Primitive Christianity,* in which he argues that the faith and practice of the Friends were those of the early Church In 1697 Penn removed to Bristol, and during the greater part of 1698 was preaching with great success against oppression in Ireland, whither he had gone to look after the property at Shannangarry.

In 1699 he was back in Pennsylvania where the success of Colonel Robert Quary, judge of the admiralty in Pennsylvania—who was in the interests of those who wished to make the province an imperial colony—and the high-handed action of the deputy Markham in opposition to the Crown, were causing great difficulties Penn carried with him particular instructions to put down piracy, which the objections of the Quakers to the use of force had rendered audacious and concerning which Quary had made strong representations to the home government, while Markham and the inhabitants apparently encouraged it. Penn and Quary, however, came at once to a satisfactory understanding on this matter, and the illegal traffic was vigorously and successfully attacked. In 1696 the Philadelphian Yearly Meeting had passed a resolution declaring slavery contrary to the first principles of the gospel Penn, however, did not venture upon emancipation; but he insisted on the instruction of negroes, permission for them to marry, repression of polygamy and adultery, and proposed regulations for their trial and punishment. The assembly, however, a very mixed body of all nations, now refused to accept any of these proposals except the last-named. His great success was with the Indians; by their treaty with him in 1700 they promised not to help any enemy of England, to traffic only with those

approved by the governor, and to sell furs or skins to none but inhabitants of the province. At the same time he showed his capacity for legislation by the share he took with Lord Bellomont at New York in the consolidation of the laws in use in the various parts of America.

Affairs now again demanded his presence in England. The king had in 1701 written to urge upon the Pennsylvania government a union with other private colonies for defence, and had asked for money for fortifications. The difficulty felt by the Crown in this matter was a natural one. A bill was brought into the lords to convert private into Crown colonies. Penn's son appeared before the committee of the house and managed to delay the matter until his father's return. On Sept. 15, Penn called the assembly together, in which the differences between the province and the territories again broke out. He succeeded, however, in calming them, appointed a council of ten to manage the province in his absence, and gave a borough charter to Philadelphia. In May 1700, experience having shown that alterations in the charter were advisable, the assembly had, almost unanimously, requested Penn to revise it. On Oct. 28, 1701 he handed it back to them in the form in which it afterwards remained. An assembly was to be chosen yearly, of four persons from each county, with all the self-governing privileges of the English House of Commons. Two-thirds were to form a quorum. The nomination of sheriffs, coroners and magistrates for each county was given to the governor, who was to select from names handed in by the freemen. Moreover, the council was no longer elected by the people, but nominated by the governor, who was thus practically left single in the executive. The assembly, however, which, by the first charter, had not the right to propound laws, but might only amend or reject them, now acquired that privilege. In other respects the original charter remained, and the inviolability of conscience was again emphatically asserted. Penn reached England in December 1701. He once more assumed the position of leader of the Dissenters and himself read the address of thanks for the promise from the Throne to maintain the Act of Toleration. He now took up his abode again at Kensington, and published while here his *More Fruits of Solitude.*

In 1703 he went to Knightsbridge, where he remained until 1706, when he removed to Brentford, his final residence being taken up in 1710 at Field Ruscombe, near Twyford. In 1704 he wrote his *Life of Bulstrode Whitelocke.* He had now much trouble from America. The territorialists were openly rejecting his authority, and doing their best to obstruct all business in the assembly; and matters were further embarrassed by the injudicious conduct of Governor John Evans in 1706. Moreover, pecuniary troubles came heavily upon him, while the conduct of his son William, who became the ringleader of all the dissolute characters in Philadelphia, was another and still more severe trial. This son was married, and had a son and daughter, but appears to have been left entirely out of account in the settlement of Penn's proprietary rights on his death.

Penn's deficiency in judgment of character was especially shown in the choice of his steward Ford, from whom he had borrowed money, and who, by dexterous swindling, had managed, at the time of his death, to establish, and hand down to his widow and son, a claim for £14,000 against Penn. Penn, however, refused to pay, and spent nine months in the Fleet rather than give way. He was released at length by his friends, who paid £7,500 in composition of all claims. Difficulties with his government of Pennsylvania continued to harass him. Fresh disputes took place with Lord Baltimore, the owner of Maryland, and Penn also felt deeply what seemed to him the ungrateful treatment which he met with at the hands of the assembly. He therefore in 1710 wrote, in earnest and affectionate language, an address to his "old friends," setting forth his wrongs. So great was the effect which this produced that the assembly which met in October of that year was entirely in his interests; revenues were properly paid; the disaffected were silenced and complaints were hushed; while an advance in moral sense was shown by the fact that a bill was passed prohibiting the importation of negroes. This, however, when submitted to the British parliament, was cancelled. Penn now, in February 1712, being in failing health, proposed to surrender his powers to the Crown. The commission of plantations recommended that Penn should receive £12,000 in four years from the time of surrender, Penn stipulating only that the queen should take the Quakers under her protection; and £1,000 was given him in part payment. Before, however, the matter could go further he was seized with apoplectic fits, which shattered his understanding and memory. A second attack occurred in 1713. He died on May 30, 1718, leaving three sons by his second wife, John, Thomas and Richard, and was buried along with his first and second wives at Jourdans meeting-house, near Chalfont St. Giles in Buckinghamshire. In 1790 the proprietary rights of Penn's descendants were bought up for a pension of £4,000 a year to the eldest male descendant by his second wife, and this pension was commuted in 1884 for the sum of £67,000.

Penn's *Life* was written by Joseph Besse, and prefixed to the collected edition of Penn's *Works* (1726). The *Selected Works* were published again in 1771 (4th ed. 3 vols., 1825), and *Some Fruits of Solitude* was reprinted in 1900 with an introduction by Edmund Gosse. See *Selections from the Works of William Penn* (ed. I. Sharpless, 2nd ed., 1915). W. Hepworth Dixon's biography, refuting Macaulay's charges, appeared in 1851. In 1907 Mrs. Colquhoun Grant, one of Penn's descendants, published *Quaker and Courtier; the Life and Work of William Penn. See* also J. W. Graham, *William Penn* (2nd ed., 1918).

PENNE, a town and episcopal see of Italy, in the province of Teramo, 26 m. S.E. of Teramo, and 16 m. from the Adriatic, 1,437 ft. above sea-level. Pop. (1921), 4,289 (town); 10,471 (commune). The church of S. Giovanni has a fine cross by Nicola di Guardiagrele. Many of the houses have fine terra-cotta friezes. It occupies the site of the ancient Pinna, the chief city of the Vestini, who entered into alliance with Rome in 301 B.C. and remained faithful to her through the Hannibalic wars.

See G. Colasanti, *Pinna* (Rome, 1907).

PENNELL, JOSEPH (1860–1926), American artist and author, was born in Philadelphia (Pa.), on July 4, 1860, and first studied there, but like his compatriot and friend, J. M. Whistler, he afterwards went to Europe and made his home in London. He produced numerous books (many of them in collaboration with his wife, Elizabeth Robins Pennell), but his chief distinction is as an original etcher and lithographer, and notably as an illustrator. Their close acquaintance with Whistler led to Mr. and Mrs. Pennell undertaking a biography of that artist in 1906, and, after some litigation with his executrix on the right to use his letters, the book was published in 1908. In 1919, Pennell published *Etchers and Etching,* and in 1921 he edited the *Whistler Journal.* He died on April 23, 1926.

PENNINE CHAIN, an extensive system of hills in the north of England. The name is probably derived from the Celtic *pen,* high, appearing in the Apennines of Italy and the Pennine Alps. The English system is comprised within the following physical boundaries. On the N. a well-marked depression, falling below 500 ft. in height, between the upper valleys of the Irthing and the south Tyne, from which it is known as the Tyne Gap, separates the Pennines from the system of the Cheviots. On the N.E., in Northumberland, the foothills extend to the North Sea. On the N.W. the Eden valley forms part of the boundary between the Pennines and the hills of the Lake District, and the division is continued by the upper valley of the Lune. For the rest the physical boundaries consist of extensive lowlands—on the E. the vale of York, on the W. the coastal belt of Lancashire and the plain of Cheshire, and on the S. and S.E. the valley of the river Trent. The Pennines thus cover parts of Cumberland, Westmorland and Northumberland, Lancashire and Yorkshire, Cheshire and Derbyshire, while the southern foothills extend into Staffordshire and Nottinghamshire.

The Pennine system is hardly a range, but the hills are in effect broken up into numerous short ranges by valleys cut back into them in every direction, for the Pennines form a north and south watershed which determines the course of all the larger rivers in the north of England. The chain is divided into two sections by a gap formed by the river Aire flowing east, a member of the Humber basin, and the Ribble flowing west and entering the Irish Sea through a wide estuary south of Morecambe Bay.

The northern section of the Pennine system is broader and generally higher than the southern. Its western slope is generally short and steep, the eastern long and gradual; this distinction applying to the system at large. In the north-west a sharp escarpment overlooks the Eden valley. This is the nearest approach to a true mountain range in the Pennine system and indeed in England. It is known as the Cross Fell Edge from its highest point, Cross Fell (2,930 ft.), to the south-east of which a height of 2,780 ft. is reached in Milburn Forest, and of 2,591 ft. in Mickle Fell. This range is marked off eastward by the upper valleys of the south Tyne and the Tees, and, from the divide between these two, branch ranges spring eastward, separated by the valley of the Wear, at the head of which are Burnhope Seat (2,452 ft.) and Dead Stones (2,326 ft.). In the northern range the highest point is Middlehope Moor (2,206 ft.), and in the southern, Chapel Fell Top (2,294 ft.). It is thus seen that the higher elevations, like the steeper slopes, lie towards the west. Cross Fell Edge terminates southward at a high pass (about 1,400 ft.) between the head of the Belah, a tributary of the Eden, and the Greta, a tributary of the Tees. This pass is followed by the Tebay and Barnard Castle line of the North Eastern railway. The hills between the Lune valley on the west and the headstream of the Eden and the Ribble on the east are broken into masses by the dales of tributaries to the first-named river—here the chief elevations are Wild Boar Fell (2,323 ft.), Whernside (2,414 ft.), and Ingleborough (2,373 ft.). The Ribble and Eden valleys afford a route for the main line of the Midland railway. Well-marked eastward ranges occur here between Swaledale and the river Ure, which traverses the celebrated Wensleydale, and between the Ure and Wharfe. In the first the highest points are High Seat (2,328 ft.) and Great Shunner Fell (2,340 ft.); and in the second Buckden Pike (2,302 ft.) and Great Whernside (2,310 ft.). There is then a general southerly slope to the Aire gap.

The southern section of the system calls for less detailed notice. Heights exceeding 2,000 ft. are rare. The centre of the section is the well-known Peak (*q.v.*) of Derbyshire. Both here and throughout the system the summits of the hills are high uplands, rounded or nearly flat, consisting of heathery, peaty moorland or hill pasture. The profile of the Pennines is thus not striking as a rule, but much fine scenery is found in the narrow dales throughout; Wensleydale, Wharfedale and other Yorkshire dales being no less famous than the dales of Derbyshire. In the parts about Settle below Ingleborough, in Derbyshire, and elsewhere, remarkable caverns and subterranean watercourses in the limestone have been explored to great depths. In Ingleborough itself are the Ingleborough cave, near Clapham; the chasm of Gaping Ghyll, over 350 ft. deep; Helln or Hellan Pot, a vast swallow-hole 359 ft. deep, only exceeded by Rowten Pot (365 ft.) near Whernside; and many others. Malham Tarn, near the head of the Aire, is drained by a stream which quickly disappears below ground, and the Aire itself is fed by a brook gushing forth in full stream at the foot of the cliffs of Malham Cove. A notable example in Derbyshire is the disappearance of the Wye into Plunge Hole, after which it traverses Poole's Cave, close to Buxton. There may also be noted the remarkable series of caverns near Castleton. Lakes are few and small in the Pennine district, but in some of the upland valleys, such as those of the Nidd and the Etherow, reservoirs have been formed for the supply of the populous manufacturing districts of Lancashire and the West Riding of Yorkshire, which lie on either flank of the system between the Aire gap and the Peak.

See ENGLAND and CUMBERLAND, YORKSHIRE, etc.

PENNS GROVE, a borough of Salem county, New Jersey, U.S.A., on the Delaware river, opposite Wilmington, Del.; served by the Pennsylvania railroad and river steamers. Pop. (1920) 6,060 (81% native white); 1928 local estimate 7,000. It is a shipping point for agricultural produce, and has manufacturing plants making smokeless powder, dyes and chemicals. The borough was incorporated in 1894.

PENNSYLVANIA, popularly known as the "Keystone" State because of its central position among the original 13 Colonies, is one of the Commonwealths of the United States of America, lying mostly between lat. 39° 43′ (the Mason and Dixon line) and 42° N. and long. 74° 43′ and 80° 31′ W. of Greenwich. The State is in the form of a rectangle, except in the north-west where a triangular projection, extending to 42° 15′ N. lat., gives it a shore-line of almost 40 m. on Lake Erie, and in the east where the Delaware river with two large bends makes deep indentations into New York and New Jersey. Pennsylvania is bounded north by New York; east by New York and New Jersey, from which it is separated by the Delaware river; south by Delaware, Maryland and West Virginia, and west by the "Panhandle" of West Virginia and by Ohio. The total area is 45,126 sq.m., of which 294 sq.m. are water surface.

Physical Features.—Pennsylvania skirts the coastal plain in the south-east below Philadelphia and is traversed from north-east to south-west by the three divisions of the Appalachian province—Piedmont or older Appalachian belt, younger Appalachian ridges and valleys, and the Allegheny plateau. In the north-west corner is a small part of the Erie plain. The entire surface has a mean elevation of about 1,100 ft. above the sea, varying from sea level on the Delaware river to 3,212 ft. (Negro mountain) in Somerset county. On the north and west borders of the lowland extending along the Delaware are two parts of a chain of semi-detached and usually rounded hills, known as the South mountains. The north-east part extends from New Jersey through Easton to Reading. The south-west part is a north-eastern prolongation of the Virginia Piedmont, known as the Cumberland prong. The Pennsylvania portion of the younger Appalachian ridges and valleys, known as the central province of the State, embraces the region between the South mountains on the south-east, and the crest of the Allegheny plateau or Allegheny front on the north-west. It extends from south-west to north-east about 230 m. and has a nearly uniform width of 50 m., except that it narrows rapidly as it approaches the north-east corner of the State. The crest lines are often of nearly uniform height for miles and generally are little broken except by an occasional V-shaped wind gap, a narrow water gap or a rounded knob. The valleys, except the Appalachian or Great valley, rarely exceed more than a few miles in width. The Pocono plateau, into which the central province merges at its north-east extremity, is a continuation of the Catskill plateau southward from New York. It is little broken, except by shallow valleys and occasional knobs. The Allegheny plateau, which extends from the crest of the Allegheny front to and beyond the west and north borders of Pennsylvania and covers more than one-half of the State, is much dissected and contains the highest elevations within the State.

The Pocono plateau in the north-east, nearly all of the central and south-east provinces and the north-east portion of the Allegheny plateau in the north-west are drained by the Susquehanna and Delaware river systems into the Chesapeake and Delaware bays. The greater part of the Allegheny plateau is drained by the Allegheny and Monongahela rivers into the Ohio river. The extreme southern portion of the central province and the extreme western portion of the south-east province are drained by tributaries of the Potomac; the Erie plain is drained by short streams into Lake Erie; and a very small section of the Allegheny plateau, in the northern part of Potter county, is drained by the Genesee river into Lake Ontario. The Susquehanna is a wide and shallow stream with a zigzag course and numerous islands, but both the Susquehanna and the Delaware, together with their principal tributaries, flow for the most part transverse to the geological structure. In the gorges and water-gaps through which they pass in the mountain region is some of the most picturesque scenery in the State. These gorges, too, are of great economic importance as passages for railways and highways. The lower portion of the Delaware river has been entered by the sea as the result of the depression of the land, giving a harbour, at the head of which developed the city of Philadelphia.

Climate and Soil.—The temperature of Pennsylvania is mild and equable in the south-east province where the ocean influences it and where the mountains bounding it on the north and north-west are some protection from the colder winds. The crests of the higher ridges in the central province are delightfully cool

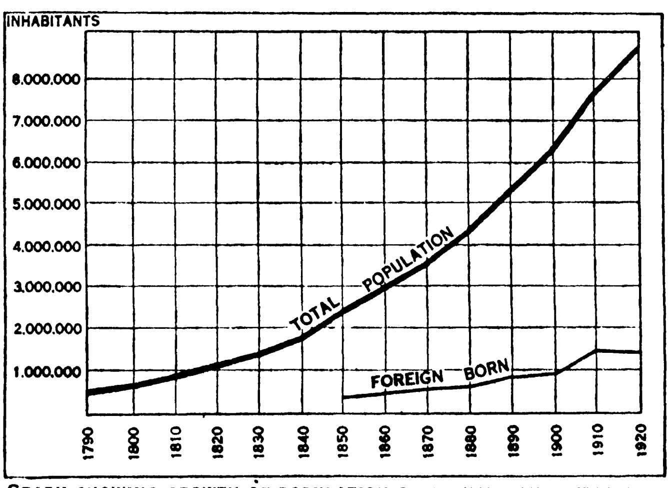
in summer, but the adjacent valleys are subject to excessive heat. In winter the mountain valleys may experience severe cold. The mean annual temperature is about 52° F. in the south-east, 50° in the centre, 47° in the north-west and 49° on the shore of Lake Erie. The summer maxima on the mountains are usually 8° to 10° less than in the valleys directly below them. There are many summer resorts in the mountains. The average annual rainfall is 44 inches.

Government.—Pennsylvania is governed under a constitution adopted in 1873 which has been amended frequently. An amendment, to be adopted, must be approved by majorities in two successive legislatures and by a majority of a subsequent popular vote.

The governor, elected for four years, is ineligible for the next succeeding term. He controls a large amount of patronage, appointing, subject to the advice and consent of two-thirds of the senate, the heads of all departments except the auditor-general, State treasurer and secretary of internal affairs. He also appoints the members of all independent administrative boards and commissions, the members of all advisory boards, and, with few exceptions, the members of all departmental boards and commissions, and fills vacancies in various offices which occur during the recess of the senate. He has a right of veto, extending to items in appropriation bills, which may be overridden by a two-thirds vote in each house. His power of pardon is limited, being subject to the recommendation of three members of a board which consists of the lieutenant governor, secretary of the commonwealth, attorney general and secretary of internal affairs.

All the elective officials, except the secretary of internal affairs, are ineligible for a second consecutive term. By a law of 1923 as amended by an act of April 13, 1927 the administrative agencies of the State were consolidated into 17 departments; viz., State, justice, attorney general, treasury, public instruction, internal affairs, military affairs, agriculture, forests and waters, labour and industry, health, highways, welfare, banking, insurance, mines, property and supplies. Six department heads designated by the governor meet with him as the executive board which standardizes employment in the various departments and approves the establishment or discontinuance of bureaux or other divisions within the departments.

There were in the two houses of the legislature in 1927 50 senators, elected for four years, and 207 representatives, elected



GRAPH SHOWING GROWTH OF POPULATION OF PENNSYLVANIA, 1790–1920

for two years. The powers of the two houses are the same except that the senate exercises the usual right of confirming appointments and of sitting as a court of impeachment, while the house of representatives initiates money bills and impeachment cases. The legislature meets in odd numbered years on the first Tuesday of January.

The supreme court consists of seven justices elected for terms of 21 years by the voters of the State at large. Minority representation is secured by the provision that each elector shall vote for one less than the number of justices to be chosen at each election. In 1895 the work of the supreme court had increased to such an extent that an act was passed by the general assembly creating the superior court of Pennsylvania which consists of a president judge and six judges. The supreme court handles all appealed cases involving over $2,500, or cases of felonious homicide and is the court of last resort. The superior court handles all other appealed cases. The State is divided into districts in which are courts of common pleas. Justices of the peace are elected in wards, districts, boroughs and townships.

Population.—The population of Pennsylvania increased from 434,373 in 1790 to 2,906,215 in 1860 and to 8,720,017 in 1920. In 1928 the U.S. census estimated it to be 9,864,000. In 1920 there were 1,392,557 foreign-born including 22,764 Italians, 177,770 Poles, 161,124 Russians, 122,755 Austrians, 121,601 Irish, 120,194 Germans and 90,666 English. The negroes increased from 156,845 in 1900 to 284,568 in 1920, owing mostly to migration from the South to Philadelphia and Pittsburgh; in 1925 only 4,914 negroes lived on farms. From 1910 to 1925 the farm population decreased from 1,050,050 to 910,847. The urban (those living in towns of 2,500 or more) population increased from 60·4% in 1910 to 64·3% in 1920.

The growth in population of the chief cities for 1910, 1920 and (estimated) 1928 is as follows: Philadelphia, 1,549,008, 1,823,779, 2,064,200; Pittsburgh, 533,905, 588,343, 673,800; Scranton, 129,867, 137,783, 144,700; Reading, 96,071, 107,784, 115,400; Erie, 56,525, 93,372 (no estimate); Allentown, 51,913, 73,502, 99,400; Harrisburg, 64,186, 75,915, 86,900; Wilkes-Barre, 67,105, 73,833, 91,900; Johnstown, 55,482, 66,327, 73,700; Chester, 38,537, 58,030, 73,200; Altoona, 52,127, 60,331, 69,100; Bethlehem, 12,837, 50,358, 67,600; Lancaster, 47,227, 53,150, 58,300; New Castle, 36,290, 44,938, 52,500; McKeesport, 42,694, 46,781, 50,400; York, 44,750, 47,512, 49,900.

Finance.—The wealth of Pennsylvania (estimated value of all tangible property) was placed in 1922 at $28,834,000,000, an increase over 1912 of $12,600,000,000. The average per caput holding was $3,187 as compared with $2,918 average for the entire United States. The assessed value in 1926 of property subject to the general property tax was $10,995,000,000 of which $8,355,000,000 was real estate and $2,640,000,000 personal property. Receipts of the State treasury for 1926 amounted to $124,836,000 ($13.10 per caput) of which but $33,504,000 was raised by property taxes. The chief sources of revenue upon which the State depends are taxes on corporations—such as the taxes on capital stock, on corporation loans and on gross receipts—automobile licences and fees, the gasolene tax, inheritance tax and anthracite coal tax. In general it is the policy to leave the general property taxes to the counties and smaller units. About two-thirds of the State income is used for the two items, highways and education. The State debt on Jan. 1, 1927, amounted to $98,029,000, of which $97,999,000 was for highway purposes.

On June 30, 1927, the total number of commercial and savings banks was 1,650, with total resources and liabilities of $6,512,856,000, capital, surplus and undivided profits of $1,107,044,000 and deposits of $4,706,824,000.

Education.—Since 1895 education has been free to all between the ages of 6 and 21 and compulsory for all children between the ages of 8 and 16. In 1926 there were 1,849,163 children enrolled in the public schools of whom 1,581,767 were in the elementary and 267,396 in secondary schools; there were also 293,785 pupils in private and parochial schools. The number of high schools in the public school system was 1,150 (634 of them of four-year approved rating); the number of private high schools and academies was 145. There were 297,231 high school students and 15,023 high school teachers. There are 14 State-owned normal schools designed to meet the need for new teachers. Eight of these, situated at Mansfield, Indiana, Shippensburg, Edinboro, East Stroudsburg, West Chester, Bloomsburg and Slippery Rock, gave four-year courses in 1925–26. The established legal minimum of preparation required of teachers in the elementary schools is the completion of a four-year high school course and not less than two years of professional preparation or its equivalent. Partial certificates and emergency certificates are issued to the extent that

fully qualified teachers are not available.

There were in 1926 about 8,500 one-roomed schools in the rural districts of the State with about 250,000 pupils in attendance. The legislatures of 1921 and 1923 provided for relatively larger aid for the poorer districts. The legislature of 1925 provided for State aid to school districts in the education of handicapped children, and also provided for the establishment of evening classes in day school subjects, and in English and citizenship classes for adults. Illiteracy decreased from 5·9% in 1910 to 4·6% in 1920, in which year 18·9% of the foreign-born whites, 6·1% of the negroes, and 0·8% of the native whites were unable to read or write.

There are seven institutions of higher learning which receive State subsidies. Chief of these is Pennsylvania State college at the borough of State College (pop. 4,000) in the central part of the State. The other six are the University of Pennsylvania at Philadelphia (16,087 students, 1926–27), University of Pittsburgh at Pittsburgh (12,026 students, 1926–27), Temple university and the Women's Medical college at Philadelphia, Jefferson Medical college and Hahnemann Medical college. In the biennium, 1927–29, $7,149,000 was allotted to these institutions, of which $4,000,000 was for the Pennsylvania State college which is State owned.

Charities and Corrections.—Penal and charitable institutions are under the supervision of the State welfare department. The western penitentiary at Allegheny opened in 1826, and the eastern penitentiary at Philadelphia opened in 1829. In the middle district, instead of a third penitentiary, the industrial reformatory was established in 1889. At Morganza there is a house of refuge. The system of juvenile courts, created under a statute of 1901, has done much to ameliorate the condition of dependent and delinquent children. There are one State and two semi-State schools for delinquent children, and two State institutions for delinquent adults. Nine hospitals for mental diseases, four hospitals for mental defectives, and 31 mental clinics are partly or wholly supported by State funds. The State supports three sanatoria for tuberculosis and ten general hospitals, the latter chiefly in the mining districts. Of the 242 hospitals in the State in 1923, 149 were partly or wholly supported by the State. There are two State hospitals for veterans and their children, and five schools for the deaf and two for the blind. The system of poor relief was reorganized by a law of 1925. Altogether there are 85 almshouses in the State maintained by county funds. In 1923 a system of old age assistance was inaugurated. In 1927–29 appropriations of the welfare department for State-owned and State-aided institutions totalled $29,775,300.

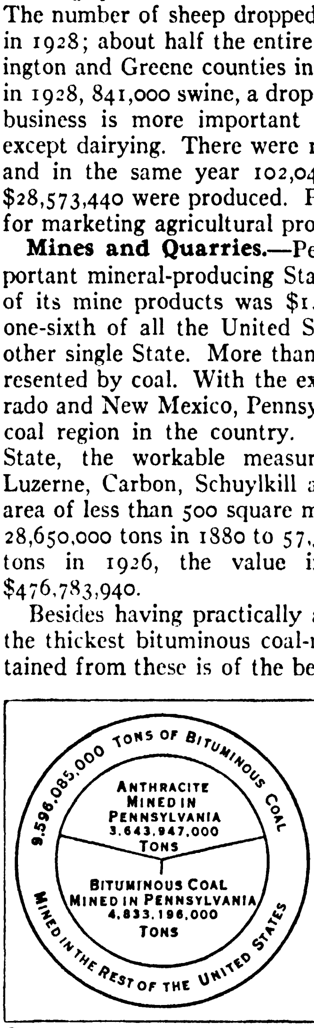
Agriculture.—Although Pennsylvania is a mining and manufacturing rather than an agricultural State, its farming interests are more extensive than is generally supposed. In 1920 about three-fifths of its area was included in farms and a little more than two-thirds of its farm land was improved. The number of farms increased from 127,577 in 1850 to 224,248 in 1900, but declined to 200,443 in 1925. In 1925, 163,695 farms were worked by owners or part owners. The total value of all farm property in 1925 was $1,460,702,000, of which the land value represented $555,146,000 and the value of farm buildings $615,026,000. The value of farm crops for the year 1927 amounted to $249,100,000.

For the most part farming is of the general and live stock type. In most counties all of the rough and most of the concentrated food for stock is produced on the farm. Tame hay is the chief crop, about two-fifths of the crop acreage in 1927 being devoted to it. The yield was 5,085,000 short tons valued at $68,350,000. Nearly half the crop acreage in 1927 was devoted to cereals, the yields and values of which were as follows: Indian corn, 50,165,000 bu. ($45,650,000); wheat, 20,301,000 bu. ($25,787,000); oats, 39,600,000 bu. ($21,384,000); buckwheat, 4,935,000 bu. ($4,194,750); rye, 1,326,000 bu. ($1,392,000); barley, 588,000 bu. ($488,000). Pennsylvania ranked first among the States in buckwheat production. Most of the buckwheat, barley and oats is grown in the northern and western counties, while Indian corn, wheat and rye are raised more extensively in the south-east. Potatoes also were a major crop, the 1927 yield of 26,400,000 bu. being valued at $31,680,000. The 1927 tobacco crop of 44,880,000 lb., of which about nine-tenths was produced in Lancaster county, added $5,834,000 to the total crop value. In 1926 17,000,000 bu. of apples were raised, Pennsylvania ranking fourth among the States in production, but in 1927 the crop fell to 6,300,000 bu. ($8,820,000). The apple district is centred in Adams county in the south-central part of the State, though Erie county is an important producer and also ranks first in grapes. Peaches are also grown in most of the southern orchards, the production being 2,498,000 bu. in 1926 and 947,000 bu. in 1927. Pears, once grown in considerable quantities, have declined greatly, only 400,000 bu. being raised in 1927.

Dairy farming predominates in the northern tier of counties where a shorter growing season and glaciated soil favour pastures and the raising of hay. In 1924 the total value of dairy products ($73,999,263) was exceeded in but three States. In 1928 the number of milch cows was 855,000, valued at $88,065,000. All cattle numbered 1,332,000, a decrease of 214,000 since 1920. Live stock farming predominates in southern and western Pennsylvania. The number of sheep dropped from 1,531,066 in 1900 to 437,000 in 1928; about half the entire number were to be found in Washington and Greene counties in the south-west corner. There were in 1928, 841,000 swine, a drop of 350,000 since 1920. The poultry business is more important than any other live stock branch except dairying. There were raised in 1924, 19,346,000 chickens; and in the same year 102,048,000 dozen eggs with a value of $28,573,440 were produced. Pennsylvania is strategically situated for marketing agricultural products.

Mines and Quarries.—Pennsylvania is by far the most important mineral-producing State in the Union. In 1926 the value of its mine products was $1,055,766,000, or slightly more than one-sixth of all the United States and nearly twice that of any other single State. More than three-fourths of the total was represented by coal. With the exception of two small areas in Colorado and New Mexico, Pennsylvania contains the only anthracite-coal region in the country. This is in the eastern part of the State, the workable measures being mostly in Lackawanna, Luzerne, Carbon, Schuylkill and Northumberland counties in an area of less than 500 square miles. The output rose steadily from 28,650,000 tons in 1880 to 57,368,000 tons in 1900 and 84,837,000 tons in 1926, the value in the latter year amounting to $476,783,940.

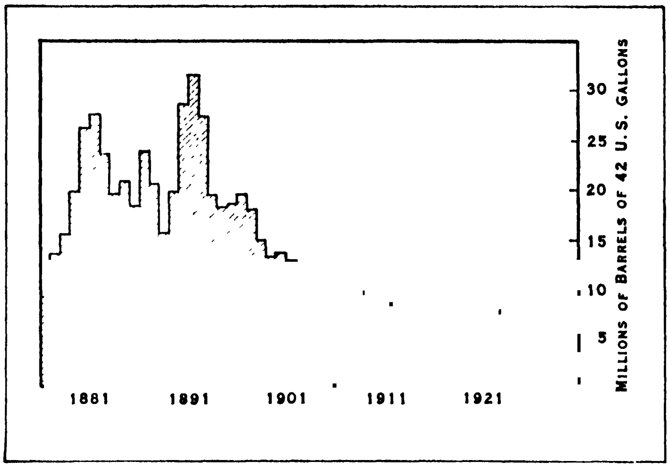
Besides having practically all the anthracite, Pennsylvania has the thickest bituminous coal-measures, and most of the coal obtained from these is of the best quality. They form the northern extremity of the great Appalachian coal-field and underlie an area of 15,000 sq.m. or more in the west of the State. The Pittsburgh district, comprising the counties of Allegheny, Washington, Fayette and Westmoreland, is exceptionally productive, and the coal in Allegheny and Washington counties is noted for its gas-producing qualities, while in Fayette and Westmoreland counties the famous Connellsville coking coal is obtained. Pennsylvania's bituminous output increased from 18,425,000 tons in 1880 to 79,842,000 tons in 1900 and 153,042,000 tons in 1926, valued in the latter year at $315,266,520.



COAL MINED IN PENNSYLVANIA SINCE THE BEGINNING OF PRODUCTION IN 1807 THROUGH 1927, COMPARED WITH THAT MINED IN THE UNITED STATES

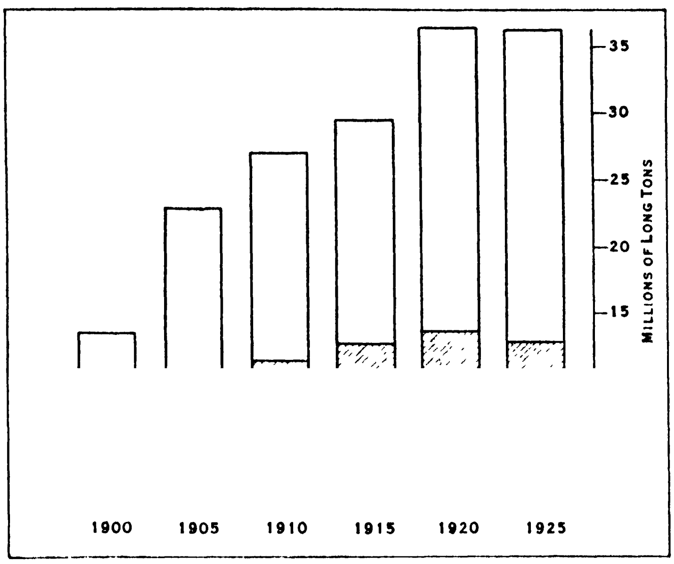
Extending from the south-west corner of the State is the Pennsylvania section of the Appalachian oil-field, which, with a small section in New York, furnished nearly all of the country's supply of petroleum for some years following the discovery of its value for illuminating purposes. The first petroleum well was drilled in 1859 at Titusville. The State's yearly output continued to increase until 1891, when it amounted to 31,424,206 barrels. Since then, however, with fewer important developments, the output declined to 7,824,000 bbl. in 1924. In 1927 it was 9,596,000 bbl.,

valued at $14,873,000. The value of the State's natural gas output increased from approximately $75,000 in 1882 to approximately $19,282,000 in 1888, the total value of its output during these and the intervening years being more than 80% of that of all the United States. In 1924 the output was valued at $45,546,000, nearly 20% of that of the entire country.



PETROLEUM PRODUCED IN PENNSYLVANIA (1876–1927): FIGURES FOR 1876 THROUGH 1881 AND 1888 THROUGH 1890 INCLUDE SMALL AMOUNTS PRODUCED IN NEW YORK

There are deposits of various kinds of iron-ore in the eastern, south-eastern, middle and some of the western counties, and from the middle of the 18th century until near the close of the 19th century, Pennsylvania ranked high among the iron-ore producing States. As late as 1880 it ranked first, with a product amounting to 1,951,496 long tons. But after the first successful experiments in making pig-iron with bituminous coal in 1845, the State's iron foundries moved rapidly westward and thus away from the chief producing centres. The discovery still later that rich ore could be transported to the western part of the State at less cost from the Lake Superior region resulted in a further decline of iron-mining within the State until in 1924 the ore mined amounted to only 807,000 long tons. By 1927 it had increased to 1,170,000 long tons.



THE PRODUCTION OF PIG-IRON AND FERRO-ALLOYS IN PENNSYLVANIA COMPARED WITH THAT IN THE UNITED STATES

Pennsylvania has extensive areas of limestone rock suitable for making cement, and in Northampton and Lehigh counties enormous quantities of it are used in this industry. In Lehigh county the first successful Portland cement plant in the United States was erected in 1870 and since then Pennsylvania has continued to lead all States in its annual output of cement. Portland cement production in the State increased from 825,054 bbl. in 1896 to 41,458,000 bbl. (valued at $70,470,000) in 1925 when it was nearly 25% of that of the United States. Limestone and dolomites suitable for building purposes are obtained chiefly in Montgomery, Chester and Lancaster counties. Until increased facilities of transport brought more desirable stones into competition they were used extensively in Philadelphia. There are limestone quarries in nearly two-thirds of the counties and great quantities of the stone are used for flux in the iron furnaces, for making quicklime, for railway ballast and for road making. Northampton, Lehigh and York counties contain the most productive slate quarries in the country, and in 1925 the value of their output was $5,885,179; the Northampton and Lehigh slate is the only kind in the United States used for school blackboards. There is an extensive area in the south-eastern part of the State containing shale clay of a superior quality for making common brick. Kaolin abounds in Chester and Delaware counties, and fire-clay in several of the western counties. In 1925 the State led all others in the value of its clay output ($2,218,658). Glass-sand abounds both in the eastern and in the western regions, and for many years Pennsylvania has ranked among the leading States in the manufacture of glass. In Chester county, also, is one of the most productive deposits of felspar, second only to those of Maine.

Manufactures.—Pennsylvania ranks second to New York in the value of its manufactures, which increased from $2,832,349,437 in 1914 to $7,381,687,533 in 1923, but declined to $6,901,762,000 in 1925. The value actually added by the manufacturing processes amounted in 1925 to $3,011,249,459. Despite the remarkable increase in value between 1914 and 1925, the number of workmen increased only from 924,478 to 999,460, while the number of establishments steadily decreased from 27,521 to 17,298. The general growth in manufacturing has been promoted by an abundance of fuel, by a good port on the Atlantic seaboard, by the frontage on Lake Erie which makes the ores of the Lake Superior region easily accessible, and by a great railway system which has been built to meet the demands arising from the natural resources. By far the most important industry is the production of iron and steel, in which the State has always held the lead. So long as charcoal only was used in the furnaces (until about 1840) and during the brief period in which this was replaced largely by anthracite, the industry was of chief importance in the eastern region, but with the gradual increase in the use of bituminous coal, or of coke made from it, the industry moved westward, where, especially in the Pittsburgh district, it received a new impetus by the introduction of iron-ore from the Lake Superior region. In the manufacture of pig-iron Pennsylvania is easily first among the States; the output in 1925 from the State's 100 blast furnaces was 12,450,103 long tons, with a value of $268,864,529 or 36·1%, by value of the output of the entire United States. The output of the 171 steel and rolling mills amounted in value to $1,086,935,222 in 1925, or 37·2%, by value, of the nation's output. The manufacture of great quantities of coke has resulted from the demand for this product in the iron and steel industry and from the abundance of coking coal. The manufacture of glass has been promoted by the supply of glass-sand and natural gas in the western part of the State; the manufacture of pottery, terra-cotta and fire-clay products by the abundance of suitable raw clay; the manufacture of silk and silk goods by the large number of women and girls in the miners' families. In each of these industries also the State has for many years produced a large portion of the country's product.

In 1925 the leading manufactures, with the value of each, were: iron and steel, $1,086,935,000; silk manufactures, $329,121,498; foundry and machine shop products, $307,693,000; pig-iron, $268,864,000; electrical machinery and apparatus, $236,843,492; printing and publishing, $234,166,000; knit goods, $230,069,000; steam railway and repair shops, $213,806,000. Others with products between $200,000,000 and $80,000,000 in value were; petroleum refining, bread and bakery products, meat and packing products, cigars and cigarettes, refining of cane sugar, men's outer clothing, motor vehicles, leather, glass, steam railway cars not built in railway repair shops, worsted goods and paper and wood pulp.

Philadelphia is the great manufacturing centre in the State. Within its limits there were, in 1925, 5,636 factories, employing 246,680 persons, which produced 28% ($1,937,414,000) of the State's manufactured articles. Of the total State output, the city produced in 1923 all the cane sugar refined, 82% of the woollen carpets, more than 75% of the clothing, more than 63% of the cotton goods and more than 60% of the printing and publishing. The relative importance of Pittsburgh as a manufacturing centre has declined because of the growth of numerous other steel centres. In 1925 it produced only 10·6% of the State's output of steel and iron. Cities in the western part of the State, such as New Castle, are nearer to the supply of iron-ore from the Great Lakes; while cities in the eastern part of the State, such as Bethlehem, are importing iron-ore from South America. After Philadelphia and Pittsburgh the more important manufacturing cities are Reading, Allentown, Johnstown, Erie, Chester, New Castle, York, Scranton, Altoona and Williamsport.

Forests.—Except on some portions of the Pocono plateau, Pennsylvania was originally well forested, and although most of the merchantable timber has been cut, about one-half of the State is still woodland. On the higher elevations the trees are mostly white pine, yellow pine and hemlock, but in the valleys and lower levels are oaks, hickories, maples, elms, birches, etc. There is an efficient State department of forestry, and State forest reserves in 26 counties amounted to 1,134,444 ac. in 1927.

Transportation and Commerce.—The mountain topography of the State made the building of roads and railways expensive and difficult, but at the same time made them more necessary. Since 1911, when the modern period of State highway construction began, the State has built a system unequalled by any other Appalachian State. The State highways, totalling 10,033 m., form a primary or trunk system connecting the county seats and all the important centres of population. Of this primary system 8,440 m. are surfaced, approximately half being paved with concrete or asphalt. Besides the State system there are rural roads totalling 91,173 m., of which 23,505 m. are surfaced. Licensed motor vehicles increased from 160,137 in 1915 to 570,164 in 1920, and to 1,554,917 in 1925.

The efficient network of railways covering the State is an important factor in the great industrial importance of Pennsylvania. The steam railway mileage increased from 8,453 in 1890 to 11,693 in 1915, after which it declined slightly to 11,337 in 1926. There were 96 electric railway companies operating 4,440 m. of track.

The State has one port of entry on the Atlantic coast, one on the Ohio river, and one on the Great Lakes. Philadelphia, the Atlantic port, exports chiefly petroleum, coal, grain and flour, and imports chiefly iron-ore, sugar, drugs and chemicals, manufactured iron, hemp, jute and flax. In 1927 it ranked third among the Atlantic ports in the tonnage of its foreign commerce, exports 1,909,461, and imports 2,541,099. Pittsburgh ranks high among the interior ports of the country. Erie on Lake Erie has a large domestic trade in iron-ore, copper, wheat and flour.

HISTORY

Swedish and Dutch Periods.—The whole country along the Delaware river before its settlement was disputed between the English, Dutch and Swedes. Both the English and Dutch had traded along the river and had established temporary posts in what is now Pennsylvania, but the Swedes were the first to effect a permanent settlement, their settlements being a continuation of those in Delaware. In 1643, John Printz, governor of New Sweden, built a fort on Tinicum island (near Chester) which he called New Gottenberg, and soon a considerable community was established at Upland (renamed Chester by Penn). In 1655 the Swedish settlements passed under the control of the Dutch who had captured Ft. Christina, the chief Swedish stronghold, in Delaware. The Dutch were in turn dispossessed by the English who took over their colonies after the fall of New Amsterdam in 1664. Gov. Nicolls, the first English governor, put the "Dukes Law" into operation along the Delaware and established a court at Upland. The Swedish settlers remained and later formed a sturdy element in William Penn's colony.

The Quaker Colony.—William Penn (*q.v.*) as early as 1666 became interested in a colony in America for Quakers suffering persecution under the "Clarenden Code." In 1680 he petitioned Charles II. for a grant of land for the purpose, and the Crown, having become indebted to Penn's father, found it easier to pay with land in America than with money. Penn named his grant Pennsylvania (Penn's Woods) in his father's honour. The charter gave him almost unlimited power. He wrote his *Frame of Government* for the Colony and sent commissioners to lay out a "great town" in systematic manner, a city which he named Philadelphia (City of Brotherly Love). Having faith in the people he delegated to them more privileges and powers than the colonists possessed in any other Colony. Absolute religious freedom was the most important and, for the times, the most remarkable concession. All Christians holding certain amounts of property were to be eligible voters and officeholders. The death penalty, in contrast to a long list of offences in other Colonies, was inflicted in Penn's Colony only for murder and treason. Philadelphia was laid out in an advantageous position fronting on both the Delaware and Schuylkill rivers and growth and prosperity began immediately. Soon after Penn's arrival in the Colony in 1682 an assembly, held at Upland, formally adopted Penn's plan of government. In 1683 Penn made his "Great Treaty" with the Indians, according to Voltaire "the only treaty not sworn to and never broken." Penn's fair methods of dealing with Indians and scrupulous care always to pay them well for their land preserved Pennsylvania from Indian hostilities during his lifetime.

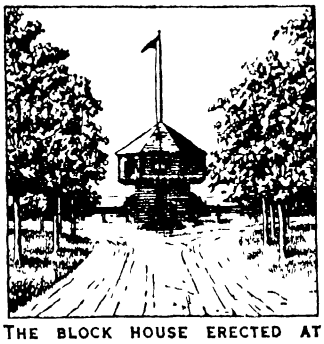
Immigration of Other Nationalities.—To this Colony, thus founded, the oppressed and persecuted of many lands came for refuge. The Quakers soon surpassed all others and were the dominant element to the time of the Revolutionary War. Some of the Quakers were of Welsh stock, a large colony settling in the "Welsh barony" in Montgomery and Delaware counties. The Mennonites came in great numbers in 1682–83 under their remarkable leader, Pastorious, and settled in Germantown, which was long the leading German community in America and the home of many early industries in Pennsylvania. Other large colonies of Germans from the Palatine countries, and belonging to the Lutheran or Reformed churches, settled on fertile lands running from Easton, through Allentown, Reading and Lebanon to the Cumberland valley. The Moravians founded important centres at Nazareth and Bethlehem. Finally the Scotch-Irish, Presbyterian in religion, an active, restless pioneer element arrived and took up the back country positions on the frontier. Because of their difference from the Quakers and Germans in temperament, and because of the peculiar frontier problems which they faced, they formed an element of opposition to the ruling element all through the 18th century. After 1770 large colonies of Connecticut "Yankees" settled in the beautiful northern Wyoming and Muncy valleys, which were claimed by Connecticut.

Pennsylvania was early involved in serious boundary disputes with Maryland, Virginia, Connecticut, New York and Delaware, the first three involving considerable bloodshed between the settlers before they were decided. A decree of Lord Chancellor Hardwicke, in 1750, settled the Maryland-Delaware dispute and led to the survey, 1763–67, of the boundary between Pennsylvania and Maryland by Mason and Dixon, a line which acquired considerable importance later as separating the free and the slave States. In 1784 Virginia agreed to the extension of the line and to the establishment of the western boundary of Pennsylvania at a meridian drawn from a point on the Mason and Dixon line five degrees of longitude west of the Delaware river. The 42nd parallel was finally selected as the northern boundary in 1789, the dispute with Connecticut over northern Pennsylvania having been decided in favour of the latter State by a court of arbitration of the Continental Congress in 1782. In 1792 the Federal Government sold to Pennsylvania the small triangular strip of territory north of the 42nd parallel and bordering on Lake Erie in order that the State might have a good port on the Great Lakes.

Upon William Penn's death in 1718 his widow became proprietary, and after her death in 1733, the proprietorship fell to John, Thomas and Richard Penn. Except for differences between

the governors appointed by the proprietors and the popular assembly over the matter of taxing the proprietors the assembly had little to contest for, and the degree of civil liberty attained in the province was very high. On the whole the Colony was happy and prosperous, trade being good in Philadelphia and the Germans having established some of the most thrifty farming communities in the Colonies.

French and Indian Wars.—The French and Indian War broke rudely in upon this peaceful expansion No longer was it possible to keep the numerous settlers from trespassing upon the Indian's lands or otherwise provoking him, nor were the Scotch-Irish of the frontier temperamentally as pacific and considerate as the Quakers and Germans had been. Furthermore, the heirs of William Penn were guilty of several sharp land deals which made the Pennsylvania tribes resentful. It was fertile soil for French propaganda In 1750 the French began building a line of forts in the Ohio valley to back up their claims to the territory, among them a fort at Presque Isle (on the present site of Erie), Ft. Le Boeuf (at Waterford in Erie county), and Ft. Venango (within the limits of the city of Franklin). Virginia, claiming western Pennsylvania at this time, sent George Washington to build a fort at the confluence of the Monongahela and Allegheny rivers, but his workmen were driven away by the French who finished the fort and named it Ft. Duquesne Washington met and defeated a force of French and Indians at Mountain Meadows, but was later besieged in a hastily thrown up breastwork (Ft. Necessity) by a larger force and forced to surrender The English upon being informed of the French movements sent an expedition under Gen. Braddock against Ft Duquesne, but on July 9, 1755, when but a few miles from the fort, Braddock's column was set upon by the French and Indians and cut to pieces, only 459 out of 1,386 men escaping During this year the frontiers of Pennsylvania suffered greatly, scarcely a lone and exposed household escaping attack Most of the settlers fled to a line of 17 forts which had been established under Franklin's direction in the mountain gaps In 1758 a second expedition against Ft. Duquesne, under Gen. Forbes, was successful. The fort was rebuilt, and named Ft Pitt after the English prime minister, and the log settlement was named Pittsburgh. With the fall of Montreal in 1760 all Pennsylvania came definitely into English hands



THE BLOCK HOUSE ERECTED AT ERIE DURING FRONTIER DAYS

Indian wars were not past, however, for when Pontiac's rebellion broke out in 1763 every fort on the frontier was besieged, and Presque Isle and Venango were easily taken by the Indians The settlers again fled back over the mountains Col. Henry Bouquet, after defeating the Indians in a desperate engagement at Bushy Run, reached Pittsburgh in time to relieve the fort, and marched on into Ohio, where he inflicted heavy defeats upon the Indians

Pennsylvania in the Revolution.—As the central Colony, Pennsylvania's attitude in the struggle with the mother country was of vast importance The British party was strong because of the loyalty of the large Church of England element, the neutrality of many Quakers, Dunkers and Mennonites, and a general satisfaction with the liberal and free government of the province, which had not suffered such catastrophic reverses as had embittered the people of Massachusetts, for instance. But the Whig party under the lead of John Dickinson, Thomas Mifflin and Joseph Reed was successful in the State, and Pennsylvania contributed greatly to the success of the Revolutionary War by the important services rendered by her statesmen, by providing troops and by the financial aid given by Robert Morris (*q v*). The two Continental Congresses (1774 and 1775–81) met in Philadelphia, except for the months when Philadelphia was occupied by the British army and Congress met in Lancaster and York, Pa, and then in Princeton, N. J. In Philadelphia the second Congress adopted the Declaration of Independence, which the Pennsylvania delegation, excepting Franklin, thought premature at the time, but which was well supported by Pennsylvania afterwards. During the Revolutionary War battles were fought at Brandywine (1777), Paoli (1777), Ft. Mifflin (1777) and Germantown (1777), and Washington's army spent the winter of 1777–78 at Valley Forge Philadelphia was occupied by the British from Sept. 26, 1777 to June 18, 1778. Soon after the signing of the Declaration of Independence, a convention of representatives of the counties met in Philadelphia, and drew up a new State Constitution which went into effect in Sept 1776, without being submitted to a vote of the people It provided for a unicameral legislative system, abolished the office of governor and substituted an executive council of 12, presided over by a president to be chosen by the legislature. With the institution of this new Government the proprietorship went out of existence and the Penn heirs were compensated by a grant of £120,000 and the guarantee of titles to certain private estates With the passing of the old Government Quaker dominance also passed out of existence.

Pennsylvania ratified the Federal Constitution in spite of powerful opposition on Dec 22, 1787, and in 1790 revised its own Constitution to conform with that instrument, the executive council being abolished, the office of governor restored and a bicameral legislative system adopted From 1790 to 1800 Philadelphia, then the largest and wealthiest city in the United States, was the seat of the Federal Government. The State capital was moved from Philadelphia to Lancaster in 1799 and from Lancaster to Harrisburg in 1812.

Progress of Settlement and Industry.—In 1800 the population of the State was 602,000. The years just previous to the Revolution and those after the Revolution were years of rapid settlement beyond the mountains. Settlement in the Upper Susquehanna valley was also rapid in this period. Bridges and roads were being built in every direction and stage-coach routes established The Philadelphia-Lancaster turnpike (1790) was the first important turnpike in America In 1806 a bill passed Congress providing for the national road from Cumberland, Md, to the Ohio, which passed through south-western Pennsylvania and had great influence in the development of that section After 1790 anthracite coal began to be mined near Mauch Chunk and transported down the rivers to Philadelphia. About 1800 iron began to be manufactured in Lancaster, Coatesville, Phoenixville and the Juanita valley. Upon the opening of the mines thousands of Irish began to settle in the mining regions

Canals and railways came into use in Pennsylvania about the same time and both played an important part in the State's development. Many of the early railways were short lines to carry coal from mines to river banks In 1834 the Columbia railroad and the Allegheny Portage railroad were begun by the State and connected with the Pennsylvania canal to form a rail-water route from Philadelphia to Pittsburgh Most of the important rivers were canalized so that they became available carriers By 1840 the burden of debt upon the State from the extensive system of internal improvements led to wide-spread popular discontent and such projects were abandoned The success of railways was by that time assured and the State began selling its enterprises to private corporations

Pennsylvania was usually Democratic before the Civil War owing to the democratic nature of its western and immigrant citizens The growth of the protectionist movement and the development of anti-slavery sentiment drew it toward the newly organized Republican party, however, and it voted the Lincoln ticket in 1860 During the Civil War the State was subject to raids along its southern border, Chambersburg being burned in 1862. The battle of Gettysburg (July 1863), a defeat of Lee's attempt to invade the North, was a turning point in the war

After the Civil War.—On the political side the chief feature of the State's history after the Civil War was the growth of the Cameron-Quay-Penrose political machine, founded by Simon Cameron, strengthened by his son James Donald Cameron, and continued under Matthew Stanley Quay and Boies Penrose, down to

the time of the latter's death in 1921. It was based upon the control of patronage, the distribution of State funds, the support of the Pennsylvania railway and other powerful corporations, and upon the ability to persuade the electors that it was necessary to vote the strict Republican ticket to save the protective system. This machine was not only all-powerful in State politics but influenced national elections. During Governor Pennypacker's administration, 1903–07, a number of new departments, among them those of forestry, health and highways, were created. Also under his administration the Pennsylvania State police were established as a more efficient body than the State militia in dealing with strikes and lawlessness. In 1913 the department of labour and industry was created and a workmen's compensation board set up. Gifford Pinchot was nominated by a close vote in 1922 and afterward elected. Under his direction the "Administrative Code" of 1923 centralizing control and consolidating departments was passed, giving the governor much more power than he had hitherto possessed. In 1927 John S. Fisher (Republican) was elected to succeed Pinchot.

Bibliography.—The official reports and publications of the various State departments and *The Pennsylvania Manual* (annual) are the best sources for recent information. The chief historical sources are the *Pennsylvania Archives* (1852–1895); *Colonial Records, 1683-1790* (1852), and S. Hazard, *Register of Pennsylvania* (1828–38). The Pennsylvania Historical Society, organized in Philadelphia in 1825, has published 14 vol. of *Memoirs* (1826–95), a *Bulletin* of 13 numbers (1845–47), one volume of *Collections* (1853) and the *Pennsylvania Magazine of History and Biography* (1877 *seq.*, quarterly). *See* A. E. Martin and H. H. Shenk, *Pennsylvania History Told by Contemporaries* (1925); T. S. March, *A History of Pennsylvania* (1915); T. K. Smith, *The Commonwealth of Pennsylvania* (1917); H. M. Jenkins, *Pennsylvania, Colonial and Federal* (1903), and G. P. Donehoo, *Pennsylvania, a History* (1926). McClure, *Old Time Notes of Pennsylvania* (1905); *The Pennsylvania German* (1900–1911 quarterly); *Proceedings of the Pennsylvania German Society* (1891 *seq.*, annually), and *Western Pennsylvania Historical Magazine* (1918 *seq.*, quarterly).

PENNSYLVANIA, UNIVERSITY OF, an American institution of higher learning, in Philadelphia. Its campus stretches from the west bank of the Schuylkill river to 39th street, and from 34th and Chestnut streets on the north to the Philadelphia General hospital and the Philadelphia Commercial museum.

The library contains (1928) 635,070 bound and 55,000 unbound volumes and pamphlets. Among the important collections are the Penniman (education), Biddle (law), Lippincott (social sciences), Lea (history), Macauley (romance, and an excellent Dante collection), the Franklin papers, the Curtis collection of Franklin imprints and the Hale collection of autographs of signers of the Declaration of Independence.

The museum has important archaeological and ethnological collections. The exhibitions largely represent the results of the museum's own expeditions to Central and South America, Alaska, various parts of the United States, Egypt, Palestine and Babylonia.

The university consists of the college, Towne Scientific school, Moore School of Electrical Engineering, Wharton School of Finance and Commerce and Schools of Education and Fine Arts. The university also includes the graduate school, schools of medicine (the first medical school in America, 1765), law, dentistry, veterinary medicine, hygiene and public health, the evening school of accounts and finance, extension schools, departments of physical education and military science and tactics, the Carter foundation (child helping), and the Graduate School of Medicine. Among affiliated divisions are the Henry Phipps Institute, devoted especially to research in tuberculosis, the Wistar Institute of Anatomy and the University of Pennsylvania Press.

Admission to the undergraduate schools requires the equivalent of graduation from a four-year high school. The graduate and law schools require a bachelor's degree for admission, the school of medicine three years of college study, and the school of dentistry, two years. About 800 scholarships are granted annually. Several large groups are for students from the public schools of Philadelphia; others are in the gift of the governor and members of the State legislature. In the graduate school there are available 15 fellowships ($1,000 annually) in addition to free tuition, for men and for women, besides 37 scholarships, varying in value from $250 and free tuition to free tuition only. There are two travelling scholarships ($2,000 each) in diplomacy and international law, one in modern languages and one in architecture ($1,000).

The corporation from 1791 to 1927 was composed of 24 trustees, with the governor of Pennsylvania as ex officio president. An amendment to the charter fixes the number of trustees at 40, 10 of these being elected by the alumni. The directing head of the university and the head of the university faculty and of the faculty of each department is the provost, a title rarely so used in American universities. The provost also presides over meetings of the trustees, the governor of Pennsylvania taking no active part in the management of the university. In 1927–28 the instructors totalled 1,341; the students, 16,382.

The year ended June 30, 1927 showed excess of assets over liabilities amounting to approximately $39,783,162, invested in part as follows: plant funds, $25,175,288; endowment funds, $12,204,109; general funds, $1,334,365. Land, buildings and contents increased by more than $4,000,000 during 1927. Private benefactions in 1926–27 totalled $1,594,335.35; fees, receipts, rentals, etc., amounted to $4,235,032.40. Tuition fees ranged from $225 to $400. Income from invested funds, gifts and other receipts for designated purposes and the State appropriation aggregated $1,286,281.58. The payment on account of instructional salaries totalled $2,343,167.67. Payments on account of other salaries and wages totalled $1,304,396.94. Current expenses and purchases of equipment brought the total to $5,350,250.08.

The university publishes: the *Astronomical Series; Contributions from the Botanical Laboratory; Contributions from the Zoological Laboratory; Series in History; Translations and Reprints from the Original Sources of European History; Series in Romanic Languages and Literature; The American Law Register; Museum Journal; Scientific Reports from the Museum; Contributions from the William Pepper Laboratory of Clinical Medicine; The Psychological Clinic; Publications of the Wistar Institute,* including *Journal of Morphology; The Journal of Comparative Neurology; The American Journal of Anatomy; the Anatomical Record* and *The Journal of Experimental Zoology.* The University of Pennsylvania Press (1920) publishes annually a number of books and monographs.

Benjamin Franklin in 1749 published a pamphlet entitled *Proposals Relating to the Education of Youth in Pensilvania,* which led to the formation of a board of 24 trustees, 19 of whom, on Nov. 13, 1749, met to promote "the Publick Academy in the City of Philadelphia," and elected Franklin president of the board, an office which he held until 1756. In 1750 there was conveyed to this board of trustees the "New Building," erected in 1740 for a meeting house and charity school; the original trustees (including Franklin) of the "New Building" date from 1740, and therefore the university attaches to its seal the words "founded 1740." The academy was opened in Jan. 1751, the city having voted £200 for the completion of the building. On Sept. 16, 1751 a charitable school "for the instruction of poor Children gratis in Reading, Writing, and Arithmetick" was opened in the "New Building." The proprietaries, Thomas and Richard Penn, incorporated "The Trustees of the Academy and Charitable School in the Province of Pennsylvania" in 1753; and in 1755 issued a confirmatory charter, changing the corporate name to "The Trustees of the College, Academy and Charitable School," etc., whereupon William Smith (1727–1803) of the University of

Aberdeen, who had become rector of the academy in 1752 and had taken orders in the Church of England in 1753, became provost of the college. In 1756 Dr. Smith established a complete and liberal curriculum. In 1757 the first college class graduated.

In 1779, after fears had been repeatedly expressed that Smith planned to make the institution sectarian, the State legislature confiscated the rights and property of the college and chartered a new corporation "the Trustees of the University of the State of Pennsylvania"; in 1789 the college was restored to its rights and property and Smith again became its provost; in 1791 the college and the University of the State of Pennsylvania were united under the title, "the University of Pennsylvania," whose trustees were elected from their own members by the board of trustees of the college and that of the university. In 1802 the university purchased new grounds on 9th street, between Market and Chestnut, where, until 1829, it occupied the administrative mansion built for the president of the United States; there new buildings were erected after 1829; and from these the university removed to its present site in 1872.

See T. H. Montgomery, *A History of the University of Pennsylvania from its Foundation to A.D. 1770* (1900); G. B. Wood, *Early History of the University of Pennsylvania* (1896); J. B. McMaster, *The University of Pennsylvania* (1897); G. E. Nitzsche, *Official Guide to the University of Pennsylvania* (1906); and E. P. Cheyney, "University of Pennsylvania," in vol. i. of *Universities and Their Sons* (1901).

PENNSYLVANIA RAILROAD COMPANY, a corporation of the Commonwealth of Pennsylvania, U.S.A., is the parent company of a group of 116 corporations known as the Pennsylvania Railroad System, united in one management through ownership of the majority of the stock, or long term leases or both. The company directly owns the principal lines of the system in Pennsylvania, and under its corporate organization directly operates about 90% of the mileage. The Pennsylvania traverses practically the entire eastern middle belt of the United States, lying between the Atlantic ocean on the east and the Mississippi river on the west, and stretching from the Great Lakes to the southern States. This is the most densely populated region in the United States, and contains the largest cities.

By the Act of Incorporation, approved on April 13, 1846, the Pennsylvania Railroad Company was incorporated for the purpose of constructing and operating a railroad from Harrisburg to Pittsburgh. On Feb. 15, 1854, the company opened for service its own through line between these cities, and on Aug. 1, 1857, through purchase or lease gained complete control of the entire Philadelphia-Pittsburgh route.

Iron, steel and coal and other raw materials provide the backbone of the Pennsylvania's traffic. The company is also a very important carrier of miscellaneous manufactured articles, fresh fruits, vegetables and general produce, packing-house products and lumber from the South and West. Serving as it does the four leading eastern seaports—New York, Philadelphia, Baltimore and Norfolk—it handles a large proportion of the nation's import and export trade. In 1927 the Pennsylvania System carried the equivalent of one ton of freight 45,538,219,469 m., and one passenger 6,386,154,279 miles. On Dec. 31, 1927, the system embraced 11,689 m. of line and 28,127 m. of track. On the entire system 4,369·21 m. were double-tracked, 917·52 m. had three tracks and 697·81 m. had four tracks. At the end of 1927 the rolling stock consisted of 7,018 locomotives, 7,921 passenger cars, 271,952 freight cars and 4,178 work cars.

The Pennsylvania Railroad System represented at the end of 1927 an investment in road and equipment of $2,440,333,861. Against this sum there were outstanding in the hands of the public securities (stocks and bonds of various companies) amounting to $1,554,832,019. The Pennsylvania Railroad Company, the parent company, had outstanding $561,765,700 of capital stock divided into shares of $50 each, on Dec. 31, 1927. Under action of the board of directors in March 1928, an allotment of $62,500,000 of additional stock was authorized to be issued to the stockholders. At the close of April 1928, the stock was in the hands of 142,602 stockholders whose average holdings were approximately 70 shares each. The total operating revenues of the system in 1927 were $721,280,031. The operating expenses, including taxes, were $611,111,782. Net railway operating income was $110,168,249. The average number of employees on the system in 1927 was 201,583. The total payroll for the year was $367,022,000. Following the close of the World War numerous problems of a serious character arose with reference to relations between employees and management. In an endeavour to solve this problem, the Pennsylvania management instituted a plan of employee representation. Under this plan differences between the employees affected and the management are referred to joint reviewing committees.

A recent development of far-reaching importance was the railroad's announcement of its entry into the air transport field. On May 16, 1928, the Pennsylvania railroad, the Curtiss Aeroplane and Motor Company, the Wright Aeronautical Company and a group of banking interests formed a new company, the Transcontinental Air Transport, Inc., for the purpose of operating a joint rail-air service between New York and the Pacific Coast. The new service contemplates an evening departure from New York on the Pennsylvania railroad, passengers using a sleeping car for the night journey and an airplane for the day.

Another step of importance was the company's announcement on Oct. 31, 1928, that work would be inaugurated soon on the complete electrification of its freight and passenger train service between New York city and Wilmington, Del., including the main line between Philadelphia and Atglen, Pa., and the low grade freight lines which join at Columbia, Pa., and connect the cities of New York, Philadelphia and Wilmington with the West. The cost of the work will be approximately $100,000,000, and it is expected it will reach completion in 1935. (W. W. A.)

PENNY, an English coin, equal in value to one-twelfth of a shilling. It is one of the oldest of English coins, superseding the sceatta or sceat. It was introduced into England by Offa, king of Mercia, who took as a model a coin first struck by Pippin, father of Charlemagne, about 735, which was known in Europe as *novus denarius*. Offa's penny was made of silver and weighed 22½ grains, 240 pennies weighing one Saxon pound (or Tower pound, as it was afterwards called), hence the term pennyweight (dwt.). In 1527 the Tower pound of 5,400 grains was abolished, and the pound of 5,760 grains adopted instead. The penny remained, with some few exceptions, the only coin issued in England until the introduction of the gold florin by Edward III. in 1343. It was not until the reign of Edward I. that halfpence and farthings became a regular part of the coinage, it having been usual to subdivide the penny for trade purposes by cutting it into halves and quarters, a practice said to have originated in the reign of Aethelred II. In 1257, in the reign of Henry III., a gold penny, of the value of 20 silver pence, was struck. The weight and value of the silver penny steadily declined from 1300 onwards, as will be seen from the following table:—

Reign	Weight	Value in silver 925 fine, at 5s. 6d. per oz.
	Grains	Penny
William I., 1066	22½	3·00
Edward I., 1300	22	3·02
„ III., 1344	20¼	2·78
„ III., 1346	20	2·75
„ III., 1351	18	2·47
Henry IV., 1412	15	2·06
Edward IV., 1464	12	1·65
Henry VIII., 1527	10½	1·44
„ VIII., 1543	10	1·37
Edward VI., 1552	8	1·10
Elizabeth, 1601	7¾	1·06

The last coinage of silver pence for general circulation was in the reign of Charles II. (1661–62), since which time they have only been coined for issue as royal alms on Maundy Thursday. Copper halfpence were first issued in Charles II.'s reign, but it was not until 1797, in the reign of George III., that copper pence were struck. This copper penny weighed 1 oz. avoirdupois. In the same year copper twopences were issued weighing 2 oz., but they were found too cumbersome and were discontinued. In 1860 bronze was substituted for the copper coinage, the alloy containing 95 parts of copper, four of tin and one of zinc. The weight was

also reduced, 1 lb. of bronze being coined into 48 pennies, as against 24 pennies into which 1 lb. of copper was coined.

The figure of Britannia first appeared on the issue of copper coins made in the reign of Charles II. The original of Britannia is said to have been Frances Stewart, afterwards duchess of Richmond (Pepys, *Diary*, Feb. 25, 1667) and Charles' mistress.

PENN YAN, a village of New York, U.S.A., the county seat of Yates county; at the foot of Lake Keuka, 45 m. S.E. of Rochester. It is served by the New York Central and the Pennsylvania railways. Pop. (1925) 5,326 (State census). Keuka is one of the most beautiful of the "finger lakes" of central New York. There are many summer cottages around it, and on the west shore is Keuka college for women (Baptist; 1921). The region is famous for its grapes, apples and grain. Among the numerous manufactures of the village are buckwheat products, grape-juice, vinegar, fruit baskets, flour, paper, boats, store fixtures, clothing and canned fruits and vegetables. The first settlers of Penn Yan were chiefly followers of Jemima Wilkinson (1753–1819), a religious enthusiast from Rhode Island, who in 1788 founded the village of Hopeton near Lake Seneca. Her followers began to desert her before 1800, and gradually the community broke up. The first dwelling on the site of Penn Yan was built in 1799. The village was made the county seat when Yates county was created in 1823, and in 1833 it was incorporated. Its name was devised from the first syllables of Pennsylvania and Yankee, to commemorate the origin of most of the early settlers.

PENNYROYAL, in botany, a herb formerly much used in medicine, the name being a corruption of the old herbalist's name "Pulioll-royall," *Pulegium regium*. It is a member of the mint genus, and has been known to botanists since the time of Linnaeus as *Mentha pulegium*. It is a perennial herb with a slender branched stem, square in section, up to a foot in length and rooting at the lower nodes, small opposite stalked oval leaves about half-inch long, and dense clusters of small reddish-purple flowers in the leaf axils, forming almost globular whorls. It grows in damp gravelly places, especially near pools, on heaths and commons. It has a strong smell somewhat like that of spearmint, due to a volatile oil which is readily obtained by distillation with water, and is known in pharmacy as *Oleum pulegii*. The specific name recalls its supposed property of driving away fleas (*pulices*). Like the other mints it has carminative and stimulant properties.

The similar American pennyroyal (*Hedeoma pulegioides*), but belonging to a different genus of the mint family (Labiatae), occurs in dry fields from Cape Breton island to Ontario and Minnesota southward to Florida and Arkansas.

PENOLOGY, penal science, that part or division of criminology which concerns itself with the philosophy and practice of society in its efforts to repress criminal activities. As the term signifies (Lat. *poena*, pain, suffering), penology has stood in the past and, for the most part, still stands for the policy of inflicting punishment on the offender as a consequence of his wrong-doing, but it may reasonably be extended to cover other policies, not punitive in character, such as probation, medical treatment and education, aimed at the cure or rehabilitation of the offender; and this is, in fact, the accepted present sense of the term.

The principal aims of penal science are: to bring to light the ethical bases of punishment, along with the motives and purposes of society in inflicting it; to make a comparative study of penal laws and procedures throughout human history and particularly at the present time; and, finally, to evaluate the social consequences of the policies in force at a given time. Thus conceived, penology represents a grouping of studies, some of which, dealing with the aims and the moral or social justifications of punishment, date from a remote past, while others, having to do with the wider social implications of the system, have scarcely yet made a beginning. As a modern and, therefore, a critical science, penology may properly be regarded as a serious effort to effect a revaluation of the concepts, theories and assumptions regarding punishment for crime which have for 2,000 years found expression in legal and philosophical literature, as well as in the penal law.

The exploration of the animating forces of the system of punishment carries the penologist far back into human nature as well as into human history. Back of any scheme of punishment is a policy and that policy is, in its turn, the fruit of a living sentiment or the result of a struggle between competing sentiments. The policy that has most persistently dominated and which is still a powerful if not controlling factor in penal legislation and practice is that of retribution, offspring of the sentiment of vengeance. Whether the offence to be compensated for is confined to an individual victim or is conceived of as an injury to the social group to which he belongs, the immediate reaction is resentment and this can be appeased only by expiation or retribution. This, with primitive literalness, gave to early society at a comparatively advanced stage the rule: life for life, eye for eye, tooth for tooth, limb for limb. It still survives in the death penalty for murder and in the drastic penalties imposed for rape and other crimes which are peculiarly offensive to the moral sentiments or to the sense of security of the community. Nearly everywhere, in the more recent stages of social development, this motive has been supplemented, but never wholly supplanted, by an unquestioning faith in the deterrent effect on potential offenders of exemplary, *i.e.*, drastic, punishments inflicted on actual offenders, which, in practice if not in theory, comes to much the same thing.

This policy of retribution is justified and sustained by an ethical philosophy which regards punishment as an integral and inviolable element in wrong-doing, as a moral necessity, "the other half of crime." This doctrine has been consistently maintained by the intuitive or idealistic philosophers from Plato to Thomas Aquinas and from Kant to T. H. Green and his disciples. The deterrent effect of punishment has also been claimed by adherents of this school but its widespread adoption as a policy has probably been due more to the influence of the utilitarian philosophy of Bentham, Paley, John Stuart Mill and Herbert Spencer, which makes the welfare of society, "the greatest good of the greatest number," the aim of all moral activity. It is this utilitarian philosophy which is now in the ascendant in penal legislation and which governs the view of most modern penologists.

Modern penology dates from the publication of Beccaria's pamphlet on "Crimes and Punishments" in 1764. This represented a school of doctrine, born of the new humanitarian impulse of the 18th century, with which Rousseau, Voltaire and Montesquieu in France and Bentham in England were associated. This, which came afterwards to be known as the classical school, assumed every criminal act to be a deliberate choice determined by a calculation of the prospective pleasures and pains of the act contemplated. All that was needed to overcome the criminal purpose was to provide for each and every crime a penalty adequate to overbalance its assumed advantages. Excessive penalties, such as death, were unnecessary and therefore unjust. This was followed, a generation later, by the neo-classical school of the revolutionary period in France, which modified Beccaria's rigorous doctrine by insisting on the recognition of varying degrees of moral, and therefore of legal responsibility, as in the case of children and the insane, as well as of mitigating circumstances in general. The doctrine of the "individualization of punishment," that is to say of the punishment of the individual rather than of the crime committed by him, which is of commanding importance in present day penology, is only a development of this fundamental principle of the neo-classical school.

This normal historical development of penology was interrupted during the last quarter of the last century by the widespread acceptance of the theory of crime and its treatment promulgated by the Italian, Lombroso, and his disciples. This, at first known as the Italian, later, as the continental, school of criminology, now claims the title of the positive school, so-called because it pursues the positive methods of modern science. Its fundamental doctrine is that the criminal is doomed by his inherited traits to a criminal career and is therefore a wholly irresponsible actor. Society must, of course, protect itself against him, but to punish him as if he were a free moral agent is as irrational as it is unethical.

While the enthusiasm for the doctrines of the positive school has waned and the alleged facts on which they were based have been largely discredited, it has, nevertheless, left a valuable legacy of influence. To it must be given much of the credit for the pres-

ent active tendency to make the mental study of the criminal an essential part of his diagnosis, a fact which has, in the last quarter-century, given the psychologist and, particularly, the psychiatrist a leading place in the development of modern penological theory. From studies such as these the present school of criminologists have discovered that there is no single formula that accounts for all violators of the penal code, while the policy of the individualization of punishment has taken on the form of individualization of treatment. Indeed, the note of the day is research—research into the factors, whether individual or social, which determine criminal activities and research into the resources of the community for making such disposition of the offender as will effectually protect the former without destroying the latter.

PENRITH, market town, urban district, Penrith and Cockermouth parliamentary division, Cumberland, England, 281 m. from London on the L.M.S. railway. Pop. (1921) 8,336. It is also served by the L.N.E. railway. A 14th century grammar school was refounded by Queen Elizabeth; and there are two mansions dating from the same reign, which have been converted into inns. Though there are breweries, tanneries and saw-mills, the town depends mainly on agriculture. There are some ruins of a castle. Near Penrith on the south, above the precipitous bank of the Eamont, stands a small but beautiful old castellated house, Yanwath Hall. To the N.E. of the town Eden Hall, rebuilt 1824, contains the celebrated enamelled goblet, the "Luck of Eden Hall."

Penrith, otherwise Penreth, Perith, Perath, was founded by the Cambro-Celts. In 1222 Henry III. granted a yearly fair extending from the eve of Whitsun to the Monday after Trinity and a weekly market on Wednesday, but before 1787 the market day was changed to Tuesday. The manor in 1242 was handed over to the Scottish king who held it till 1295, when Edward I. seized it. In 1397 Richard II. granted it to the first earl of Westmorland; it then passed to Warwick the king-maker and on his death to the crown. In 1694 William III. granted it to the earl of Portland, by whose descendant it was sold in 1787 to the duke of Devonshire. In the 18th and early part of the 19th century Penrith manufactured checks, linen cloth and ginghams. Clock and watch-making seems to have been an important trade here in the 18th century. The town suffered much from the incursions of the Scots, and Ralph, earl of Westmorland, who died 1426, built the castle; but a tower called the Bishop's Tower had been previously erected on the same site. In 1597–98, 2,260 persons perished by plague in the Penrith rural deanery. During the Civil War the castle was dismantled by the Royalist commandant. The church of St. Andrew is of unknown foundation, but the list of vicars is complete from 1223.

PENRY, JOHN (1559–1593), Welsh Puritan, was born in Brecknockshire in 1559; tradition points to Cefn Brith, a farm near Llangammarch, as his birthplace. He was educated at Peterhouse, Cambridge, and St. Alban's Hall, Oxford. He did not seek episcopal ordination, but was licensed as University Preacher. The tradition of his preaching tours in Wales is slenderly supported; they could only have been made during a few months of 1586 or the autumn of 1587. At this time ignorance and immorality abounded in Wales. In 1562 an act of parliament had made provision for translating the Bible into Welsh, and the New Testament was issued in 1567; but the number printed would barely supply a copy for each parish church.

Indignant at this negligence, Penry published, early in 1587, *The Aequity of an Humble Supplication—in the behalf of the country of Wales, that some order may be taken for the preaching of the Gospel among those people.* Archbishop Whitgift thereupon caused him to be brought before the High Commission and imprisoned for about a month. On his release Penry married at Northampton, where he lived for some years, and set up a printing press. It was successively located at East Molesey (Surrey), Fawsley (Northampton), Coventry and other places in Warwickshire, and finally at Manchester, where it was seized in August 1589. On it were printed Penry's *Exhortation to the governours and people of Wales,* and *View of . . . such publike wants and disorders as are in the service of God . . . in Wales;* as well as the celebrated *Martin Marprelate* tracts. In January 1590 his house at Northampton was searched and his papers seized, but he succeeded in escaping to Scotland. There he published several tracts, as well as a translation of a learned theological work known as *Theses Genevenses.*

Returning to England in September 1592, he joined the Separatist Church in London, in which he declined to take office, though after the arrest of the ministers, Francis Johnson and John Greenwood, he seems to have been the regular preacher. He was arrested in March 1593, and efforts were made to find some pretext for a capital charge. Failing this a charge of sedition was based on the rough draft of a petition to the queen that had been found among his private papers; the language of which was indeed harsh and offensive, but had been neither presented nor published. He was convicted by the Queen's Bench on May 21, 1593, and hanged on the 29th.

See the Life, by John Waddington (1854).

PENRYN, a market town and port, and municipal borough of Cornwall, England, 2 m. N.W. of Falmouth, on a branch of the G.W. railway. Pop. (1921) 3,149. Penryn owed its development to the fostering care of the bishops of Exeter within whose demesne lands it stood. These lands appear in Domesday Book under the name of Trelivel. In 1230 Bishop Briwere granted to his burgesses of Penryn that they should hold their burgages freely at a yearly rent of 12d. by the acre for all service. Bishop Walter de Stapeldon secured a market on Thursdays and a fair at the Feast of St. Thomas. The return to the bishop in 1307 was £7, 13s. 2½d. from the borough and £26, 7s. 5d. from the forum. In 1311 Bishop Stapeldon procured a three days' fair at the Feast of St. Vitalis. Philip and Mary gave the parliamentary franchise to the burgesses in 1553. James I. granted and renewed the charter of incorporation, providing a mayor, 11 aldermen and 12 councillors, markets on Wednesdays and Saturdays, and fairs on May 1, July 7 and Dec. 21. The charter having been surrendered, James II. by a new charter *inter alia* confined the parliamentary franchise to members of the corporation. This proviso however was soon disregarded, the franchise being freely exercised by all the inhabitants paying scot and lot. An attempt to deprive the borough of its members, owing to corrupt practices, was defeated by the House of Lords in 1827. The act of 1832 extended the franchise to Falmouth in spite of the rivalry existing between the two boroughs. In 1885 the united borough was deprived of one of its members. Penryn and Falmouth are now in one of the county parliamentary divisions of Cornwall. The corporation of Penryn was remodelled in 1835, the aldermen being reduced to four.

Its foreign trade, dating from the 14th century, is considerable. The extra-parochial collegiate church of Glasney, founded by Bishop Bronescombe in 1265, had a revenue at the time of its suppression under the act of 1545 of £221, 18s. 4d. The town lies at the head of the estuary of the Penryn river, which opens from the main estuary of the Fal at Falmouth. Granite, which is extensively quarried in the neighbourhood, is dressed and polished at Penryn, and there are also chemical and bone manure works, engineering, iron and gunpowder works, timber-yards, brewing, tanning and paper-making. The harbour dries at low tide, but at high tide has 13 ft. of water.

PENSACOLA, a city of Florida, U.S.A., on Pensacola bay (an arm of the Gulf of Mexico), 50 m. S.E. of Mobile; a port of entry

and the county seat of Escambia county. It is on Federal highways 90 and 131, and is served by the Frisco system and the Louisville and Nashville railroad, as well as by transoceanic and coastwise steamship lines. Pop. 31,035 in 1920 (34% negroes); estimated locally at nearly 45,000 in 1928 The large land-locked harbour has a controlling depth of 32 feet. Its narrow entrance (between the island of Santa Rosa on the east and a narrow peninsula on the west) is guarded by Ft Pickens and (on the mainland) Ft. Barrancas, headquarters of the IV Corps area coast defence Between Ft. Barrancas and the city is the principal air-training station of the U S navy. The city (9·75 sq m in area) is bordered on three sides with water. From the bay it rises gently to heights commanding wide views, and on its eastern and western boundaries are Bayou Texar and Bayou Chico There are 27 public parks, and near by are many beaches and other pleasure resorts The traffic of the port in 1925 amounted to 757,009 tons (45% foreign commerce) valued at $29,130,467 The city has a large wholesale trade, extensive fisheries, dry-docks, and over 70 manufacturing plants, with an annual payroll of $8,000 000 Lumber, naval stores, marble, mattresses, excelsior, sails, tents, awnings, ships, small boats, dredges, fertilizer, brick, tile and cotton-seed oil are leading products Since 1913 a commission form of government has been in operation

Pensacola bay may have been visited by Ponce de León in 1513 It was reached in 1528 by Pánfilo de Narváez, with 240 followers, and in 1540 De Soto established his base of supplies here A settlement which lasted two years was made in 1559 by Tristan de Luna, and another (on land now occupied by the naval air station) in 1696 by Don Andreas d'Arriola, who built Ft San Carlos (still standing) In 1718 Pensacola was captured for France (then at war with Spain) by Sieur de Bienville, and recaptured by a Spanish force from Havana; and in 1719 was again taken by de Bienville, who burned the town and destroyed the fort. When it was restored to Spain, in 1723, a new town was built, at the west end of Santa Rosa island, but after a destructive hurricane in 1754 the survivors went back to the mainland, building on the present site of the city In 1763, when the Floridas were ceded to Great Britain, Pensacola was made the capital of West Florida, and most of the Spanish population went to Mexico and Cuba

During the Revolutionary War it was a refuge for many Loyalists from the North On May 9, 1781, it was captured by Don Bernardo de Gálvez, the Spanish governor at New Orleans, whereupon most of the English left, though trade remained in the hands of the English merchants During the War of 1812 the British made it a centre of operations, and in 1814 entered the harbour to take formal possession, but were repulsed by Gen Andrew Jackson In 1818 Gen Jackson captured the city from the Spanish, on the ground that they were encouraging the Seminole Indians, and in 1821 Florida as a whole was finally transferred to the United States, the ratification ceremony and transfer of flags taking place in the public square (now City Hall park) of Pensacola. In 1824 Pensacola was chartered as a city and was selected as the site of a Federal navy yard On Jan. 12, 1861, the navy yard was seized by the State Government, but Ft. Pickens remained under Federal control, and on May 8, 1862, the Confederates evacuated the city.

PENSHURST, a village in Kent, England, at the confluence of the Eden and Medway, 4½ m S W of Tonbridge. Pop (1921) 1,531. The village has some old houses, including a timbered house of the 15th century It has also a factory of cricket implements. The church is chiefly late Perpendicular. Penshurst Place is celebrated as the home of the Sidney family The mansion is quadrangular, and has a court, chapel and hall (*c.* 1341) with open timber roof and a minstrels' gallery

PENSIONARY, a name given to the leading functionary and legal adviser of the principal town corporations of Holland, because they received a salary, or pension. At first this official was known by the name of "clerk" or "advocate" The office originated in Flanders The earliest "pensionaries" in Holland were those of Dort (1468) and of Haarlem (1478). The pensionary conducted the legal business of the town, and was the secretary of the town council and its representative and spokesman at the meetings of the provincial states. The post of pensionary was permanent and his influence was great.

In the States of the province of Holland the pensionary of the order of nobles (*Ridderschap*) was the foremost official of that assembly and he was named (until the death of Oldenbarneveldt in 1619) the land's advocate, or more shortly, the advocate. The importance of the advocate was much increased after the outbreak of the revolt in 1572, and still more so during the long period 1586–1619 when John van Oldenbarneveldt held the office The advocate drew up and introduced all resolutions, concluded debates and counted the votes in the provincial assembly When it was not in session he was a permanent member of the college of deputed councillors who carried on the administration. He was minister of justice and of finance All correspondence passed through his hands, and he was the head and the spokesman of the deputation, who represented the province in the states-general. The conduct of foreign affairs in particular was entrusted almost entirely to him.

After the downfall of Oldenbarneveldt the office of lands'-advocate was abolished, and a new post, tenable for five years only, was erected in its place with the title of *Raad-Pensionaris,* or pensionary of the council, usually called by English writers grand pensionary In the stadtholderless régime 1650–72 the grand pensionary became even more influential than Oldenbarneveldt himself, since there was no prince of Orange filling the offices of stadtholder, and of admiral and captain-general of the Union. From 1653–72 John de Witt, re-elected twice, made the name of grand pensionary of Holland for ever famous during the time of the wars with England The office was abolished after the conquest of Holland by the French in 1795

PENSIONS: CIVIL SERVICE, MUNICIPAL, ETC. The pension scheme for British civil servants is laid down in the Superannuation Acts 1834 to 1919. (*See* SUPERANNUATION) The whole cost of the pensions is borne by the state Pensions are awarded by the Treasury and are payable only to those state paid permanent civil servants who are admitted into the civil service with a certificate from the Civil Service Commissioners or who hold their appointments directly from the Crown The latter is a very small class Broadly speaking the permanent members of the administrative, technical, clerical and manipulative grades are pensionable and the members of the industrial grades are non-pensionable, although a certain number of industrials, especially in the dockyards, are pensionable.

Under the Acts in force prior to 1909, a civil servant retiring at or over the age of 60, and after not less than 10 years' service, was eligible for a pension calculated at $\frac{1}{60}$ of his salary (meaning salary at the date of retirement or, in certain cases, average salary for the last 3 years) for each completed year of his service, with a maximum of $\frac{40}{60}$ On retirement for permanent ill-health he was eligible for a pension similarly calculated if he had served for 10 years or more, and for a short service gratuity of one month's salary for each year of his service if he had served for less than 10 years. If retired owing to the abolition of his office or a reorganization of staff effecting greater efficiency and economy he could be granted an annual compensation allowance, which, in practice, was calculated at $\frac{1}{60}$ of his salary for each completed year of his service, whether more or less than 10 years. This pension scheme applied to women as well as to men.

Following the recommendations of the Royal Commission on Superannuation in the Civil Service, the benefits were altered by the Superannuation Act, 1909, for all future *male* entrants and for those existing pensionable *males* who wished to come under the new scheme and were allowed to do so on proof of good health The old scheme continued to apply to females Under the new scheme pension is calculated in eightieths, instead of sixtieths, with a maximum of $\frac{40}{80}$; but in addition to the reduced pension and the short service gratuity there is, after two years' service, a lump sum allowance calculated at $\frac{1}{30}$ of salary for each completed year of service, with a maximum of $\frac{45}{30}$. And, if the civil servant dies in the service after serving for 5 years or more

his legal personal representatives may be granted a death gratuity of one year's salary or, if greater, $\frac{1}{30}$ of a year's salary for each completed year of service: if he dies after retirement on pension his legal personal representatives may be granted a sum equal to the excess, if any, of a year's salary over the total amount received in pension and lump sum. For male civil servants as a whole the new benefits were estimated to be equal in value to the old. The Act of 1909 also altered the compensation allowance, but only for future entrants whether male or female, to whatever could be granted (whether pension or gratuity) if the retirement had been for ill-health. If a person in receipt of pension or compensation allowance is re-employed in government service the pension or allowance is suspended or abated so that the pay and pension or allowance together do not exceed the pay at the date of retirement. It is customary to grant to women, who, under departmental regulations, resign on marriage a gratuity of one month's pay for each completed year of pensionable service, with a maximum of 12 months' pay, provided they have rendered not less than 6 years' service, including non-pensionable service. By the Pensions (Increase) Acts 1920 and 1924, small pensions and compensation allowances granted before Aug. 4, 1914, or, with certain limitations, between that date and Aug. 20, 1920, may in certain circumstances be increased by from 30% to 70%, provided that the increase does not raise the total income of the pensioner (or the joint income of husband and wife) above £200 (if married) or £150 (if unmarried). Those Acts apply also to police and certain municipal pensioners. There are special scales of pension under special Acts for Diplomatic Officers, Colonial Governors and certain officials in the Supreme Court. The total expenditure on these pensions, etc., in the financial year 1926–7 was approximately £6,335,078, of which £3,055,197 was in respect of the Post Office. The Digest of Pension Law and Regulations for the Civil Service, published by H.M. Stationery Office, gives the law and the regulations arranged under the headings of their subject matter.

Judicial Pensions.—The Lord Chancellor of Great Britain receives a pension of £5,000 however short a time he may have held office, but he usually continues to act as a Law Lord in the House of Lords without salary. Judges receive pensions—in England, ranging from £3,500 to £4,000, and in Scotland, of $\frac{2}{3}$ of salary—after 15 years' service or on retirement through permanent ill health. County Court Judges, Metropolitan Police Magistrates and Scottish Sheriffs and their substitutes receive pensions under special Acts.

Municipal, etc., Pensions.—A considerable number of British local authorities have obtained special parliamentary powers for giving pensions to their staff. The Local Government, etc., Officers' Superannuation Act, 1922, laid down a pension scheme which local authorities, other than Poor Law authorities in England and Asylum authorities, may under certain conditions adopt if they wish. Under that scheme, officials and servants who occupy pensionable posts are eligible for pensions, towards which they have to contribute 5% of their pay. Pension is payable, after not less than 10 years of local authority service, on retirement for permanent ill-health or at age 65 (or age 60 after 40 years' service), and amounts to $\frac{1}{60}$ of salary (on the average of the last 5 years) for each year of service, with a maximum of $\frac{40}{60}$. Service before contributions commenced normally reckons in one-hundred-and-twentieths, instead of sixtieths. Contributions, less any pension received, are returnable at death or on termination of employment before becoming eligible for a pension, in some cases with, and in others without, interest. The pension scheme for English Poor Law officers and servants, laid down in the Poor Law Officers' Superannuation Acts 1896 and 1897, gives benefits generally similar to those under the Local Government, etc., Officers' Superannuation Act, 1922. The employee, however, contributes only 2% of his pay, and service before contributions commenced reckons in full in all cases, but the contribution required is $2\frac{1}{2}$% if the non-contributing service was more than 5 but less than 15 years and 3% if it exceeded 15 years. Asylum officers, other than officers of the Metropolitan Asylums Board who elected to remain under the Poor Law Officers' Superannuation Acts, are pensionable under the Asylum Officers' Superannuation Act, 1909.

School Teachers' Pensions.—By the School Teachers (Superannuation) Act, 1918, which applies to England and Wales, full time teachers in schools aided by state grants and in a few other schools, became eligible for superannuation benefits generally similar to those applicable to male civil servants who entered after 1909 (*see* under CIVIL SERVICE), except that pensions are calculated on average salary for the last 5 years of service. The whole cost of these benefits was to be borne by the state. From June 1, 1922, however, the teachers were required to contribute 5% of their salaries towards the cost of the benefits. In 1925, following the Report of the Departmental Committee on the Superannuation of School Teachers (Cmd. 1962), which gives a brief history of teachers' superannuation in England and Scotland prior to April 1, 1919, the Teachers (Superannuation) Act, 1925, was passed amplifying the scheme and imposing a contribution of 5% of salaries also on the teachers' employers, to commence from April 1, 1928. The 10% total contributions are on the basis of covering the cost of the benefits in respect of future service: the cost in respect of service prior to April 1, 1928, reduced by the teachers' contributions since 1922, remains a charge on the Exchequer. As regards Scotland, the position since April 1, 1919, has been generally similar except that the employers' contributions commenced from April 1, 1926. The benefits are paid from, and the contributions to, the Education (Scotland) Fund, to which the Exchequer contributes each year $\frac{11}{80}$ of the net expenditure (benefits paid less contributions received) during the year on teachers' superannuation in England and Wales.

Police Pensions.—Pensions for members of police forces in Great Britain are granted under the Police Pensions Act 1921. The members contribute 5% of their pay towards the cost of the pensions. The pension amounts to half of pay after 25 years' service and two-thirds of pay after 30 years' service. After not less than 10 years' service smaller pensions may be given on retirement for ill-health. Service before age 20 does not reckon. There are higher scales of pension for retirements caused by injuries received in the execution of duty. If a member has served for 5 years or more his widow receives a pension of from £30 to £50 a year according to his rank, but if his death resulted from injury sustained in the execution of his duty the widow's pension may in certain circumstances be one-third of his pay. Allowances may in certain circumstances be granted to children until they reach age 16. Members serving on July 1, 1919, were allowed, if they wished, to remain under the previous pension scheme under which a pension of two-thirds of pay could be earned after 26 years' service, but 15 years' service was necessary to earn pension on retirement for ill-health. The Report of the Committee on the Police Service (Cmd. 253) gives some account of police pensions prior to 1921.

Ecclesiastical Pensions.—The pensions of clergy of the established Church in England are regulated by contributory schemes under the Episcopal Pensions Measure, 1926, for diocesan bishops including the two archbishops, and under the Clergy Pensions Measure, 1926, for all other clergy holding ecclesiastical preferments and offices who were under age 55 on Dec. 31, 1926. Before the passing of these measures there were systems of pensions for deans and canons and incumbents, charged upon the incomes of their successors, and these remain in force for those members of the clergy who had attained the age of 55 on Dec. 31, 1926.

Civil List Pensions.—These are pensions granted by the sovereign upon the recommendation of the First Lord of the Treasury and paid (since 1837) from the Consolidated Fund. By 1 and 2 Vict. c. 2 they are to be granted to "such persons only as have just claims on the royal beneficence, or who by their personal services to the Crown, or by their performance of duties to the public, or by their useful discoveries in science and attainments in literature and the arts have merited the gracious consideration of their sovereign and the gratitude of their country." A sum of £1,200 is allotted each year in addition to the pensions already in force, and a list of the pensions granted each

year is presented to Parliament. The pensions paid in 1926–7 amounted to £22,686. (*See* PENSIONS: THE UNITED STATES.)

(F. SK.)

PENSIONS, MINISTRY OF: *see* GOVERNMENT DEPARTMENTS.

PENSIONS: NAVY, ARMY AND AIR FORCE. In Great Britain, the retired pay and pensions of members of the fighting forces of the Crown and the pensions payable after their death to their dependent relatives are regulated by Orders in Council as regards the Royal Navy and Royal Marines, Royal Warrants as regards the Army and King's Orders as regards the Royal Air Force. The regulations are administered by the Admiralty, the War Office and the Air Ministry, respectively, except those relating to retired pay or pension granted on account of disablement or death due to service in the World War or in former wars, which are administered by the Ministry of Pensions. Retired pay is granted to officers on retirement, usually for age, ill-health or at their own request, at rates which depend mainly upon length of service and rank held on retirement. Officers with insufficient service to qualify them for retired pay may in certain circumstances be granted gratuities.

New scales of retired pay, subject to review triennially in the light of changes in the cost of living, were introduced in 1919. Although the regulations differ in the several forces, the following figures indicate fairly closely the annual pensions that may be earned at the rates in force in 1928 by officers of equivalent rank. Admirals of the Fleet, £1,692: Field Marshals and Marshals of the Royal Air Force never retire, but, when not employed, receive half pay of the same amount: Other Flag Officers, General Officers and Air Officers, up to £1,339.10.0.: Captains, R.N., Colonels and Group Captains R.A.F., up to £846: Commanders R.N., Lieutenant Colonels and Wing Commanders R.A.F., up to £564: Lieutenant Commanders and Lieutenants R.N., Majors and Squadron Leaders R.A.F., up to £423. Long service pensions are granted to Seamen, Marines, Soldiers and Airmen on discharge after 22 years' service in the Royal Navy, 21 in the Royal Marines and the Army and 24 in the Royal Air Force. Special pensions are also granted in exceptional cases.

The basic pension in each service is, in 1929, at the rate of 1½d. a day for each year of service while additions are granted for service in ranks or ratings above Able Seaman, Marine, Private or Aircraftman and on attainment of age 55. The average rate of pension is about £65 per annum. Pensions may also be awarded to men invalided after at least 14 years' service, and gratuities to men invalided after shorter periods of service. Disability retired pay and disability pensions, either in the form of additions to the rates for service or otherwise, may be granted to officers and men who on retirement or discharge are found to be disabled above a certain degree from causes attributable to the service. Pensions are granted to the widows of officers dying from wounds, injuries or disease attributable to the service at annual rates varying from £90 (widow of a Sub-Lieutenant, Royal Navy, Second Lieutenant in the Army or Royal Marines or Pilot Officer in the Royal Air Force) to £600 (widow of an Admiral of the Fleet, Field Marshal or Marshal of the Royal Air Force) and "compassionate allowances" of £24 annually to each child within the prescribed age limits.

In cases of death not attributable to the service, widows' pensions, varying from £45 to £300 annually (maximum rates) according to the husband's rank, may be granted to widows and "compassionate allowances" up to a maximum of £16 annually to each child. These pensions and allowances cannot be claimed as a right and are not granted to widows without regard to their other means. Pensions are granted to the widows and children of men only in cases of death attributable to the service. The rates of widows' pension vary from 10/6d. to 27/6d. weekly according to the rank of the husband and the age of the widow, while the children's pensions are at the rate of 5s. a week. Widows' pensions may be refused or withdrawn at the discretion of the administering authority on account of unworthiness.

The cost for 1926 of the pensions described was approximately as follows:—

	R.N.& R.M.	Army	R.A.F.
	£	£	£
Officers' retired pay	2,553,000	3,881,000	155,000
Men's pensions	4,320,000	4,511,000	36,000
Widows' pensions, etc.	174 000	205,000	13,000
	7,047,000	8,597,000	204,000

The cost during the same year of the pensions granted by the Ministry of Pensions in respect of disablement or death attributable to the World War and former wars was £56,617,000, of which £3,134,000 was paid to disabled officers, £26,648,000 to disabled men and £26,835,000 to the dependants of deceased officers and men. (*See* PENSIONS IN THE UNITED STATES.)

(C. M. B.)

PENSIONS, OLD AGE: *see* OLD AGE PENSIONS; PENSIONS: THE UNITED STATES.

PENSIONS: PERPETUAL OR HEREDITARY. Perpetual or hereditary pensions in Great Britain were freely granted either to court favourites or as a reward for political services from the time of Charles II. onwards. Such pensions were very frequently attached as "salaries" to places which were sinecures, or posts which were really necessary were grossly overpaid, while the duties were discharged by a deputy at a small salary. On the accession of George III. and his surrender of the hereditary revenues in return for a fixed civil list, this civil list became the source from which the pensions were paid. (*See* CIVIL LIST.) The three pension lists of England, Scotland and Ireland were consolidated in 1830, and the civil pension list reduced to £75,000, the remainder of the pensions being charged on the consolidated fund.

The Bradlaugh Agitation.—In 1887, Charles Bradlaugh, M.P., protested strongly against the payment of perpetual pensions, and as a result a committee of the House of Commons enquired into the subject (*Report of Select Committee on Perpetual Pensions*, 248, 1887). An appendix to the report contains a detailed list of all hereditary pensions, payments and allowances in existence in 1881, with an explanation of the origin in each case and the ground of the original grant; there are also shown the pensions, etc., redeemed from time to time, and the terms upon which the redemption took place. The nature of some of these pensions may be gathered from the following examples: To the duke of Marlborough and his heirs in perpetuity, £4,000 per annum; this annuity was redeemed in August 1884 for a sum of £107,780, by the creation of a ten years' annuity of £12,796 17s. per annum. By an act of 1806 an annuity of £5,000 per annum was conferred on Lord Nelson and his heirs in perpetuity. In 1793 an annuity of £2,000 was conferred on Lord Rodney and his heirs All these pensions were for services rendered, and although justifiable from that point of view a preferable policy was pursued in the 20th century by parliament voting a lump sum, as in the cases of Lord Kitchener in 1902 (£50,000) and Lord Haig and other distinguished commanders at the end of the World War.

Charles II. granted the office of receiver-general and controller of the seals of the court of king's bench and common pleas to the duke of Grafton. This was purchased in 1825 from the duke for an annuity of £843, which in turn was commuted in 1883 for a sum of £22,714 12s. 8d. To the same duke was given the office of the pipe or remembrancer of first-fruits and tenths of the clergy. This office was sold by the duke in 1765, and after passing through various hands was purchased by one R. Harrison in 1798. In 1835 on the loss of certain fees the holder was compensated by a perpetual pension of £62 9s. 8d. The duke of Grafton also possessed an annuity of £6,870 in respect of the commutation of the dues of butlerage and prisage. To the duke of St. Albans was granted in 1684 the office of master of the hawks. The sums granted by the original patent were: master of hawks, salary, £391 1s. 5d.; four falconers at £50 per annum each, £200; provision of hawks, £600; provision of pigeons, hens and other meats, £182 10s.; total £1,373 11s. 5d. This amount was reduced by office fees and other deductions to £965, at which amount it stood until commuted in 1891 for £18,335. To the duke of Richmond and his heirs was granted in 1676 a duty of one shilling per ton on all coals exported from the Tyne for consumption in England.

This was redeemed in 1799 for an annuity of £19,000, which was afterwards redeemed for £633,333.

The conclusions of the committee were adverse to the continuance of such pensions, and after its report recommendations were adopted by the Government and outstanding hereditary pensions were gradually commuted.

PENSIONS: POLITICAL. In Great Britain, by the Political Offices Pensions Act, 1869, pensions were instituted for those who had held political office. For the purposes of the act political offices were divided into three classes: (1) those with a yearly salary of not less than £5,000; (2) those with a salary of less than £5,000 and not less than £2,000; (3) those with a salary of less than £2,000 and more than £1,000. For service in these offices there may be awarded pensions for life in the following scale: (1) a first class pension not exceeding £2,000 a year, in respect of not less than four years' service or its equivalent, in an office of the first class; (2) a second class pension not exceeding £1,200, in respect of service of not less than six years or its equivalent, in an office of the second class; (3) a third class pension not exceeding £800 a year, in respect of service of not less than ten years in an office of the third class.

The service need not be continuous, and the act makes provision for counting service in lower classes as a qualification for pension in a higher class. These pensions are limited in number to twelve, but a holder must not receive any other pension out of the public revenue; if so, he must inform the Treasury and surrender it if it exceeds his political pension, or if under he must deduct the amount. He may, however, hold office while a pensioner, but the pension is not payable during the time he holds office. To obtain a political pension, the applicant must file a declaration stating the grounds upon which he claims it and that his income from other sources is not sufficient to maintain his station in life. The act states that not more than one pension can be granted in the same year.

It should be added that the act has fallen into abeyance, and in 1928 no such pensions were being paid. The last recipient was Lord Chaplin, who died in 1923. Lord George Hamilton relinquished his pension in the same year.

PENSIONS: THE UNITED STATES. The soundness of a pension system depends principally on whether the system contains within itself the power of self-perpetuation and not on the nature of the organization nor the scale of the pension benefits. If financial provisions, scientifically calculated, will provide the pension payments as they fall due, the system is self-perpetuating, assuming an administration that adheres to its rules. This condition rarely exists except on a reserve basis, where enough is accumulated before the pension is granted to pay it during its entire existence. If a pension system is dependent upon casual collections or on a periodic vote of funds out of a corporation treasury, it does not contain within itself the element of perpetuity and is practically always on a cash disbursement basis where the resources are provided as the pension payments are actually made. When there is no question of the financial adequacy or the good faith of the organization, as in the case of governments, such a system is reliable.

The problem of the accrued liabilities must be recognized; it is the fact that during the past service of all members of a pension system, there has been no financial provision for that part of their pension represented by this past service. Either there must be a large sum paid down, or a proportionate loading of future financial provisions or a partial or total repudiation of such past service, if the pension system is not to start bankrupt. A rigid adherence to the rules on which the actuarial calculations were made is as essential as the calculations themselves. (M. SA.)

Military Pensions.—On Aug. 26, 1776, Congress offered pensions equal to half-pay to officers and men disabled in the Revolutionary War, with proportionate pensions in case of partial disability. For all following wars and the various Indian disturbances, pension laws of constantly expanding liberality for the soldiers, their widows and other relatives, have been passed. For each war, generally, first pensions on account of disability alone were passed, then pensions in case of dependence, and finally pensions based solely on service however short. Politics unavoidably figured largely in this pension legislation. Since 1861, outside of the liberal general acts, 69,254 cases were dealt with by special acts of Congress. In 1905 the pensioners exceeded 1,000,000. On June 30, 1927, there were 489,942 names on the pension rolls, of which 302,692 were the result of the Civil War. The total expenditure for the fiscal year ending June 30, 1927, was $230,152,712, of which $166,493,209 was for the Civil War, $57,232,828 for the War with Spain and the rest for a few survivors of earlier wars and for the regular establishment. The total expenditure for pensions, 1866–1927, was $7,397,053,627.09. From 1776 the total is $7,491,499,071.32.

War Risk Insurance Act.—This act became a law on Oct. 6, 1917, and provided allowances for the immediate dependents of those in the service, compensation for the soldier in the event of disability or for his dependents in case of death and war risk insurance providing benefits to the veteran during his permanent and total disability and to his relatives in the event of his death. No general pension laws were enacted. Insurance protection at a peace time rate was provided for every soldier, the hazard of war being borne by the United States. Upon application and without medical examination, insurance was granted against death or total permanent disability in any multiple of $500, and not less than $1,000 or more than $10,000. The beneficiaries were limited to a spouse, child, grandchild, parent, brother or sister or to any or all of them and during total permanent disability to the injured person. The benefits were payable in 240 equal monthly installments of $5.75 for each $1,000 of insurance. Benefits for total permanent disability were payable during total permanent disability without limitation as to the number of installments. This insurance was authorized at the net premium according to the American Experience Table of Mortality and interest at 3½% per annum, on the yearly renewable term basis, computed for payment monthly. Provision was made for the conversion of this term insurance into other forms of level premium insurance within five years after the date of the termination of the war, and for the termination of such insurance, unless converted, at the end of such period. This limitation date was later extended by law to include July 2, 1927. Within 15 months after the passage of the amendment, insurance had been granted to more than 4,500,000 applicants amounting to approximately $40,000,000,000. The liability incurred by the United States for losses under war risk insurance is approximately $1,500,000,000, while the total amount of premium received is less than $500,000,000. The monthly benefits payable will extend over a period of more than 20 years after the date of the termination of the war.

Converted insurance was provided on the net premium basis, the Government bearing the cost of administration and the extra losses resulting from the hazards of military and naval service. Converted insurance is participating, and benefits are made payable in one sum or other optional settlements elected by the insured. A recent amendment to this act removed all restrictions as to who may be designated as beneficiary under converted insurance. A large percentage of those in service never paid a premium on their insurance after discharge. At the present time (1929) approximately 650,000 veterans are insured under legal reserve policies in an aggregate amount of more than $3,000,000,000. This converted insurance is self-sustaining and dividends have been paid regularly to all policy holders. All the forms of relief, insurance and the care of veterans have been consolidated in the Veterans' Bureau. For the fiscal year ending June 30, 1927, the cost of this bureau was $405,348,447.70. Since April 6, 1917, the total cost of all such operations concerned with the World War has been $3,904,592,602.56. (G. E. I.)

Civil Service.—On May 22, 1920, Congress adopted a civil service pension plan. Retirement is permissible, after 15 years of service, at ages from 62 to 70, according to certain classifications of service. The amount of pension, depending upon length of service, ranges from 30% to 60% of the average basic salary of the employee during the last 10 years of service. There is a minimum, in any case, of $180 a year, and a maximum of $1,020 a year. The plan is financed by a deduction of 3½% from the

salaries of all Government employees, the Government being responsible for all that may otherwise be needed, including the accrued liabilities. There has been some demand for more liberal provisions by associations of civil service employees. A more adequate system exists in the Department of State for the permanent officers of the foreign service. The deduction from pay is 5% and the pensions are higher, a maximum pension of $5,400 being possible. The treasury will eventually have to pay the cost in excess of the contributions, and the accrued liabilities.

State and Municipal Pensions.—State and municipal pensions began with enabling acts of State legislatures permitting municipalities to establish pension plans for hazardous services, such as the police and fire departments, and later for the public school teachers. The public school teachers' plans have gradually become to a large extent State-wide and in a few instances comprehensive plans for all State employees have been adopted.

The earlier plans did not establish a balance between the revenue of the system and the pensions promised, covering the entire period of the plan's existence. Outside sources of income, which could bear no relation to the amount of the pensions and the longevity of pensioners, were important items of revenue, such as licences for carrying fire-arms, deductions for teachers' absences, etc. The New York City Police Pension Fund was the earliest one in force. In 1893 a contribution of 2% of salary was required. It bore no relation to the cost of the plan. It was, however, copied literally by cities over the entire country. Sometimes the contributions, such as an equal amount from each individual, were entirely unrelated to the pension. There was the common error of regarding a balance in the treasury, almost inevitable in the early years of even the worst constructed system, as a real surplus and therefore an evidence of solvency. (M. SA)

Teachers' Pensions.—Beginning with Chicago in 1893 and a State organization in New Jersey in 1896, half of the States now have comprehensive systems of teachers' pensions and in the others there are many city or county provisions that are developing toward State-wide systems. Where the teacher is wholly an officer of the Government, pensions are likely to be paid entirely by the State and to be closely related to rigid governmental control of training, certification, tenure and salary. Free pensions are considered, and properly, as partial compensation, but as such are generally valued too highly and this keeps salaries unduly low. Political pressure upon free pension systems has frequently resulted in arbitrary changes in regulations that have frustrated many hopes. Even more frequently friendly legislation has increased the privileges of free pension systems until their cost, which is rarely reckoned in advance, has become intolerable, promised privileges have been reduced, and entire pension systems have been modified or abandoned. Teachers' pensions, therefore, are now most generally provided in part by contributions from the teachers,—an arrangement that is ethically, socially and economically sound. As yet, however, the teacher's contribution rarely bears any precise relation to the benefits that are expected, it being still quite customary to decide that certain benefits are desirable, to require teachers to make modest contributions, and then to hope that the employing State or city or institution will provide the remainder of the cost, whatever it may be. The disappointment of such extravagant hopes, however, is developing an increasing agreement that the cost of pensions should be borne by equal contributions from the employing organization and the teacher, that pension provisions must be carefully related to the funds that are available, and that the carrying out of the plans shall be guaranteed by contracts between the system and each member. Less agreement exists that the contributions of the employer and the teacher should be made jointly, year by year, so as to accumulate throughout the teacher's service. There is, however, no other way of making certain that the prospective pension will be adequate and that the funds necessary to provide the pension will be available at the time of retirement.

Experience and enquiry agree that retiring allowances of approximately half of the active pay preceding retirement, together with pensions for widows of approximately half of the retiring allowances, provide reasonable comfort at a cost that is not too great for the teacher and the employer. The principle of half-pay, however, has been the occasion of many difficulties, on account of the necessity of estimating the pay over a period of many years, and adequately preparing for payment. The only safe application of the principle of half-pay is to estimate its cost from as many instances of completed and prospective service as are available, to fix deposits and contributions on this basis; usually as a percentage of salary, and then to promise pensions that are not a proportion of any series of future salaries but annuities than can be definitely provided for by contracts based on the deposits and contributions that are made, on a guaranteed rate of interest, and upon specified tables of mortality. Tables can then be provided by means of which any teacher can ascertain the amount accumulated by any deposit over any number of years, and the annuity that any accumulation will provide for a man or woman, beginning at any age, according to various options.

Retirement on the basis of age is ordinarily optional at 60 to 65 and compulsory at 70. A contractual contributory plan allows of greater adjustment to individual needs, the annuities being whatever the sums accumulated will provide at any age chosen for retirement. Contractual annuities also make possible choice of provisions for a member alone, for both himself and his widow, or for a return to his estate, should he die before receiving in annuity payment, the full accumulation to his credit at the time of retirement. When annuity accumulations are used for benefits other than those of retirement on the basis of age, about 50% is usually devoted to such age retirement, 30% to death benefits and 10% each for benefits in case of withdrawal or disability. Disability, withdrawal and death benefits reduce the benefits at retirement, but teachers appear to prefer the return of their accumulations in these cases, even though they must, in consequence, look forward to smaller allowances on retirement. Pensions for retirement on the ground of twenty, thirty or forty years of service, irrespective of age or disability are still common but rapidly disappearing. Such provisions injure the service by causing able people to retire early: they may extend retirement to a third or a half of a beneficiary's adult life, and they are so expensive that their cost has been known to approximate one-third of the entire salary budget.

Allowances in case of disability before the normal age of retirement are desirable, because of their relief of individual distress and the comfort produced by the removal of apprehension as to possible distress in case of disability. Statistics concerning the incidence and continuance of disability among teachers are, however, as yet so fragmentary and untrustworthy, that it is difficult to provide contractual protection against disability. Most pension systems, therefore, provide this protection wholly or largely at the cost of the employer, who is more able than the teacher to bear the variations of this load.

Teachers who withdraw from service before the normal age of retirement should, theoretically, continue to retain the benefit not only of their own deposits but also of the employer's contributions, and the interest accumulations of both. This is economically sound and facilitates desirable changes in teaching positions. In practice, however, the employer's contribution is rarely credited to the teacher who withdraws and his own deposits are sometimes returned without interest. Also for teachers who die in service before the normal age of retirement, only their deposits with interest are usually paid, sometimes with the proceeds of group life insurance provided by the employer.

For the administration of any pension plan it is customary to have a small board or committee, including the superintendent, principal or other educational head of the organization, together with two, four or six other persons, equally representing the employing organization and the teachers. It is desirable to specify that any factors in a pension plan can be modified as experience may suggest, by agreement between the teachers and the employing organization.

For university and college teachers the local pension plans of particular institutions and free pension plans, like that of the Carnegie Foundation, are being gradually superseded by comprehensive contributory contractual plans such as the Federated

Superannuation System of the English universities and, in the United States, the Teachers' Insurance and Annuity Association, which provide contractual annuities for the officers and teachers of some 200 universities, colleges and research institutions. (C. Fu.)

Industrial Pensions.—Among the earliest plans were those of the American Express Company (about 1875) and the Baltimore and Ohio Railroad (about 1884). The United States Steel Corporation was also among the first to establish a pension system.

Pensions for employees are now allowed by most railways, many large banks and some industrial organizations because of age or illness after service ranging upward of 15 years. There are probably not fewer than 500 industrial pension programmes. Very few of these were in operation before 1900, and probably less than 100 before 1910. Almost all began informally as older employees became incapacitated. Beginning as a sort of charity, pensions in industry are coming to be considered as the economical way to clear the rolls of the less efficient workers, and therefore as constituting a legitimate charge against production. This change of attitude has resulted in a change of business practice—an increasing number of industries now setting up annually during the active life of the workers a reserve out of which to provide pensions payable in the future. There is an increasing tendency to permit or require the payment of a part of the cost by the employees through contribution generally made by deduction from pay. The usual contribution is from 2 to 5%, depending on the amount and nature of the benefits granted. In most places the employee's contribution is returned on leaving the service.

The customary pension age is from 60 to 70, usually 5 years lower for women than for men. The amount of pension is generally based on a percentage of the average salary received over a given period of service; sometimes the period over which the average is calculated is as short as three years, but the tendency is to lengthen the period and in the most modern plans, to cover the entire period of service. In view of the fact that pensions when paid constitute life annuities, there is also a tendency to employ the service of life insurance companies in the administration of pension schemes. (I. K.)

Church Pensions.—The Protestant Episcopal Church was the first organization in America, according to the *Journal of the International Congress of Actuaries*, to establish a pension system after actuarial calculations. It was planned in 1912, and incorporated in 1914, being placed under State insurance supervision. This was an innovation in English-speaking countries. In 1916, the church under the leadership of William Lawrence, bishop of Massachusetts, raised $8,750,000 to carry the accrued liabilities up to the extent of a $600 a year pension for every clergyman in service when its pension system became operative on March 1, 1917. Thereafter the pension system is carried by every Protestant Episcopal Church paying an equivalent of 7½% of the salary paid to the clergy. The assets of the Church Pension Fund in 1928 were approximately $25,000,000. The Presbyterian Church in the U.S.A. (North) raised in 1928 the sum of $15,000,000 for the accrued liabilities of their pension system and requires each congregation to pay 7½% on salaries and the ministers to pay 2½%. Its system is working successfully. The Congregational Churches have a "Pilgrim Memorial Fund" of $5,000,000, the interest of which helps to pay the 6% contributions on the salaries of those ministers who join; the church is supposed to pay one-half. Other churches, such as the Disciples of Christ and the Methodist Episcopal Church, are at work on similar enterprises. There are still denominations which have not advanced beyond the plan of "ministerial relief" or are still depending on endowed pensions.

Old Age Pensions.—Old age pensions are in operation in Alaska (at 65, after 10 years' residence); in Montana (at 70, after 15 years' residence for those with incomes below $300 a year); and in Wisconsin (at 70, after 15 years' residence, with property below $3,000). Colorado, Kentucky, Maryland and Nevada have passed similar acts, but the counties, which alone have authority to put such legislation in force, have not done so. The State courts declared unconstitutional such old age pension laws in Arizona and Pennsylvania. (M. Sa.)

Mothers' Pensions.—The term "mothers' pensions" is popularly applied to the plan by which mothers of dependent children receive financial assistance from public authority to enable them to keep their children with them in their own homes, avoiding the necessity for institutional care. Laws providing such assistance or "pensions" are to be found on the statute books of more than 40 States in the Union and such legislation seems likely to become universal throughout the country. Missouri and Illinois were the first States to pass legislation of this character, both States enacting statutes in the year 1911. The Missouri law at first applied only to one community within the State—Kansas City—while the Illinois statute was of State-wide application. In the beginning, assistance to mothers was generally limited to widows and a few States still adhere to that limitation, notably Connecticut, Maryland, New Jersey, Texas and Utah. The tendency has been, however, to include mothers, whether widows or not, whose children were dependent for a variety of reasons: where the mother is deserted or divorced, or where the husband and father is physically or mentally incapacitated or imprisoned. In Michigan, Nebraska and Tennessee the mother of an illegitimate child may be eligible for assistance, but this is not the general rule.

In order to establish the dependency of the children it must appear that the mother, as well as the father, is incapable of caring for them without assistance. The usual provision is that a mother is ineligible if she has personal or real property of a value in excess of a prescribed amount. Also the mother must be of good moral character, capable of giving good care and her home must be a suitable one for the child. The aid may be granted until the child reaches the age of 16 years, although a few States have a slightly higher or lower age limit. There is considerable variety in the provisions of the laws of the various States regarding the amounts of money which may be granted to the mother for her children. The maximum which could be granted to a family with three children varies from $30 a month in certain jurisdictions to $70 in others.

The administration of mothers' pensions is carried on under different methods in different States. The juvenile court is the administering agency in 20 jurisdictions. In other States the public board of the county, town or city which administers poor relief in general also administers mothers' pensions. This has not usually been as successful, because mothers are not to be regarded as supplicants for public relief but as co-operating with the public authorities in the rearing of future citizens. A third form of administration is through specially created county boards. These boards are usually made up of citizens of the county who serve without compensation. Such boards may or may not have paid assistants and usually there is some form of State supervision. Such is the law in Pennsylvania, Delaware and New York.

It has been estimated that while there are approximately 400,000 children in the United States who would be eligible for assistance under these laws if they were fully applied, in all probability not more than 130,000 are actually receiving public aid at any given time. It is evident that much remains to be done in the United States to improve administrative methods and to establish the high purpose of this beneficent legislation. (W. Ho.)

PENSIONS, WAR: *see* War Pensions.

PENTAMETER, a line consisting of the first colon of a hexameter (*q.v.*) with penthemimeral masculine caesura (*see* Caesura) twice repeated, thus:—

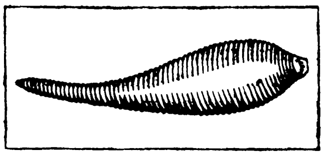
— ⏑⏑ — ⏑⏑ — || — ⏑ ⏑ — ⏑ ⏑ —
No—but a |most bur|lesque| barbarous| experi|ment

Its name (Gr., "five-measure") seems to be derived from the fact that it can be scanned, very artificially, as five feet,

– ⏑ ⏑ | – ⏑ ⏑ | – – | ⏑ ⏑ – | ⏑ ⏑ –.

The second half must always consist of dactyls, but spondees are allowed in the first half, as shown above. Diaeresis must occur at the end of the first half (*see* CAESURA). In Latin, Ovid and his followers, and to a less extent Tibullus and Propertius, introduce numerous minute refinements, unknown in Greek. The pentameter is seldom found without the hexameter, following which it makes an elegiac couplet. This is used for all manner of subjects, but somehow got the reputation (*see* OVID, *Amores* III. 9, 4) of being a melancholy metre, and its name was absurdly derived from Gr. *e e lege*, "Say, alas, alas," *see* Suidas, *s.v. elegos*. Hence the modern sense of *elegy* (*q.v.*).

PENTASTOMIDA, also called Linguatulida, a group of parasitic animals of uncertain systematic position but sometimes regarded as degenerate Arachnida (*q.v.*) of the order Acari. The body is worm-like, unsegmented, but superficially annulated, the alimentary canal traverses it from end to end, and close to the mouth, which is encircled by a horny ring, are two pairs of horny hooks. There are no special organs of respiration or circulation and the nervous system consists of a collar round the oesophagus and a pair of ventral strands. The sexes are distinct, the females are oviparous and the generative orifice in the males of all species and in the females of one genus, *Reighardia,* opens upon the ventral surface of the fore part of the body, whereas in the females of the others it is close to the anus.



WORM-LIKE PENTASTOMID (LINGUATULA SERRATA), A NOSE PARASITE OF DOGS

There are three well marked types:—*Reighardia,* which has the genital orifice of both sexes opening anteriorly and the hooks behind the mouth, is regarded as the representative of a special family, Reighardiidae. Only one species is known, namely, *R. sternae,* a parasite of terns and sea-gulls. Much better known are *Linguatula* (*Pentastomum*) and *Porocephalus* (*Armillifer*) assigned to the family Linguatulidae or Porocephalidae, which is characterised by the posterior position of the genital orifice in the females and the situation of the hooks nearly level with the mouth.

Both these forms are of pathogenic importance to man. *Linguatula serrata* (*Pentastomum taenioides*) is comparatively broad and flat and finely annulated. The male is less than an inch long, the female considerably larger. When mature they live in the nasal cavities of dogs, wolves or foxes, and the ova, discharged in mucous secretion upon vegetation, may be swallowed by hares, rabbits, domesticated animals or man. The larvae, upon hatching in the stomachs of these intermediate hosts, make their way to the liver, kidneys, lungs or other visceral organs, there to remain encysted until the host is devoured by the canine carnivore into whose nasal chambers they pass to become adult and breed. The parasitic cycle is thus very like that of tape-worms.

Porocephalus (*Armillifer*) *armillatus,* larger than *Linguatula,* has the body cylindrical and marked by a series of upstanding, thick, rick-like ridges. The parasitic cycle is similar to that of *Linguatula,* but the hosts are different. The adults infest the lungs of African snakes, pythons (*P. regius* and *P. sebae*) and Puff adders (*Bitis nasicornis*). The eggs, disseminated by these reptiles, are taken up in water or vegetable food by a great variety of animals, by negroes, monkeys, ungulates, hedgehogs and even lions and leopards, in whose viscera the immature forms have been found encysted. Infection of the lungs or other important internal organs in man by this parasite may be followed by serious pathological results. (R. I. P.)

PENTATEUCH, the Greek name corresponding to the Jewish חמשה חומשי תורה (the five-fifths of the Torah, or Law), and applied to the first five books of the Old Testament (Genesis, Exodus, Leviticus, Numbers, Deuteronomy). The Pentateuch, together with Joshua, Judges and Ruth, with which it is usually united in Greek mss., makes up the Octateuch; the Pentateuch and Joshua together have recently been named the Hexateuch. *See* BIBLE and the articles on the several books.

PENTECOST, a feast of the Jews, is celebrated on the 50th day after the Passover (hence its name "Pentecost," a Greek word meaning "fiftieth"), and now on the following day also, *i.e.,* Sivan 6 and 7. In the Bible, where a festival of one day only is referred to, it is described as "the feast of Harvest" (Ex. xxiii. 16), and "the day of the First-Fruits" (Num. xxviii. 26). It really marked the close of the grain-harvest which in Palestine lasted seven weeks (from Passover to Pentecost). Hence the name Feast of Weeks.

The agricultural character of this feast clearly reveals its Canaanite origin (*see* HEBREW RELIGION). It does not, however, rank equal in importance with the other two agricultural festivals of pre-exilian Israel, viz., the *Maṣṣōth* or feast of unleavened cakes (which marked the beginning of the corn harvest), and the *Asiph* ("ingathering" later called *succōth,* "booths") which marked the close of all the year's ingathering of vegetable products. This is clear in the ideal scheme of Ezekiel (xlv. 21 *seq.*) in which, according to the original text, Pentecost is omitted (*see* Cornill's revised text and his note *ad loc.*). It is a later hand that has inscribed a reference to the "feast of weeks" which is found in our Massoretic Hebrew text. Nevertheless occasional allusions to this feast, though secondary, are to be found in Hebrew literature, *e.g.,* Isa. ix. 3 and Ps. iv. 7. In the earliest codes, viz., Ex. xxiii. 16 (Elohist) and in Ex. xxxiv. 22 (Yahwist), no explicit statement about the time of celebration is given; but in Deut. xvi. 9 the time is defined as an interval of seven weeks from the beginning of the corn-harvest at the end of which the feast was celebrated. For the later elaboration of sacrifices and ritual, *see* Lev. xxiii. 10–21, Num. xxviii. 26 *seq.*

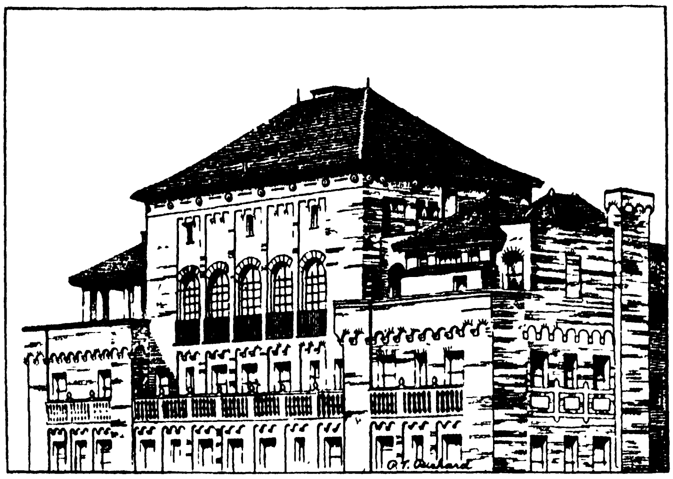
See further SADDUCEES and compare generally the article "Pentecost" in D. B. Hastings, *Ency. Bib.* and *Jew. Enc.* (G. H. B.)

PENTELICUS (Βριλησσός, or Πεντελικὸν ὄρος from the deme Πεντέλη; mod. Mendeli), a mountain north-east of the Athenian plain, height 3,640 ft. Its white marble was not regularly worked until after the Persian wars; later all the chief buildings and sculptures of Athens were constructed of it. The ancient quarries are mostly on the south side; the modern quarries on the north side. There was a statue of Athena on the mountain.

PENTHEUS, son of Agāvē, daughter of Cadmus. For his legend, *see* DIONYSUS.

PENTHIÈVRE, COUNTS OF. In the 11th and 12th centuries the countship of Penthièvre in Brittany (dep. of Côtes-du-Nord) belonged to a branch of the sovereign house of Brittany. Henry d'Avaugour, heir of this dynasty, was dispossessed of the countship in 1235 by the duke of Brittany, Pierre Mauclerc, who gave it as dowry to his daughter, Yolande, on her marriage in 1238 to Hugh of Lusignan, count of La Marche. Duke John I. of Brittany, Yolande's brother, seized the countship on her death in 1272. In 1337 Joan of Brittany brought Penthièvre to her husband, Charles de Châtillon-Blois. In 1437 Nicole de Blois, a descendant of this family, married Jean de Brosse, and was deprived of Penthièvre by the duke of Brittany, Francis II., in 1465. The countship, which was restored to Sebastian of Luxemburg, heir of the Brosses through his mother, was erected for him into a duchy in the peerage of France (*duché-pairie*) in 1569, and was afterwards held by the duchess of Mercoeur, daughter of the first duke of Penthièvre, and then by her daughter, the duchess of Vendôme. The duchess of Vendôme's grandson, Louis Joseph, inherited Penthièvre in 1669, but it was taken from him by decree in 1687 and adjudged to Anne Marie de Bourbon, princess of Conti. In 1696 it was sold to the count of Toulouse, whose son was called duke of Penthièvre. This title finally passed to the house of Orleans.

PENTHOUSE, originally any subsidiary or added structure attached to a larger building and covered by a roof sloping down in one slope away from the main wall of the building; also any bracketed, sloping roof projecting from the wall of a building to give shelter to a door, window or outside stair. In modern usage the term is applied especially to any subsidiary roof construction,



BY COURTESY OF THE "ARCHITECTURAL FORUM"

UPPER PART OF THE ALLERTON HOUSE, NEW YORK CITY, ILLUSTRATING ONE OF THE TYPES OF PENTHOUSE (ARTHUR LOOMIS HARMON, ARCHITECT)

and in particular to structures built above the main roof line and recessed behind the exterior wall line, to house water tanks, elevator machinery and occasionally living quarters.

PENTLANDITE. This mineral, whose composition is usually given as (Fe,Ni)S, is probably a solid solution of pyrrhotite and millerite, although it is said to crystallize in the cubic system. It has a bronzy-yellow metallic lustre and is not magnetic like pyrrhotite. It is found intimately associated with nickeliferous pyrrhotite at Sudbury, Ontario, and may contain as much as 20% of nickel.

PENTSTEMON, in botany, a genus of plants (family Scrophulariaceae), comprising about 150 species, chiefly natives of North America, with showy open-tubular flowers. Noteworthy species are *P. laevigatus* (smooth beard-tongue), *P. Digitalis* (foxglove beard-tongue), and *P. hirsutus* (hairy beard-tongue), of the eastern and southern States; *P. alpina* (alpine beard-tongue), *P. cyananthus* (blue beard-tongue), and *P. barbatus* (bearded pentstemon), of the Rocky Mountain region, and *P. antirrhinoides* (snapdragon beard-tongue), *P. diffusus* (spreading beard-tongue), and *P. centranthifolius* (scarlet bugler), of the Pacific States; these and various others are more or less cultivated. The pentstemon of the florist has, however, sprung from *P. Hartwegii,* of Mexico, and *P. Cobaea,* of the south-western United States, and possibly some others. The plants endure English winters unharmed in favoured situations. They are freely multiplied by cuttings, selected from the young side shoots, planted early in September, and kept in a close cold frame till rooted. They winter safely in cold frames, protected by mats or litter during frost. They produce seed freely, new kinds being obtained by that means.

PENUMBRA (Lat. *paene,* almost, *umbra,* a shadow), in astronomy, the partial shadow of a heavenly body as cast by the sun. It is defined by the region in which the light of the sun is partially but not wholly cut off through the interception of a dark body. *See* ECLIPSE.

PENUTIAN, a North American Indian language family, constituted by Dixon and Kroeber (*Univ. Calif. Publ. Am. Arch. Ethn.,* vol. xvi., 1919) by the union of five stocks previously considered distinct. These five are Maidu (*q.v.*), east of Sacramento river, California; Wintun, including Patwin, to the west; Costano, San Francisco and Monterey bays; Miwok, central Sierra Nevada; Yokuts, San Joaquin valley. The area occupied approximates closely to the drainage of the great interior valley of California. The population, estimated at above 50,000 in 1770, had shrunk to 3,500 in 1910. The name Penutian is artificial, being a composite of the stems for the numeral word "two" in two branches of the family: *pen,* in Maidu, Wintun, Yokuts, and *uti* in Costano and Miwok. The unity of the family has not been considered proved by all authorities, but according to E. Sapir various native languages north of California, such as Kus, Takelma, Kalapuya, Chinook (*q.v.*), Tsimshian (*q.v.*), would be genetically related.

PENZA, a province of the Russian S.F.S.R., surrounded by those of Saratov, Tambov, Ryazan, Nizhegorod and Ulianovsk. Area 45,903 sq.km. Pop. (1926) 2,207,668. The province forms part of the Central Russian plateau, here reaching a height of 900 ft. It is deeply dissected by rivers, the chief being the Moksha, flowing north to the Oka, the Sura to the Volga, and the Khoper flowing south to the Don. The Moksha and Sura are navigable and other streams are available for floating timber. Patches of forest occur in the west, and also to the east of the Sura river, but are insufficient for local timber needs, most of which are supplied by timber floated down the rivers from the north. Of the land favourable for cultivation, 82·2% is used and agriculture is the main occupation. Marshes exist in the Krasnoslobodsk district, and sandy stretches along the rivers, but there is much fertile black earth.

The climate is severe, with five months of frost, a brief and hot summer, and a rainfall averaging 16–18 inches. The traditional three field system and primitive implements are obstacles to agriculture, and the low literacy rate, 24·4%, makes progress difficult. Winter rye and oats are the chief crops, lentils are produced for export, and peas, sunflower seed, potatoes, beetroot, fruit and vegetables are successfully grown. Efforts are being made to introduce maize cultivation and to discourage the sowing of buckwheat, because of its variable yield. Sheep, dairy and working cattle, pigs and horses are bred, the sheep providing wool for the felt and woollen industry and fat for tallow. Factory industries include saw-milling, paper and match manufactures, and woollen cloth, felt, glass, leather, tobacco and oil pressing works. There is a comparatively good railway net, but the only town with a population of over 16,000 is Penza (*q.v.*). There are Great Russians, Tatars, Mordvinians and Mescheryaks among its mixed population, and the north was mainly settled by refugee Raskolniks (Dissenters).

PENZA, the chief town of the above province, situated at the confluence of the Penza with the navigable Sura, in 53° 12′ N., 44° 59′ E. Pop. (1926) 91,151. The town has saw-mills and paper and match factories, and its position at the intersection of north to south and east to west railways, and on a navigable river has made it an important trading centre for corn, timber and the products of sheep and cattle raising. It dates from the 17th century and was captured by Pugachev in 1776. It has several times been destroyed by fire.

PENZANCE, town and seaport, in St. Ives parliamentary division, Cornwall, England, the terminus of the G.W.R., 325½ m. W.S.W. of London. Pop. (1921) 12,087. It is on Mount's Bay, opposite St. Michael's Mount, being the westernmost port in England. The site of the old town slopes upward from the harbour, to the west of which there extends an esplanade and modern residential quarter. The harbour has an area of 24 ac., with 17 to 21 ft. depth, and floating and graving docks. There is a large export trade in fish. Other exports are tin and copper, granite, serpentine, vegetables and china clay. Imports are principally coal, iron and timber. Great quantities of early potatoes and vegetables, together with flowers and fish, are sent to London and elsewhere. Nearly two miles inland to the north-west is Madron (pop. 3,277). The church of St. Maddern is principally Perpendicular, with earlier portions and a Norman front. There is also a "wishing well" and the ruins of a baptistry both of extreme antiquity. Megaliths are not uncommon. Three miles north-east is Ludgvan (pop. 2,052), and to the south Paul (5,398), which includes the village of Newlyn.

Penzance (Pensans) was recognized as a port in 1512 by Henry VII., but its importance as a fishing village dates from the 14th century. During the war with Spain the town was devastated in 1595. The charter of incorporation was granted in 1614, after the town had been rebuilt and a pier erected. In 1663 Penzance was constituted a coinage town for tin.

The public buildings include a library, museum, mining and science schools, the West Cornwall infirmary and a meteorological station.

PEONAGE, a form of involuntary servitude which developed in Mexico. It prevailed extensively in Yucatán and especially in

the Valle Nacional, where cheap labour was required in the cultivation of tobacco. The beginning of peonage, however, has been traced as far back as the conquest of Mexico by the Spaniards. Early in the history of Mexico the conquerors worked out a scheme by which the poor, especially the Indians, could be forced to do the work of the planters and mine operators. The word *peon* became synonymous with the English word labourer, but it later was restricted in its meaning to those labourers who were compelled to serve their creditors to pay debts which by contract they had pledged themselves to pay in labour. Although the 13th amendment and legislation of the U S. Government prohibited any such involuntary servitude in that country, the former slave-holding States devised certain legislation, following emancipation, which might make labour compulsory. Under these State laws employers deceived ignorant men by inducing them to sign contracts for labour in payment of debts, and those who might pay fines imposed by the courts to sign other similar contracts.

For a number of years peonage continued in the United States without any one directing much attention to it because it was practised in those sequestered parts where negroes were not enlightened and where the majority of the planters raised no objection. Such practices were authorized by special laws in certain Southern States, and public opinion permitted the practice when there were no laws specifically providing for it. The laws penalized failure to comply with contracts for employment, enticement of labourers from their employers, violation of a contract with a surety who had paid the fine of a misdemeanour, acts of vagrancy, and the operations of emigrant agents. The laws of few States contained similar clauses binding those who rented land on shares.

In rural districts far removed from the populous centres the chain gang system of forced labour under the pretence of farming out the services of misdemeanants or penal offenders developed into great injustices. A number of cases were brought to light in 1902 and 1903, and the offenders were tried. The jury, however, failed to convict The practice of leasing short-term prisoners, both blacks and whites, to managers of labour camps has continued in a few of the Southern States.

PEORIA, a city of north-central Illinois, U S A , on the Illinois river where it widens to form Lake Peoria, midway between Chicago and Saint Louis; a port of entry and the county seat of Peoria county. It has a municipal airport and is a station on the Chicago-to-Gulf airway; is on Federal highways 24 and 124; and is served by the Big Four, the Burlington Route, the Chicago and Alton, the Chicago and Illinois Midland, the Chicago and North Western, the Illinois Central, the Illinois Traction (electric), the Minneapolis and St. Louis, the Pennsylvania, the Nickel Plate, the Peoria and Pekin Union, the Peoria Terminal, the Rock Island, and the Toledo, Peoria and Western railways; and by river steamboats and motor-bus and truck lines. Pop. (1920) 76,121, 87% native white; estimated by the Census Bureau at 84,500 in 1928. The local estimate for 1928, including contiguous suburbs, was 108,500. The city extends for 8 m. along the river (6,000 ft. across at its widest point) and has an area of 11·5 square miles. The commercial and industrial districts lie on a plain running back 200–5,000 ft. from the river to bluffs 200–400 ft. high, occupied by the residential sections. Peoria lake, the adjacent reaches of the river, its tributary brooks, the wooded bluffs, canyons and waterfalls, provide beautiful scenery in and about the city. The public parks cover 1,450 acres. At the western edge of the city is the 25 ac. campus of Bradley Polytechnic Institute, a co-educational college of arts and sciences (including a school of Horology), founded in 1896 by Mrs. Lydia Bradley, and endowed by her with $2,000,000. There are 3 high and 30 elementary public schools, and 8 parochial schools.

In the heart of the corn belt and of a vast coal-field, with deposits of sand, gravel and gypsum in the immediate vicinity, the centre of a network of railroads and highways, and on the waterway from the Great Lakes to the Gulf, Peoria is a great shipping and distributing point, has a large wholesale and retail trade, and has developed important manufacturing industries. The wholesale and jobbing business is estimated at $30,000,000 annually. The output of the 350 plants in and near the city in 1927 was valued at $212,000,000. Among the principal products are commercial solvents, washing machines, tractors, agricultural implements, furnaces, oil burners, stock feeds and corn products. In the village of East Peoria (pop. 1920, 2,214) is the plant which produced the "caterpillar" tanks used in the World War (now used for farm tractors). The first successful gasolene motor-boat was launched on Lake Peoria; and in the experiment shop of Charles E. Duryea was built the first practicable gasolene engine in the United States. Before the adoption of national prohibition the manufacture of distilled liquors was the city's principal industry. Peoria is the headquarters of the National Swine Show and ships large quantities of fish. The city's assessed valuation of property for 1927 was $88,722,802.

Peoria was named after one of the five tribes of the Illinois Indians. In 1680 La Salle built Ft. Crèvecoeur on the bluffs opposite the present city, but it was destroyed and deserted within the year. A French mission was probably established in the vicinity as early as 1711; and by 1725 there was a settlement of French and half-breeds known by the name of Peoria on the west shore of the lake. This village was abandoned during the Revolution, but another had been founded about 1778, on the present site, by Jean Baptiste Maillet, and was called by his name. In Nov. 1812, about half the town was burned by a company of Illinois militia, sent to build a fort, who alleged that the villagers had fired on their boats. In 1813 Ft. Clark was erected on the site of the old village. It was evacuated in 1818 and soon afterwards was destroyed by the Indians. Peoria was incorporated as a town in 1835 and chartered as a city in 1845. In 1850 it had a population of 5,095. In 1880, and at each succeeding Federal census, it has ranked first among the cities of the State after Chicago.

PEPE, GUGLIELMO (1783–1855), Neapolitan general, born at Squillace in Calabria, took part in 1799 in the republican movement at Naples inspired by the French Revolution; he fought against the Bourbon troops under Cardinal Ruffo, was captured and exiled to France. He entered Napoleon's army and served first under Joseph Bonaparte and later under Joachim Murat. After commanding a Neapolitan brigade in the Peninsular campaign, Pepe returned to Italy in 1813, with the rank of general, to help to reorganize the Neapolitan army. When the news of the fall of Napoleon (1814) reached Italy Pepe and other generals demanded from Murat a constitution. On Napoleon's escape from Elba (1815) Pepe served on Murat's staff in the campaign of 1815. The Neapolitan officers retained their rank under Ferdinand IV. (*q.v.*) who now regained the throne of Naples. While engaged in suppressing brigandage in the Capitanata, Pepe organized the carbonari (*q.v.*) into a national militia, and was preparing to use them for political purposes. He had hoped that the king would grant a constitution, but when that hope failed he meditated seizing Ferdinand, the emperor of Austria, and Metternich, who were expected at Avellino, and thus compelling them to liberate Italy (1819). The scheme broke down, but in 1820 a military revolt broke out. Pepe was sent against the rebels, but while he was hesitating as to what course he should follow Ferdinand promised a constitution (July 1820). A revolt in Sicily having been repressed, Pepe was appointed inspector-general of the army. In the meanwhile the king, who had no intention of respecting the constitution, obtained the loan of an Austrian army with which to restore absolute power. Pepe now took command of the army and marched against the Austrians. He attacked them at Rieti (March 7, 1821), but his raw levies were repulsed. The army was gradually disbanded, and Pepe went into exile, keeping up his connection with the carbonari. In 1848 Pepe returned to Naples, where a constitution had again been proclaimed. He was given

command of the Neapolitan army which was to co-operate with Piedmont against the Austrians, but when he reached Bologna the king recalled him and his troops. Pepe resigned his commission in the Neapolitan service, and crossed the Po with 2,000 volunteers to take part in the campaign. He joined Manin in Venice and took command of the defending army. On the fall of Venice, Pepe and Manin were among those excluded from the amnesty; he again went into exile and died in Turin in 1855.

The story of Pepe's life down to 1846 is told in his own interesting *Memorie* (Lugano, 1847), and his *Narrative of the Events . . . at Naples in 1820 and 1821* (London, 1821); for the later period of his life *see* the general histories of the Risorgimento, and the biographical sketch in vol. ii. of L. Carpi's *Risorgimento* (Milan, 1886)

PEPERINO, an Italian name applied to a brown or grey volcanic tuff, containing fragments of basalt and limestone, with disseminated crystals of augite, mica, magnetite, leucite, etc The typical peperino occurs in the Alban Hills, near Rome, and was used by the ancients, under the name of lapis albanus, as a building stone and for the basins of fountains Other tuffs and conglomerates in Auvergne and elsewhere are also called peperino The name originally referred to the dark coloured inclusions, suggestive of pepper-corns In English the word has sometimes been written peperine

PEPO, the typical fruit of the plants of the gourd family (Cucurbitaceae) consisting of a large, fleshy, berry-like structure with a tough rind and a spongy seedy interior, as in the pumpkin, squash, melon and cucumber (*See* CUCURBITACEAE)

PEPPER, WILLIAM (1843–1898), American physician, was born in Philadelphia on Aug 21, 1843 He was educated at the University of Pennsylvania, graduating from the academic department in 1862 and from the medical department in 1864 In 1868 he became lecturer on morbid anatomy in the same institution and in 1870 lecturer on clinical medicine From 1876 to 1887

FROM BAILLON HISTOIRE DES PLANTES' (H BONNAIRE)

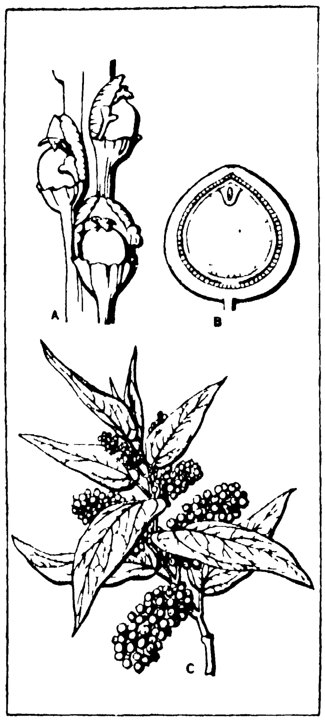
FRUITING BRANCH OF BLACK PEPPER (PIPER NIGRUM)

For black pepper-corns, the berries are gathered before ripe and dried; for white pepper, the outside layer of fruit is removed by maceration

he was professor of clinical medicine, and in 1887 succeeded Dr. Alfred Stillé as professor of theory and practice of medicine. He was elected provost of the university in 1881, resigning in 1894 He is best known for his *System of Medicine* (1885–86). He died on July 28, 1898, at Pleasanton (Calif).

PEPPER, a name applied to several pungent spices known respectively as black, white, long, red or cayenne, Ashanti, Jamaica and melegueta pepper, but derived from at least three different natural orders of plants

Black pepper is the dried fruit of *Piper nigrum* (family Piperaceae), a perennial climbing shrub indigenous to the forests of Travancore and Malabar, from whence it has been introduced into Java, Sumatra, Borneo, the Malay peninsula, Siam, the Philippines and the West Indies It climbs on tree-trunks by roots in the same way as ivy, and from its climbing habit is known as the pepper vine It is one of the earliest spices known to mankind, and for many ages formed a staple article of commerce between India and Europe. Tribute has been levied in pepper; one of the articles demanded in 408 by Alaric as part of the ransom of Rome was 3,000 lb of pepper, and its exorbitant price during the middle ages was one of the inducements which led the Portuguese to seek a sea-route to India. The discovery of the passage round the Cape of Good Hope led (1498) to a considerable fall in the price Pepper remained a monopoly of the Portuguese crown as late as the 18th century. In Great Britain it was formerly taxed very heavily, the impost in 1623 amounting to 5s , and as late as 1823 to 2s 6d per pound.



FROM BAILLON, "HISTOIRE DES PLANTES" (H BONNAIRE)

A HERMAPHRODITE FLOWERS OF BLACK PEPPER (PIPER NIGRUM) B LONGITUDINAL SECTION THROUGH FRUIT OF BLACK PEPPER C FRUITING BRANCH OF THE CUBEBS PEPPER (PIPER CUBEBA)

The largest quantities of pepper are produced in Penang, the island of Riouw and Johore near Singapore. Singapore is the great emporium for this spice in the East, the largest proportion being shipped thence to Great Britain. The varieties of black pepper met with in commerce are known as Malabar, Aleppy or Tellicherry, Cochin, Penang, Singapore and Siam

Pepper owes its pungency to a resin, and its flavour to a volatile oil, of which it yields from 1 6 to 2 2%, it also contains a yellow crystalline alkaloid, called piperine, to the extent of 2 to 8%, which has the same empirical formula as morphine, $C_{17}H_{19}NO_3$, but differs in constitution and properties The only use of black pepper is as a condiment

White pepper differs from black only in being prepared from the ripe fruits These, after collection, are kept in the house three days and then bruised and washed in a basket with the hand until the stalks and pulpy matter are removed, after which the seeds are dried It is, however, sometimes prepared from the dried black pepper by removing the dark outer layer It is less pungent than the black but possesses a finer flavour.

Long pepper is the fruit-spike of *Piper officinarum* and *P longum,* gathered shortly before it reaches maturity, and dried The former is a native of the Indian archipelago; the latter is indigenous in the hotter provinces of India, Ceylon, Malacca and the Malay islands

Ashanti or *West African pepper* is the dried fruit of *Piper Clusii*, a plant widely distributed in tropical Africa, occurring most abundantly in the country of the Niam-niam It differs from black pepper in being rather smaller, less wrinkled, and in being attenuated into a stalk, like cubebs (the dried unripe fruits of *P Cubeba*), to which it bears considerable resemblance externally The taste, however, is pungent, exactly like that of pepper, and the fruit contains piperine It was imported from the Grain Coast by the merchants of Rouen and Dieppe as early as 1364 and was exported from Benin by the Portuguese in 1485 In tropical Africa it is extensively used as a condiment.

Melegueta pepper, known also as "Guinea grains," "grains of paradise" (*q v*) or "alligator pepper," is the seed of *Amomum Melegueta,* a plant of the ginger family (*See* also CAYENNE PEPPER.)

PEPPER-CORN, the fruit or seed of the pepper plant, hence anything very small or insignificant. Pepper-corn rent is a merely nominal rent, reserved for the purpose of having the tenancy acknowledged by the tenant. Building leases frequently reserve a pepper-corn as rent for the first few years. (*See* RENT.)

PEPPER-GRASS, a name given, especially in the United States, to certain species of *Lepidium* (family Cruciferae), which are widely spread as weeds. They are erect, annual herbs with freely branching stems, about ½ to 1½ ft. high, small, toothed or deeply cut leaves, minute white flowers, followed by elongated, cylindrical clusters of small, short-stalked, flattened, nearly round, slightly notched pods. Examples are the wild pepper-grass (*L. virginianum*), with mostly undivided leaves, found in fields from Quebec to Minnesota and southward to Mexico and the West Indies, and also naturalized in southern Europe, and the roadside pepper-grass (*L. ruderale*), with narrowly divided leaves, native to Europe but now naturalized from Nova Scotia to Texas, and occurring also in Australia.

PEPPERMINT, an indigenous perennial herb of the family Labiatae, and genus *Mentha* (*see* MINT), the specific name being *Mentha piperita,* is distinguished from other species of the genus by its stalked leaves and oblong-obtuse spike-like heads of flowers. It is met with, near streams and in wet places, in several parts of England and on the European continent, where—as also in the United States—it is cultivated for the sake of its essential oil. It was, however, only recognized as a distinct species late in the 17th century, when Dr. Eales discovered it in Hertfordshire and pointed it out to Ray, who published it in the second edition of his *Synopsis stirpium britannicarum* (1696). The medicinal properties of the plant were speedily recognized and it was admitted into the *London Pharmacopoeia* in 1721, under the name of *Mentha piperitis sapore.*

Two varieties are recognized by growers, the white and the black mint. The former has purplish and the latter green stems; the leaves are more coarsely serrated in the white. The black is more generally cultivated, probably because it is found to yield more oil, but that of the white variety is considered to have a more delicate odour, and obtains a higher price. The white is the kind chiefly dried for herbalists. When pure the oil is nearly colourless and has an agreeable odour and powerful aromatic taste, followed by a sensation of cold when air is drawn into the mouth. When oil of peppermint is cooled to 4° C it sometimes deposits colourless hexagonal prisms of menthol, $C_{10}H_{20}O$, which are soluble in alcohol and ether, almost insoluble in water, and fusible at 92° F; the oil consists chiefly of menthol and a terpene called menthene, $C_{10}H_{18}$. Oil of peppermint is often adulterated with a third part of rectified spirit, which may be detected by the milkiness produced when it is agitated with water. Oil of rosemary and rectified oil of turpentine are sometimes used for the same purpose.

FROM BAILLON, "HISTOIRE DES PLANTES" (H. BONNAIRE)

PEPPERMINT (MENTHA PIPERITA), SHOWING (A) SINGLE FLOWER, (B) LONGITUDINAL SECTION THROUGH FLOWER (A AND B ENLARGED)

Peppermint oil is largely distilled at Canton, a considerable quantity being sent to Bombay, also a large quantity of menthol. The species cultivated in the neighbourhood of Canton, is *Mentha arvensis,* var. *glabrata.* In Japan also the distillation of oil of peppermint forms a considerable industry, the plant cultivated being *M. arvensis,* var. *piperascens.* The oil, under the name of *hakka no abura,* is exported from Hiogo and Ozaka, but is said to be frequently adulterated. The menthol is obtained by subjecting the oil to a low temperature, when it crystallizes out and is separated. The two varieties of *M. arvensis* just named yield much more menthol than *M. piperita.*

Since about 1900 the United States has been an important producer of peppermint oil. Production on a large commercial scale was first attained in southern Michigan. Shortly after the World War peppermint culture was extended to northern Indiana, the two States producing in 1925 more than three-fourths of the world's supply of true peppermint oil.

The volatile oil of *Mentha piperita* is a valuable and widely used drug. Its chief constituents are menthol and menthene, which is a liquid terpene. The British Pharmacopoeia contains two preparations of this oil, the *Aqua menthae piperitae* and the *Spiritus menthae piperitae.* The oil has the characters of its class, with certain special features. Its local anaesthetic action is exceptionally strong, and is also powerfully antiseptic. These properties make it valuable in the relief of toothache and also in certain forms of dyspepsia and in colic generally, "soda-mint lozenges" being a familiar form. The characteristic anti-spasmodic action of the volatile oils is perhaps more marked in this than in any other oil, and greatly adds to its power of relieving pains arising in the alimentary canal.

PEPPERRELL, SIR WILLIAM (1696–1759), American soldier, was born in Kittery, Me., then a part of Massachusetts, on June 27, 1696. He studied surveying and navigation, and joined his father in his ship-building, fishing and general trading business, quickly becoming one of the wealthiest and most influential men in the province. He was commissioned captain (1717), major, lieutenant-colonel, and in 1726 colonel of militia. Pepperrell served in the Massachusetts general court (1726–27), and in the governor's council (1727–59), of which for 18 years he was president. Although not a trained lawyer, he was chief justice of the court of common pleas from 1730 until his death. In 1745 he was commander-in-chief of the New England force of about 4,000, which, with the assistance of a British squadron under Commodore Peter Warren, besieged and captured the French fortress of Louisburg, the garrison of which surrendered on June 16, Pepperrell and Warren taking possession on the following day. For his services Pepperrell, in Nov. 1746, was created a baronet —the only New Englander so honoured. He was active in raising troops during the "French and Indian War," and received the rank of lieutenant general in Feb. 1759. He died in Kittery, Me., on July 6, 1759.

See Usher Parsons, *Life of Sir William Pepperrell, Bart.* (Cambridge, Mass., 1855), based on the family papers; L. Dame, "Life and Character of Sir William Pepperrell," *Essex Inst. Hist. Coll.,* vol. xxi., pp. 161–176 (1884); "The Pepperrell Papers," *Mass. Hist. Soc. Coll.,* ser. 6, vol. x. (1899); Charles Henry Lincoln (Ed.), *The Journal of Sir William Pepperrell Kept During the Expedition Against Louisbourg* (1910); and John Francis Sprague, sketch in *Three Men from Maine* (1924).

PEPPER TREE, a tree which has no proper connection with the true pepper (*Piper*), and is really a member of the family Anacardiaceae, being known botanically as *Schinus Molle,* from the Peruvian name *Mulli.* It is a native of tropical South America and is grown in the open air in the south of Europe. Introduced into California, it became widely popular as an ornamental tree, but

later it was found to be a host plant for scale insects very destructive to orange orchards, with the result that in citrus districts the trees were cut down and further plantings discouraged. It is a small tree with unequally pinnate leaves, filled with volatile oil stored in large cells or cysts, which are visible to the naked eye and appear like holes when the leaf is held up to the light. When the leaves are thrown upon the surface of water the resinous or oily fluid escapes with such force as violently to agitate them. The flowers are small, whitish, arranged in terminal clusters and polygamous or unisexual, with five sepals, as many petals, ten stamens (as large as the petals in the case of the male flower, very small in the female flower, but in both springing from a cushion-like disk surrounding the base of the three-celled ovary).

The fruit is a small, globose, pea-like drupe with a bony kernel enclosing a single seed; its fleshy portion has a hot aromatic flavour from the abundance of the resin it contains. The resin is used for medicinal purposes by the Peruvians, and has properties similar to mastic. The very similar Christmas-berry-tree (*S. terebinthifolius*), native to Brazil, with stiffer, less pendulous branches, more densely clustered flowers and smaller, bright red fruit, is sparingly planted for ornament. The Japan pepper tree is *Zanthoxylum piperitum* the fruits of which have also a hot taste. Along the Riviera the tree known as *Melia Azedarach* or the "Pride of India," is sometimes also incorrectly called the pepper tree.

PEPSIN, an enzyme or ferment obtained by drying the mucous lining of the fresh and healthy stomach of a pig, sheep or calf. As used it is a light yellow-brown or white powder, or pale yellow, translucent grains or scales. It is only slightly soluble in water and alcohol. Pepsin digests proteins and is used to help gastric digestion in old people and those in whom there is a deficient secretion of the gastric juice. It is useful in chronic catarrhal conditions of the stomach, the dyspepsia of alcoholism, and in gastric ulcer and cancer of the stomach. Many varieties of proprietary peptonizing tablets are on the market and are convenient for the preparation of peptonized milk. Predigested foods should not be used over a long period or the digestive functions of the stomach may atrophy from disuse.

Pancreatic solution, derived from the pig's pancreas digested in alcohol, has the power of converting starch into sugar from the presence of the enzyme amylopsin, and albumen and fibrin into peptones from the presence of trypsin. It only acts in an alkaline medium and at a temperature under 140° F. If used to peptonize milk sodium bicarbonate should be added. Many commercial preparations are on the market.

PEPUSCH, JOHN CHRISTOPHER (1667–1752), English musician, of German parentage, was born in Berlin. He was for many years musical director at Lincoln's Inn Fields theatre, and arranged the tunes and composed the overture for Gay's *Beggar's Opera,* doing the like later for its sequel, *Polly.* In 1737 he became organist of the Charterhouse. His later years were spent in study, in the composition of chamber music and some admirable motets, and in teaching some favoured pupils, among these being Boyce. Pepusch died on July 20, 1752. His *Treatise on Harmony* (anonymous 1st ed. 1730) is believed to have been an embodiment of his rules drafted by his pupil, Viscount Paisley, afterwards earl of Abercorn.

PEPYS, SAMUEL (1633–1703), English diarist, was born on Feb. 23, 1633, in a house in Salisbury Court, close to St. Bride's Churchyard, where his father, John Pepys, carried on the business of a tailor. The family can be traced in Cambridgeshire as far back as the reign of Edward I. They rose by slow degrees from the class of small copyholders and yeoman farmers to the position of gentry. In 1563 they had a recognized right to use a coat of arms. The name was pronounced in the 17th century, and has always been pronounced by the family, "Peeps." John Pepys was a younger son, who, like other gentlemen in his position in that age, went into trade. He married Margaret Kight, "washmaid to my Lady Veere," whose brother William was a butcher in Whitechapel. This was regarded as a *mésalliance,* for Samuel refers to his mother's relations with a certain disrespect. In 1661 John Pepys inherited a small estate at Brampton near Huntingdon, where he died in 1680, his wife having predeceased him in 1667.

Samuel was fifth child and second son of a large family, all of whom he survived. His first school was in Huntingdon, but he was afterwards sent to St. Paul's in London, where he remained till 1650. On June 21 in that year he was entered at Trinity Hall, Cambridge, but migrated to Magdalene as a sizar on Oct. 1. On March 5, 1651, he went into residence, obtaining a Spendluffe scholarship a month after entering, and one on Dr. John Smith's foundation on Oct. 4, 1653. In March, 1654, he proceeded to the B.A. degree, and in 1660 to that of M.A. Nothing is known of his university career except that on Oct. 21, 1653, he was publicly admonished with another undergraduate for having been "scandalously overseene in drink." At Cambridge he wrote a romance, *Love is a Cheat,* which he afterwards destroyed.

On Dec. 1, 1655, he was married at St. Margaret's Church, Westminster, to Elizabeth, daughter of Alexander Marchant, Sieur de St. Michel, a French Huguenot exile from Anjou who had married an English lady named Kingsmill. Pepys had at this time no independent means, and probably relied on his relatives, the Mountagus, to provide for him. On March 26, 1658, he was cut for the stone, an event which he always kept in memory by a solemn anniversary. In 1659 he went as secretary with his kinsman, Edward Mountagu, afterwards Earl of Sandwich, on a voyage to the Sound. On his return he was engaged as a clerk under Mr. (afterwards Sir Edward) Downing, one of the four Tellers of the Exchequer. In 1660 he accompanied Mountagu when he commanded the fleet which brought King Charles II. back from exile. In that year, by the interest of his kinsman, he was appointed clerk of the acts in the Navy Office, but was compelled to buy off a competitor, one Barlow, with an annuity of £100. Though he was so ignorant of business that he did not even know the multiplication table when he first took office, he soon mastered the needful mechanical details by working early and late. He had other posts and honours, which came to him either as consequential on his Clerkship, or because he was a useful official.

The Official.—On July 23, 1660, he was appointed a clerk of the privy seal, but he resigned the office on Aug. 17, 1662. On Sept. 24, 1660, he was made a justice of the peace. In 1662 he was appointed a Younger Brother, and in 1672 an Elder Brother of the Trinity House. In 1662 also he was named a commissioner for managing the affairs of Tangier, then occupied by an English garrison. In 1664 he became a member of the corporation of the Royal Fishery, and in 1665 was appointed treasurer for Tangier. In that year also he was elected a Fellow of the Royal Society.

During the naval war with Holland (1665–67) he proved himself an indefatigable worker. As surveyor of victualling, the whole burden of a most important department was thrown on him in addition to his regular duties. While the plague was raging in London in 1666 he remained at his post when many of his colleagues ran away, and he manfully avowed his readiness to take the risk of disease, as others of the King's servants faced the dangers of war. He had now gained the full confidence of the lord high admiral, the Duke of York, afterwards King James II. When, on the termination of the war, the navy office was violently attacked in Parliament, he was entrusted with its defence. The speech which he delivered at the bar of the House of Commons on March 5, 1668, passed for a complete vindication. The charges of mismanagement were well founded, but the fault was not in the officials of the navy office only, and Pepys, who was master of the details, had no difficulty in making out a defence.

Nobody indeed was better acquainted with the defects of the Office, for in 1668 he drew up for the Duke of York two papers of inquiry and rebuke, "The Duke's Reflections on the several Members of the Navy Board's Duty" and "The Duke's answer to their several excuses." (*See* Pepysian mss. at Magdalene, No. 2242 and Harleian mss. 8003.) In 1668 he went for a fortnight's tour in the west of England, and in 1669 he and his wife travelled in Holland and France. His success in addressing Parliament gave him the ambition to become a member of the House of Commons. He stood for Aldeburgh, but the death of his wife,

on Nov. 10, 1669, prevented him from conducting his canvass in person, and he was not elected. In 1673 he was, however, returned for Castle Rising. The validity of his election was questioned by his opponent, Mr. Offley, and the committee of privileges decided against him, but the prorogation of the House prevented further action.

The no-popery agitation was now growing in strength. The Duke of York was driven from office by the Test Act, and Pepys was accused of "popery," partly on the ground that he was said to keep a crucifix and altar in his house, partly because he was accused of having converted his wife to Roman Catholicism, but the charges broke down on examination. In 1673 Pepys was transferred by the King from the navy office to the secretaryship of the admiralty. In 1679 he was member for Harwich, and in the height of the Popish Plot mania he was accused, manifestly because he was a trusted servant to the Duke of York, of betraying naval secrets to the French. He resigned office on May 21, 1679, and on the following day he was committed to the Tower, but he was released on bail on July 9, and in the following February the charges against him were finally dropped.

In October 1680 he was with the king at Newmarket, and took down the narrative of his escape after the battle of Worcester. In 1676 Pepys had been appointed a governor of Christ's Hospital and was elected Master of the Trinity House, and in 1677 he became Master of the Clothworkers Company. A proposal to make him Provost of King's College, Cambridge, in 1681, came to nothing. In 1682 he accompanied the Duke of York to Scotland, and in 1683–84 he was engaged in arranging for the evacuation of Tangier. He visited the place and kept a diary of his voyage, and of a subsequent tour in Spain. In 1684 he was elected president of the Royal Society.

When the Admiralty Commission of 1679 was dissolved in 1684, Pepys was restored to the secretaryship of the admiralty, and he retained the office when James II. ascended the throne. His chief work during this period was the establishment of the Special Commission of 1686 "for the recovery of the navy," by which its impaired efficiency was entirely restored. In 1685 he again sat in Parliament as member for Harwich, and in the same year he was for a second time Master of the Trinity House. The Revolution of 1688 ended his official career. He was dismissed on March 9, 1689, and spent the rest of his life in retirement, and, except for two brief imprisonments in 1689 and in 1690 "on suspicion of being affected to King James," in peace. He died at his friend William Hewer's house in Clapham on May 26, 1703, in the 71st year of his age.

His last years were passed in correspondence with his friends, who included Evelyn and Dryden, or in arranging his valuable library. This was left on his death to his nephew, John Jackson, son of his sister Paulina, and in 1724, by the terms of his will, was transferred to Magdalene College, Cambridge, where it is still preserved.

The Diary.—Such was the outward and visible life of Samuel Pepys, public servant, whose diligence was rewarded by success. The other Pepys, whom Sir Walter Scott called "that curious fellow," was revealed in 1825, when his secret diary was partly published. The first entry was made on Jan. 1, 1660, the last on May 31, 1669, when the increasing weakness of his eyes, which had given him trouble since 1663, compelled him to cease writing in the conditions he imposed upon himself. If there is in all the literature of the world a book which can be called "unique" with strict propriety, it is this. Confessions, diaries, journals, autobiographies abound, but such a revelation of a man's self has not been discovered. The diary is a thing apart by virtue of three qualities which are rarely found in perfection when separate and nowhere else in combination. It was secret; it was full; and it was honest. That Pepys meant it for his own eye alone is clear. He wrote it in Shelton's system of tachygraphy, published in 1641, which he complicated by using foreign languages or by varieties of his own invention whenever he had to record the passages least fit to be seen by his servants, or by "all the world." Relying on this cypher, he put down whatever he saw, heard, felt or imagined, every motion of his mind, every action of his body, and he noted all this, not as he desired it to appear to others, but as it was to his seeing.

The result is "a human document" of amazing vitality. The style is as peculiar as the matter—colloquial, garrulous, racy from simplicity of language, and full of the unconscious humour which is never absent from a truthful account of the workings of nature in the average man. To his credit must be put the facts that he knew the animalism and the vice of the Restoration period to be what they were; that he had a real love of music, and gave help to musicians, Cesare Morelli, for instance; that though he made money out of his places he never allowed bad work to be done for the navy if he could help it; that he was a hard worker; and that he had a capacity for acts of kindness and generosity.

The diary, written in shorthand in 6 volumes, was included among his books at Magdalene. On the publication of Evelyn's diary in 1818, the then master of Magdalene, the Hon. and Rev. George Neville, decided to publish Pepys's. The library contained both the short and the longhand copy of Pepys's account of King Charles's adventures, but its contents were so little known by the curators that this key was overlooked. The ms. was deciphered between 1819 and 1822, by John Smith, afterwards rector of Baldock in Hertfordshire. The first and partial edition, edited by Richard Griffin Neville, third Lord Braybrooke, appeared in 1825. It attracted great attention, and was reviewed by Sir Walter Scott in the *Quarterly* for January 1826. A second edition followed in 1828. A third and enlarged edition appeared in 1848–49, and a fourth in 1854. A still fuller edition was published in 1875–79 by Dr. Mynors Bright. Finally, in 1893–99 Dr. H. B. Wheatley printed the whole of the diary with the exception of a few unprintable passages. Pepys's only known publication in his life was the *Memoires of the Royal Navy* (1690).

PER-ACIDS, that is, acids which have oxidising powers in virtue probably of an oxygen atom linked to a hydroxyl group thus: $-O-OH$, are described under the corresponding element, *e.g.*, persulphuric acid under SULPHUR.

PERCEVAL, the hero of a comparatively small but highly important group of romances, now forming part of the Arthurian cycle. Originally the story of Perceval was of the character of a folktale, and that one of considerable importance and worldwide diffusion. He is represented as the son of a widow, *"la dame veuve,"* his father having been slain, in battle or tourney, either immediately before or shortly after his birth. The mother, fearful lest her son should share his father's fate, flies to the woods, either with one attendant or with a small group of faithful retainers, and there brings up her son in ignorance of his name and parentage, and all knightly accomplishments. The youth grows up strong, swift-footed, and of great personal beauty, but, naturally, of very limited intelligence. He spends his days chasing the beasts of the forest.

As the result of a chance meeting with a party of knights he determines to set forth into the world in search of knighthood. He comes to Arthur's court, where he creates a sensation by his personal beauty and uncouth behaviour. He succeeds, by a cast of his javelin, in slaying the Red Knight, a foe of Arthur's who

has vainly challenged the knights of the Round Table, and clothing himself in his armour, sets out on a series of adventures which differ in the various versions, but the outcome of which is that he becomes a skilful knight, and regains the heritage of his father.

This, the *Perceval* story proper, has been recognized by scholars as the variant of a widespread folk-tale theme, designated by J. G. von Hahn as *the Aryan Expulsion and Return Formula*, which counts among its representatives such heroes as Perseus, Cyrus and Romulus and Remus. This particular variant appears to be of British-Celtic origin, and the most faithful representative of the original tale is now very generally held to be the English *Syr Percyvelle of Galles,* a poem preserved in the Thornton ms. of Lincoln cathedral library. Here the hero is nephew to Arthur on the mother's side, and his father, of the same name, is a valiant knight of the court. A noticeable feature of the story is the uncertainty as to the hero's parentage; the mother is always a lady of rank, a queen in her own right, or a sister of kings, but the father's rank varies, he is never a king, more often simply a valiant knight, and never of equal rank with his wife.

The connection of the story with Arthur and his court brought about an important development, the precise steps of which are not yet clear. Perceval became the hero of the Grail Quest, ousting Gawain, to whom the adventure originally belonged, and the *Perceval* became merged in the *Grail* tradition. Of the *Perceval-Grail* romances the oldest, from the point of view of ms. preservation, is the *Perceval* or *Conte del Graal* of Chrétien de Troyes, but as Chrétien had already, in a previous poem (*Cligés*), referred to Perceval as *"un vassal de grant renon,"* and states at the commencement of the *Conte del Graal* that he is about to "rimoier" the best tale told in a royal court, it is quite clear that, contrary to the theory of Foerster and Golther, Perceval is no invention of Chrétien's, but was already a popular hero. Unfortunately the *Perceval* was left unfinished, so we are without a guide (which the conclusion might have afforded) to the precise character of Chrétien's source, and the three writers, Wauchier de Denain, Gerbert and Manessier, who eventually carried the story to a conclusion, differ widely from each other, and were clearly familiar with divergent traditions. An interesting problem is that of the relation between Chrétien's poem and the *Parzival* of Wolfram von Eschenbach, which was long held to be a translation from the French poem, in spite of the fact that Wolfram himself asserts that his source was the work of a certain Kiot, and that Chrétien has told the story wrong. A fragment attached to two of the Chrétien mss. relates the birth and parentage of the hero, the death of his father, and flight of the mother (details only alluded to by Chrétien) in a manner which corresponds curiously with the German poem, and which, taken in connection with the knowledge, on the part of other writers, of features peculiar to the *Parzival,* would indicate that Wolfram was right, and that the two works are independent derivations from a common source.

We have also two prose versions of the *Perceval* story, the older, contained in two mss. only, is attributed to Robert de Borron, and forms the final section of his trilogy, concluding with a version of the death of Arthur, manifestly derived from a rhyming chronicle, akin to but not identical with that of Wace. The second romance, the *Perlesvaus,* obviously knew, and used, this text, but it is a much longer and more complicated romance, relating the adventures of Gawain, Lancelot and Perceval (Perlesvaus) in quest of the Grail. It probably formed at one time the *Quest* section of the prose *Lancelot,* and was later displaced in favour of the Galahad version. In fact two Paris mss. retain its opening adventure as introductory to the Galahad *Queste,* and in the early printed editions the two are found together. It was in all probability composed towards the close of the 12th century by a Welsh monk of Glastonbury, and was apparently designed to exploit the discovery of the tombs of Arthur and Guenevere in that abbey.

The exact position of the Welsh *Mabinogi, Peredur, son of Evrawc,* is still a matter of debate. It certainly contains incidents which are found in Chrétien, but there is also much which is obviously of Welsh and folk-lore origin. The theory that it is a mere translation of the French poem must be rejected, but its exact relation, with that of other *Mabinogion* to the parallel French versions is uncertain. (*See* also GRAIL, THE HOLY; WAGNER, RICHARD.)

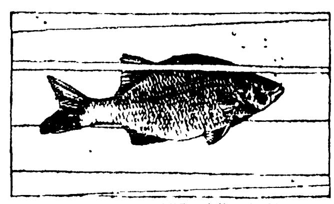
PERCEVAL, SPENCER (1762–1812), prime minister of England from 1809 to 1812, second son of John, 2nd earl of Egmont, was born in Audley Square, London, on Nov. 1, 1762. He was educated at Harrow and at Trinity College, Cambridge, and was called to the bar at Lincoln's Inn in 1786, becoming K.C. in 1796. Entering parliament for Northampton in 1796, he supported the administration of Pitt. In 1801, on the formation of the Addington administration, he was appointed solicitor-general, and in 1802 he became attorney-general. An ardent opponent of Catholic Emancipation, he delivered in 1807 a speech on the subject which helped to destroy the Grenville administration; he then became chancellor of the exchequer under the duke of Portland, whom in 1809 he succeeded in the premiership. Perceval retained office till he was shot by a madman named Bellingham, a bankrupt with a grievance, who had vainly applied to him for redress, in the lobby of the House of Commons on May 11, 1812. Bellingham was certainly insane, nevertheless he was hanged.

See Spencer Walpole, *Life of Spencer Perceval* (1874), and P. Treherne, *Spencer Perceval* (1909).

PERCH, a fresh-water fish (*Perca fluviatilis*), generally distributed over Europe, northern Asia and North America, and a type of the *Percidae,* a family of spiny-rayed fishes. It inhabits rivers and lakes, but thrives best in waters with a depth of over 3ft.; in large lakes it frequently descends to 50 fathoms and more. It occurs in Scandinavia as far north as the 69th parallel.



BY COURTESY OF THE N Y. ZOOLOGICAL SOCIETY

THE WHITE PERCH (MARONE AMERICANA), ONE OF 125 SPECIES

The species exhibits many variations in shape, some specimens being high-backed, others low and long-bodied. A rich greenish-brown with golden reflections covers the back and sides, which are ornamented with five or seven dark cross-bands. A large black spot occupies the membrane between the last spines of the dorsal fin; and the ventral, anal and lower part of the caudal are bright vermilion. The perch is carnivorous and most voracious.

Perch are good, wholesome food, and highly esteemed in inland countries. The perch is exceedingly prolific; it begins to spawn when three years old, in April or in the first half of May, depositing the ova, which are united by a viscid matter in lengthened or net-shaped bands, on water plants. Other members of the *Percidae* are the pope (*q.v.*) and the pike-perch (*q.v.*).

See C. Tate Regan, *British Fresh Water Fishes.*

PERCHE, a region of France extending over the departments of Orne, Eure, Eure-et-Loir and Sarthe. Its boundaries are Normandy north and west, Maine south-west, Vendômois and Dunois south, Beauce east, and Thimerais on the north-east. The greater part of the district is occupied by a semicircle of heights (from 650 to 1,000 ft) stretching from Moulins-la-Marche to Montmirail; within the basin formed thereby lie the chief towns—Mortagne, Nogent-le-Rotrou and Bellême. Stock-raising and dairy-farming flourish in the Perche, which is famous for the production of a breed of large horses. Cider-apples and pears are grown. In the middle ages the Perche constituted a countship of which Corbon, Mortagne and Nogent-le-Rotrou were successively the capitals. Under the *ancien régime* it formed, together with Maine, a *gouvernement* of which Mortagne was the capital

PERCIVAL, JAMES GATES (1795–1856), American poet, philologist, and geologist, was born in Berlin (Conn.), on Sept. 15, 1795. Few Americans have been so versatile or so eager in the acquisition of learning. He was a graduate of Yale, a practising physician, an editor, a linguist who knew ten languages and who did important work on *Webster's Dictionary*, a prolific poet,

assistant surgeon and lecturer on chemistry at West Point, a botanist, State geologist of Connecticut (1833–42) and of Wisconsin from 1854 until his death at Hazel Green, May 2, 1856.

See his *Poetical Works* (1859) with a biographical sketch by L. W. Fitch; J. H. Ward, *Life and Letters of James Gates Percival* (1866).

PERCY (Family). This family, whose deeds are so prominent in English history, was founded by William de Perci (*c.* 1030–1096), a follower of the Conqueror, who bestowed on him a great fief in Yorkshire and Lincolnshire. The register of Whitby Abbey, which he founded anew, and in later days the heralds, were responsible for the fabulous origin and pedigree of the family. By Emma, daughter of Hugh de Port, a great Hampshire baron, William was father of several sons, of whom Alan the eldest succeeded him. His grandson William was the last of the house in the direct line, and left two sisters and coheiresses, Maud countess of Warwick, who died childless, and Agnes. Agnes de Perci had married Josceline, styled "brother of the queen" (*i.e.*, Adeliza of Louvain, second wife of Henry I.), whose legitimacy has been questioned, and from this marriage descended the second house of Percy (which name it assumed), till its own extinction in the male line five centuries later (1670). By it was brought into the family the great Petworth estate in Sussex, which Josceline had obtained from his sister, who was holding Arundel and its fief. His son Richard (*c.* 1170–1244) and Richard's nephew William (*c.* 1183–1245) were among the barons who rose in arms against John, but the latter made his peace with Henry III., and had his lands restored to him. Richard de Percy was one of the twenty-five barons appointed to enforce the observance of Magna Carta.

Henry de Percy (*c.* 1272–1315), William's grandson, was one of Edward I.'s most active agents in the subjugation of Scotland till the success of Robert Bruce drove him out of Turnberry Castle, and made him withdraw into England. Percy strengthened his position in the north of England by purchasing lands from Anthony Bek, bishop of Durham, among which was the honour of Alnwick, the principal seat of the family ever since.

Henry's son, another Henry (*c.* 1299–1352), did splendid service to his sovereign by defeating and taking prisoner David II., king of Scotland, at the battle of Neville's Cross (1346).

To him succeeded another Henry Percy (1322–1368), a feudal baron like his predecessors, who fought at Crécy during his father's lifetime and whose brother Thomas Percy (1333–1369) was bishop of Norwich from 1356 to 1369. Henry Percy, 1st earl of Northumberland, father of the famous Hotspur, Sir Henry Percy (*q.v.*), was killed at Bramham Moor in 1408, while in arms against the king, and his title and estates were forfeited. But, by an act no less gracious than politic, Henry V. restored them in 1414 to this earl's grandson, Henry (1394–1455), then a prisoner with the Scots, whose liberation he procured from the duke of Albany during the time of James I.'s captivity. From that day the loyalty of the family to the house of Lancaster was steadfast and undeviating. The 2nd earl died fighting for Henry VI. at the first battle of St. Albans in 1455; the 3rd, Henry (1421–1461), was slain on the bloody field of Towton; the 4th, Henry (1446–1489), was killed in quelling an insurrection in the time of Henry VII. So strong was the Lancastrian feeling of the family that even Sir Ralph Percy (1425–1464), a brother of the earl who fell at Towton, though he had actually submitted once to Edward IV., turned again, and when he fell at Hedgley Moor in April 1464 consoled himself with the thought that he had, as he phrased it, "saved the bird in his bosom."

No wonder, then, that in Edward IV.'s days the title and estates of the family were for a time taken away and given to John Neville Lord Montagu, brother of Warwick the king-maker. But the north of England was so accustomed to the rule of the Percys that in a few years Edward saw the necessity of restoring them, and did so even at the cost of alienating still further the powerful family of the Nevilles, who were then already on the point of rebellion.

A crisis occurred in the fortunes of the family in the reign of Henry VIII. on the death of Henry, the 6th earl (*c.* 1502–1537), whose brothers Sir Thomas and Sir Ingelram Percy, much against his will, had taken part in the great insurrection called the Pilgrimage of Grace. The title was forfeited on his death, and was granted by Edward VI. to the ambitious John Dudley, earl of Warwick, who was attainted in the succeeding reign.

It was restored under Queen Mary to Thomas Percy (1528–1572), a nephew of the 6th earl, who was one of the three earls who took the lead in the celebrated rising of 1572, and was beheaded at York. His brother Henry (*c.* 1532–1585), who succeeded him, was no less unhappy. Involved in Throgmorton's conspiracy, he was committed to the Tower of London, and was found shot in bed there. His son, Henry (1567–1632), the next earl, suffered like his two predecessors for his Catholicism. The Crown lawyers sought in vain to implicate him in the Gunpowder Plot, but he was imprisoned for fifteen years in the Tower and compelled to pay a fine of £30,000. Algernon (1602–1668), the son who next succeeded, was a parliamentary general in the Civil War. The male line of this illustrious family became extinct, at least in the direct line, in 1670 about five hundred years after the marriage of Agnes de Perci with Josceline of Louvain.

The last earl's daughter Elizabeth, a great heiress, was mother by Charles Seymour, 6th duke of Somerset, of Algernon, 7th duke, who was summoned (in error) as Lord Percy in 1722 and created earl of Northumberland in 1749. On the duke's death in 1750 his earldom of Northumberland passed under a special remainder, with the main inheritance of the Percys, to Sir Hugh Smithson, bart. (1715–1786), who had married his daughter and eventual heiress in 1740, and was created duke of Northumberland and Earl Percy in 1766. From this marriage descends the present ducal house, which bears the name of Percy in lieu of Smithson.

See E. B. De Fonblanque, *Annals of the House of Percy* (1887), and G. Brenan, *History of the House of Percy* (edited by W. A. Lindsay, 1902), both somewhat adulatory and needing critical revision; Tate, *History of Alnwick* (1866); Hartshorne's paper on the Percys and their Castles in the Newcastle volume of the *Archaeological Institute* (1852); E. A. Freeman, "The Percy Castles" (1875) in *English Towns and Districts;* G. T. Clark, *Medieval Military Architecture* (1884); G. E. C(okayne), *Complete Peerage* (1895), vol. vi.; Bishop Percy, *Northumberland Household Book*. *See* also the article *Northumberland, Earls and Dukes of.*

PERCY, SIR HENRY, called Hotspur (1364–1403), eldest son of Henry, 1st earl of Northumberland, was born on March 20, 1364. He saw active service when he was fourteen at the siege of Berwick. His zeal in border warfare won the name of Hotspur for him from his opponents. In 1386 he was sent to Calais, and raided French territory, but was shortly afterwards recalled to defend England against a naval attack by France. In popular story and ballad he is known as one of the heroes of Otterburn or Chevy Chase. In the summer of 1388 the Scots invaded England by way of Carlisle, sending a small body under the earls of Douglas, Mar and Moray to invade Northumberland. The earl of Northumberland remained at Alnwick, but sent his sons Sir Henry and Sir Ralph against the enemy. In hand-to-hand fighting before the walls of Newcastle, Douglas is said to have won Sir Henry's pennon, which he swore to fix upon the walls of Dalkeith. The Scots then retreated to Otterburn, where Percy, who was bent on recovering his pennon, attacked them on a fine August evening in 1388. Douglas was slain in the battle, though not, as is stated by Walsingham, by Percy's hand: Henry Percy was captured by Sir John Montgomery, and his brother Ralph by Sir John Maxwell. Hotspur was released on the payment of a heavy ransom, to which Richard II. contributed £3,000, and in the autumn his term as warden of Carlisle and the West March was extended to five years. In 1399 together with his father he joined Henry of Lancaster. Henry IV. gave the charge of the West March to Northumberland, while Henry Percy received the castles of Bamburgh, Roxburgh and Berwick, and the wardenship of the East March, with a salary of £3,000 in peace time and £12,000 in war. During the first year of Henry's reign Hotspur was appointed justiciar of North Wales and constable of the castles of Chester, Flint, Conway, Denbigh and Carnarvon. Henry also gave him a grant of the island of Anglesey, with the castle of Beaumaris. William and Rees ap Tudor captured Conway Castle on April 1, 1401, and Percy in company with the prince of Wales set out to recover the place, Percy pro-

viding the funds. In May he reported to the king the pacification of Merioneth and Carnarvon, and before the end of the month Conway was surrendered to him. His demands for arrears of pay were, however, refused, and he had the same difficulty in obtaining money for his northern charge that he had experienced in Wales. Anglesey was taken from him, and he was deprived of Roxburgh Castle in favour of his rival, the earl of Westmorland The Scots again invaded England in the autumn of 1402, headed by the earl of Douglas and Murdoch Stewart, son of the duke of Albany, but were heavily defeated by Northumberland and Hotspur at Humbledon, or Homildon Hill, on Sept 14 Disputes with the king arose over the disposal of the Scottish prisoners, Percy insisting on his right to hold Douglas as his personal prisoner, and he was summoned to court to explain It is related that when he arrived Henry asked for Douglas, and Hotspur demanded in return that his brother-in-law, Edmund Mortimer, should be allowed to ransom himself from Owen Glendower, with whom he was a prisoner High words followed, in the course of which Henry called Percy a traitor, struck him on the face, and drew his sword on him. Percy is said to have answered this defiance with the words, "Not here, but on the field." This was late in 1402, and in 1403 Hotspur issued a proclamation in Cheshire stating that Richard II was alive, and summoning the inhabitants to his standard He was joined by Douglas, Glendower, and Thomas, Earl of Worcester, who together proclaimed the young earl of March king When he arrived at the Castle Foregate, Shrewsbury, early July 21, and demanded provisions, he found the king's forces had arrived before him He retired in the direction of Whitchurch, and awaited the enemy about 3½ m from Shrewsbury After a long parley, the Scottish earl of March, fighting on the royal side, forced on the battle in the afternoon, the royal right being commanded by the prince of Wales Hotspur was killed, the earls of Douglas and Worcester, Sir Richard Venables of Kinderton, and Sir Richard Vernon were captured, and the rebel army dispersed Worcester, Venables and Vernon were executed the next day Percy's body was buried at Whitchurch, but was disinterred two days later to be exhibited in Shrewsbury The head was cut off, and fixed on one of the gates of York

See NORTHUMBERLAND, EARLS AND DUKES OF, and PERCY (FAMILY). Also *Chronique de la traison et mort de Richard II*, ed B Williams (Eng Hist Soc, 1846); J Creton, *Histoire du roy Richard II*, ed John Webb, in *Archaeologia* (xx, 1824), and Adam of Usk's *Chronicon*, 1377–1404, ed E M Thompson (1876), the authorities are cited in detail in J H Wylie's *England under Henry IV* (1884–98), and Sir J H Ramsay's *Lancaster and York* (Oxford, 1892) Holinshed's *Chronicle* was the chief source of Shakespeare's account of Hotspur in *Henry IV*.

PERCY, THOMAS (1729–1811), bishop of Dromore, editor of the *Percy Reliques*, was born at Bridgnorth on April 13, 1729 He studied at Christ Church, Oxford, and in 1753 became vicar of Easton Maudit, Northamptonshire, and in 1756 rector of Wilby in the same county, benefices which he retained until 1782 At Easton Maudit most of the literary work for which he is now remembered—including the *Reliques*—was completed When his name became famous he was made domestic chaplain to the duke and duchess of Northumberland, and was tempted into the belief that he belonged to the illustrious house of Percy Through his patron's influence he became dean of Carlisle in 1778 and bishop of Dromore in Ireland in 1782 He died on Sept 30, 1811 He and his wife (Anne Gutteridge) lie buried in the transept which Percy added to Dromore Cathedral The *Reliques of Ancient English Poetry* (1765) was based on an old manuscript collection of poetry, rescued by Percy in Humphrey Pitt's house at Shifnal, Shropshire, from the hands of the housemaid who was about to light the fire with it. The manuscript was edited in incomplete form by J W Hales and F J Furnivall in 1867–1868 His influence on Scott and the Romantics was very great

Percy's other works include editions of the poems of the Earl of Surrey (1763) and of the *Household Book* of the duke of Northumberland in 1514, a translation of Mallet's *Northern Antiquities* (1770). *See* his *Life* by Miss Gaussen (1908) *See* A C C Gaussen, *Percy: Prelate and Poet* (1908) The *Reliques* has been edited by various hands, notably by H B. Wheatley (1876).

PERDICCAS, the name of three kings of Macedonia, who reigned respectively *c.* 700 B.C., *c.* 454–413 B.C., and 364–359 B.C., and of one of Alexander the Great's generals, son of Orontes, a descendant of the independent princes of the province of Orestis At Alexander's death Perdiccas was probably acting chiliarch (vizier), and supported the claim of the unborn child of Roxana to the throne. Meleager's revolt forced a compromise, under which Philip Arrhidaeus and the unborn child (if a son) were to be joint kings, with Craterus as regent for Arrhidaeus and, perhaps, Perdiccas for the infant, who was duly born a son (Alexander IV) The Lamian war called Craterus to Europe and left Perdiccas in control; it was he who divided up the satrapies In the ensuing confusion Perdiccas may be classed among those who wished to keep the Empire a unity, though personal friendship and circumstances first grouped him with Ptolemy, a convinced separatist, against Antipater and Antigonus Perdiccas had to abandon Alexander's Arabian schemes, but set himself to complete the conquest of Asia Minor When Antigonus refused to help, he invaded Cappadocia in 322, established his most reliable subordinate, Eumenes, there, and made progress in Pisidia and Armenia. Then he called Antigonus to account; Antigonus fled to Antipater and Craterus and convinced them that Perdiccas was aiming at the throne; Ptolemy joined them. Perdiccas marched to meet the allies, failed to force the Nile at Pelusium, and his soldiers mutinied and murdered him (*See* MACEDONIAN EMPIRE) (E R B)

PEREDA, JOSÉ MARÍA DE (1833–1906), Spanish novelist, was born at Polanco near Santander, and began his literary career by contributing articles to a local journal, *La Abeja montañesa*, in 1858 In 1864–71 appeared his powerful realistic sketches of local life and manners under the title of *Escenas montañesas*, and a second series was published under the title of *Tipos y paisajes* (1871). These were followed by *Bocetos al temple* (1876), *Tipos trashumantes* (1877), and *El Buey suelto* (1877), which was intended as a reply to the thesis of Balzac's work, *Les Petites misères de la vie conjugale* More and more pessimistic as to the political future of his country, Pereda took occasion in *Don Gonzalo González de la Gonzalera* (1879), to ridicule the revolution as he had seen it at work, and to pour scorn upon the *nouveaux riches* who exploited liberalism for their personal ends Two novels by his friend Pérez Galdós, *Doña Perfecta* and *Gloria*, drew from Pereda a reply, *De Tal palo tal astilla* (1880), in which he endeavours to show that tolerance in religious matters is disastrous alike to nations and to individuals The *Esbozos y rasguños* (1881) is of lighter material, and is less attractive than *El Sabor de la Tierruca* (1882), a striking piece of landscape which won immediate appreciation. In *Pedro Sánchez* (1883) Pereda leaves his native province to portray the disillusion of a sincere enthusiast who has plunged into the political life of the capital Pereda's masterpiece is *Sotileza* (1884), a vigorous rendering of marine life by an artist who perceives and admires the daily heroisms of his fisher-folk It has often been alleged against the author that he confines himself to provincial life, to lowly personages and to unrefined subjects, and no doubt an anxiety to clear himself from this absurd reproach led him to attempt a description of society at the capital in *La Montálvez* (1888), which is certainly the least interesting of his performances In *La Puchera* (1889) he returned to the marine subjects which he knew and loved best Again in *Peñas arriba* (1895), his love of country life is manifested in the masterly contrast between the healthy labour of the fields and the squalid life of cities

Pereda belongs to the native realistic school of Spain, which, founded by the unknown author of *Lazarillo de Tormes*, was continued by Mateo Alemán, Cervantes, Quevedo, Castillo Solórzano and many others. With the single exception of Cervantes, however, the picaresque writers are almost entirely wanting in the spirit of generous sympathy and tenderness which constitutes a great part of Pereda's charm His realism is purely Spanish, as remote from Zola's moroseness as from the graceful sentimentality of Pierre Loti Few 19th-century writers possessed the virile temperament of Pereda, and, with the single exception of Tolstoy, none kept a moral end more steadily in

view. This didactic tendency unquestionably injures his effects. Moreover, his grim satire occasionally degenerates into somewhat truculent caricature, and the excessive use of dialect and technical terms which caused him to supply *Sotileza* with a brief vocabulary is a grave artistic blemish. But he saw, knew, understood character; he created not only types, but living personages, such as Andrés, Cleto and Muergo in *Sotileza,* Pedro Juan and Pilara in *La Puchera;* and he personified the tumult and calm of the sea with more power than Victor Hugo displayed in *Les Travailleurs de la mer.* His descriptive powers were of the highest order, and his style, pure of all affectations and embellishments, is of singular force and suppleness. With all his limitations, he was as original a genius as Spain produced during the 19th century. (J. F.-K.)

PÈRE DAVID'S DEER, an aberrant mule-like deer (*q.v.*), the first evidence of whose existence was made known in Europe by the Abbé (then Père) David, who in 1865 obtained the skin of a specimen from the herd in the imperial park at Pekin. The front prong of the main fork of each of the large antlers, which lack brow-tines, curves forward and divides at least once; while the hind prong is of great length, undivided, and directed backwards in a manner found in no other deer. The tail reaches the hocks, and is donkey-like in form. The head is long and narrow, with a prominent ridge for the support of the antlers, moderate-sized ears, and a narrow and pointed muzzle. A gland and tuft are present on the skin of the outer side of the upper part of the hind cannon-bone; but there is no gland on the inner side of the hock. Although new-born fawns are spotted, the adults are uniformly coloured; the general tint of the coat at all seasons being reddish tawny with a tendency to grey. The antlers are shed and replaced twice a year, a unique feature. The true home of this deer has never been ascertained, all now living being kept in confinement.

PÈRE DAVID'S DEER, THE MI-LOU OF CHINA: TRUE HOME UNKNOWN

PEREGRINE FALCON: *see* FALCON.

PEREGRINUS PROTEUS (2nd cent. A.D.), Cynic philosopher, of Parium, Mysia. At an early age he was suspected of parricide, and was obliged to leave his native place. During his wanderings he reached Palestine, where he became the virtual head of the Christian community. His fanatical zeal and craving for notoriety led to his imprisonment, but the governor of Syria freed him. He resumed his wandering life, at first assisted by the Christians, but having been detected profaning the rites of the Church, he was excommunicated. During a visit to Egypt he made the acquaintance of the famous Cynic Agathobulus and joined the sect. Meeting with little encouragement, he journeyed to Rome, whence he was expelled for insulting the emperor Antoninus Pius. Crossing to Greece, he finally took up his abode at Athens. Here he obtained many pupils, including Aulus Gellius But, having given offence by his attacks on Herodes Atticus and finding his popularity diminishing, he announced his intention of immolating himself on a funeral pyre at the celebration of the Olympian games in 165, and actually carried it out. Lucian, who was present, has given a full description of the event.

See C. M. Wieland's *Geheime Geschichte des Philosophen Peregrinus Proteus* (Eng. trans., 1796); this is an attempt to rehabilitate his character. *See* also Lucian, *De morte Peregrini;* Aulus Gellius xii. II.; Ammianus Marcellinus xxix.; Philostratus, *Vit. Soph.* ii. I., 33; J. Bernays, *Lucian und die Kyniker* (1875); E. Zeller, "Alexander und Peregrinus," in his *Vorträge und Abhandlungen,* ii. (1877); and Überweg, *Grundriss der Gesch. der Philosophie,* Bd. I. (1926).

PEREIRE (Pereira), **GIACOBBO RODRIGUEZ** (1715–1780), one of the inventors of deaf-mute language, was born at Estremadura, Spain, on April 11, 1715. He fell in love with a young girl who had been dumb from birth, and devoted himself to discovering a method of imparting speech to deaf-mutes. He devised a sign alphabet for the use of one hand. Pereire was made a member of the Royal Society of London in 1759. He died at Paris on Sept. 15, 1780.

PEREKOP, a village of the Crimean A.S.S.R., on the isthmus which connects the Crimea with the Continent. It was formerly a salt trading town, but declined rapidly after the opening of the Kharkov to Sevastopol railway. It was re-graded as a village in 1925. In ancient times the isthmus was crossed by a ditch which gave the name of Taphros to a Greek settlement. This line of defence having fallen into decay, a fort was erected and a new ditch and dike constructed in the 15th century by the Tatar khan of the Crimea, Mengli Ghirai, and by his son and successor Sahib Ghirai. The fort, known as Kapu or Or-Kapu, became the nucleus of the town. In the middle ages Perekop was known as Tuzla. In 1736 it was captured by the Russians and again in 1738 under Lascy (Lacy), who blew up the fort and destroyed a great part of the dike. In 1754 the fort was rebuilt by Krim Ghirai; but the Greek and Armenian inhabitants of Perekop formed a new settlement at Armyanskiy Bazar (Armenian Market), 3 m. south. Captured in 1771, the town passed into Russian possession with the rest of the Crimea in 1783.

PERENNIALS, the name given to those plants whose natural term of life or life cycle continues for more than two growing periods or years in contradistinction to annuals (*q.v.*), which exist for a single growing period, and biennials (*q.v.*) whose life term embraces only two growing periods. Perennials may be woody (*e.g.,* trees and shrubs) or herbaceous (*e.g.,* iris).

PEREYASLAVL, a town of the Ukrainian S.S.R., in 50° 4′ N., 31° 30′ E., at the confluence of the Trubezh and the Alta, which reach the Dnieper 5 m. lower down at the town's port, the village of Andrushi. Pop. (1926) 14,975. Though founded in 993 by Vladimir the Great of Moscow in memory of his success over the Turkish Pechenegs, Pereyaslavl has now few remains of antiquity. From 1054 Pereyaslavl was the chief town of a separate principality. As a southern outpost it often figures in the 11th, 12th and 13th centuries, and was plundered by the Mongols in 1239. In later times it was a centre of the Cossack movement; and in 1628 the neighbourhood was the scene of the extermination of the Polish forces known as "Tara's Night." By the Treaty of Pereyaslavl in 1654 the Cossack chieftain Bogdan Chmielnicki acknowledged the supremacy of Tsar Alexis of Russia. The town is the centre of an agricultural district and has a flour-milling industry, but no railway.

PÉREZ, ANTONIO (*c.* 1540–1611), for some years the favourite minister of Philip II. of Spain and afterwards the object of his unrelenting hostility, was the natural son of Gonzalo Pérez, secretary both to Charles V. and to Philip II. Legitimated by an imperial diploma issued (1542) at Valladolid, Pérez became secretary of State in 1567, protonotary of Sicily, and at the death of Ruy Gomez de Silva, prince of Eboli, in 1573, head of the "despacho universal," or private bureau, from which Philip governed by correspondence the affairs of his dominions. Juan de Escovedo, another of the king's secretaries, attached after 1574 to Don John of Austria to check the latter's ambitious schemes, was sent by John to Rome to obtain the pope's consent to his plan for making himself master of England by marrying Mary Queen of Scots. Pérez was shown the pope's letter by his nuncio in Spain; he informed Philip who authorized him to arrange for the murder of Escovedo. After several unsuccessful attempts to poison Escovedo, Pérez had him assassinated in a street of Madrid on March 31, 1578. A prosecution was set on foot by the representatives of the murdered man. Philip appeared at first willing to protect his accomplice; ultimately he was the secret instigator of those who sought his ruin. Pérez was arrested on July 28, 1579. The process dragged on until 1589 when, on the eve of being condemned, Perez escaped to Aragon. An Aragonese by birth, by the ancient "fueros" of that kingdom, he could claim a public trial and so bring into requisition documentary evidence of the king's complicity in the deed.

To avoid this, Philip ordered Pérez to be transferred from the civil prison in Saragossa to that of the Inquisition, on a charge

of heresy arising from certain blasphemous expressions used by Perez. A popular tumult broke out, Perez escaped across the Pyrenees, and Aragon was punished by losing its ancient "fueros" altogether (1591) after a crushing defeat from Philip's armies. Perez was well received at Pau by Catherine de Bourbon, passed on to the court of Henry IV. of France, and both there and in England, his talents and diplomatic experience, as well as his well-grounded enmity to Philip, secured him at first much popularity. In England he became intimate with Francis Bacon, and was also much in the society of the earl of Essex. After the Peace of Vervins (1598) he lost all political importance; his efforts to obtain pardon from Philip III. proved vain and he died in poverty and obscurity in Paris on Nov. 3, 1611.

See A. Perez, *Pedazos de Historia* (*c.* 1594); *Relaciones* (Paris, 1598); *Cartas* (Bib. de Autores Esp., xiii.); F. Mignet, *Antonio Perez et Philippe II.* (Paris, 1845); J. A. Froude, *An Unsolved Historical Mystery* in *The History of the Spanish Armada* (London, 1892); M. Hume, *Españoles e ingleses* (1903); J. Fitzmaurice-Kelly, *Antonio Perez* (Oxford, 1922).

PÉREZ DE AGALA, RAMÓN (1880–), Spanish novelist and poet, was born at Oviedo. Beginning with a volume of verse, *La Paz del Sendero* (1904), he first attracted notice as a novelist by *La Pata de la Raposa* (1912). *Luna de Miel, Luna de Hiel* (1923) and its sequel, *Los Trabajos de Urbano y Simona* (1923), contain excellent descriptive passages, while in *El Ombligo del Mundo,* the author writes of his native Asturias.

PÉREZ DE HITA, GINÉS (1544?–1619), Spanish novelist and poet, served in the campaign of 1569–71 against the Moriscos. He relates his experiences in the second part of the *Guerras civiles de Granada* (1595–1604?), which purports to be a chronicle based on an Arab original. It is in reality a historical novel. The events which led to the downfall of Granada are related with uncommon brilliancy, and the sympathetic transcription of life at the Emir's court undoubtedly influenced the Hispano-Mauresque novels of Mlle. de Scudéry and others.

PÉREZ GALDÓS, BENITO (1845–1920), Spanish novelist, was at first engaged in political journalism, but the reception given to his early novels, *La Fontana de oro* (1870) and *El Audaz* (1871), encouraged him to adopt novel-writing as a profession. He had already determined upon the scheme of his *Episodios nacionales,* a series which might compare with the *Comédie humaine.* Old charters, old letters, old newspapers were collected by him with the minuteness of a German archivist; no novelist was ever more thoroughly equipped as regards the details of his period. *Trafalgar,* the first volume of the *Episodios nacionales,* appeared in 1873, and long before the first series ended in 1879 Pérez Galdós took rank among the foremost novelists of his time. A monument of industry and exact knowledge, of realism and romantic conception, the *Episodios nacionales* were carried on into a fifth series, raising the total of volumes to forty-six. Parallel with his immense achievement in historical fiction, Pérez Galdós published a collection of romances dealing with contemporary life, its social problems and religious difficulties. Of these the best known, and perhaps the best, are *Doña Perfecta* (1876); *Gloria* (1877); *La Familia de León Roch* (1878); *Marianela* (1878); *Fortunata y Jacinta* (1887); and *Angel Guerra* (1891). Nor does this exhaust his prodigious activity. Besides adapting several of his novels for stage purposes, he wrote original dramas such as *La Loca de la Casa* (1893), *San Quintín* (1894), *Electra* (1900) and *Mariucha* (1903); but his diffuse, exuberant genius was scarcely accommodated to the convention of theatrical form.

PERFUMES, substances, generally of complex composition, which by reason of their fragrance gratify the sense of smell. The history of perfumes is closely associated with that of cosmetics (*q.v.*), and many of the earliest forms were made by digesting odorous vegetable substances with sesame, almond or olive oil. The principle underlying this process is still made use of although in an improved form and will be referred to later under *Maceration.*

Natural Perfumes.—These are the product of plant metabolism and their highest form is found in the scent of fresh flowers. This fragrance is due to the occurrence in the petals of minute traces of essential oil which in rose and lavendar is in the free state, whereas in jasmin and tuberose it is in the form of a glucoside. Under favourable conditions this complex substance is progressively decomposed in the presence of an enzyme or ferment with the formation of a volatile oil. The occurrence of natural perfume is, however, by no means confined to the inflorescence but frequently exists in other parts of the vegetable organism. Briefly it is found in the

flowers of cassia, carnation, clove, hyacinth, heliotrope, mimosa, jasmin, jonquille, orange blossom, rose, reseda, violet and ylang ylang;
flowers and leaves of lavender, rosemary, peppermint and violet;
leaves and stems of geranium, cinnamon and patchouli;
barks of cinnamon and cassia;
woods of cedar, linaloe and santal;
roots of angelica, sassafras and vetivert;
rhizomes of calamus, ginger and orris;
fruits of bergamot, lemon, lime and orange;
seeds of bitter almonds, anise and nutmeg;
gums or *oleo-resinous exudations* from myrrh, peru balsam, storax and tolu.

As mentioned above, the odoriferous constituents of the plant generally occur as a volatile oil which, after separation as described below, is a highly aromatic, mobile liquid. This usually contains several individual bodies, differing chemically, and to one or more of these the typical odour of the oil is due. Chemistry has been able in many cases to establish definitely these principal constituents, as, for instance, the odour of almond oil is attributed principally to *benzaldehyde,* of clove oil to *eugenol* and of lemon oil to *citral.* Where the oil is of complex composition, the typical odour is believed to be due to several perfectly blended constituents. For instance, in rose otto the *higher aliphatic aldehydes* in minute traces, together with the esters of the alcohols *geraniol* and *citronellol,* undoubtedly determine the distinctive rose fragrance. The separation of these natural odoriferous materials from the plant is no easy matter since a process that is suitable for one is of no use for another because the delicate perfume substance may be destroyed or decomposed or, furthermore, may be incompletely extracted. It will be best to describe briefly each process of the plant material under treatment.

Distillation.—This is effected by either boiling the vegetable organism with water in a closed apparatus when the source of heat may be an open fire or a steam-heated coil or jacket in the bottom; or by blowing live steam through the material. In each case the still is connected at the top with a condenser, through which the steam passes, carrying with it in suspension the fine particles of essential oil, the condensed steam and oil emerging from the lower orifice. On standing aside the oil floats to the top and is separated. Distillation with an open fire is the oldest process and in places far distant from modern factories this is resorted to by the peasants. It is, however, not free from danger, for if the water in the apparatus gets low the material is burnt, then the odour of the resulting oil is impaired. In some parts of Bulgaria this method is used for preparing rose otto and in some parts of India for distilling palmerosa oil. When steam is used for distillation a separate boiler is erected near by and the question of damaging the oil by burning is therefore eliminated Generally the raw material does not touch the bottom of the apparatus but is supported upon a false bottom or perforated sheet of metal and sometimes placed in an open wire basket suspended inside. In some cases the water used for distillation dissolves part of the oil or its constituents. It is sold separately, as, for instance, rose water or orange-flower water. Modern apparatus as used in Europe and America is often required to take one ton of material, such as lavender or peppermint, the capacity of the still being about 1,200 gallons. This process is applicable to the majority of the vegetable organisms mentioned above, the principal exceptions being some of the *flowers* and most of the *fruits.*

Expression.—The general name of the processes used to extract the essential oil occurring in the peels of bergamot, lemon, lime and orange fruits. The *sponge process* is used mainly for lemons and oranges cultivated in Sicily and the Calabrian belt. Girls cut the fruits either transversely or longitudinally and remove the pulp. The peel is then steeped in water to make the

cells more turgid. Men then press this drained peel on sponges which absorb the oil. The sponges are squeezed and the oil runs out into a shallow earthenware bowl placed in front of each operator. As each bowl is filled it is emptied into jars and allowed to stand until any juice has separated at the bottom. Subsequently it is filtered and packed in copper cans for export. The *Ecuelle method* consists of rolling the whole fruits about in hollow vessels covered with spikes inside. The oil cells are broken and the liquid flows into a receptacle in the handle. It is then clarified as above. *Machines* are now largely used to extract the oil from bergamots and lemons. In some cases the peel is broken and the oil collected, while in others the whole fruit is subjected to pressure, when the oil and juice run out together. The oil is separated in a machine something like a milk separator and comes out at the top (cream orifice). Limes are sometimes pressed by the sponge process, but the greater part of the oil is a by-product in the preparation of lime-juice.

Extraction.—The general name given to the processes used for extracting the essence from those flowers to which distillation would not be suitable because (1) the high temperature of steam would damage some of the unstable aromatic constituents and (2) the yield would be inadequate. *Enfleurage* has been employed in the south of France for many years and until comparatively recently was the process used for extracting all flowers. To-day it is used mainly for jasmin and tuberose and depends upon the absorption of perfume by fats. Wooden frames, called "chassis," each support a glass plate, on both sides of which is painted a specially prepared and purified mixture of beef and pork fats. The petals are spread lightly on the layers of grease and the chassis piled one upon the other. These are left for some hours until the grease has absorbed all the perfume. Fresh flowers replace the exhausted ones and the process is repeated until the fats are fully charged with perfume. These fats are known as *pomades. Maceration* differs from enfleurage in that the flowers are immersed in hot fats or oils at about 65°C. The heat ruptures the cells and the perfume is absorbed by the fat. Roses and all other flowers excepting jasmin and tuberose are treated this way. *Volatile solvents* are now largely used for extracting the essence from all flowers and many leaves and mosses. The vegetable organism is placed in a series of hermetically sealed cylinders and petroleum ether of great purity is allowed to run through them slowly. The last container is connected with a vacuum still and the solvent is distilled off and returned to the tank for use again. The perfume remains behind in the retort and is called a *concrete.* It contains the highly odorous essence together with natural and insoluble plant waxes. The concretes are shaken with strong and pure alcohol for 24 hours in machines called "batteuse." The perfume and some wax is dissolved and the insoluble waxes filtered out. The alcoholic extract is then placed in a freezing mixture, when the soluble waxes are separated. The solution of the pure flower essence is distilled *in vacuo,* which removes the alcohol and leaves behind the so-called *absolute flower oil.* This is the most expensive type of perfumery raw material and in the case of jasmin is worth from £3 to £6 an ounce according to the flower crop. The quantity of this flower used per annum for oil or other of these processes has for many years exceeded 1,300 tons while in the case of orange blossom it is even 2,000 tons.

Animal Perfumes.—These are of great importance in preparing finished perfumes and impart to them "life" and diffusiveness. The principal animal perfume is musk. This is a dried secretion from the preputial follicles of the male musk deer, which inhabits the mountainous districts of the Atlas and Himalayan ranges. The most important commercial variety is known as *Tonquin musk,* coming from Tibet and the plains of Kokonor, where the animal is found at altitudes of about 8,000 feet. The Chinese hunters capture the deer by various means and after killing it remove the gland completely. This is dried to develop the odour when it is known as a musk *pod.* After treatment and frequent adulteration with blood, earth, shot and hide the pods find their way to Tatsienlu in the province of Szechven. This is the principal centre for the trade and pods are then sent to dealers in Shanghai, whence they are exported. A quantity of musk is retained by the Chinese for medicinal purposes. *Ambergris* is a calculus formed in the intestines of the sperm whale. It is sometimes found there when the animal is killed but at others is picked up in the sea after being expelled. The calculus is the product of an intestinal disease caused probably by the insufficient digestion of cuttlefish, a food much appreciated by the sperm whale. To find a large piece of ambergris is a rare stroke of luck for sailors and one of the largest pieces ever found was stated to weigh 248 lb. and was valued at £13,200. *Civet* is a soft fatty substance of foetid odour imported principally from Abyssinia and packed in horns. It is a glandular secretion of both male and female civet cats. *Castor* is another perfume of animal origin, being the dried preputial follicles and their secretion from the Canadian and Russian beaver.

Balsams, Gums and Oleo-resins.—These are very important raw materials for perfumes because they generally have a soft and tenacious odour. Commercial samples consist of the natural exudation from the plant together with extraneous matter which is present owing to the crude methods of collection in different parts of the world. The valuable portion of the material contains a small percentage of highly odorous essential oil and a large proportion of soluble resin. The extraneous matter is eliminated by treating the crude substance with alcohol or other solvent, filtering out the insoluble matter and concentrating the filtrate by suitable methods. Some of the more important substances coming under this head are as follows:—*Benzoin* is obtained from trees native to Siam, Sumatra and Java. Incisions are made in the trunk and when the bark is removed the resin flows out as a milky sap and dries in the sun. *Labdanum* is a secretion from the leaves of several species of a genus of the rock rose family. The modern method is to collect the leaves and extract them, as described above, by means of volatile solvents. *Storax* is a balsam obtained from trees occurring in vast forests in the south-west of Asia Minor. It is collected by the Yaruks who beat the outer bark of the tree in midsummer and this causes the balsam to exude into the inner bark. The outer bark is then removed and the inner bark stripped off with knives. It is boiled with water, when the balsam separates and floats to the top.

Synthetics and Isolates are substances of standard quality prepared by chemical means. An isolate exists in a natural product and is separated from it in a nearly pure state. Examples of this are geraniol, an alcohol from palmerosa oil; carvone, a ketone from caraway oil; eugenol, a phenol from clove oil; safrol, a phenolic ether from camphor oil. A synthetic is "built up" from other substances, but this does not mean that it cannot exist in nature. There are many instances where a perfumery material occurs as one of the constituents of an essential oil, but it would never pay to separate it because it can be synthesised chemically much cheaper. Examples are phenyl ethyl alcohol, occurring in rose otto but synthesised from phenyl acetic esters; benzyl acetate, occurring in jasmin oil but synthesised from benzyl alcohol; linalyl acetate, occurring in lavender and bergamot oils but synthesised from acetic anhydride and linalol. Many synthetics, however, do not, so far as is known, exist in nature but are the result of chemical research. Examples are ionone, having the odour of violets and synthesised from citral and acetone; hydroxy-citronellal, having the odour of lilies and lilac and synthesised by hydrating citronellal; phenyl acetic aldehyde, having the odour of hyacinths and synthesised from cinnamic acid; musk ketone, having an odour recalling that of animal musk and synthesised by nitrating butyl-meta-xylene; d-cresyl phenylacetate, having an odour resembling that of narcissus and synthesised from coal tar liquors. Other important synthetic aromatic chemicals are amyl salicylate—(odour of clover); anisic aldehyde—(odour of may-blossom); benzylidene acetone—(odour of sweet pea); beta naphthol ethers—(odour of orange blossom); coumarin—(odour of tonka-beans); iso-eugenol—(odour of carnation); heliotropin—(odour of heliotrope); ethyl protocatechuic aldehyde—(odour of vanilla); gamma undecalactone—(odour of peaches); methyl phenyl acetate—(odour of gardenia); terpineol—(odour of lilac).

Artificial Flower Oils.—These are very widely used in the

as a basis for finished perfumes, but more particularly for scenting cosmetics. The misconception which exists concerning the crudeness of odour of these oils is altogether unfounded, especially when they have been prepared by an expert. It is quite true to say that no perfume offered to the public is entirely made from natural flower extracts. It is the *absolutes* skilfully blended with the synthetics, balsams and animal extracts that impart the delicious softness of odour so much appreciated The question of price generally decides how much of the natural substance shall enter the artificial compound For instance, a good jasmin oil made without any absolute would cost about two shillings an ounce. If about 2% of real Jasmin were added (and this proportion is necessary for the best oils) then the price would be doubled In many cases the perfume of flowers has been analysed, not completely because so far the reactions are not known for detecting many of the mere traces of aromatics present in a flower When a flower perfume has been analysed by present methods, however, it is a relatively simple matter to prepare an imitation from the known constituents, but there is always something lacking in the artificial odour. In order to compensate for this missing link a small quantity of the natural extract is used. In those cases where the composition of the flower perfume is not known the chemist must employ the nearest natural substance having an odour akin to that being imitated For instance, the composition of the perfume of violets is not known, so a small percentage of cassia absolute is used to give a natural finish to the ionone employed as its base

Finished Perfumes.—These are prepared from the artificial flower oils by solution in alcohol of about 80% strength They are toned or blended with balsams, gums and oleo-resins, which retard the rate of evaporation, and small quantities of extracts of animal origin are added to give greater persistence and diffusiveness of odour In many cases further quantities of flower extracts are added to improve the delicacy of the perfume and the whole is allowed to stand for several weeks or months in glass-lined tanks to allow it to mature The tenacity of a scent is of the utmost importance, and the longer a perfume will remain fragrant after application to the handkerchief or garment the more popular it becomes This is known as *fixation* and must be controlled during the whole of the process of manufacture Examples of fixators are (1) oils—patchouli, clary sage, santalwood, vetivert; (2) balsams, gums and oleo-resins—benzoin, labdanum, myrrh, oakmoss, storax; (3) synthetics—benzyl cinnamate, ethyl phthalate, coumarin, musk ambrette, heliotropin, vanillin. Many perfumes are so-called bouquets of flowery odour, yet representing no particular flower In these cases the typical odour is generally a combination of synthetics, one of which is used in sufficient quantity to create a new perfume note

PERGA (mod *Murtana*), an ancient city of Pamphylia, situated about 8 m. inland, at the junction of a small stream (Sari Su) with the Cestrus. It was a centre of native influences as contrasted with the Greek, which were predominant in Attalia, and it was a great seat of the worship of "Queen" Artemis, here represented as a human-headed cone and a purely Anatolian nature goddess. There Paul and Barnabas began their first mission in Asia Minor (Acts ix. 13). A much frequented route into Phrygia and the Maeander valley began at Perga, and Alexander made it the starting-point of his invasion of inner Asia Minor Long the metropolis of Pamphylia Secunda, it was superseded in Byzantine times by its port, Attalia, which became a metropolis in 1084. The extensive ruins all lie in the plain south of the Acropolis. The walls are well preserved, but of late Roman or Byzantine reconstruction. The most notable monument is the theatre outside the walls on the S.W. Modern Murtana is only a large village.

PERGAMUM or PERGAMUS (mod. *Bergama*), an ancient city of Teuthrania, a district in Mysia It is usually named Πέργαμον by Greek writers, but Ptolemy has the form Πέργαμος.

Little but mythology is known of the city till the time of Xenophon, but it had been striking coins since 420 B.C. at latest. Its importance began under Lysimachus. In 283 B C. Philetaerus, governor of the fortress, rebelled, and Pergamum became the capital of a little principality. Philetaerus contrived to keep on good terms with his neighbours on all sides (283–263 B.C.). His nephew Eumenes (263–241) succeeded him, increased his power, and even defeated Antiochus II. of Syria near Sardis His successor Attalus I. (241–197) won a battle over the Gauls, and assumed the title of king Other Greek kings in Asia Minor reduced Pergamenian power to a very low ebb about 222 On the other hand, the influence of the Romans was beginning to make itself felt in the East. Attalus prudently connected himself with them and shared in their continuous success. Pergamum thus became the political and cultural capital of a considerable territory. The splendour of Pergamum was at its height under Eumenes II. (197–159) He continued true to the Romans during their wars with Antiochus and Perseus, and his kingdom spread over the greater part of western Asia Minor, including Mysia, Lydia, and a great part of Phrygia, Ionia and Caria He left an infant son, Attalus (III), and a brother, Attalus II. (Philadelphus), who ruled 159–138, and was succeeded by his nephew, Attalus III. (Philometor) The latter died in 133, and bequeathed his kingdom to the Romans, who erected part of it (excluding Great Phrygia, which they gave to Mithradates of Pontus) into a province under the name of Asia Pergamum continued to rank for two centuries as the capital, and subsequently, with Ephesus and Smyrna, as one of the three great cities of the province; and the devotion of its former kings to the Roman cause was continued by its citizens, who erected on the Acropolis a temple to Augustus It was the seat of a *conventus*, including the cities of the Caicus valley and some of those in the northern part of the Hermus valley Under the Roman Empire Pergamum was one of the chief seats of the worship of Asclepius "the Saviour" Pergamum was the chief centre of the imperial cult under the early empire, and in Rev. ii 13 is referred to as the place of "Satan's throne" It was also an early seat of Christianity, and one of the Seven Churches The place, re-fortified by the Byzantines, and still retaining its name as Bergama, passed into Muslim hands early in the 14th century The lower town was rebuilt, and in the 17th and 18th centuries became a chief seat of the great Dere Bey family of Kara Osman Oglu, which did not resign it to direct Ottoman control until about 1825 It is still an administrative and commercial centre of importance Excavations in the late 19th century at the south end of the Acropolis led to the discovery of the Altar of Zeus erected by Eumenes II in 180 B C. to celebrate his victory over the Gauls In very high relief and representing furious action, these altar sculptures are the finest which survive from the Pergamene school, which replaced the repose and breadth of earlier schools by excess of emphasis and detail The summit of the Acropolis is crowded with public buildings, between the market place, which lies at the southern point, and the Royal Gardens on the north. In the interval are the Zeus altar; the great hexastyle Doric temple of Athena flanked by the palace on the east, by the theatre and its long terrace on the west, and by a library on the north; and a large Corinthian temple of Trajan The residential part of the Greek, and practically all the Roman city lay below the Acropolis on ground now mostly occupied by modern Bergama; but west of the river Selinus, on rising ground facing the Acropolis, are the remains of a Roman theatre, an amphitheatre and a circus.

PERGOLESI (or PERGOLESE), **GIOVANNI BATTISTA** (1710–1736), Italian musical composer, was born at Jesi near Ancona on Jan. 3, 1710. He was sent by a noble patron to complete his education at Naples, where he became a pupil of Greco, Durante and Feo for composition and of Domenico de Matteis for the violin. His earliest known composition was a sacred drama, *La Conversione di S. Guglielmo d'Aquitania*, between the acts of which was given the comic intermezzo *Il Maestro di musica*. These works were performed in 1731, probably by fellow pupils, at the monastery of St. Agnello Maggiore. Pergolesi was then commissioned to write an opera for the court theatre, and in the winter of 1731 successfully produced *La Sallustia*, followed in 1732 by *Ricimero*, which was a failure. Both operas had comic intermezzi, but in neither case were they successful. After this he abandoned the theatre for a time and wrote thirty sonatas for two violins and bass for the prince of Stigliano. In September 1732 he returned to the stage with a comic opera in Neapolitan dialect, *Lo Fratè inammorato*, which was well received; and in 1733 he produced a serious opera, *Il Prigionier*, to which the celebrated *Serva padrona* furnished the intermezzi. About this time (1733–1734) Pergolesi accompanied the duke of Maddaloni to Rome. The failure of *L'Olimpiade* at Rome in January 1735 was followed by a conspicuous success with his comic opera *Il Flaminio* at Naples in September of the same year. In 1736 he was sent by the duke of Maddaloni to the Capuchin monastery at Pozzuoli, the air of the place being considered beneficial to cases of consumption. Here he is supposed to have written the celebrated *Stabat Mater;* Paisiello, however, stated that this work was written soon after he left the *Conservatorio dei poveri di Gesù Cristo* in 1729. Of quite a different nature was the humorous, not to say improper, *Scherzo fatto ai Cappuccini di Pozzuoli.* Pergolesi died prematurely on March 17, 1736, and was buried in the cathedral of Pozzuoli.

BIBLIOGRAPHY.—The most complete life of Pergolesi is that by E. Faustini Fasini (Ricordi, 1900); G. Annibaldi's *Il Pergolesi in Pozzuoli, vita intima* (Jesi, 1890) gives some interesting additional details derived from documents at Jesi, but is cast in the form of a romantic novel. H. M. Schletterer's lecture in the *Sammlung musikalischer Vorträge*, edited by Count P. von Waldersee, is generally inaccurate and uncritical, but gives a good account of later performances of Pergolesi's works in Italy and elsewhere. Complete lists of his compositions are given in Eitner's *Quellen-Lexicon* and in Grove's *Dictionary* (1927).

PERGOLESI, MICHAEL ANGELO, an 18th-century Italian decorative artist, who worked chiefly in England to which he came about 1770. Like Cipriani he was brought, or attracted, to England by Robert Adam. He worked extensively for the Adams, and his designs are typical of much upon which their reputation rests. He designed furniture, mantelpieces, ceilings, chandeliers, doors and mural ornament with equal felicity. The centre panels of his walls and ceilings were often occupied by classical and pastoral subjects painted by Cipriani, Angelica Kauffmann, Antonio Zucchi, her husband, and sometimes by himself. Pergolesi was in large measure responsible for the designs for the painted satinwood furniture; some of this painted work was, apparently, executed by his own hand.

The chief source of information upon his works is his own publication, *Designs for Various Ornaments on Seventy Plates*, a series of folio sheets, without text, published between 1777 and 1801.

PERI, JACOPO (1561–1633), Italian composer, was born at Florence on Aug. 20, 1561, of a noble family. After studying under Cristoforo Malvezzi of Lucca, he became maestro di cappella, first to Ferdinand, duke of Tuscany, and later to Cosmo II. He was a member of the literary and artistic circle which frequented the house of Giovanni Bardi, conte de Vernio, where the revival of Greek tragedy with its appropriate musical declamation was a favourite subject of discussion. The poet Ottavio Rinuccini supplied a drama with the title of *Dafne*, to which Peri composed music, and this first attempt at opera was performed privately in 1597 in the Palazzo Corsi at Florence. In 1600 Rinuccini and Peri were commissioned to produce an opera on the occasion of the marriage of Henry IV. of France with Maria de' Medici. This work (*L'Euridice*) attracted a great deal of attention, and the type once publicly established, the musical drama was set on the road to success by the efforts of other composers and the patronage of other courts. Peri afterward wrote recitatives to Rinuccini's *Arianna* (1608), an opera *Adone* for Mantua (1620), and *La precedenza delle dame* for the court of Florence (1625). He died in Florence on Aug. 12, 1633.

Peri's *Dafne* (which has entirely disappeared) and *L'Euridice* (printed at Florence 1600; reprinted Venice 1608 and Florence 1863) are of the greatest importance not only as being the earliest attempts at opera, but as representing the new monodic and declamatory style which is the basis of modern music as opposed to the contrapuntal methods of Palestrina and his contemporaries. Of his work only *L'Euridice* and the *Varie musiche a una, due a tre voci* (Florence, 1609) survive.

See R. Rolland, *Histoire de l'opéra en Europe avant Lulli et Scarlatti* (1895).

PERIANDER (625–585 B.C.), the second tyrant of Corinth. In contrast with his father Cypselus, the founder of the dynasty, he is generally represented as a cruel despot. The Greek tradition, however, is probably derived from a prejudiced source. There is no doubt that he was ruthless with the remains of the nobility. A careful sifting of the available evidence would rather tend to represent Periander as a ruler of probity and insight, and the firmness and activity of his government is beyond dispute. His home administration was so successful that he was able to dispense with direct taxation, and, combined with the far-seeing colonizing activities, laid the foundations of Corinth's commercial and industrial prosperity. Periander further appears as a patron of literature, for it was by his invitation that the poet Arion came to Corinth to organize the dithyramb. To promote and protect Corinthian commerce he established colonies at Potidaea and Apollonia in Macedonia, at Anactorium and Leucas in northwestern Greece, and he is said to have projected a canal through the isthmus. In Greece proper he conquered Epidaurus and annexed Corcyra. He cultivated friendly relations with the tyrants of Miletus and Mytilene, and maintained a connection with the kings of Lydia, of Egypt and, possibly, of Phrygia.

Periander was reckoned one of the seven sages of Greece, and was the reputed author of a collection of maxims (Ὑποθῆκαι) in 2,000 verses. The letters ascribed to him are spurious.

See Herodotus iii. 48–53, v. 92; Aristotle, *Politics*, v. 6, 10–12; Heracleides Ponticus in C. Müller's *Frag. hist. graec.* ii. 212; Nicolaus Damascenus, *ibid.*, iii. 393; Diogenes Laertius, *De vitis clarorum philosophorum*, i. ch. 7; *Cambridge Ancient History* (vol. iii. 1925).

PERIANTH, the term used in botany to denote the outer covering of the flower, composed of more or less modified but non-reproductive leaves and divided usually into an outer, often greenish whorl, the calyx of sepals; and an inner, often brightly-coloured whorl, the corolla of petals. (*See* FLOWER.)

PERIBOLOS or **PERIBOLUS,** in architecture, a sacred enclosed space, usually containing a temple, altar or shrine, especially used of such enclosures in ancient Greece, but occasionally of the enclosed, consecrated ground around an early mediaeval church, which was the limit to which its rights of sanctuary extended.

PERICARDIUM, DISEASES OF THE. (For anatomy, *see* COELOM AND SEROUS MEMBRANES.) The serous sac in which the heart is contained may be the seat of inflammation (pericarditis) along with the cardiac valves and heart muscle in the course of acute rheumatism or other acute diseases. The normal shiny appearance is then lost, the membrane becomes congested and inflammatory serum exudes into the cavity. In this stage the visceral and parietal layers grate upon one another with the heart's beat and give rise to a "friction rub" over the front of the chest which can be heard with the stethoscope and may be perceptible to the hand. As more inflammatory exudation is poured out the surfaces are separated and friction disappears. From this point the course of the disease varies according as the inflam-

mation advances or recedes. If it advances fluid may accumulate in the sac to an extent that seriously impedes cardiac action, while if the pericarditis accompanies or follows pneumonia the fluid may become purulent. In either event exit must be given to the fluid surgically. If the disease recedes the roughened pericardial surfaces again come into contact through absorption of the exuded fluid, and friction reappears. Later, fibrous adhesions are formed between the two layers of pericardium over a greater or smaller area; sometimes they become universally adherent and the cavity is obliterated. Exudation of fluid into the pericardial cavity, apart from inflammation, occurs in certain diseases of the kidney and is then often unaccompanied by symptoms though it is a very grave omen. In rupture of the heart or of certain varieties of aneurism the pericardial sac is suddenly filled with blood. Distress is extreme and death occurs after a few seconds from mechanical interference with the action of the heart. Other conditions affecting the pericardium either act by inducing inflammation or are so rare that they cannot be considered here.

(W. S. L.-B.)

PERICLES (*c.* 490–429 B.C.), Athenian statesman, was born about 490 B.C., the son of Xanthippus and Agariste. His father took a prominent part in Athenian politics, and in 470 held high command in the Greek squadron which annihilated the remnants of Xerxes' fleet at Mycale; through his mother, the niece of Cleisthenes, he was connected with the former tyrants of Sicyon and the family of the Alcmaeonidae. His early training was committed to the ablest and most advanced teachers of the day; Damon instructed him in music, Zeno the Eleatic revealed to him the powers of dialectic; the philosopher Anaxagoras, who lived in close friendship with Pericles, had great influence on his cast of thought and was commonly held responsible for that calm and undaunted attitude of mind which he preserved in the midst of the severest trials.

The first important recorded act of Pericles falls in 463, when he helped to prosecute Cimon on a charge of bribery, after the latter's Thasian campaign; but as the accusation could hardly have been meant seriously Pericles was perhaps put forward only as a lay-figure. Undue prominence has commonly been assigned to him in the attack upon the Areopagus in 462 or 461 (*see* AREOPAGUS; CIMON), which was mainly the work of his senior colleague Ephialtes. To Ephialtes likewise we must ascribe the renunciation of the Spartan alliance and the new league with Argos and Thessaly (461).

Not long after, however, when Ephialtes fell by the dagger, Pericles undoubtedly assumed the leading position in the State. On several later occasions, and throughout the period 443–429 B.C., he held the office of strategus (general-in-command), and to the end of his life he remained the most influential speaker in the ecclesia (popular assembly). The beginning of his ascendancy is marked by an unprecedented outward expansion of Athenian power. In continuance of Cimon's policy, 200 ships were sent to support the Egyptian insurgents against Persia (*c.* 459 B.C.), while detachments operated against Cyprus and Phoenicia. At the same time Athens embarked on several wars in Greece proper. An alliance with the Megarians, who were being hard pressed by their neighbours of Corinth, led to enmity with this latter power, and before long Epidaurus and Aegina were drawn into the struggle. On sea the Athenians, after two minor engagements, gained a decisive victory which enabled them to blockade Aegina. On land their general Myronides beat off two Corinthian attacks on Megara, which had been further secured by long walls drawn between the capital and its port Nisaea, nearly a mile distant. In 457 the Athenians and their allies ventured to intercept a Spartan force which was returning home from central Greece. At Tanagra in Boeotia a pitched battle was fought, in which both Pericles and the partisans of Cimon distinguished themselves. The Spartans were successful but did not pursue their advantage, and soon afterwards the Athenians, seizing their opportunity, sallied forth again and obtained the submission of all Boeotia, save Thebes, and of Phocis and Locris. In 455 Tolmides secured Naupactus on the Corinthian gulf; in 454 Pericles himself made a descent upon Oeniadae at the mouth of the gulf. These years mark the zenith of Athenian greatness. Yet the drain on the country's strength was severe, and when news arrived in 453 that the Egyptian armament had been destroyed by the Persians a reaction set in, and Cimon was empowered to make peace with Sparta on the basis of the *status quo*. For a while the old anti-Persian policy again found favour in Athens, and Cimon led a great expedition against Cyprus; but on his death hostilities were suspended, and a lasting arrangement with Persia was brought about. It was probably in order to mark the definite conclusion of the Persian War and to obtain recognition for Athens' work in punishing the Mede that Pericles now proposed a pan-Hellenic congress at Athens to consult about the rebuilding of the ruined temples and the policing of the seas; but owing to the refusal of Sparta the project fell through.

Pericles may now have hoped to resume his aggressive policy in Greece proper, but the events of the following years completely disillusioned him. In 447 an Athenian army, which had marched into Boeotia to quell an insurrection, had to surrender in a body at Coroneia, and the price of their ransom was the evacuation of Boeotia. Upon news of this disaster Phocis, Locris, and Euboea revolted, and the Megarians massacred their Athenian garrison, while a Spartan army penetrated into Attica as far as Eleusis. In this crisis Pericles induced the Spartan leaders to retreat, apparently by means of a bribe, and hastened to reconquer Euboea; but the other land possessions could not be recovered, and in a thirty years' truce which was arranged in 445 Athens definitely renounced her predominance in Greece proper. Pericles' foreign policy henceforward underwent a profound change—to consolidate the naval supremacy, or to extend it by a cautious advance, remained his only ambition. While scouting projects for interference in distant countries, he occasionally made a display of Athenian power abroad, as in his expedition to the Black sea (after 445 B.C.) and in the colonization of Thurii (445–443 B.C.), which marks the resumption of a western policy. The peaceful development of Athenian power was interrupted by the revolt of Samos in 440. Pericles himself led out a fleet against the seceders; he won a first engagement, but unwisely divided his armament and allowed one squadron to be routed. In a subsequent battle he reduced the town itself.

Turning to Pericles' policy towards the members of the Delian League, we find that he frankly endeavoured to turn the allies into subjects (*see* DELIAN LEAGUE). A special feature of his rule was the sending out of numerous cleruchies (*q.v.*), which served the double purpose of securing strategic points to Athens and converting the needy proletariat of the capital into owners of real property. The land was acquired either by confiscation from disaffected states or in exchange for a lowering of tribute. The chief cleruchies of Pericles are: Thracian Chersonese (*c.* 450 B.C.), Lemnos and Imbros, Andros, Naxos and Eretria (before 447); Brea in Thrace (446); Oreus (445); Amisus and Astacus in the Black sea (after 445); Aegina (431).

In his home policy Pericles carried out more fully Ephialtes' project of making the Athenian people truly self-governing. His chief innovation was the introduction of payment from the public treasury for State service. He provided a remuneration of one to two obols a day for the jurymen, and he created a "theorikon" fund which enabled poor citizens to attend the dramatic representations of the Dionysia. In connection with this system of salaries should be mentioned a somewhat reactionary law carried by Pericles in 451, by which an Athenian parentage on both sides was made an express condition of retaining the franchise and with it the right of sitting on paid juries. The measure by which the archonship was opened to the poorer citizens (457 B.C.) may also be due to Pericles (*see* ARCHON).

The last years of his life were troubled by a new period of storm and stress. A conflict between Corcyra and Corinth, the second and third naval powers of Greece, led to the simultaneous appearance in Athens of an embassy from either combatant (433). Pericles had, as it seems, resumed of late a plan of western expansion by renewing alliances with Rhegium and Leontini, and the favourable position of Corcyra, on the trade-route to Sicily and Italy, as well as its powerful fleet, no doubt helped to

induce him to secure an alliance with that island, and so to commit an unfriendly act towards a leading representative of the Peloponnesian League. Pericles now seemed to have made up his mind that war with Sparta, the head of that League, had become inevitable. In the following spring he fastened a quarrel upon Potidaea, a town in Chalcidice, which was attached by ancient bonds to Corinth, and in the campaign which followed Athenian and Corinthian troops came to blows. A further *casus belli* was provided by a decree forbidding the importation of Megarian goods into the Athenian empire, presumably in order to punish Megara for her alliance with Corinth (spring 432). The combined complaints of the injured parties led Sparta to summon a Peloponnesian congress which decided on war against Athens, failing a concession to Megara and Corinth (autumn 432). In this crisis Pericles persuaded the wavering assembly that compromise was useless, because Sparta was resolved to precipitate a war in any case. An embassy calling upon the Athenians to expel the accursed family of the Alcmaeonidae, clearly aimed at Pericles himself as its chief representative, was left unheeded, and early in 431 hostilities began between Athens and Sparta and their respective allies (*see* PELOPONNESIAN WAR).

At the same time Pericles was being sorely hampered by his adversaries at home. The orthodox Conservatives and some democrats who were jealous of his influence, while afraid to beard the great statesman himself, combined to assail his nearest friends. The sculptor Pheidias (*q.v.*) was prosecuted on two vexatious charges (probably in 433), and before he could disprove the second he died under arrest. Anaxagoras was threatened with a law against atheists, and felt compelled to leave Athens. A scandalous charge against his mistress Aspasia, which he defeated by his personal intercession before the court, was taken very much to heart by Pericles. His position at home scarcely improved during the war. His policy of abandoning the countryside was unpopular with the land-owning section of the people, who from the walls of Athens could see their own property destroyed by the invaders. At the end of the first year of war (early in 430) Pericles made a great appeal to the pride of his countrymen in his well-known funeral speech. But in the ensuing summer, after a terrible outbreak of plague had ravaged the crowded city, the people became thoroughly demoralized. Pericles led a large squadron to harry the coasts of the Peloponnese, but met with little success. On his return the Athenians sued for peace, though without success, and a speech by Pericles had little effect on their spirits. Late in 430 they deposed him from his magistracy. In addition to this they prosecuted him on a charge of embezzlement and imposed a fine of 50 talents. A revulsion of feeling soon led to his reinstatement, apparently with extraordinary powers. But the plague, which had carried off two of his sons and a sister, had left its mark also on Pericles himself. In the autumn of 429 he died and was buried near the Academia, where Pausanias (150 A.D.) saw his tomb. A slightly idealized portrait of Pericles as *strategus* is preserved to us in the British Museum bust, No. 549, which is a good copy of the well-known bronze original by Cresilas.

If we now endeavour to give a general estimate of Pericles' character and achievements, it will be well to consider the many departments of his activity one by one. In his foreign policy his standpoint was at all times purely Athenian. We may clearly distinguish two periods in his administration of foreign affairs. At first, joining to Cimon's anti-Persian ambitions and Themistocles' schemes of western expansion a new policy of aggression on the mainland, he endeavoured to push forward Athenian power in every direction, and engaged himself alike in Greece proper, in the Levant and in Sicily. After Cimon's death he renounced the war against Persia, and the collapse of 447–445 had the effect of completing his change of attitude. Henceforward he repressed all schemes of adventure and confined himself to the gradual expansion and consolidation of the empire. It is not quite easy to see why he abandoned this successful policy in order to hasten on a war with Sparta, and neither the Corcyrean alliance nor the Megarian decree seems justified by the facts as known to us, though commercial motives may have played a part which we cannot now gauge. In his adoption of a purely defensive policy at the beginning of the Peloponnesian War he severely tried the temper of the Athenians, but in the main his policy was sound, and the disasters of the war cannot fairly be laid to his charge. In his attitude towards the members of the Delian League Pericles likewise maintained a purely Athenian point of view, and his appropriation of federal funds for Athenian purposes is difficult to justify. But he could hardly be said seriously to have oppressed the subject cities. Under Pericles Athens also attained her greatest measure of commercial prosperity, and the activity of her traders all over the Levant, the Black sea and the West, is attested not only by literary authority, but also by many Attic coins and vases.

Pericles' home policy has been much debated since ancient times. His chief enactments relate to the payment of citizens for State service. These measures have been interpreted as an appeal to the baser instincts of the mob, but this assumption is entirely out of keeping with all we know of Pericles' general attitude towards the people, over whom Thucydides says he practically ruled as a king. We must, then, admit that Pericles sincerely contemplated the good of his fellow-countrymen, and we may believe that he endeavoured to realize that ideal Athens which Thucydides sketches in the funeral speech—an Athens where free and intelligent obedience is rendered to an equitable code of laws, where merit finds its way to the front, where military efficiency is found along with a free development in other directions and strangles neither commerce nor art. In accordance with this scheme Pericles sought to educate the whole community to political wisdom by giving to all an active share in the government, and to train their aesthetic tastes by making accessible the best drama and music. It was most unfortunate that the Peloponnesian War ruined this project by diverting the large supplies of money which were essential to it.

Pericles also incurred unpopularity because of his rationalism in religious matters; yet Athens in his time was becoming ripe for the new culture, and would have done better to receive it from men of his circle—Anaxagoras, Zeno, Protagoras and Meton—than from the more irresponsible sophists. The influence of Aspasia on Athenian life, though denounced unsparingly by most critics, may indeed have been beneficial, inasmuch as it tended towards the emancipation of the Attic woman from the over-strict tutelage in which she was kept. As a patron of art and literature Pericles was a still greater force. He counted Sophocles and probably also Herodotus among his personal friends, and he left a profound impression on the mind of Thucydides. He is largely responsible for the splendour of Attic art in his time, for had he not so fully appreciated and given such free scope to the genius of Pheidias, Callicrates and Ictinus, Athens would hardly have witnessed the raising of the Parthenon and other famous structures.

Of Pericles' personal characteristics we have a peculiarly full and interesting record. He was commonly compared to Olympian Zeus, partly because of his serene and dignified bearing, partly by reason of the eloquence with which he held friend and foe spellbound. The same dignity appeared in the grave beauty of his features, though the abnormal height of his cranium afforded an opportunity for ridicule of which the comedians made full use.

ANCIENT AUTHORITIES.—Our chief source must always remain Thucydides (i. and ii. 1–65), whose insight into the character and ideals of Pericles places him far above all other authorities. The speeches which he puts into his mouth are of special value in disclosing to us Pericles' inmost thoughts and aspirations (i. 140–144; ii. 35–46; ii. 60–64). Thucydides alone shows sympathy with Pericles, but he was by no means a blind admirer. Of other 5th-century sources, Aristophanes is obviously a caricaturist, pseudo-Xenophon (*de republica Atheniensium*) a mere party pamphleteer. Plato, while admiring Pericles' intellect, accuses him of pandering to the mob; Aristotle in his *Politics* and especially in the *Constitution of Athens*, which is valuable in that it gives the dates of Pericles' enactments as derived from an official document, accepts the same view. Plutarch (*Pericles*) gives many interesting details as to Pericles' personal bearing, home life, and patronage of art, literature and philosophy; but he reproduces scandalous anecdotes in a quite uncritical spirit.

For Pericles' politics, *see* E. Abbott, *Pericles and the Golden Age of Athens* (1898); Ad. Schmidt, *Das Perikleische Zeitalter;* and the relevant parts of the general histories of Greece. For Pericles' buildings,

see E. A. Gardner, *Ancient Athens* (1902) and M. L. d'Ooge, *The Acropolis of Athens* (1908). *See* ATHENS: *History;* GREECE: *Ancient History;* and GREEK ART. (M. C.)

PERIDOTITE, a plutonic holo-crystalline rock composed in large part of olivine, and almost or entirely free from felspar. The rocks are the most basic, or least siliceous plutonic rocks, and contain much iron oxide and magnesia. Hence they have dark colours and a high specific gravity (3·0 and over). In some peridotites, such as the *dunites,* olivine greatly preponderates over all other minerals. It is always in small, rather rounded crystals without good crystalline form, and pale green in colour. Most of the rocks of this group, however, contain other silicates such as augite, hornblende, biotite or rhombic pyroxene, and often two or three of these are present. By the various mineral combinations different species are produced, *e.g.,* mica-peridotite, hornblende-peridotite, enstatite-peridotite. Of the accessory minerals the commonest are iron oxides and chromite or picotite. In some peridotites these form segregations or irregular masses which are of importance as sources of the ores of chromium. Platinum and the nickel-iron compound awaruite are found in rocks of this class in New Zealand. Red garnet (pyrope) characterizes the peridotites of Bohemia. The diamond mines of South Africa are situated in pipes or volcanic necks occupied by a peridotite breccia which has been called *kimberlite.* In this rock in addition to diamond the following minerals are found; hypersthene, garnet, biotite, pyroxene (chrome-diopside), ilmenite, zircon, etc.

Some peridotites have a granular structure, *e.g.,* the dunites, all the crystal grains being rounded and of nearly equal size; a few are porphyritic with large individuals of diallage, augite or hypersthene. Some are banded with parallel bands of dissimilar composition, the result probably of fluxion in a magma which was not quite homogeneous. The great majority of the rocks of this group are poikilitic, that is to say, they contain olivine in small rounded crystals embedded in large irregular masses of pyroxene or hornblende. The structure is not unlike that known as ophitic in the dolerites, and arises from the olivine having first separated out of the liquid magma while the pyroxene or amphibole succeeded it and caught up its crystals. In hand specimens of the rocks the smooth and shining cleavage surfaces of hornblende and augite are dotted over with dull blackish green spots of olivine; to this appearance the name "lustre-mottling" has been given. Although many peridotites are known in which the constituent minerals are excellently preserved, the majority have undergone much mineralogical alteration. The olivine is specially unstable and is altered to serpentine while the pyroxene and amphibole are in large measure fresh. In some cases the whole rock is changed to an aggregate of secondary products. Most serpentines (*q.v.*) arise in this way. *See* also PICRITE. (J. S. F.)

PÉRIER, CASIMIR PIERRE (1777–1832), French statesman, was born at Grenoble on Oct. 11, 1777, the son of a rich banker and manufacturer, Claude Périer (1742–1801), who was one of the first directors of the Bank of France; of his eight sons, Augustin (1773–1833), Antoine Scipion (1776–1821), Casimir Pierre and Camille (1781–1844), all distinguished themselves in industry and in politics. Casimir joined the army of Italy in 1798. On his father's death he left the army and with his brother Scipion founded a bank in Paris. He opposed the ruinous methods by which the duc de Richelieu sought to raise the war indemnity demanded by the Allies, in a pamphlet *Réflexions sur le projet d'emprunt* (1817), followed in the same year by *Dernières réflexions . . .* in answer to an inspired article in the *Moniteur.* In the same year he entered the chamber of deputies for Paris, taking his seat in the Left Centre and making his first speech in defence of the freedom of the press. Re-elected for Paris in 1822 and 1824, and in 1827 for Paris and for Troyes, he sat for Troyes until his death. Under Louis Philippe Périer became president of the chamber of deputies, and sat for a few months in the cabinet without a portfolio.

On the fall of the ministry of Laffitte, Casimir Périer, who had drifted more and more to the Right, was summoned to power (March 13, 1831), and in a year he restored civic order in France and re-established her credit in Europe. Paris was only held in check by the premier's determination; revolts at Lyons and Grenoble were also put down. The minister refused to be dragged into armed intervention in favour of the revolutionary Government of Warsaw, but he constituted France the protector of Belgium by the prompt expedition of the army of the north against the Dutch in Aug. 1831; French influence in Italy was asserted by the audacious occupation of Ancona (Feb. 23, 1832); and the refusal of compensation for injuries to French residents by the Portuguese Government was followed by a naval demonstration at Lisbon. In the spring of 1832 during the cholera outbreak in Paris, Périer visited the hospitals with the duke of Orleans. He fell ill the next day and died on May 16, 1832.

His *Opinions et discours* were edited by A. Lesieur (2 vols., 1838); C. Nicoullaud published in 1894 the first part (*Casimir-Périer, député de l'opposition, 1817–1830*) of a study of his life and policy; and his ministry is exhaustively treated by Thureau-Dangin in vols. i. and ii. (1884) of his *Histoire de la monarchie de juillet.*

For the family in general *see* E. Choulet, *La Famille Casimir-Périer* (Grenoble, 1894).

PERIGEE, in astronomy that point of the moon's orbit or of the sun's apparent orbit at which the moon or sun approaches nearest to the earth (Gr. περί, near, γῆ, the earth). The sun's perigee and the earth's perihelion (*q.v.*) are so related that they differ 180° in longitude, the first being on the line from the earth toward the sun, and the second from the sun toward the earth. The longitude of the solar perigee is now 101°, that of the earth's perihelion 281°.

PÉRIGORD, as a French province, formed part of the military government of Guienne and Gascony, and was bounded on the north by Angoumois, on the east by Limousin and Quercy, on the south by Agenais and Bazadais, and on the west by Bordelais and Saintonge. It is now represented by the departments of Dordogne and part of Lot-et-Garonne. Périgord was in two divisions: Périgord blanc (cap. Périgueux) and Périgord noir (cap. Sarlat). Under the Roman empire it was included in *Aquitania secunda,* and it afterwards formed the diocese of Périgueux. From the 8th century it had its own counts, who were feudatories at first of the dukes of Aquitaine and afterwards of the kings of England. In the 15th century the county passed to the dukes of Orleans, and in the 16th came to the family of d'Albret, becoming Crown land again on the accession of Henry IV.

See the *Dictionnaire topographique du département de la Dordogne* by the Vicomte de Gourgues (1873); the Bulletin of the *Société historique et archéologique du Périgord* (1874 *seq.*); *l'Inventaire sommaire de la "Collection de Périgord"* in the Bibliothèque nationale (1874); J. L. Dessalles, *Histoire du Périgord,* 3 vols. (Libourne, 1883–86).

PÉRIGUEUX, a town of south-western France, formerly capital of the old province of Périgord, now chief town of the department of Dordogne, 79 m. E N E. of Bordeaux, on the railway between that city and Limoges. Pop. (1926), 30,482. Vesunna was the capital of the Petrocorii, allies of Vercingetorix when Caesar invaded Gaul. The country was afterwards occupied by the Romans, who built a second city of Vesunna on the right bank of the Isle opposite the site of the Gallic town. The barbarian invasion brought this prosperity to a close. St. Front preached Christianity here in the 4th century and over his tomb there was raised a monastery, which became the centre of the new town called Le Puy St. Front. The *cité* was pillaged by the Saracens about 731, and in 844 the Normans devastated both quarters. The new town soon began to rival the old city in importance, and it was not until 1240 that the attempts of the counts of Périgord and the bishops to infringe on their municipal privileges brought about a treaty of union. During the Hundred Years' War, Périgueux was twice attacked by the English, who took the *cité* in 1356; and the whole town was ceded to them by the Treaty of Brétigny, but returned to the French Crown in the reign of Charles V. The county passed by marriage into the hands of Anthony of Bourbon, father of Henry IV., and was converted by the latter into royal domain. During the Huguenot wars Périgueux was frequently a stronghold of the Calvinists, who in 1575 did great destruction there, and it also suffered during the troubles of the Fronde.

The town, standing on a height on the right bank of the Isle,

is divided into three parts. On the slope of the hill is the mediaeval town; to the west is the modern town; to the south of the modern town is the old Roman town or *cité*. Three bridges connect Périgueux with the left bank of the Isle, where stood Vesunna, the capital of the Petrocorii. Hardly a trace of this old Gallic town remains, but not far off, on the Plateau de la Boissière, the rampart of the old Roman camp can still be traced. On the right bank of the Isle, in the Roman city, there have been discovered some baths of the first or second century, supplied by an aqueduct 4 m. long, which spanned the Isle. A circular building, called the "Tower of Vesunna," stands at what was formerly the centre of the city. It is believed to have been originally the cella or main part of a temple, probably dedicated to the tutelary deities of Vesunna. The amphitheatre, now in ruins, had a diameter of 1,312 ft., that of the arena being 870 ft.; and dates from the 3rd or even the 2nd century. The counts of Périgueux used it for their château, and lived in it from the 12th to the end of the 14th century. In 1644 it was given over by the town to the Order of the Visitation, and the sisters built their nunnery with stones from it. Of the ruins of the *cité*, the Château Barrière is an example of the fortified houses formerly common there. Two of its towers (third or fourth century) formed part of the fortified enceinte; the highest tower is of the tenth century; and the part now inhabited is of the 11th or 12th century, and was formerly used as a burial chapel. The bulk of the château is of the 12th, and some of the windows of the 16th century.

The chief mediaeval building in the *cité* is the (11th and 12th centuries) church of St. Etienne, once the cathedral; it has a fine carved wooden reredos of the 17th century and a tomb of a bishop of the 12th century. In the mediaeval town, known as Le Puy-St.-Front, is the cathedral of St.-Front which, till its restoration in the 19th century, was of unique architectural value. Nearby are the remains of an old basilica of the 6th century, above which rises the unique Byzantine 11th century belfry. It is composed of two massive cubes, placed the one above the other in retreat, with a circular colonnade surmounted by a dome. To the south-west of St. Front, the buildings of an old abbey (11th to 16th century) surround a 13th century cloister. Of the fortifications of Le Puy-St.-Front, the chief relic is the Tour Mataguerre (14th century).

Périgueux is the seat of a bishop, prefect and court of assizes, and has tribunals of first instance and of commerce and a board of trade-arbitrators. The trade of the town is in pigs, truffles, vegetables, brandy, poultry, pies known as *pâtés de Périgord,* and all kinds of preserved foods. There are quarries in the adjacent vicinity.

PERIHELION, in astronomy, the point of nearest approach of a body to the sun (Gr. *περί,* near, *ἥλιος,* sun). The earth is at perihelion about Jan. 3.

PERIM, a British island in the Strait of Bab-el-Mandeb and 96 m. W. of Aden. Pop. about 200. Formed of volcanic rocks, it stands on the shallow threshold of the Red sea, 2 m. from the Arabian shore, and is about 3½ m. long with an area of 7 square miles. It is horse-shoe shape and a good harbour (depth of water 30 ft.) occupies the concavity on the south side. It is a coaling and revictualling station for vessels. Perim, the Diodoros island of the *Periplus,* was garrisoned from 1799–1801 by a British force and in 1857, in view of the cutting of the Suez canal, annexed to Great Britain, becoming a fortified charge of the Aden residency. It is a cable station and has a lighthouse on the eastern end of the island.

PERINO DEL VAGA (1500–1547), a painter of the Roman school, whose true name was PERINO (or PIERO) BUONACCORSI. He was born near Florence on June 28, 1500. Perino was first apprenticed to a druggist, but soon passed into the hands of a mediocre painter, Andrea da Ceri, and, when eleven years of age, of Ridolfo Ghirlandajo. The painter, Vaga from Toscanella, undertook to settle the boy in Rome, but first set him to work in Toscanella. Perino, when he at last reached Rome, was poor, and with no clear prospect beyond journey-work for trading decorators. He was eventually entrusted with some of the subordinate work undertaken by Raphael in the Vatican. He assisted Giovanni da Udine in the stucco and arabesque decorations of the loggie of the Vatican, and executed some of those small scriptural subjects which go by the name of "Raphael's Bible"—Raphael himself furnishing the designs. Perino's examples are: "Abraham about to sacrifice Isaac," "Jacob wrestling with the Angel," "Joseph and his Brethren," the "Hebrews crossing the Jordan," the "Fall and Capture of Jericho," "Joshua commanding the Sun to stand still," the "Birth of Christ," "His Baptism" and the "Last Supper." He also painted, after Raphael's drawings, the figures of the planets on the ceiling of the great hall of the Appartamenti Borgia. He executed many other works about Rome.

After Raphael's death in 1520 he executed several works independently in Rome, in the churches of S. Marcello and Trinità de Monti. He then returned to Florence, where his work was much appreciated. On his return to Rome in 1523 he associated himself with Giulio Romano, and Penni, whose sister he married. After Le Sacco di Roma in 1527 he settled in Genoa, where he was employed in decorating the Doria Palace. He ornamented the palace and frescoed historical and mythological subjects in the apartments, fanciful and graceful arabesque work, sculptural and architectural details. Among the principal works are: the "War between the Gods and Giants," "Horatius Cocles defending the Bridge," and the "Fortitude of Mutius Scaevola." He also did some work in Pisa in the Duomo and elsewhere. Finally he returned to Rome, where Paul III. allowed him a regular salary. He worked in the Sala della Segnatura (Vatican) on the monochrome decoration of the basement, to replace Fra Giovanni's woodwork decoration which had been destroyed in the Sacco of 1527; he was engaged in the decoration of the Sala Reale, begun by Paul III., when his health gave way, and he died on Oct. 19, 1547. He is buried in the Pantheon. (W. M. R.)

PERINTHUS (Turk. *Eski Eregli,* Old Heraclea), an ancient town of Thrace, on the Propontis, 22 m. W. of Selymbria, strongly situated on a small peninsula. It was a Samian colony, founded about 599 B.C. for trade with Thrace and beyond. Its original name was Mygdonia; later it was called Heraclea Thraciae or Heraclea Perinthus. In 340 B.C. it successfully resisted Philip II. of Macedon and rivalled Byzantium in importance.

PERIODICAL. The term "periodical" refers to reviews and magazines appearing monthly or at longer intervals; it has also been applied to weekly and other newspapers but these are for the most part excluded here. The date in parentheses is the date when the periodical was first published.

The general output of literature reflects changes in the constitution of society (in the large sense) and of the political outlook, but whereas in books we find an index to the life and thought of a generation, the periodical is, or should be, a mental chart recording from day to day the level of average educated intelligence of its readers.

It may be said, generally, that there have been five definite epochs in periodical literature: its birth in the seventeenth century; its jubilee in the eighteenth century, when Addison and Steele did their brilliant work; its rapid expansion in the first half of the nineteenth century; the revolt of the specialists in the latter half; and the vast output of the present, with popular approbation as its objective.

The Early Periodicals.—The beginning of the periodical was in the 17th century, when catalogues of books (1646) were first issued. The bare titles of books, however, did not seem sufficiently attractive, catalogues being, in the opinion of many, "dry things scarce able to raise in men that gust and appetite to learning." Short notices were added by the bookseller or by his hack. The amalgamation of the titles and the commentaries brought the "notices" into greater prominence until they became the leading features. A further strong impetus was given to this new departure by the *Journal des Sçavans,* which began to be printed in France in 1665, and by Britain's *Acta Philosophica* (1665), from both of which editors drew material. A little later they also made abstracts from the *Acta Eruditorum,* issued in Germany in 1682. The French *Journal* was entirely devoted to giving its readers summaries of books. Its publication has continued up to the present time, with only one short break at the end of the eighteenth century. The *Philosophical Transactions* of the Royal

Society (1665) followed in imitation of, and with a similar scope to, the French *Journal*. The aim was stated to be "to give some account of the present undertakings, studies and labours of the Ingenious in many considerable parts of the world." These two journals were, in reality, the parents of the periodical. In the *Weekly Memorials for the Ingenious* (1682) a further development may be registered, when an original contribution made its appearance for the first time. A few years after it was followed by the *Universal Historical Bibliothèque* (1686), which announced its intention of printing reviews of the most important books and the "quality of the author if known." This seems to be the first attempt at periodical criticism, and the first time that it is recorded that an editor asked for contributions from the learned. The innovation was welcome. Periodicals began at once to increase. An interesting attempt, on account of its novelty and originality, was the *Athenian Gazette* (1690), the forerunner of *Notes and Queries* and *Answers,* in which undertaking Samuel Wesley was partner with John Dunton, the editor. Defoe appears as one of the contributors to this magazine when it was issued under the name of the *Athenian Mercury.* In 1692 Dunton issued supplements in which natural history and natural phenomena were dealt with, thus still further widening the scope of the periodical. The *Compleat Library* (1691–92, also printed for John Dunton) came next in order of time and importance with a definite plan allotting a given space to original contributors and to the reviews of books. This magazine contained the elements of criticism as understood to-day. The *Works of the Learned,* 1691, by J. de la Crose deserves mention because it has been said to be the first literary periodical. Side by side with these attempts at giving the public serious reading were periodicals which, though vulgar and obscene, reflect the manners of the day. The best known was Edward Ward's *London Spy,* which is full of well-drawn sketches of London life.

Essay Periodicals.—A new phase in periodical literature began with the eighteenth century. The chief representatives are the *Tatler* (1709), which established the essay periodical as a type, the *Spectator* (1711), the *Guardian* (1712), and the *Examiner* (1710). Politics now became blended with literature. All the great writers then were politicians. Swift and Bolingbroke wrote diatribes for the *Examiner* and filled its pages with personal attacks against the leading men and women of the day; Addison and Steele used their pens in the *Spectator* and *Guardian* to defend Whig principles. The former attained such popularity for its outspoken articles that its sale rose to 4,000. These journals were the only medium then existing of telling men what was happening in politics, and the only guide available for those who desired a lead. Addison and Steele owed their position as public men to the brilliant essays they wrote. The pen was their only weapon, for neither was an orator. The success they achieved, however, was checked by the Stamp Act, passed to curb the licence of the Press and to restrain frank criticism. Owing to its restriction, several periodicals were compelled to cease printing. They had gone a step further than their predecessors in giving current news, social and legal, and in criticising books on literature, history and travel. Perhaps the two most interesting of the century are the *North Briton* (1762) and *Gentleman's Magazine* (1731). The former was edited by John Wilkes (*q.v.* for its history).

The latter, the *Gentleman's Magazine,* though not then the leading monthly, is better known to us than any other of the older periodicals. It contained summaries of events at home and abroad, scraps of art and antiquity, and short and accurate obituary notices now so often consulted by the genealogist.

THE MODERN BRITISH PERIODICAL

The modern periodical burst upon the world with a singular glory at the very beginning of the nineteenth century. The three outstanding periodicals were the *Edinburgh* (1802), the *Quarterly* (1809), and *Blackwood* (1817).

The story of the founding of the *Edinburgh* is recorded in full in Cockburn's *Life of Lord Jeffrey,* 1852. A group of young men, among whom were Sydney Smith, Henry Brougham and Francis Jeffrey, resolved, after some consultation together, to start a new magazine to be called the *Edinburgh Review.* The credit of mooting the idea is generally accorded to Sydney Smith. The aim of the *Edinburgh* was "to erect a higher standard of merit, and secure a bolder and a purer taste in literature, and to apply philosophical principles and the maxims of truth and humanity to politics." But the promoters were not sanguine; it seemed an almost unjustifiable experiment. Undaunted, however, the venture took shape and the first number appeared in October 1802. "The effect," says Cockburn, "was electrical. It was an entire and instant change of everything that the public had been accustomed to in that sort of composition The learning of the new journal, its talent, its spirit, its writing, its independence, were all new. Its literature, its political economy and its pure science were generally admired. It was hailed as the dawn of a brighter day."

The Tory spirit was roused to action by the *Edinburgh.* To maintain their principles the *Quarterly* and *Blackwood* came out as rivals. These three journals together have maintained the political and literary note of the founders up to the present day, the political element always predominating.

The Popular Magazine.—In the next fifty years the crowd of magazines hurtle against each other on the bookstall and in reading-rooms. No sooner has one outstripped the other in popularity than another starts in the race seeking to surpass its rival in excellence and dignity. Their names seem legion and the heterogeneity bewildering. Four—*All the Year Round* (1859), the *Cornhill* (1860), *Macmillan's Magazine* (1860), and *Temple Bar* (1861)—are typical of the period.

The beginnings of these magazines have resolved round the question of supply and demand. Competition between publishers was now alive and active. The series started with *All the Year Round,* with Charles Dickens as editor, and was succeeded after a short lapse of time by the other three under the respective editorships of Thackeray, David Masson, and George Augustus Sala. Since their object was to beguile the leisure hours of the public, fiction was preferred to politics. The tables were turned. The political article was either non-existent or was relegated to the background. The classical and literary essay had proved failures.

The *Cornhill,* the most characteristic example of the spirit of modernity that was creeping in, was launched by Mr. George Smith in 1860 with the idea of making the popular serial the chief attraction. Though the plan cannot be claimed as original, the enterprise necessary to carry it out belongs to Mr. Smith. His scheme was the first definite move in this direction. The novelty of it "lay in uniting the popular lure of the serial with the literary work of the more serious reviews" A pleasant record of the founding of this magazine is given in the *History of the House of Smith, Elder.*

Children's Magazines.—An outstanding feature of the late 19th century is the development of literature for the young, principally due to the spread of education. In a world bent on introducing new methods and making experiments in the upbringing of children, with encyclopaedias and dictionaries expressly written that they may be comprehended by them, it is not surprising that the serial for boys and girls should also fill an important niche. The best magazines contain a mixture of fiction, science and practical suggestions to young people in a variety of crafts which might appeal when grammar becomes tedious. The credit for originating this special kind of literature seems to belong to the New World *The Young Misses' Magazine* (1806) of Brooklyn apparently led the way, and was then followed by many others until in the seventies of the nineteenth century the avalanche of printed matter began to move forward and has never ceased to advance The first to appear were *Little Folks* (1871), *The Boys' Own Paper* (1879) and *The Girls' Own Paper* (1880). Among the most popular monthlies in England are *My Magazine* (1914), formerly the *Children's Magazine* (1911), ably edited by Arthur Mee, and *Child Education* (1924). In the United States *St. Nicholas* (1873) and *Youth's Companion* (1827) call for mention.

Historical and Scientific Magazines.—The revolt of the

'eighties and 'nineties, as we have termed this next period, though not quite accurate when one comes to examine details, is significant of this period when historian, antiquarian and scientist first became aware that the ordinary periodical did not meet their requirements. A glance at the dates when the principal historical and other scientific magazines were founded will bring conviction to those who would be inclined to question this contention. A few samples are sufficient to show the tendency.

The *English Historical Review* began in 1886, the *Classical Review* in 1887, the *Church Quarterly Review* in 1875, the *Asiatic Quarterly* in 1886 (since 1914 called the *Asiatic Review*), the *Law Quarterly* in 1885, the *Magazine of Art* in 1878, and the *Western Antiquary* in 1883.

The Coming of Illustrations.—The general periodical had not, however, come to a standstill. On the contrary, new magazines were keeping the printer busy. It is only necessary to mention *The Nineteenth Century* in 1877, which immediately took the foremost place in the political and literary field, and *Longman's Magazine* or *Murray's Magazine;* but these were merely developing on the lines of their predecessors, and forced their way into notice by dint of the great ability displayed by their editors. This period is also notable for the first magazine that made illustrations a distinct feature. Many had already inserted full-page illustrations and woodcuts in the 'sixties, but none of these approached to what we now accept as an illustrated magazine. The *English Illustrated Magazine* (1884) may perhaps be considered the parent of illustrated periodicals, though no doubt the bibliographer would name an earlier one. The continually changing attitude of the public is clearly shown by George Augustus Sala, who had stated in *Temple Bar* (1861) that, with due regard to the interests of his readers, he preferred to give them sixteen extra pages of print rather than an illustration or two.

The journalism of our own day was quick to take the suggestion thus received. Popularisation is its keynote. Innumerable publishers adopted the view of Sir George Newnes that a magazine should give "wholesome and harmless entertainment to crowds of hard-working people craving for a little fun and amusement," and should provide the public with light literature and a large supply of illustration to please the senses. The failure of Mr. W. T. Stead to see eye to eye with Sir George Newnes when the *Review of Reviews* was brought out resulted in the issue of the *Strand Magazine* in 1891. The design of that magazine was that it should "contain stories and articles by the best British writers and special translations of the chief foreign authors." Its policy was "to change individual features as soon as there were signs that the public were tired of them." No limit was to be put to illustration. It was a bold move, and even the publishers felt that they were embarking "upon the wildest extravagance in furnishing no fewer than a hundred and ten illustrations in a single number." It must be remembered that this was before the general adoption of process engraving, and that woodcuts were still in use. The success which followed was phenomenal. Though fiction predominated, many articles of a scientific nature, comprehensible to the lay mind, were printed. One notable example deserves mention, namely, the contribution of Professor Langley on his own aeroplane with a picture of its flight, which may be said to be the first representation of the working of an aerial machine. The periodical market is now crowded with magazines of this kind of varying merit and popularity.

Canada.—Canada naturally did not show the same literary activity in the 18th century as the mother country, but the standard to which it has attained gives it precedence among British self-governing dominions. The first monthly in Eastern Canada, or Nova Scotia as it was called, was *The Nova Scotia Magazine* (1789–92), and in Canada proper *The Canadian Magazine* (Quebec, 1823–25). In addition to these there were the bi-lingual *Quebec Magazine* (1791–93), a quarterly; and several others entirely in French, *L'Abeille canadienne* (1818); *La Bibliothèque canadienne* (1825–30), continued as *L'Observateur* (1830–31); and the *Magasin du Bas-Canada* (1832). *The Literary Garland* had a longer life (1838–50) than most of those that preceded and was for some time the only English magazine published in Canada. A series of interesting French-Canadian reviews followed; the foremost *La Revue canadienne* (1864) contained the best writing of contemporary French-Canadian men of letters. A short-lived serial *The Bystander* (1880–83) was edited by Goldwin Smith. The quite modern publications are *The Queen's Quarterly* (1893), the organ of the Queen's University, Kingston, Ont.; *The Canadian Forum* (1920); *The Dalhousie Review* (1921). Mention should also be made of the *University Magazine*, the organ of McGill University, now no longer issued; and *Le Canada Français* (1888), published by the Université Laval de Quebec.

Australia and New Zealand.—There has not been any lack of literary venture in the great Southern colonies, but among the many magazines issued in the 19th century only one or two can lay claim to any real merit. But it must be remembered that the learned societies print Journals or Transactions which in a small community supply the need. *The Sydney University Magazine* (1855 and 1878–79), continued as *The Sydney University Review*, was of some importance and of literary value. The best magazine now is probably *The Bulletin*, in which many noted Australian writers have first made their mark. Apart from *The Bulletin* there are two monthlies, *Life* and *Stead's Review*. The former is popular and illustrated, while the latter is a copy of the well-known *Review of Reviews*. *The Lone Hand* (1907) and the *New Triad*, New South Wales, take the lead among popular serials. A journal of outstanding merit, *The Economic Record*, the organ of the Economic Society of Australia and New Zealand, cannot be included among literary reviews.

UNITED STATES

The periodical made its appearance in America later than in England. After the struggle with Great Britain was over, the Americans with the enthusiasm of a young nation exerted themselves to the utmost to lay the foundation of a national literature. One of the items in their programme was the periodical, which they took special care to encourage. From the very beginning it seemed to them an essential vehicle of culture. The postal authorities with a generosity uncommon in modern days, stimulated its circulation by the grant of liberal terms for postage.

In imitation of *The Gentleman's Magazine*, Benjamin Franklin founded *The General Magazine* (1741) at Philadelphia, but its life was short. Several attempts to bring out new periodicals were made during the next thirty years, but none seemed to grasp what the public wanted. *The Pennsylvania Magazine* (1775–76), perhaps the most notable, was the joint work of Robert Aitken and Thomas Paine.

The most important magazines of the 18th century were *The American Museum* (1787); *The Universal Asylum and Columbian Magazine* (1790); *The Monthly Anthology* (1803), an interesting Bostonian experiment, in which the study of Belles Lettres predominated; established by Phineas Adams, it was taken over a few months later by the Anthology Club of which Ticknor, Everett, William Tudor and Bigelow were members; *The Salmagundi* (1807) for which Washington Irving wrote; *The Literary Magazine* (1803–07), whose editor was Charles Brockden Brown, and the *Port Folio* (1809) issued in 1801 as a weekly newspaper, and then in 1809 transformed into a monthly. This last named exercised a considerable influence over the literary life of the period by its disinterested devotion to pure literature. Its editor, Joseph Dennie, received the nickname of "The American Addison."

A peculiar feature of the 18th and early 19th centuries in America was the desire of every town of any size to have its own magazine run by its own small literary coterie. Each group wished to express its own opinion and to direct the literary taste of its fellow townsmen. An interesting and creditable example of these provincial attempts was *The Medley* (1803) issued in Lexington, Kentucky. The premier place in periodical literature belongs to *The North American Review* (1815). It is the only one that survived through the troublous days that followed its inception. Its list of contributors contained among others the names of Edward T. Channing, Richard Henry Dana, John Adams, George Ticknor, Daniel Webster and George Bancroft. Its

first editor, William Tudor, gave as the reason for establishing it "a desire to emancipate America from undue subservience to England in literary matters." After a period of comparative dullness and prosy writing, it emerged to new life in 1864 under the joint editorship of Lowell and Charles Eliot Norton.

Holmes, Lowell and Emerson.—A few years later the *North American Review* was followed by *The United States Literary Gazette* (1825–27) to which Longfellow made many contributions; by the *New England Magazine* (1831–35), famous as the medium selected by Oliver Wendell Holmes for the chapters of his *Autocrat of the Breakfast Table;* by Lowell's *Pioneer* (1843), a short-lived publication not without interest, since it contained tales by Poe and Hawthorne, and by *The Dial* (1840–44) published quarterly by a group of New England transcendentalists with Emerson as its second and unwilling editor. "I wish it to live," he wrote in his diary, "but I do not wish to be its life. Neither do I like to put it into the hands of the Humanity and Reform men, because they trample on letters and poetry; nor in the hands of scholars, for they are dead and dry." It was not a financial success and ended with an existence of four years.

Among other periodicals of high standing were the *Knickerbocker Magazine* (1833), an early and successful popular magazine published in New York (after a succession of well known editors, Lewis Gaylord Clark assumed control of the magazine until it ceased to appear in 1859); the *Boston Quarterly Review* (1838), merged five years afterwards with the *Democratic Review,* and the *Southern Literary Messenger* (1834).

Not unworthy of mention are two successful magazines of the lighter kind, *Godey's Lady's Book* (1830) and *Graham's* (1841). Poe, Longfellow and Holmes wrote for the former, while Lowell, Hawthorne and Simms contributed to the latter. When the middle of the century was reached, and more especially after the Civil War, competition between publishing houses began in earnest. The position of the *North American Review,* the sole survivor of the early 19th century, was assailed on every side. Its most serious rivals were *Harper's Magazine* (1850), *The Atlantic Monthly* (1857), and some years later *Scribner's Magazine* (1870), *The Century* (1881) and *The Forum* (1885).

The financial difficulties of the preceding generation were gradually overcome by the new processes in printing, by the great advance in the art of illustration, and by the increased facilities of transport, while the rapid development of advertising has also done a great deal to secure the commercial success of the periodical, unfortunately often to its detriment.

The outstanding feature of the 20th century is the decline in popularity of the quarterlies with their long and heavy reviews, and the rise of the magazine with short well written essays, charming stories, and illustrations of artistic excellence. Among the many reviews devoted to literature it is difficult to select the best, but attention must be called to the *American Mercury* (1924), and to *The Bookman* (1895) a purely literary monthly of some years' standing.

FRANCE

The *Journal des Sçavans* in France, the first number of which appeared in January, 1665, is acknowledged to be the parent of modern periodical literature. The credit of having mooted the idea is due to Denys de Sallo, who at the time was regarded as a genius and inventor for having framed the scheme. Its intention and scope is given in the *Encylopédie méthodique* "il a été inventé pour le soulagement de ceux qui sont ou trop occupés ou trop paresseux pour lire les livres entiers."

One of its principal successors, the *Nouvelles de la République des lettres* (1684), though published at Amsterdam, was edited by Bayle who had retired to Holland, where, in spite of the comparative liberty of the press, nothing had as yet been issued resembling the *Journal.* A very few years after, the *Mémoires pour servir à l'histoire des sciences et des arts,* known by the name of *Journal de Trévoux* (1701–67), was brought out under the auspices of the Jesuits, who announced that it would contain extracts and criticisms from books of science printed in France and elsewhere. Their primary object, however, was to defend religion from attack, and it was probably for this reason that it incurred the displeasure of Voltaire. Its course ran so smoothly that for thirty years the printers of the little town of Trévoux were kept busy, until it became more convenient to transfer the headquarters of the Journal to Paris. Simultaneously the *Spectator* and *Tatler* were appearing in England, giving a new impulse to periodical literature. The French, characteristically averse from imitation, hesitated, and refused to follow the lines laid down by Addison and his companions. It was not till 1722 that Marivaux made his unsuccessful attempt to rival the Englishmen by issuing his *Spectateur français* (1722). The *Spectateur suisse* (1723), *Le nouveau Spectateur* (1758) and others came after but were of little value. *Le Pour et le Contre* (1723–40) edited by the Abbé Prévost, and full of anecdote and miscellaneous information, had also some traits in common with the English reviews. Another periodical of high rank of the 18th century—Voltaire proclaimed it the chief journal—was the *Journal encyclopédique* (1756–73) founded by P. Rousseau, who carried on his work for many years under the protection of the Count of Horion, minister of the prince bishop of Liége. When the latter died, Rousseau was compelled to transfer the Journal from Liége to Bouillon on account of the philosophical articles it contained, but permission was given him to establish his presses there.

Development of the periodical in France has not been quite so rapid as in England and elsewhere, though it has proceeded on similar lines. The cheapness of books has probably had a considerable influence. What the French term "Journaux de lecture" or "de récréation," like the *Gentleman's Magazine,* made their appearance late in France, and have not met with the same remarkable success as in England and America. The first genuine example may be said to be *Le Journal pour tous* (1855) an illustrated literary magazine which was much sought after. The periodicals of the specialist seem to have started a little earlier than in England; the first law journal (*Journal du Palais*), appeared in 1672, the first medical journal (*Nouvelles découvertes dans toutes les parties de la médecine* par Blégny) in 1679.

The leading reviews to-day are:—*Revue des deux Mondes* (1829), *Nouvelle Revue* (1879), *Revue bleue* (1863), *Revue de Paris* (1894), *Le Mercure de France* (1890), *Revue de France* (1871), *Revue Hebdomadaire* (1892) and *Chronique des Lettres françaises* (1922).

GERMANY

The *Acta Eruditorum* (1682), the earliest of German periodicals, as has been mentioned above, was not only limited in the choice of subjects to mathematics, physics and botany, but was also handicapped by the use of the Latin language. Nevertheless, German men of science, like Leibnitz, the botanist Ettmüller, and the mathematician Pfautz combined to make the *Acta* a central meeting ground where the results of their researches might be read. The plan turned out so successful that others decided to try the same experiment. In consequence, a large number of similar journals issued from the press. Christian Thomasius, professor in the University of Halle and the founder of journalism in Germany, led the way with the first learned periodical in the German language. *Schertz- und Ernsthaffter Vernünftiger und Einfältiger Gedanken über allerhand lustige und nützliche Bücher und Fragen* (1688). Twenty years later, soon after the English periodicals of Addison and Steele had reached Hamburg, the Germans taking these, especially the *Spectator* and the *Guardian,* as models brought out *Der Vernunftler* (1713), *Die Lustige Fama* (1718), *Discoursen der Maler* (1721). But the culminating point was reached when F. Nicolai introduced his *Briefe die neueste Literatur betreffend* (1759) to the world, and enlisted as collaborators Lessing and Mendelssohn. Nicolai offered a yearly prize of 50 thalers for the best tragedy, an early example of rewards offered by a periodical. This move had a considerable influence on the dramatic literature in Germany in those days. The *Frankfurter Gelehrten Anzeigen* (1772) formerly *Frankfurter Gelehrte Zeitung* (1736) followed a few years later and is chiefy interesting because Goethe wrote for it as a young man, and similarly the *Jenaische Litteratur-Zeitung* (1804) of which Goethe may be said to have

acted as editor in chief. But *Der Teutsche Mercur* (1773–89) stands out more prominently than most of the preceding, and its appearance marks a further stage in the history of this branch of literature.

Germany, split up as she was into a variety of states, was just beginning to show signs of an awakening to a new political consciousness, while editors and writers were forced to note events in the world beyond their boundaries and to discuss politics. The happenings in America and France drove them into new currents of thought. When at last the century was drawing to a close, politics were displacing literary matter in the pages of the periodical so completely that the editor of *Minerva* (1792) wrote "the best poems are unread; men are craving for the journals to satisfy their political appetite."

Fifty years later, after the Revolution of 1848, the periodical in Germany as everywhere else underwent another phase. Editors with a view to increasing their circulation appealed to a wider public of intelligent readers for support. The magazines became more attractive and their matter lighter. Among these may be cited *Westermanns Monatshefte* (1856), *Unsere Zeit* (1857), *Gartenlaube* (1853). The number of monthly publications has gone on increasing ever since, until at the present moment they may be reckoned in thousands. The trend of development does not differ much from that in other countries, while the reading public of Germany is less given to this form of literature than in England.

The best known are the *Preussische Jahrbücher* (1838), the *Deutsche Rundschau* (1874), *Historische Zeitschrift* (1859), *Neue Rundschau* (1889), *Die Literatur* (1898), and *Deutsche Vierteljahrsschrift* (1923).

OTHER EUROPEAN COUNTRIES

Holland.—The oldest periodicals in Holland are the *Examinator* (1719) and *Den Amsterdamschen Hermes* (1722–23). In 1837 *De Gids* was founded as the organ of Liberalism and at the same time of a new movement in literature. It is still the most important of Dutch reviews although it lost its literary leadership when *De Nieuwe Gids* started in 1885 and has never quite regained it. Of twentieth century literary periodicals *Het Haagsch Maandblad* (1921) and *De Stem* (1920) are important.

Italy.—The conditions under which literary men worked in Italy were different from those in other countries. Here the church interfered to a greater degree in the production of books, while the fact that Italy was broken up into a number of petty states militated against the circulation of literature. It was unwise for writers to touch on politics, and religious matters for the most part were barred; sanction of the church being always necessary when anything new was conceived. Nevertheless, the *Journal des Scavans* had its imitator in Rome when Cardinal Ricci began to print *Il Giornale de' Litterati* (1668–79), and Venice, always in the forefront in literary activities, issued the *Galleria di Minerva* (1696). The rivalry, however, of the various academies and princes acted as a continual curb, and the outlook of editors and writers remained circumscribed for a long period. Even in the 18th century when Baretti undertook to publish *La Frusta letteraria* (1763), liberty of the press was still unheard of. Baretti so mercilessly attacked the writers of Italy and even the ruling princes, that after a few years of precarious existence the *Frusta* was suppressed. He had also incurred displeasure by his disapproval of the opinions of a coterie of young men in Milan whose organ *Il Caffè* was greatly influenced by French thought. The best modern periodicals are *Nuova Antologia* (1866) a bi-monthly, *La Critica* (1903) edited by B. Croce, *La Revista d'Italia* (1897), *La Rassegna italiana* (1918), *Revista di cultura* (1920), *La Cultura* (1922), *Il Convegno* (1919) and *Le opere e i Giorni* (1922).

Poland.—The position in Poland has always been difficult owing to political turmoil, to the partition of Poland and subsequent Draconian measures of both Russian and Prussian governments. The first monthly seems to have been the *Pamiętnik* of Sartkowski (1782–92). When Russia became more liberal in 1905 the press began to revive, but the modern period does not start till 1918. The present reviews in French and German are chiefly intended to give information to the foreigner.

Portugal.—In Portugal the *Jornal Enciclopedico* (1779) and subsequently *O Panorama* (1837–68) were the chief serials. The latter was concerned with history and letters, and Herculano published his historical tales in it. The nearest approach to the English *Nineteenth Century* were the *Revista universal* (1841–59) the *Revista Peninsular* (1855–56) and the *Revista de Portugal*. *O Instituto* which began in 1853 still continues, and is a scientific and literary review, and the *Lusitania* (1924), which is literary, artistic and historical.

Russia.—In Russia the Academy of Sciences led the way by the issue of a monthly (1755), and four years later the first private undertaking, the *Trudolyubivaya Pchela* (1759), came out. Shortly after, Novikov, a distinguished man of letters in the reign of Catherine II., brought out two or three serials (1777–82) simultaneously, but throughout the whole of the 18th century the public in Russia does not seem to have fancied this kind of publication; subscribers were few and entirely confined to readers in Moscow and St. Petersburg (Leningrad). In the 19th century the most representative magazines were the *Vestnik Evropy* (1802–30) edited by the historian Karamsin; the *Biblioteki dlya Chteniya* (1834), the first to obtain any commercial success; the *Sovremmenik* (1836), founded by Pushkin; the *Russkaya Starina* (1852), limited to archaeology and history, but of considerable value; the *Russky Vestnik* (1856), edited by the well-known publicist Katkov; the *Vestnik Evropy* (1866), a continuation of the earlier *Vestnik*, to which the novelist Turgenev contributed; the *Russkoe Bogatstvo* (1878); *Russkaya Misl* (1881); *Letopis* (1913), edited by Maxim Gorki. The latest comer, the *Novy Mir* (New World), is the chief journal in present day Russia.

Scandinavian Countries.—The northern countries of Europe, Sweden, Norway and Denmark, have never lagged behind in the production of literature. The earliest periodical in Sweden was *Svenska Argus* (1733) moulded on Addison's and Steele's *Spectator*. Of modern reviews the following are worth mentioning: *Ord och Bild* (1892), *Nordisk Tidskrift* (1878) which prints historical and philosophical essays and studies but excludes articles on political and religious topics, and *Det nya Sverige* (1907), a very conservative organ. For special information on the early history of periodicals in Sweden Sylwan's *Svenska pressens historia intill 1772* (1896) should be consulted. In Norway *Ugentlige Korte Afhandlinger* (1760) claims priority. *Samtiden* (1890), started by Gerhard Gran in Bergen, and transferred about 1900 to Oslo, is now the leading Norwegian journal. It is edited by Prof. J. S. Wörm-Müller. In Denmark *Nye Tidender om laerde Sager* (1720) is the oldest critical periodical. The leading monthlies are: *Tilskueren* (1884), *Gads danske Magasin* (1906) and the latest, *Dansk Udsyn* (1921).

Spain.—In Spain the periodical came much later than in France, and it was in the beginning dependent on its French prototype. The earliest examples date from the middle of the 18th century, the two best known being *Efemérides Barometricomedicas matritenses* (1743–47) edited by Fernández Navarrete, and the *Diario de los Literatos de España* (1737–42). A third, *Memorial literario* (1784) might be added.

During the reign of Ferdinand VII. (1784–1833) and of his predecessor, literary men worked under great disadvantages. The censorship of the press was active, and the church viewed printed matter with suspicion. The numbers who subscribed to periodicals were few, while their distribution in the provinces was difficult. The life of a new periodical was therefore often short, both the editor and the author receiving but a poor reward for their labour. In spite of these restrictions, however, there are two or three worth noting—*Misceldnea de Comercio, Artes y Literatura* (1819–21) and *El Censor* (1820–22).

When Cristina became regent in 1833 those antagonistic to the press lost much of their power and many new periodicals began to come out. To a great extent they also began to free themselves from foreign influence.

The publication of reviews is one of the most characteristic features of present day Spain; they are generally literary. Every town or province has its own organ. The most important general

eview of the 20th century was *La Lectura*, but it has now ceased to appear. At present there is *La Revista de Occidente* (1923) edited by Ortega y Gasset; *Residencia* published by the Residencia de Estudiantes, Madrid, is also good and of greater nterest than its title would imply. Mention may also be made of he *Gaceta literaria; La Pluma* (1919); and *La Revista hispanoamericana de ciencias, letras y artes* (1921).

Switzerland.—The *Nova litteraria helvetica* (1703–15) of Zurich is the earliest literary periodical which Switzerland can show. This was followed by the *Bibliothèque italique* (1728–36) and the *Bibliothèque britannique* (1796–1815) both published at Geneva. The leading Swiss periodicals now are *La revue mensuelle* (Geneva, 1897); *La Revue de Genève* (1919); *Bibliothèque universelle* (1816), and *Revue Suisse* (1838) amalgamated n 1838 as the *Bibliothèque universelle et revue suisse. La Suisse romande* (1885) only lasted twelve months. *Théologie et philosophie* (1868–1872), an account of foreign literature on those subjects, was continued as *Revue de théologie et de philosophie* (1873) at Lausanne. Among later periodicals may be mentioned *Archives de psychologie de la Suisse romande* (1901) edited by Flournoy and Claparède; *Jahresverzeichnis der schweizerischen Universitätsschriften* (1897–1898); *Untersuchungen zur neueren Sprach- und Literaturgeschichte* (1903); *Zwingliana: Mitteilungen zur Geschichte Zwingli und der Reformation* (1897).

PERIODIC CURRENT, as applied to radio, is alternating current in which the frequency is determined by the electrical constants of the circuits in which it flows.

PERIODIC LAW, THE. The classification of the elements, in the strict chemical sense, is a comparatively recent problem, for it was not until about the beginning of the 19th century that the two kinds of chemical substances, elements and compounds, were clearly differentiated. The early years of the century witnessed a rapid development in analytical chemistry, the art of distinguishing different chemical substances, and the consequent building up of a vast body of knowledge of the chemical and physical properties of both elements and compounds. This rapid expansion of chemical knowledge soon necessitated classification, for on the classification of chemical knowledge are based not only the systematized literature of chemistry but also the laboratory arts by which chemistry is passed on as a living science from one generation of chemists to another. The elementary substances are few in number, rather less than a hundred, with distinctive properties, whereas compound substances are extremely numerous, in the order of a million, with properties correspondingly diversified and often overlapping. The fact that many compounds contain elements in common renders classification easy, whereas elements, having no chemical components, are not readily amenable to classification. It thus occurred that the classification of elements lagged many years behind that of compounds, and, in fact, no general agreement had been reached among chemists as to the classification of elements for nearly half a century after the systems of classification of compounds had become established in general use.

Probably the earliest steps towards the classification of the elements were taken by J. W. Döbereiner between 1817 and 1829, when he showed that certain triads of elements possessed close relationships between their members, the alkaline-earth metals, calcium, strontium, and barium, for example, having many properties in common, those of strontium being a mean between those of calcium and barium. Similarly in the halogen triad, the properties of bromine are a mean between those of chlorine and iodine, while in the alkali metal triad the properties of sodium are a mean between those of lithium and potassium. J. B. A. Dumas, L. Gmelin, E. Lenssen, Max von Pettenkofer, and J. P. Cooke, between 1828 and 1854, expanded Dobereiner's suggestions by showing that similar relationships were more extensive than between triads of elements, fluorine being added to the halogens, and magnesium to the alkaline-earth metals, while oxygen, sulphur, selenium, and tellurium were classed as one family, and nitrogen, phosphorus, arsenic, antimony and bismuth as another family of elements.

Many attempts were subsequently made to prove that the atomic weights of the elements were expressible by an arithmetical function, and in 1862 A. E. B. de Chancourtois proposed a classification of the elements based on the new values of atomic weights (*q.v.*) consequent on Stanislao Cannizzaro's system of 1858. De Chancourtois plotted the atomic weights on a helical curve such that corresponding points differed by 16, the atomic weight of oxygen. This curve brought closely related elements on to corresponding points, and he suggested in consequence that "the properties of the elements are the properties of numbers," a remarkable prediction in the light of the modern view that the elements are characterized by the natural numbers from unity onwards which express the numbers of electrons in atoms (*See* ATOMIC NUMBERS.) In the following year, 1863, J. A. R. Newlands proposed a system of classification of the elements in the order of atomic weights, the elements being assigned ordinal numbers from unity upwards and divided into seven groups having properties closely related to the first seven elements, hydrogen, lithium, beryllium, boron, carbon, nitrogen and oxygen. This septenary relationship was termed the *law of octaves*, by analogy with the seven intervals of the musical scale. A somewhat similar classification was put forward by William Odling a year later, and in 1869 Dmitri I. Mendeléev, as a result of an extensive correlation of the properties and atomic weights of the elements, proposed the periodic law by which "the elements arranged according to the magnitude of atomic weights show a periodic change of properties."

The Periodic Classification of the Elements as proposed

by Mendeléev in 1869 had few advantages over the classifications of Newlands and Odling, the families of elements in all three classifications being arranged in horizontal rows. The principal virtue of Mendeléev's classification lay in the fact that he clearly recognized that the outstanding periodic property of the elements is valency (*q.v.*). Valency is a number that expresses how many times the equivalent weight of an element is contained in its atomic weight. As the equivalent weight of an element is the weight of it which combines with, displaces from combination, or is otherwise chemically equivalent to unit weight of hydrogen, the valency of an element is simply the number of atoms of hydrogen that are equivalent to an atom of the element in chemical combining capacity. Mendeléev's classification was essentially a classification by valency, the elements falling into seven families with valency from one to seven respectively. This classification by valency was further emphasized by Mendeléev in 1871, when he put forward an improved form of the periodic table, in which the families of elements were arranged in eight vertical groups having valency from one to eight. This form of the table has continued unchanged to the present day, and on it is based practically the whole modern system of arrangement and classification of chemical knowledge. Moreover, on this periodic arrangement is ultimately based the bulk of scientific knowledge of the electronic structure of atoms.

After the formulation of the periodic law and classification by Mendeléev, numerous attempts were made to express the law in rigid terms and the classification in a completely unambiguous form. Most of these, which have no longer even historical importance, served merely to demonstrate that the octet arrangement by valency is indispensable to the classification of the elements. The discovery of the inert gases, argon, etc., by Lord Rayleigh and Sir William Ramsay from 1894 onwards, introduced a new complication into the periodic classification. The properties of argon indicated that it should be placed between the highly electronegative element, chlorine, and the highly electro-positive element, potassium, that is, between a halogen element and an alkali metal. As the inert gases have no valency, Mendeléev proposed to create a new "zero" group to accommodate them, thus increasing the number of groups or families from eight to nine, despite the fact that several places in group VIII. were unoccupied. For example, neon is the sole element having atomic weight between that of fluorine in group VII. and that of sodium in group I., and could thus have been accommodated in one of the vacant spaces of group VIII. of Mendeléev's table. The other inert gases could also be fitted into the remaining vacancies of group VIII.

This classification of the elements into eight families or groups, having valency from one to eight respectively, presents certain anomalies. For example, only one element, hydrogen, precedes the inert gas helium of group VIII., though there are seven other groups. The inert gas argon has atomic weight greater than potassium in group I., though it should have smaller atomic weight according to its position in the group VIII. preceding; the properties of cobalt indicate that it should precede nickel in the classification, though its atomic weight is slightly greater; the atomic weight of iodine in group VII. is less instead of greater than that of tellurium in group VI.; the triad of elements, iron, cobalt and nickel, require to be placed in group VIII., in order that univalent copper shall fall into group I., and similarly with the triads ruthenium, rhodium, palladium, and osmium, iridium, platinum. The anomalies relating to the position of hydrogen and that of these triads are inherent in the periodic classification. The anomalies relating to atomic weight are, however, only apparent.

Mendeléev assumed that the periodicity of properties was a function which depended primarily on the magnitude of the atomic weights. It is certain that this is not strictly true, and that the order of the elements follows another function, the numbers of electrons in atoms, known as the atomic numbers (*q.v.*). These numbers are based on the theories of Sir Ernest Rutherford and Niels Bohr as to the structure of atoms. In Rutherford's theory an atom consists of a central massive nucleus surrounded by nearly massless negatively charged electrons, sufficient in number to neutralize the positive nuclear charge. Bohr's theory involved a quantitative explanation of the lines in the spectra of atoms in terms of the nuclear charges, and was utilized by H. G. J. Moseley to determine the nuclear charges from X-ray spectra. Moseley's work showed that atoms, adjacent in the periodic classification, differ by unity in nuclear charge and therefore by one electron. Assuming that iron had 26 electrons as the 26th element in the chemical order, Moseley showed that cobalt had 27 and nickel 28 electrons, despite the fact that nickel has a smaller atomic weight than cobalt. The method was successfully applied to the other periodic anomalies, and it was proved that the true order of the elements in the classification is that of atomic number, not atomic weight. The periodic law consequently states that the properties of the elements are periodic functions of their atomic numbers.

The Abridged or Typical Classification.—Examination of the properties of the elements in the order of atomic number shows that the elements fall into series or periods of eight families having valency from one to eight respectively. The first series, consisting of hydrogen and helium, may be regarded as a rudimentary or primitive period, hydrogen being the prototype of all the valent elements and helium the prototype of all the non-valent or inert elements. The eight elements succeeding helium, lithium to neon, form a period of eight groups from I. to VIII. The next eight elements, from sodium to argon, form a similar period of eight groups. These two octet periods may be regarded as generalized types for the classification of the remaining elements. Instead of eight, however, there are 18 elements up to the next inert gas, krypton. Of these 18 only eight exhibit close resemblance to the preceding elements of the two short typical periods. These eight elements are potassium, calcium, gallium, germanium, arsenic, selenium, bromine and krypton—exactly sufficient to fill the eight groups of this 4th period. This arrangement leaves a gap of ten in atomic number between calcium (20) and gallium (31), by excluding the ten elements from scandium to zinc. These ten elements exhibit a gradual transition in properties from close resemblance to calcium on the part of scandium to close resemblance to gallium on the part of zinc. The ten excluded elements may consequently be regarded as a first transition series bridging a gap in atomic number and in properties between more typical elements of the period.

Similar considerations apply to the 18 elements from rubidium to the next inert gas, xenon, ten elements from yttrium to cadmium being excluded and relegated to the second transition series, leaving a typical period of eight elements, rubidium, strontium, indium, tin, antimony, tellurium, iodine and xenon. In the next period, the sixth, 32 elements occur from caesium to the inert gas radon. Nevertheless, as in the two preceding periods, only eight elements are closely related to those of the short typical periods, these eight being caesium, barium, thallium, lead, bismuth, polonium, the unknown halogen element 85, and radon; 24 elements from lanthanum to mercury are consequently excluded and relegated to the third transition series. In the last period, radium alone shows close resemblance to elements in the typical periods, and the remainder, actinium, thorium, protoactinium and uranium, are consequently relegated to the fourth transition series.

The typical classification of the elements, shown in Table I., thus consists of 7 periods each consisting of eight groups, each period, except the rudimentary 1st, and the incomplete 7th, commencing with an alkali metal and ending with an inert gas. This arrangement illustrates the extreme regularity of the periodicity of properties of the elements included in this abridged classification. It further reveals that basic or alkaline character increases steadily in each vertical group from a minimum in period one to a maximum in period seven, and decreases steadily in each horizontal period from a maximum in group I. to a minimum in group VIII. This decrease in basicity in each period, however, is not quite uniform, but occurs by a series of leaps, all the elements yielding alkaline hydroxides being in groups I. and II., those yielding amphoteric hydroxides (soluble in both acids and alkalis) being included in groups III. and IV., while all the acidic and non-basic elements are included in groups V. to VIII. The elements can thus be further classified into an *alkaline* class of two

groups I and II, and *amphoteric* class of two groups III and IV, and a *non-alkaline* or *acidic* class of four groups V to VIII It may further be observed that, where elements exhibit variable valency, this variation occurs by two or four units Elements of group III., for example, exhibit variable valencies of three and one, those of group IV valencies of four and two, those of group V valencies of five, three and one, and so forth. This variation of valency by two or four units is intimately related to the three main classes of elements, the alkaline class of two groups, the amphoteric class of two groups, and the non-alkaline class of four groups, a reduction in valency of two or four units being accompanied by an increase in basic character equivalent to a decrease in group number of two or four units Thallium of group III, for example, on reduction from valency three to one, exhibits the properties of an alkali metal of group I. with valency one

The variations in alkaline character of the elements of Table I., as one proceeds either along the horizontal periods or down the vertical family series, lead, by a sort of cross-hatching, to a manifestation of resemblances between elements otherwise unrelated in the classification For example, these variations explain the close resemblance of beryllium and aluminium, two metals which are not in the same group or period. In a similar way resemblances arise between lithium and magnesium, and between boron and silicon So pronounced is this diagonal resemblance in the periodic table that a line, drawn between beryllium and boron and between aluminium and silicon and continued diagonally across the table, completely separates all the metallic from all the non-metallic elements, and allocates hydrogen and arsenic to the non-metals and antimony to the metals All the known nonmetals are in the abridged classification (Table I) which also includes a space for the missing halogen (eka-iodine)

The Transition Series.—The elements excluded from the abridged classification, as showing considerable divergence in properties from the typical elements of the first two octet periods, are ten in the 4th period, ten in the 5th period, twenty-four in the 6th period, and four of the five known elements of the 7th period Examination of the properties of the ten transition elements of the 4th period, reveals that these elements can be arranged in a period of eight groups, III, IV., V.. VI, VII, VIII., I and II., scandium, the lightest element, being proper to group III, and zinc, the heaviest element, proper to group II, the triad, iron, cobalt and nickel, being included within group VIII A similar arrangement holds good for the ten transition elements of the 5th period, yttrium, the lightest, being proper to group III like scandium, and cadmium, the heaviest, to group II like zinc, the triad, ruthenium, rhodium and palladium, being included within group VIII

In the 6th period, however, there are 24 transition elements The heaviest nine exhibit extremely close resemblance to the heaviest nine of the two preceding transition periods, celtium (hafnium) thus being proper to group IV like zirconium and titanium, while mercury is proper to group II like cadmium and zinc, the triad, osmium, iridium and platinum like its two forerunners being included within group VIII Group III alone remains unoccupied and 15 elements remain in this transition series These 15 elements, the "rare earth" metals from lanthanum to lutecium, all exhibit characteristic trivalency and an extremely close resemblance to yttrium and scandium of the preceding two periods. The 15 elements are consequently all proper to group III Of these 15, however, lanthanum alone is characteristic in yielding a strongly alkaline hydroxide and diamagnetic salts The remaining 14 elements, cerium to lutecium, may, therefore, be relegated to a transition sub-series, lanthanum remaining as the typical group III element of this transition period, thereby reduced to ten elements closely resembling the ten in each of the preceding transition periods The 14 excluded elements (*see* Table III) cannot be arranged to form a period as none of them exhibits valency higher than four or lower than two They thus constitute an anomalous sub-series of this transition period.

In the last period, the 7th, the transition series includes only the radioactive elements, actinium, thorium, protoactinium, and uranium, with valency from three to six respectively These elements may, therefore, be allocated to groups III, IV, V, and VI.

of the transition period. As there is no gap in atomic number between actinium (89) and thorium (90), similar to the gap of 14 between lanthanum (57) and celtium (72) in the preceding transition period, it may be regarded as certain that the transition elements of period 7 do not include a "rare earth" sub-series similar to that of period 6

The transition classification, shown in Table II consists of four similar periods comprising an octet of groups from III. to II, each period containing a triad of elements in group VIII and a single element in each of the other groups This classification resembles the abridged or typical classification in that basic character decreases in each period from a maximum in the lightest to a minimum in the heaviest element, and increases in each group from a minimum in the lightest to a maximum in the heaviest element The transition classification differs from the abridged classification in that valency differences of one unit in an element can exist, that all the elements are metals, and that nearly all can yield coloured salts at all stages of valency, whereas the valency difference for elements in the abridged classification is invariably two or four units.

The Complete Periodic Classification.—On combining the abridged classification (Table I) with the transition classification (Table II), the full periodic classification including the whole of the known elements is obtained, and is shown in Table IV

Seven main periods suffice to include all the elements, a rudimentary period of two elements, two simple or short periods each of eight elements, and four complex or long periods each consisting of two sub-periods. Each period comprises eight groups commencing with I and ending with VIII, the simple periods and the first sub-periods of the long periods terminating with inert or noble gases, whereas the second sub-periods of the long periods terminate with noble metals To indicate the close resemblance of hydrogen in its univalency to the alkali metals and to the halogens, it is included in both groups I and VII, helium being included in group VIII from its close resemblance to the other noble gases, despite the fact that it differs from them in possessing only two instead of eight potential valency factors or electrons

The transition elements are shown in thin type to distinguish them from the elements most closely allied to the typical elements of the first two octet periods. To preserve the symmetry of the octet classification, the 15 "rare earth" elements of group III, succeeding barium in atomic weight, are represented only by their most typical member, lanthanum, the other 14 being shown in detail in a footnote to the table

Mendeléev stated that a natural law only acquires scientific importance when it yields practical results in elucidating unexplained phenomena, in disclosing unrecognized occurrences, and in evoking verifiable predictions The periodic law has been used in the classification of the elements, in the determination of atomic weights of elements from equivalent weights, in correcting atomic weights, in the prediction of the existence and properties of new elements and in the determination of the electronic structures of atoms It was used by Mendeléev to determine the atomic weights of indium and beryllium, which were then in dispute and could not be settled, as only the equivalent weights were known In the same way Mendeléev was enabled to predict the existence and properties of eka-boron, eka-aluminium, eka-silicon, eka-manganese, dwi-manganese, and eka-tantalum, now identified with the elements scandium, gallium, germanium, masurium, rhenium and polonium respectively. Similarly the discovery of the noble gases, helium and argon (crude) led to the prediction of eka-helium, and eka-, dwi-, and tri-argon, now known as neon, krypton, xenon and radon respectively (*See* ATMOSPHERE)

Interpretation of the Periodic Law.—The recognition of the existence of a definite periodicity in the chemical properties of the elements, particularly with regard to valency, soon led to many hypotheses as to the inner meaning of the periodic law At first, attempts were made to express this periodicity in terms of mathematical relations between atomic weights, but after the periodicity of properties was found to be a function of atomic numbers, instead of atomic weights, investigations were almost solely directed to the relations between electrons in atoms All modern interpretations of the periodic law are based on hypotheses as to the electronic structures of atoms, and all possess the common feature that they postulate, tacitly or explicitly, the existence of a natural law of uniform atomic plan to which all atoms con-

rm. Essentially this law is that the electronic structural pattern every atom is a recapitulation of the patterns of all atoms ıving fewer electrons.

Examination of the periodic classification at once reveals that .e most basic or alkali-forming atoms have electrons which are ost easily detached, and that, in general, basic character is pro- ›rtional to electron mobility. Take, for example, the thallium om: it possesses a single most feebly attached electron responsi- e for the powerful alkalinity of its hydroxide in which the ılency is unity; it further possesses two more firmly attached ectrons by which it becomes trivalent and yields an oxide of latively feeble basicity. It is evident that the electrons in an om are not all equally firmly bound, but that there is a pro- 'essive increase in firmness of binding as more and more elec- ons are disclosed by increase of valency. If different atoms are ›mpared, this rule of increase of firmness of electron binding with ılency increase is still found to hold true, bivalent magnesium, ›r example, being less basic and having more firmly bound elec- ons than univalent sodium. This general feature is abundantly 'ident in the abridged classification (Table I.) in which basic alkali-forming character decreases steadily in each period from ·oup I. to group VIII.

The maximum firmness of binding of electrons observable in ıe elements of group VIII in each period, leads to curious re- ılts. Helium of atomic number 2 and with 2 electrons is chemi- ılly inert. The next element, lithium, of atomic number 3 and ith 3 electrons, is definitely only univalent and thus possesses electrons which resemble the helium 2 in being unavailable for ıemical combination by valency. From lithium, valency and ·mness of electron binding increase to a new maximum in neon, hich is chemically inert like helium. In each period the same cir- ımstances are observable, leading to the conclusion that the .ert gases represent specially stable arrangements of electrons. his arrangement is obviously one of 2 electrons for helium, and for all the other inert gases.

The fact that each period begins with a univalent alkali metal, ›llowing an inert gas of the previous period, involves that each kali metal contains the stable structures of all the preceding inert ıses, and similarly for every other element in the classification. he bivalent group II. element radium, for example, must contain ıe structures of the inert gases radon, xenon, krypton, argon, ›on and helium, and must, therefore, contain the seven electron ·oupings, 2, 8, 8, 8, 8, 8, 2 in order of decreasing firmness of ectron binding, that is, from the atomic nucleus outwards, ıe last 2 being the valency electrons. The number of elec- on groups is 7, radium being in the 7th period. In Bohr's theory f atomic structure, based on spectral evidence, these groups of ectrons are referred to as quantum groups and are characterized y quantum numbers from 1 to 7, which are identical with the rdinal numbers appropriate to the various chemical periods. his description of electron groups by quantum numbers is con- ›nient to avoid confusion between the facts of periodic classi- cation and those of electronic structure.

Law of Uniform Atomic Plan.—It has been indicated that the ements in each chemical period fall into three classes, an alkaline, ı amphoteric, and a non-alkaline class, consisting of 2, 2 and 4 ele- ıents respectively per period. It has further been indicated that alency variation occurs only by two units, that a bivalent ele- ıent can never be univalent, a quadrivalent element never trival- nt. This involves that 2 valency electrons in an atom are most rmly bound, 2 less firmly bound and any remaining least firmly ound. Sulphur, with 6 electrons, for example, can be bivalent 'ith 2 weakly bound electrons, quadrivalent with a further 2 more rmly bound, and sexavalent with a further 2 still more firmly ound. Hence, the inert gas octet of electrons comprises three ıb-groups, the first with 2 electrons most firmly bound, the ›cond also with 2 but less firmly bound, and the third with 4 lectrons least firmly bound. This 2, 2, 4 sub-grouping is discerni- le throughout all the periods shown in the abridged classification nd is thus present in each quantum group of electrons in all toms.

In the 4th chemical period, ten elements intervene between groups II. and III. and form a transition series, and it can be shown that none of the ten transition elements possesses more than 2 electrons of the 4th quantum group, and that all the 10 more firmly bound electrons are proper to the 3rd quantum. Examination of the transition classification shows that it is divisible into two classes (*see* Table II.), the first consisting of 4 elements with high natural valencies and the second of 6 elements with low natural valencies. This division of the transition period corresponds with a division of the ten electrons into two sub-groups of 4 more firmly and 6 less firmly bound. This sub-grouping is general throughout all the transition series and leads to the conclusion that the 3rd, 4th and 5th quantum groups can be extended from the 2, 2, 4 sub-grouping of the inert gases to 2, 2, 4, 4, 6 discernible onwards from univalent copper, silver and gold, respectively.

In the 6th chemical period, 14 elements intervene between groups III. and IV. of the transition classification and form a transition sub-series. It can be shown that the firmness of binding of the 14 electrons concerned relates them to the 4th quantum group. This sub-series can further be shown on various grounds to be divisible into two classes, the first comprising the six cerium earths and the second the eight lutecium earths (usually referred to as the "yttrium earths"). This division of the sub-series corresponds with a division of the 14 electrons into two sub-groups of 6 electrons more firmly and 8 less firmly bound. The 4th quantum group is thus extended from the sub-grouping 2, 2, 4, 4, 6 to 2, 2, 4, 4, 6, 6, 8.

From the foregoing group and sub-group schemes, the structure of the heaviest atom, uranium with 92 electrons, may be deduced to contain the groups 2, 8, 18, 32, 18, 8, 6, comprising the sub-groups 2; 2, 2, 4; 2, 2, 4, 4, 6; 2, 2, 4, 4, 6, 6, 8; 2, 2, 4, 4, 6; 2, 2, 4; 2, 2, 2. The precise form of the law of uniform atomic plan is now evident. The maximum numbers of electrons in main groups are equal to twice the squares of the natural numbers, $2(1^2, 2^2, 3^2, 4^2) = 2, 8, 18, 32$; the number of sub-groups in a main group is equal to one less than twice the natural number characterizing the group, the 4th group having $2 \times 4 - 1 = 7$ sub-groups; the numbers of electrons in the sub-groups of a main group are equal to twice the natural numbers taken in duplicate, the last sub-group being unduplicated and equal to twice the natural number characterizing the main group, the 4th group having the sub-groups, $2(1, 1, 2, 2, 3, 3, 4) = 2, 2, 4, 4, 6, 6, 8$. This law of uniform atomic plan discloses clearly the inner meaning of the periodic law of chemistry in terms of the arrangement of electrons within atoms.

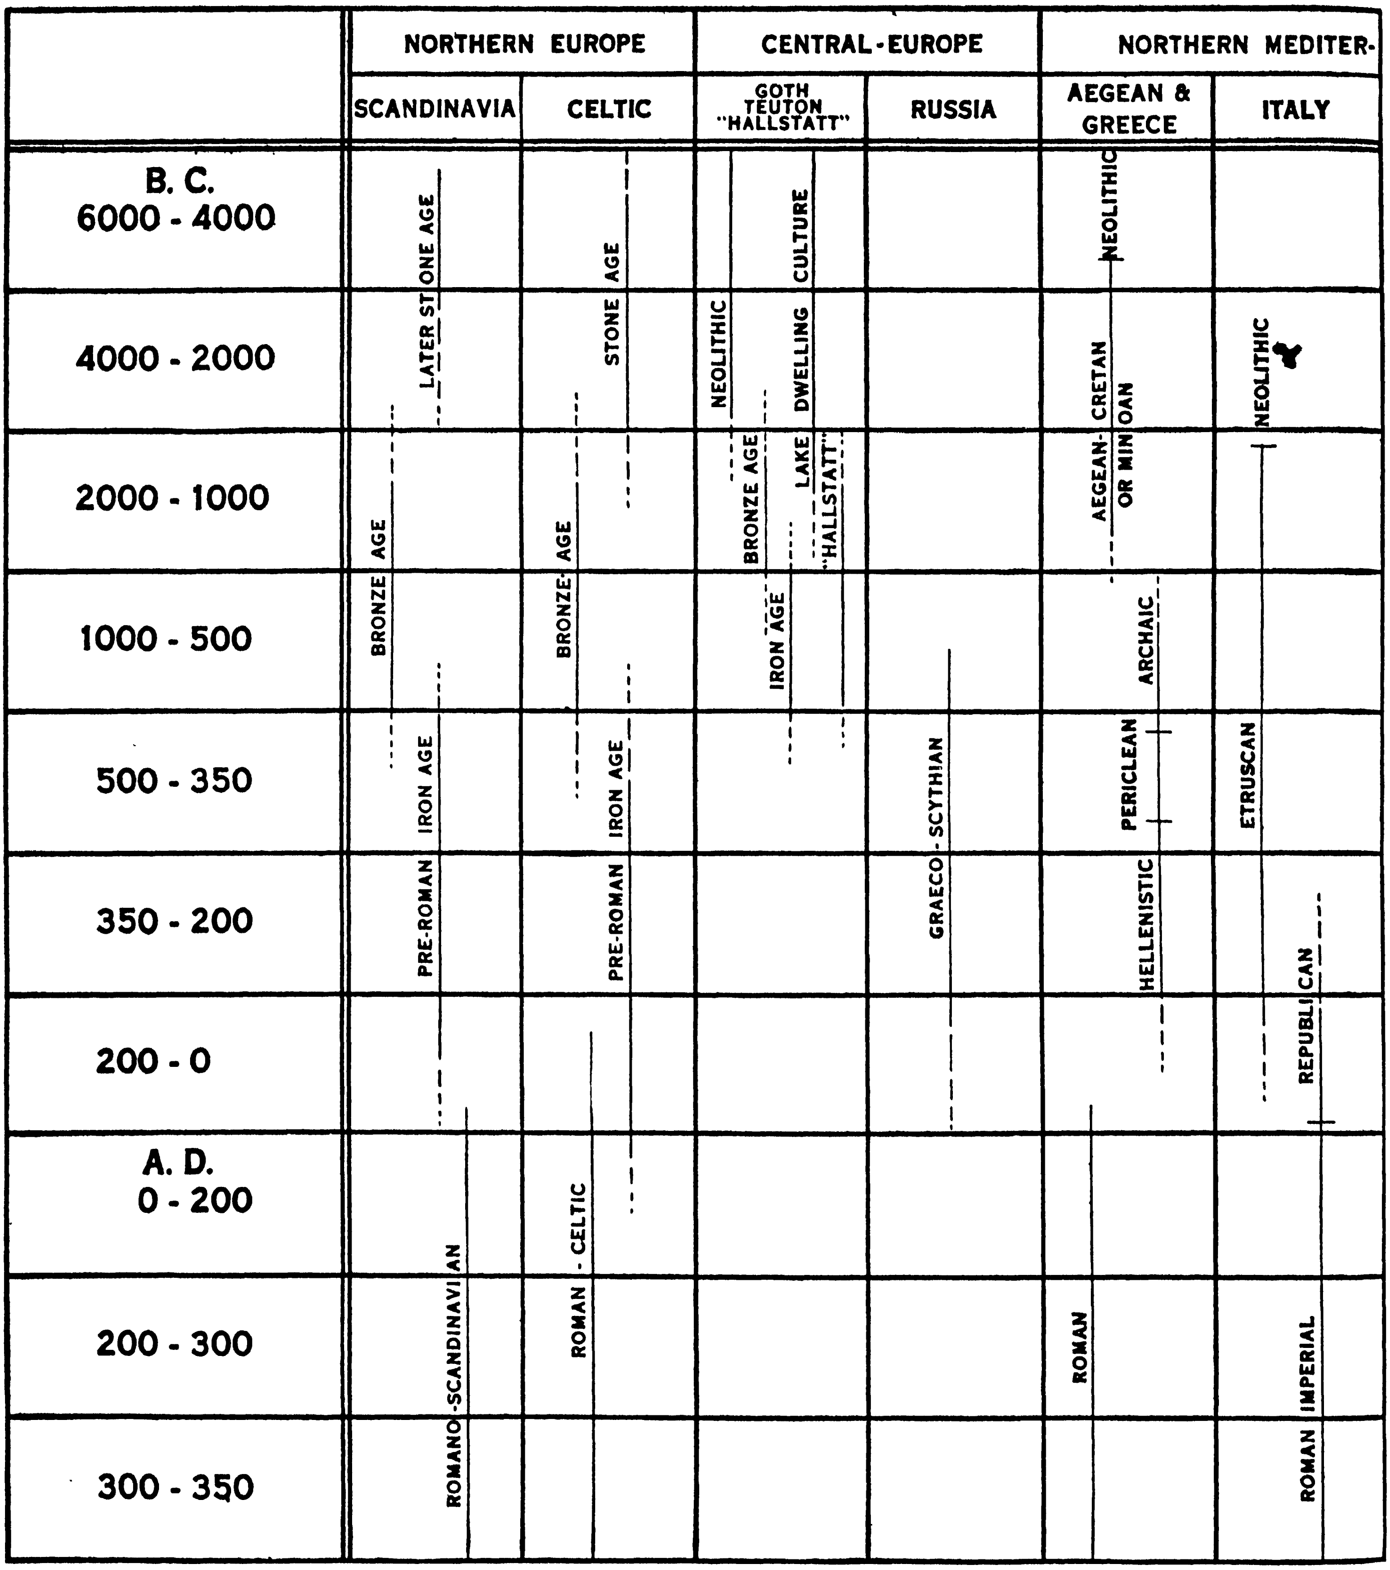
PERIODONTOCLASIA or **PYORRHEA ALVEOLARIS:** *see* PYORRHEA.

PERIODS OF ART. An art period is that duration of time within which the main arts, both fine and applied, show a general recognizable trend or group of characteristics. These characteristics which the reader will find described under the various articles listed at the end of this article, like those of the human beings who created them, are usually complex and difficult to describe, often being wholly unrecognizable until the observer has equipped himself with a considerable experience in the identification, comparison and classification of various works of art and, even when he is so equipped, these characteristics are sometimes found to be the basis of irreconcilable discussion so far as details are concerned, by the greatest of experts. That there are, however, specific characteristics upon which the majority of authorities agree and which clearly indicate the time and geographical location on the earth's surface, wherein some certain work of art was conceived and made, cannot be denied. It is on such expert classification quite as much as upon the deductions of archaeological research that the whole fabric of the history of art, as well as our understanding of the extent and characteristics of the various cultural periods, is based.



The chart which extends over the following four pages gives a chronological and geographical outline of the various periods of art throughout the world
location is indicated by the name of the country or general area specified at the tops of the columns of the chart. The years, starting at 6000 B.C., or
years in extent and the later ones being finally reduced on the second part of the chart to 100 years in extent.

The first part of the chart covers the time from 6000 B.C., or earlier, to A.D. 350, the second, from A.D. 350 to the present time. It should
had been arrived at.

In the indication of a given period a solid line shows the length of time during which its influence was felt. If the beginning or end of the line is
had a definite beginning or end, such as did many of those in China identified by the dynasties in which they occurred.

The datings of the earliest periods are necessarily vague, often being legendary in character and consequently frequently the field of controversy.
latter part of this article, as well as by the authors under whose strict supervision each statement was carefully weighed and checked. Under the heading
of great doubt; the common names for these cultures are therefore given. Similarly the divisions under the headings "Aegean and Greece" and "Italy"

Civilization seems to have developed from barbarism first in Egypt, in the Tigro-Euphrates Valley, in India or in China, though authorities differ as

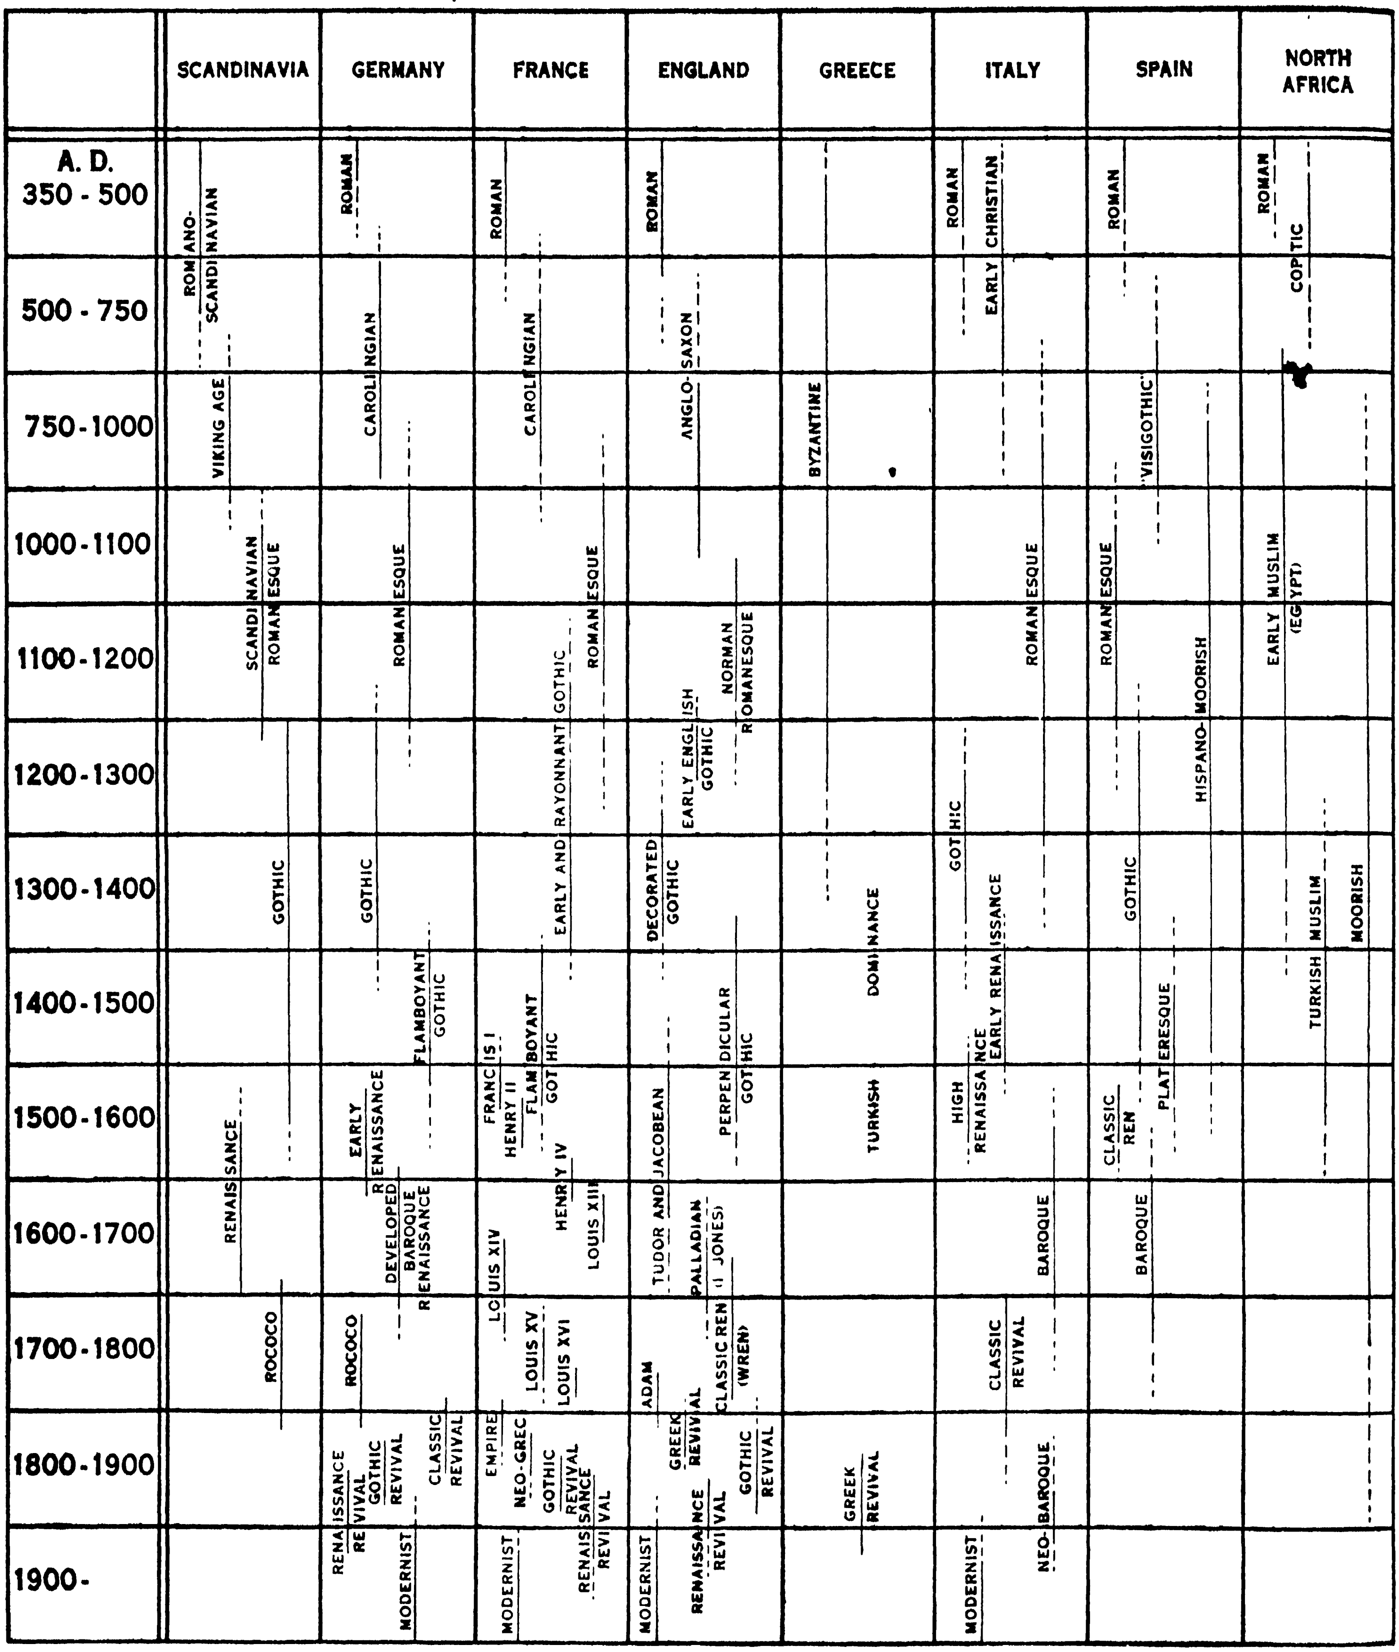
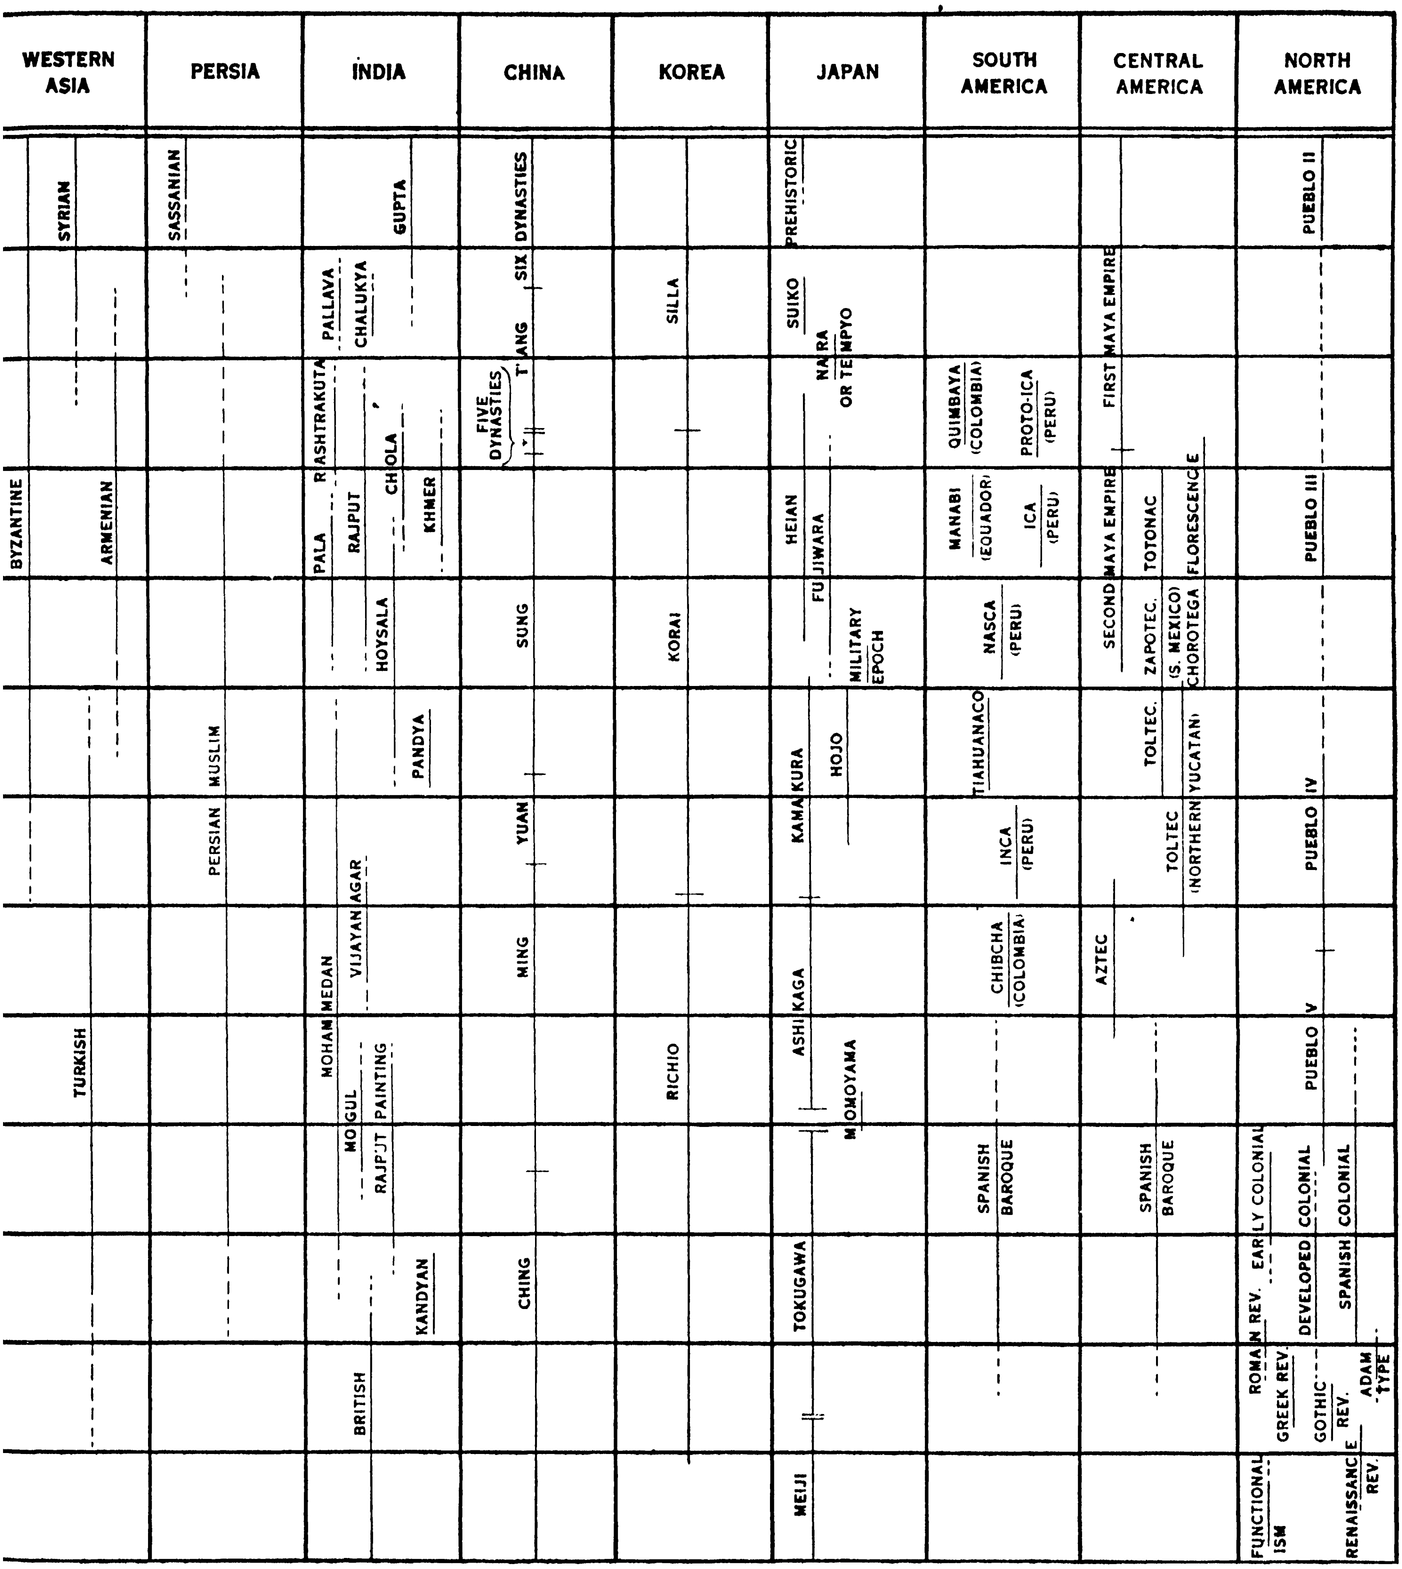
some of the most beautiful bronzes known to the collectors of to-day. Thus, the reader will find it possible, through the use of this chart, to organize
to bring together from various sources of information.



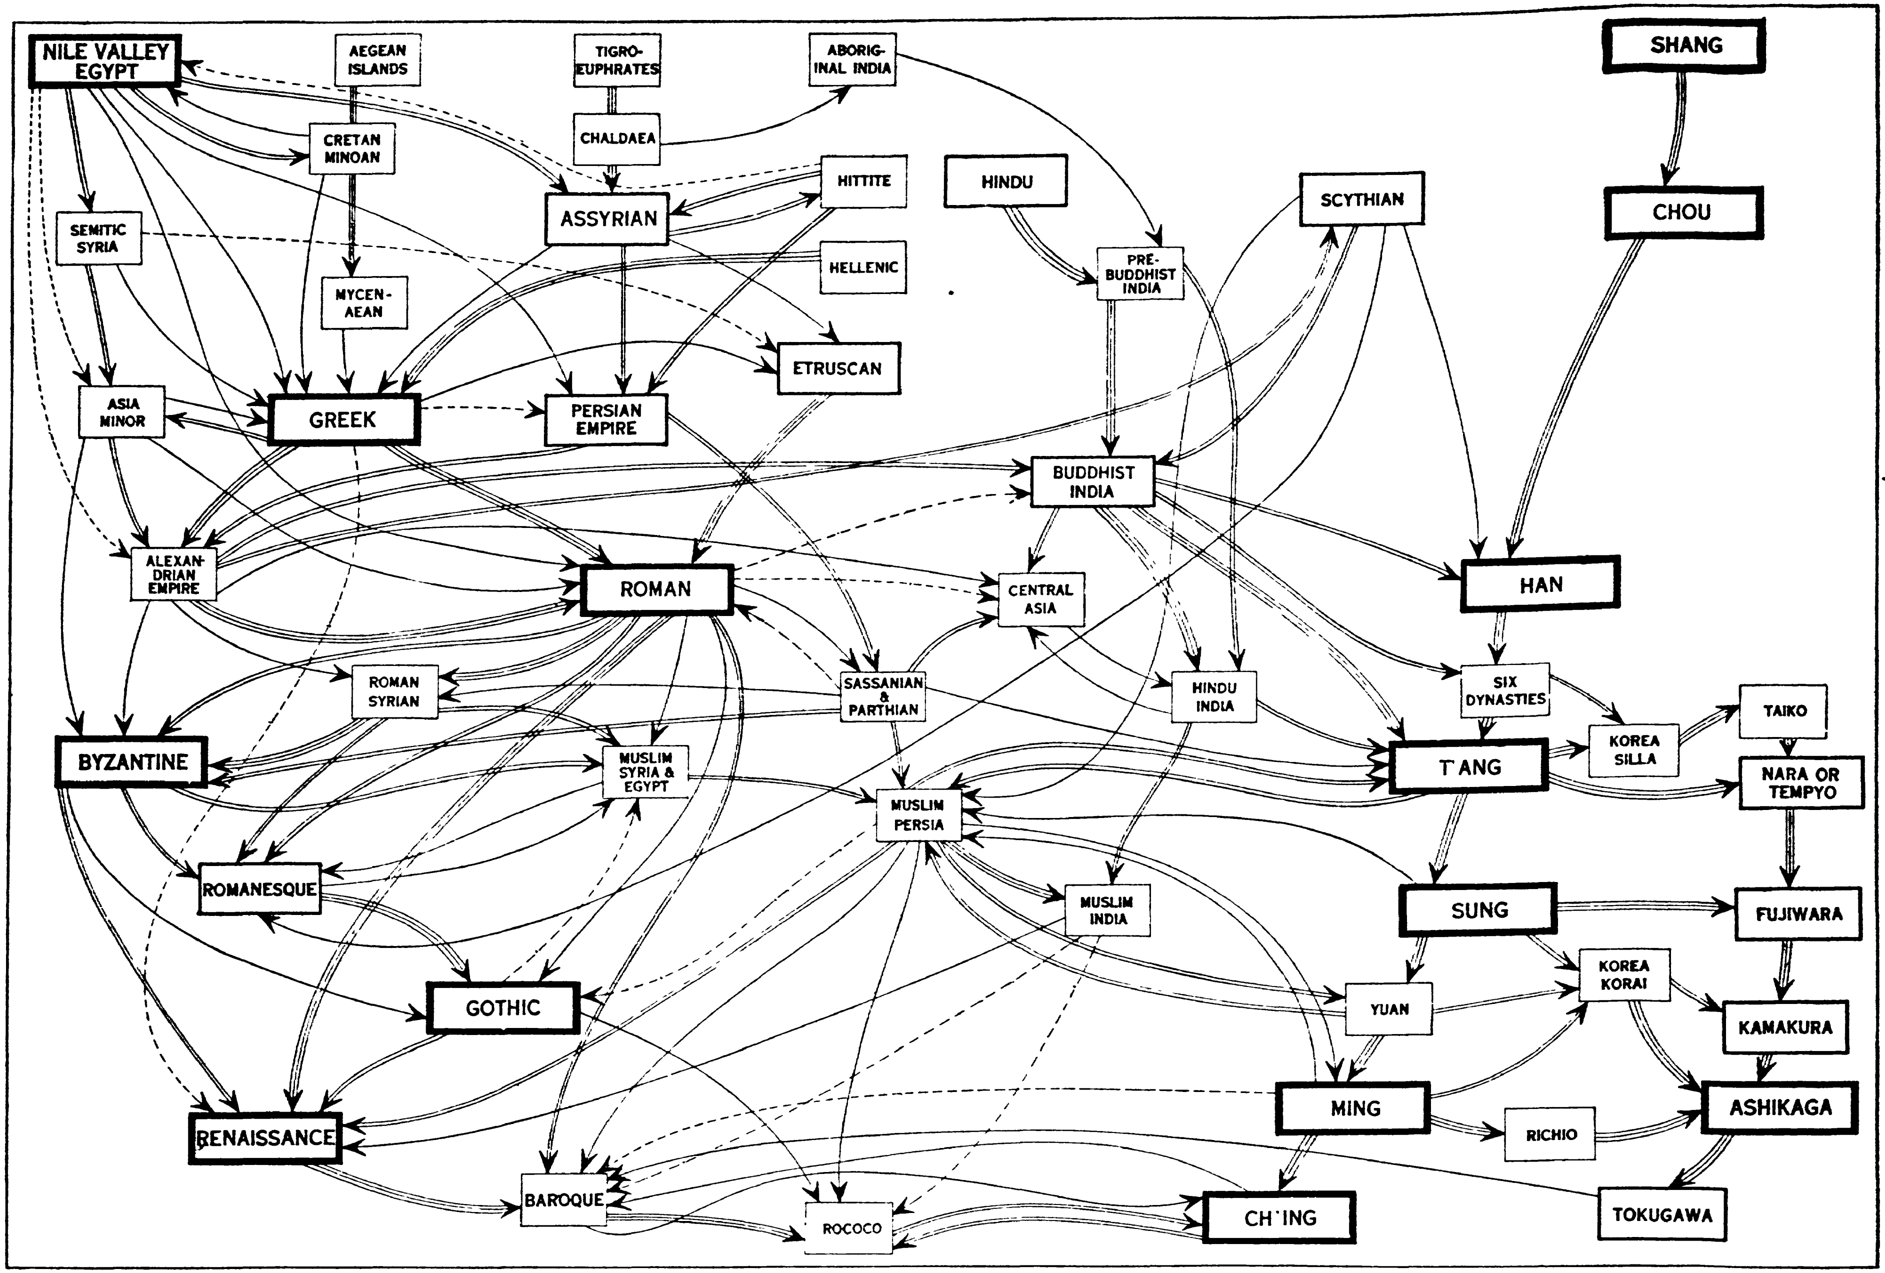
It was found necessary in the above second section of the chart on the periods of art, not only to make smaller subdivisions of time ranging from 250 geographical subdivisions because of the altered, more numerous and more definite national demarcations. The countries of Europe separated, and though partly distinct from, but parallel with, the continent. Korea and Japan, though closely bound to China, found their own expression, and finally North new culture in this area. Many authorities include Carolingian and Romanesque under the general title of Romanesque Art and the line between early Syrian under "Western Asia" are sometimes considered variant forms of the Byzantine; even the widely divergent Armenian style is occasionally called shores of the Adriatic.

A new use for these charts is illustrated in this second one: that of the study of one single period of art, such as the Gothic and its development "Early and Rayonnant" style in France followed almost immediately by its rise in Germany, Spain and England, later in Scandinavia, and still later characteristics that made the Baroque so appealing, at a later date, Gothic art soon became flamboyant as indeed it immediately afterwards became in there was a revival in Gothic art between A.D. 1800 and A.D. 1900 not only in Germany, France, and England, but in America where the original in the various countries and the approximate dates easily fixed in mind.



ears to 100 years owing to the continually increasing speed in the development of art periods throughout the world, but to alter and add to the
here was a strong mutual influence, each began a more or less individual national development. England, starting with the Roman period, developed
merica which had known only Pueblo culture until the 17th Century became inhabited by Europeans who brought to it and developed an entirely
hristian work and certain work of the Italian Romanesque styles is quite impossible to fix definitely. Both the Coptic under "North Africa" and the
yzantine. The word Byzantine as used on the chart is confined to that art produced under the direct influence of Constantinople, in Greece and on both

the various countries which felt its influence. With this section it may be seen that Gothic art started between A.D. 1100 and A.D. 1200 in the
Italy where its influence lasted for only a comparatively short time, giving way to the Renaissance. In Germany perhaps because of the same national
rance while in England it was, after the original introduction, first the "decorated" style and later the "perpendicular" style. It may also be seen that
eriod had never existed. In the same way, the influence of the Roman, the Carolingian and Romanesque, as well as many other periods, can be traced



This chart is not designed to show chronological relationships though the earlier civilizations are near the top and the more recent arranged below (for chronological comparisons the charts on the preceding four pages should be consulted)—neither is there any attempt to arrange the countries in which the periods occurred geographically, the primary intention being simply to show those influences which were brought to bear upon the various most important periods, omitting all question of the original genius of each nation which received, amalgamated and translated these influences as well as added their own contributions. The importance of the period is indicated by the weight of the outline. It will be seen that there are three classifications.

A dotted arrow indicates traces; a single arrow, definite but slight influence; a double arrow strong; and a triple arrow such influence as to be a dominant factor in the period. Arrows running both ways indicate reciprocal influences such as those between Muslim Persia, and T'ang China. In general the terms used are in their broadest interpretations; thus, "Romanesque" covers Carolingian, as well.

As was pointed out in the notes under the first chart in the reference to the period between 500 B.C. and 350 B.C., there seems to occur at times a nearly world-wide stimulus or depression in the field of art. From A.D. 1400 to A.D. 1500 that great movement called the Renaissance prevailed through southern Europe; at the same time the Gothic movement in northern Europe was still productive; western Asia saw perhaps its highest pinnacle in painting, pottery making, rug weaving and the other arts; and in the Far East the great Ming Dynasty (1368 to 1644) was at its height. It seems strangely inexplicable that though the individual causes seem to differ, in some cases being due to religious fervour, in others the pomp resulting from great wealth, the results were nevertheless equally worthy.

Yet when we study that small part of the history of man of which we have records we find that the development of civilization has extended over only a comparatively brief period of time and that it has in the various parts of the earth been parallel and consistent. Thus, though we of the western world may look down upon the civilization of the Far East, perhaps because the East did not produce such efficient battleships, it is evident on closer study that the Chinese are very much like the Westerners. They understood and used bronze at about the same time and, though they have never taken the same interest in iron and steel, it was their invention of the lens and gunpowder which made possible these modern battleships.

Not only were there a number of cultures which originated at about the same time, but it must be kept in mind that from 2,000 years ago (at just the time these cultures began to take on marked individual characteristics) travel, inspired by commerce and war, commenced to bind together the races of man with an ever stronger bond. It is therefore not so surprising that at certain given times man's development in the various parts of the world should be such as to produce simultaneously great artistic achievements.

The tremendous wars which the Mongols waged under Jenghis Khan and which influenced the East and West alike may have dammed the flood of production until it rose to the irresistible pressure which found expression in the courts of the Ming Dynasty as well as in those so similar ones of Renaissance Italy. The religious fervor which made Gothic art possible was not dissimilar to that felt in Western Asia and China and both were probably the result of the oppressions of war and at the same time reactions against a too materialistic wealth

This consideration leads us to question what now seems to be the world trend What can be hoped for the immediate future? To a remarkable degree the improved methods of travel and communication are bringing together the various peoples National characteristics are being so blended as to show signs of a loss of identification The Japanese artist is like the French, influenced by Cézanne, and there are American sky-scrapers in China. Undoubtedly this is going to prove a happy thing for all art as well as for civilization though just now the process is a discouraging one. There is bound, however, to emerge a functional art with a world-wide appeal.

A much more threatening element is that easily perceived interest on man's part in the new toys provided him by a bountiful science. The publics of all countries are becoming so interested in the moving pictures that there is little time to spare for looking at paintings Similarly, the radio, the automobile and a thousand other inventions bid for man's amusement and time, and compete with all artists How long it will take the world to adjust itself to this melting down of various characteristics, and to the building up of wider and more profound characteristics; how long it will take artists to adjust themselves to the new competitive demands and learn to make use of the inventions of science rather than combat them or have them make use of art, is a question that cannot yet be answered, but it is certain that until these two obstacles are overcome there can never be great art such as there has been in the past.

Thus we must get out of the habit of thinking that the last art is the best art. There is more loss than gain to be seen when the earlier arts such as those of Egypt or China or Greece are weighed in the scale against the modern, in spite of (or perhaps because of) all the new means available to artists of to-day which these earlier civilizations did not know

The following articles deal with the various periods of art: ART; ARCHAEOLOGY; Stone age: *Palaeolithic, Mesolithic, Neolithic;* Bronze Age; Iron Age; HALLSTATT; EGYPT: *Art and Archaeology; Architecture*; INDIAN AND SINHALESE ART AND ARCHAEOLOGY; BABYLONIA AND ASSYRIA; PHOENICIA; ETRUSCANS; CARTHAGE; WESTERN ASIATIC ARCHITECTURE; PERSIA: Archaeology; PERSIAN ART, PAINTING AND CALLIGRAPHY; PARTHIA; PUEBLO; GREEK ART; ROMAN ART; BYZANTINE ART; CHINESE ARCHITECTURE; CHINESE PAINTING; CHINESE SCULPTURE; JAPANESE ARCHITECTURE; JAPANESE PAINTING AND PRINTS; JAPANESE SCULPTURE; CAROLINGIAN; ROMANESQUE ART; GOTHIC ART; RENAISSANCE ART; BAROQUE, LOUIS STYLES; ROCOCO; MODERN ART; MODERN ARCHITECTURE.

Thanks must be given for their kind assistance in providing the facts upon which the charts in this article have been constructed to Professor Alfred W. Tozzer, Dr. Herbert J. Spinden, Dr. Ananda K. Coomaraswamy and Alan R Priest.

Bibliographies on the various periods will be found at the end of the above-mentioned articles. (W. E. Cx.)

PERIOECI, in Greek *Perioikoi,* in ancient Laconia the class intermediate between the Spartan citizens and the helots (*q v*). Ephorus says (Strabo viii 364 seq) that they were the original Achaean inhabitants of the country (Gr περίοικοι—"dwellers around") The term, however, came to denote not a nationality but a political status, and afterwards included Arcadians on the northern frontier of Laconia, Dorians, especially in Cythera and in Messenia, and Ionians in Cynuria They inhabited a large number of settlements, varying in size from important towns like Gythium to insignificant hamlets. They possessed personal freedom and some measure of communal independence, but were under the immediate supervision of Spartan harmosts (governors) and subject to the general control of the ephors They were excluded from all Spartan offices of state and from the assembly, and, owing to the absence of any legal right of marriage (ἐπιγαμία) the gulf between the two classes was impassable *See* SPARTA

PERIPATETICS, the name given in antiquity to the followers of Aristotle (*q v*), either from his habit of walking up and down as he lectured to his pupils (Gr. περιπατεῖν, to walk about, or from the περίπατος covered walk) of the Lyceum. (*See* ARISTOTLE.)

PERIPATUS, a genus of remarkable worm-like Arthropoda (*q.v.*) belonging to the class Onychophora (*q v*). The name is often loosely used to denote all members of this class, which is in many respects intermediate between the segmented-worms (Annelida, *q v*) and the Arthropoda (insects, spiders, crabs, etc), though most nearly related to the latter. There are about 40 species of *Peripatus,* found chiefly in tropical America, tropical Africa and the East Indies

PERISCOPE, an optical instrument used in land warfare and in submarine navigation to enable an observer to see his surroundings while remaining under cover or submerged. It invariably includes among its optical elements two mirrors or reflecting prisms to change the direction in which the light travels, the first to divert it down the interior of a tube and the second to guide it into a direction convenient for observation. In addition there is usually a more or less complex telescopic system, and in some types devices are added for taking ranges, for measuring the speeds with which various objects are moving, for searching the whole sky, and for varying the magnifying power of the telescope

The simplest type of periscope, consisting of a tube and two mirrors at its ends placed parallel to one another and at an angle of 45° with the axis of the tube, is not of recent origin, but the great developments which have been made in modern times are due to requirements for submarine navigation. These developments secure a large angular field of view when the tube is of considerable length and yet of restricted diameter and give an enlarged image. As in other military instruments, clear vision through the periscope even under adverse conditions is of great

importance, and the beam of light brought to the observer's eye must therefore be of a diameter large enough to fill his pupil when it is somewhat widely opened. These various conditions tend to be opposed to one another, so that the design of each instrument represents a compromise which may vary over a considerable range as more or less importance is attached to one or the other of these requirements.

A typical submarine periscope consists externally of a tube about 30 ft. long and 6 in. in diameter except for a length of from two to three feet at the top, where the diameter may be reduced to two inches or even less. At the lower end a length of several feet of the full diameter is required for passing through the long stuffing box where the instrument enters the hull of the submarine. A diameter of about six inches is needed to resist the bending moment caused by the resistance of the water as the submarine advances; an increase in the diameter adds to the resistance offered by the periscope to the boat's progress. The narrowing at the top is introduced to make the part which projects above the surface of the water less conspicuous. The optical effects of this constricted portion are so pronounced that the dimensions assigned to this part determine the design of the instrument. It is debatable whether the tendency has not been to attach too much importance to this reduction in the diameter of the tube.

If an observer looks through a series of tubes of the same diameter but of different lengths, placing his eye close to the end of the tube, his field of view will be smaller with a long tube than with a short one. The factor governing the extent of the field of vision is obviously the proximity of his eye to the front end of the tube. Thus in a periscope the only way of increasing the field of view is to locate the eye virtually near the top of the tube by inserting therein a system of lenses which, in addition to satisfying other conditions, will form an image of the observer's eye in the required position. These further conditions ensure the transmission to the real eye of all the light (assuming for the moment that all losses of light on refraction through the lenses of the instrument may be neglected) that reaches the virtual eye position: roughly, they involve the insertion in the tube of a lens at intervals proportional to the distance of the virtual eye from the open end of the tube. Thus if the field of view is to be doubled the number of lenses needed in a tube of given length and diameter must be doubled. Two tubes, the length and diameter of one being twice that of the other will give the same field of view, but the diameters of the light beams transmitted will be in the ratio two to one. Since diameter of beam and angular field are reciprocally proportional, the angular field may be doubled in the large tube for a fixed number of lenses without reducing the illumination below that obtained with the smaller tube. It follows that for a given angular field and a given diameter of emergent beam the number of lenses required is proportional to the length of the tube and inversely proportional to the square of its diameter. As an illustration, the number of lenses required to transmit a given beam down a tube three feet long and two inches in diameter will transmit the same beam down a tube 27 feet long if the diameter is increased to six inches.

The chief objection to an increase in the number of lenses in an instrument is the reduction in the brightness and clearness of the image it involves. The brightness suffers because the amount of light transmitted through the instrument is decreased owing to reflection, absorption and scattering; the clearness is diminished because, of the transmitted light, a decreasing proportion is concerned with the formation of the real image, the rest forming spurious images or appearing as mere fog. When these additional lenses belong to a narrow part of the instrument, their powers, being inversely proportional to the interval between successive lenses—that is, proportional to the inverse square of the diameter of the tube—are high, and their effects in introducing irremovable aberrations, such as chromatic aberration and curvature of field, are correspondingly great. From the optical point of view that narrowness in the tube, even for a short length, is very detrimental to the production of a good instrument.

The optical system in a periscope is intended to give a view roughly similar to that obtained by direct vision. Usually angular magnification of one and a half is preferred. An angular field of about 40° is ordinarily attained, with an emergent beam of diameter 4 or 5 millimeters.

The use of a simple telescope in addition to the top and bottom reflectors would not allow such a field of view to be attained in a periscope of normal length. The typical method of developing more complex telescopes to meet the conditions consists in adding one telescope to another, with their objectives facing one another. The resulting magnifying power is the ratio of the magnifying powers of the component telescopes, and may therefore be kept down to the low value desired, while the leading lenses, which constitute the eyepiece of the first telescope, are of the small diameter needed. A system of this kind will yield satisfactory images near the axis whatever the separation of the two objectives may be; but in the outer parts of the field, owing to the obliquity of the corresponding beams between these lenses, the brightness of the image is reduced as the separation is increased. There is thus a limit to the length attainable by the use of two telescopes, but the addition of more telescopes gives correspondingly greater lengths.

In many periscopes a higher power than one and a half, nearly always six, can be introduced instantly in place of the lower power without any change in the focus or displacement of the centre of the field of view. In order to avoid loss of light or reduction of the field as seen by the observer (the "apparent" field), the change of power must be effected at the top of the instrument, that is, in the narrow portion of the tube. This requirement of course adds to the difficulties inseparable from a narrow tube. Of the many different means of changing the power employed by different makers only one will be illustrated.

When it is required to search the complete sky, the top reflector must consist of a prism, or alternatively of two prisms placed with their reflecting bases close together and parallel to one another. The way in which light from different altitudes is directed down the tube is evident from fig. 1.

Principles of Construction.—The accompanying series of illustrations (figs. 2 to 4) show the general principles of construction, together with the appearance of the two ends, in one of many patterns made by Messrs. Barr and Stroud. Fig. 2 shows diagrammatically the arrangement of the optical parts in a bifocal periscope giving a field of view of 40° with a power of $1\frac{1}{2}$ and a field of 10° with a power of 6. The system will be considered first as a high power instrument. Light enters through the plane parallel plate *a*, which is sealed into the tube, making a watertight joint; immediately afterwards it is reflected downwards by the prism *b*, and is then refracted in turn by the lenses *e*, *f* and *g*, which constitute an inverted astronomical telescope. Of these *e* corresponds to the eye lens, *f* to the field lens of the eyepiece and *g* to the object glass. This telescope is followed by a second, comprising four lenses *h*, *k*, *m* and *n*: *h* is the objective, *k* a collector lens, which may be moved along the axis of the tube for focusing and the remaining pair *m* and *n* together constitute the eyepiece of the periscope. The lower reflector is the prism *l*, to which the lens *m* of the eyepiece is cemented.

The first telescope produces an inverted image of angular magnification measured by the ratio of the focal lengths of *e* and *g*. The second telescope magnifies this image in a ratio depending on the relation of the focal length of the pair of lenses *h* and *k* to that of the eyepiece *m* and *n*. By a proper selection of these focal lengths a power of six can be obtained. The inverted image formed by the first telescope is reinverted by the second, so that objects viewed through the periscope present their natural appearance. To obtain a power of one and a half with a correspondingly augmented field, Messrs. Barr and Stroud introduce a Galilean telescope which gives an upright image in front of the system just described. Since a diminished angular magnification is to be obtained, the negative lens *c* of the Galilean telescope precedes the objective *d*. When the high power is in use the lenses *c* and *d* are swung to one side, as at c_1 and d_1, against the side of the tube. Fig. 2 shows the paths of two beams through the low power system, that along the axis having the full cross section admitted by the lenses *g* and *h*

and the other from a point at the edge of the field showing by its smaller cross section the diminution in illumination which takes place.

Fig. 3 shows the upper end of a Barr and Stroud periscope of the sky-searching type. The lower end is illustrated in fig. 4.

To enable the observer's line of sight to be directed to any part of the horizon, the instrument is rotated about its axis by the

FIG. 2.—GENERAL PRINCIPLE OF TYPE OF PERISCOPE USED IN SUBMARINES

FIGS. 3 & 4.—SKY-SEARCHING TYPE, SHOWING UPPER AND LOWER ENDS

handles shown in fig. 4. When not in use the handles can be folded out of the way. The eyepiece (between the handles in fig. 4) has a rubber cushion which serves as a protective guard. In focus with the image of external objects are seen the graduations of vertical and horizontal scales. These scales enable the observer to make a fair estimate of the apparent sizes of objects and approximate distances. The bearing scale is projected into the field of view by means of a small prismatic telescope. As a result of this projection the bearing scale appears in the top of the field of view so as to be readily seen by the observer without taking the eye from the eyepiece.

In addition to reading the bearing it is important that the observer should be able to bring any object into the centre of the field of view without removing his eye from the eyepiece. This involves control over the angle of elevation of the line of sight and ability to adjust the focus. By rotating one of the handles about its axis the top prism of this periscope may be adjusted for elevation. The two milled heads, which are shown projecting from the bottom of the periscope in fig. 4, control not only the entire focusing adjustment but also regulate the light filters. The change of magnification or power is brought about by rotating the second handle.

In ordinary use the low power telescope is employed, and a change is only made to the high power when it is desired to observe an object more minutely than is possible with the low power. As the low power embraces an angular area sixteen times as great as the high power, large regions can be observed much more rapidly than with the high power.

Special provision has to be made for desiccating the air in the interior of the periscope from time to time. The material of the tubes must be non-magnetic and not liable to be corroded by seawater. Very slight action of this kind is serious, since it causes the tube to work stiffly in its watertight gland.

The principles of construction of periscopes for use on land are the same as those described for naval instruments. The conditions to be satisfied are in general less stringent than in submarine periscopes, and in the absence of important special features it is unnecessary to give illustrations of these instruments. *See* the article "Periscope" in *Dictionary of Applied Physics*, vol. 4. (T. SM.)

PERISSODACTYLA, an order of hoofed, herbivorous mammals, including the tapirs, horses, rhinoceroses and their extinct relatives, in all of which the number of digits (toes) on each hindfoot is either three or one. The name Perissodactyla ("odd toes") was given by Sir Richard Owen, to distinguish the group from the Artiodactyla, or even-toed, ungulate (hoofed) mammals, in which the number of functional digits on each foot is usually either four or two.

The earliest known perissodactyls (Lower Eocene) had four toes on each forefoot and three on each hindfoot. These numbers are still retained in the feet of the existing tapirs, but in the ancestral rhinoceroses the outer digit of the forefoot (corresponding to the fifth of the human hand) gradually became reduced and finally disappeared, leaving three toes on each forefoot and three on each hindfoot, as in existing rhinoceroses. In the horse family the earliest known members started with four functional digits in each hand and three in each foot, the only traces of the first and fifth toes of the ancestral mammals being the inner and outer wrist bones (carpals) that formerly supported these digits. In the course of time the whole foot of the early horses grew very long, the side toes were lifted off the ground, became much reduced in size and were finally eliminated, the chief traces of the second and fourth toes of the original five-toed foot being the "splint" bones, or vestigial metacarpals, on the side of the greatly enlarged middle toe. This symmetrical middle toe of the horse therefore represents the logical extreme of the initial perissodactyl tendency for the axis of symmetry to pass through the middle or third digit rather than between the third and fourth digits as in the artiodactyls.

Both the perissodactyls and the artiodactyls were originally small, swift-footed, herbivorous mammals, in which the wrist and heel were raised far above the ground and the animals ran on the enlarged nails, or hooves, of their principal digits. The numerous resemblances between perissodactyls and artiodactyls are chiefly independently acquired adaptations to similar habits. Even in Lower Eocene times (perhaps 60 million years ago) representatives of the two orders differed so greatly in skeleton and dentition that they must have been derived from widely different families of primitive placental mammals of the Cretaceous epoch. The old concept of the Perissodactyla and the Artiodactyla as being suborders of a single group, the Ungulata Vera or Diplarthra, is erroneous and the two "sub-orders" are in fact wholly distinct.

As noted above, the oldest known perissodactyls are found in the Lower Eocene of North America and Europe. It was formerly believed that these were in turn derived from *Phenacodus* (*q.v.*), but more recent palaeontological research shows that *Phenacodus* was a specialized side-branch of its own order, the Condylarthra, and is definitely excluded from the ancestry of the Perissodactyla by numerous details of specialization. The direct ancestors of the Eocene Perissodactyla remain unknown. However, the comparative morphology of the dentition and of the skeleton indicates that the Perissodactyla, like other orders of placental mammals, were derived eventually from small insectivorous placental mammals of the Cretaceous period The origin and evolution of the numerous families of perissodactyls from the Lower Eocene through many ascending horizons of the Tertiary, has been intensively studied in Europe and North America, and their palaeontological history is more fully known than that of any other mammalian order.

The early Eocene perissodactyls were small animals with four toes on each forefoot and three on each hindfoot. The upper molar teeth bore four principal cusps with two oblique cross-crests running from the two inner cusps forward and outward, toward the outer side. The two main outer cusps were conical, the second set further in toward the middle than the first, so that the outer half of the crown was oblique. Each lower molar crown was more or less W-shaped in top view. The premolars were not yet molariform, although the last upper premolar (p^4) was already

well on the road toward the molar pattern. The front teeth (incisors) were all present, small and not peculiarly specialized.

Horses.—From such a form the line leading to the horses began to lengthen the middle digits and lift the side toes off the ground; in the upper molar teeth the oblique cross-crests became markedly twisted, while the main outer cusps became broadly crescentic; the upper premolars gradually became more molariform until three of them equalled or even surpassed the molars in size and complexity. The subsequent evolution of the horse family is treated elsewhere (*see* EQUIDAE; HORSE).

Tapirs.—In the line leading to the tapirs the number of toes did not change but the animals grew larger, heavier, and their feet broadened. In the cheek teeth the cross-crests became less oblique, more transverse, finally becoming two high, straight, sharp-edged ridges, shearing with similar ridges on the lower molars. The most distinctive feature is the trunk or proboscis, in which the nose and upper lip are combined into a mobile, more or less protrusile organ. The proboscis of the tapir, however, has no finger-like projection of the tip and lacks the mobility and adaptability of that of the elephant. The corresponding alterations in the skull of the tapir are far less than in the case of the elephant, involving only a moderate retreat or retraction of the nasal bones. The middle septum or cartilage of the nose also is far more conspicuous and extended further forward (*see* TAPIR). Thus the skeleton as a whole retains much that was characteristic of the earliest Eocene members of the order. The feet, for instance, have the same number of digits and arrangement of all the elements as in the very earliest Perissodactyla, and the rest of the skeleton is also primitive except for the modifications of the nasal region for the support of the proboscis. Even the cross-crested molars are much like those of the Eocene lophiodonts (family Lophiodontidae), which were, however, intermediate between the tapirs and the rhinoceroses.

Palaeotheres.—The family of the palaeotheres (Palaeotheriidae) was characteristic of the Eocene of Europe and was closely related to the horse family. The typical genus, *Palaeotherium,* resembled a tapir in general proportions but had three instead of four toes on each forefoot; it had at most only the beginning of a proboscis; the upper molar crowns comprised a W-shaped outer wall and two oblique cross-crests united with the two conical inner cusps. The palaeotheres are connected with the horses through such small light-limbed forms as *Palaeoplotherium.*

Titanotheres.—The titanothere family (Titanotheriidae) ranged from the Lower Eocene of Wyoming to the summit of the Lower Oligocene in South Dakota, Nebraska and Saskatchewan. Representatives have also been found in the Eocene of Europe and in the Upper Eocene and Lower Oligocene of Mongolia. The oldest known titanotheres (*Eotitanops*) were about as large as a sheep but shaped more like a tapir except that they had no proboscis, while the nose and lips were possibly somewhat horse-like. The most distinctive character is found in the upper molar teeth, the crowns of which had a W-shaped outer wall, two conical internal cusps and vestigial cross-crests. The lower molar crowns were W-shaped. This general type of molar was retained throughout the history of the family, the chief modification being that in the later forms the W-shaped outer wall of the upper molar crowns became higher and more curved toward the mid-line of the palate, while the internal cusps remained conical and low.

During the Eocene and Lower Oligocene the titanotheres became differentiated into numerous genera and over 100 species. The fossil remains of the Oligocene were formerly abundant in the "Big Badlands" on the White river in South Dakota and Nebraska. The primitive perissodactyl numbers of four toes on the forefeet and three on the hindfeet were retained throughout the family. In the main lines leading to the Lower Oligocene end-forms the size of the body increased until a bulk surpassing that of the largest recent rhinoceros was finally attained. Of the middle-sized genera of the Middle and Upper Eocene the most notable was the genus *Palaeosyops,* comprising animals larger than tapirs, with widespreading feet, broad, rounded skull and low-crowned, circular-cusped molars. At the opposite extreme was the genus *Dolichorhinus,* with an extremely elongated skull and snout, laterally compressed but not long feet, and upper molars with deepened outer wall and flattened outer cusps. The genus *Manteoceras* ("prophet-horn") was more or less intermediate between these extremes, but possessed a small bony swelling above and in front of the eye on each side of the skull. In later forms this swelling became more and more pronounced, until in the Oligocene titanotheres it grew into huge transversely-paired bony outgrowths from the naso-frontal junction, above and in front of the eyes. The shape of these bony protuberances differed in the numerous genera and species. In the more primitive Oligocene forms the "horns" were more or less three-sided, with a pointed tip, but in the more advanced genera they were broad transversely and compressed anteroposteriorly (*Brontotherium*), or erect with cylindrical section (*Megacerops*), or club-shaped (*Brontops robustus*), or three-faced with a rounded, recurved tip (*Menodus*). The skulls of these genera were relatively long (*Brontotherium, Menodus*), or wide (*Brontops robustus, Megacerops*), or of intermediate proportions (*Allops*). The skeleton of the largest titanotheres abounded in adaptations for the support of the huge bodies. Whereas the earliest forms had rather narrow hands and feet, the later giants of the race had very broad four-toed forefeet, parallel to those of the hippopotamus, and broad, short, three-toed hindfeet, parallel to those of the rhinoceros. The angles of the elbows and knees, which were well bent in the earlier running forms, opened out in the larger forms as in other "graviportal" mammals, while the ilium spread widely across the back to support the weight of the viscera. The great monograph on the titanotheres by H. F. Osborn affords one of the clearest and most interesting demonstrations of the facts of evolution yet recorded.

Chalicotheres.—The family of the chalicotheres (Chalicotheriidae) has been described under ANCYLOPODA. Here it will suffice to note that the primitive hoofs grew into long curved claws which seem to have been used for scratching the ground, perhaps in search of water and succulent tubers. The earliest known chalicothere, *Eomoropus* of the Eocene of Wyoming, retained the primitive perissodactyl numbers of four toes in the forefeet and three in the hindfeet, while the upper molars approximated to the Eocene perissodactyl type.

Rhinoceroses.—The family of the rhinoceroses (*see* RHINOCEROS) is connected with that of the lophiodonts by such forms as *Hyrachyus* of the Eocene of North America. *Hyrachyus* has been called "the cursorial rhinoceros" because by comparison with its massive modern relatives it was distinctly light-limbed. Somewhat smaller than a South American tapir, it resembled that animal in the general configuration of its body and limbs. It did not, however, have a proboscis and, unlike a rhinoceros, it had no horn above the nose. All its front teeth of both jaws were unspecialized, not yet like those of later rhinoceroses. Its upper molar teeth, however, had already begun to foreshadow the rhinoceros type in the obliquity and marked flattening of the outer surface of the hinder outer cusp, although the two outer main cusps were not yet submerged in the general outer wall. None of the known species of *Hyrachyus* were directly ancestral to the lines leading to the later rhinoceroses, some of the forerunners of which (named *Prohyracodon* and *Eotrigonias*) were already established during Eocene times. In *Trigonias* of the Lower Oligocene the true rhinoceros characters of the molars and premolars were well defined and the second lower incisors had begun to be enlarged as tusks. On the other hand, *Trigonias* was hornless and retained four toes on each forefoot and the upper canines, though small, were still retained. Most of the later Oligocene rhinoceroses had eliminated the fifth or outer digit of the forefoot and had also lost the upper and lower canines. In *Diceratherium,* a small rhinoceros abundant in the Lower Miocene of Nebraska, a small transversely-placed pair of oval horn-swellings developed near the tip of the nasal bones. This group became extinct during the Miocene. Meanwhile the "aceratheres," or hornless rhinoceroses of Europe, were numerous during the Oligocene and Miocene and some of them probably gave rise to the lines leading to the modern Sumatran and Indian rhinoceroses.

In addition to these central forms there were many peculiar

side lines. In the Miocene and Lower Pliocene of North America and Europe were swarms of extremely short-footed hippopotamus-like rhinoceroses (*Teleoceras,* etc.), with massive heads and very high-crowned molars and a single horn on the tip of the nose. The two existing species of African rhinoceroses and the related woolly rhinoceros of the Pleistocene of Europe are very highly specialized; their exact derivation is unknown. The strangest of all was the fossil *Baluchitherium* from the Upper Oligocene of Turkestan, Baluchistan and Mongolia, a titanic animal with a skull over four feet long and an estimated height at the shoulder of 13 feet.

Besides all these true rhinoceroses, there were two extinct groups to which some authors give the rank of distinct families, namely the hyracodonts and the amynodonts. The hyracodonts were small cursorial forms with rhinoceros-like molar teeth and unspecialized front teeth. Of these, the very small *Triplopus* of the Middle and Upper Eocene had exceedingly long, slender, three-toed feet. The Oligocene *Hyracodon* was much larger,—about the size of a calf,—with stockier feet. Both genera were exclusively North American. The amynodonts were larger forms, the oldest of which appears in the Upper Eocene of Utah. It was followed in the Lower Oligocene of the Big Badlands region of South Dakota by *Metamynodon,* a somewhat hippopotamus-like form with enlarged tusk-like upper and lower canine teeth and very elongated oblique outer walls of the upper molars; the stout forefeet retained four digits, the spreading hindfeet had the usual three toes of the rhinoceroses. Members of the same family have been found in the Lower Oligocene or Uppermost Eocene of Burma, Europe and Mongolia.

Origin of the Order.—The Perissodactyla as an order probably originated in the northern hemisphere, perhaps in basal Eocene times, from some as yet undiscovered relatives of the Eocene condylarths or protoungulates. By Lower Eocene times the group was well represented in western North America and western Europe and was already beginning to diverge into numerous families which have been classified by Osborn in five superfamilies, namely the Hippoidea (containing the lines leading to the palaeotheres and horses), the Chalicotheroidea (or chalicotheres), the Titanotheroidea (or titanotheres), the Tapiroidea (or tapirs and lophiodonts) and the Rhinocerotoidea (or rhinoceroses, hyracodonts and amynodonts). By Upper Eocene times the order was well represented in Burma and Mongolia. It was not until late Miocene or Pliocene times that the horses and tapirs penetrated into South America and the group never reached even the outposts of the Australian region. In Africa, which is now its greatest stronghold, it is conspicuously absent from the Upper Eocene and Lower Oligocene of Egypt and is not known until the Miocene or Pliocene. On the whole the existing Perissodactyla represent a beaten order which has been gradually crowded out by the ruminant artiodactyls. Of its surviving families, the rhinoceroses and tapirs seem doomed to extinction unless preserved by stringent regulation. The zebras, however, seem to have a better chance of survival in certain districts.

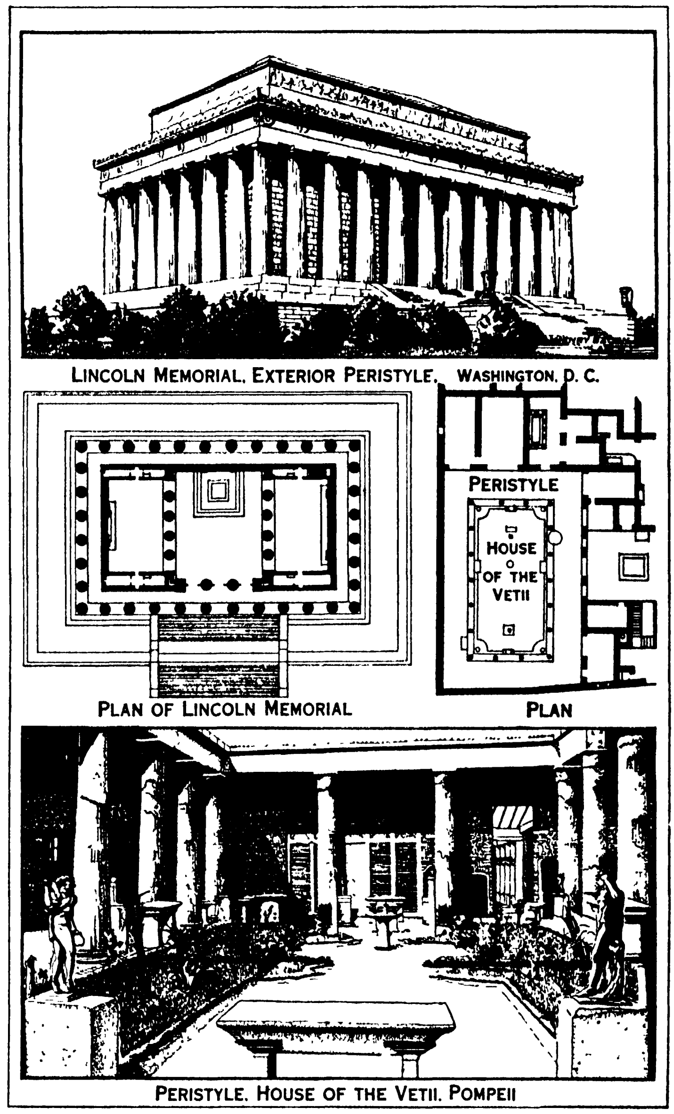
PERISTYLE, in architecture, a range of columns surrounding the outside of a building or an enclosed room and also a range of columns surrounding or enclosing a court. The term is sometimes applied to the inner colonnaded court of a Roman house, reserved for family use, in contradistinction to atrium (*q.v.*), the outer, or more public court.

PERITONITIS, inflammation of the peritoneum. (*See* Coelom and Serous Membranes.) It may be acute or chronic, and either localized or diffused.

Acute peritonitis commonly follows such conditions as hernia and obstruction of the bowels, wounds penetrating the abdomen, perforation of viscera, as in ulcer of the stomach, and of the intestine in typhoid fever, bursting of abscesses or cysts into the abdominal cavity, and extension of inflammation from some abdominal or pelvic organ, such as the appendix, the uterus or bladder. At first localized, it may afterwards become general. The changes in the peritoneum are congestion; exudation of lymph in greater or less abundance, at first greyish and soft, thereafter yellow, becoming tough and causing the folds of the intestine to adhere together; effusion of fluid, either clear, turbid, bloody or purulent.

Acute peritonitis usually begins with a shivering fit, vomiting and pain in the abdomen with extreme tenderness, so that pressure, even of the bed-clothes, cannot be borne. The patient lies on the back with the knees drawn up to relax the abdominal muscles; the breathing becomes rapid and shallow, and is performed by movements of the chest only, the abdominal muscles remaining quiescent—which is not the case in healthy respiration. The abdomen becomes swollen by flatulent distension of the intestines, which increases the distress. There is usually constipation. The skin is hot; the pulse is small, hard and wiry; the face is pinched and anxious. When the peritonitis is due to perforation—as may



PLAN OF HOUSE OF VETII FROM, "POMPEII, ITS LIFE AND ART" (MACMILLAN)

EXAMPLES OF PERISTYLE: (ABOVE) IN MODERN ARCHITECTURE, (BELOW) IN ANCIENT ARCHITECTURE

happen in the case of gastric ulcer or of ulcers of typhoid fever, or in the giving way of a loop of strangulated bowel—the above-mentioned symptoms and fatal collapse may all take place in from twelve to twenty-four hours. The puerperal form of this disease, which comes on within a day or two after childbirth, is often rapidly fatal. The actual cause of death is the absorption of the

poisonous bacterial products formed in the peritoneal cavity.

Chronic peritonitis may follow a localised acute attack, or may be tuberculous. In the former case, the gravest symptoms having subsided, some abdominal pain continues, and there is swelling of the abdomen, due to thickening of the peritoneum, and the presence of fluid. This kind of peritonitis may also develop slowly without any preceding acute attack

Tuberculous peritonitis occurs either alone or in association with tuberculous disease of a joint or of the lungs Often it is associated with tuberculous mesenteric glands, particularly in children. The chief symptoms are abdominal discomfort, or pain, and distension of the bowels The patient may suffer from either constipation or diarrhoea, or each alternately. Along with these local manifestations there may exist high fever, rapid emaciation and loss of strength But some cases of tuberculous peritonitis present few symptoms of any kind In some cases, the neighbouring coils of intestine having been glued together, a collection of serous fluid takes its place in the midst of the mass, and, being walled in by the adhesions, forms a rounded tumour, dull on percussion, but not tender or painful Such cases, when occurring in women, are apt to be mistaken for cystic disease of the ovary.

The sole treatment of acute peritonitis is surgical.

PERIWINKLE, the popular name of a genus of Gastropod molluscs (*Littorina*) of wide distribution in temperate and cold seas. They are all of small size and have spiral, roughly globular shells, which in some species are smooth, in others ornamented with low spiral ribs. Some 80 living species of *Littorina* have been described and there are many fossil forms The common British *Littorina littorea*, about an inch long, has a wide range of colour-variation. This species appeared on the shores of New Brunswick and Nova Scotia between 1850 and 1860 and was found on the coast of Maine in 1868 It has since spread rapidly along the American coast, and is now common as far south as Delaware Bay. Among species native to North American shores are *L rudis*, very abundant from New Jersey to the Arctic ocean and found also on the Pacific coast, and *L palliata*, common from New Jersey to far northern shores Both the last-named species are smaller than *L. littorea*. *L. irrorata*, about equal in size to *L. littorea*, is frequent from Vineyard sound to Florida.

Systematically the periwinkles are placed among the Taenioglossate Pectinibranchs and are allied to the river snails (*Vivipara*) and the cowries (*Cypraea*). The anatomy of certain species has been studied and has been found to exhibit a peculiar modification of the gills, the filaments of which are prolonged across the surface of the mantle-cavity (*see* MOLLUSCA) and are broken up into vascular branches, so as to transform the mantle-cavity into an organ of aerial respiration *Littorina littorea* is sometimes found beyond high-water mark and has been found half a mile from the sea.

According to Blegvad *Littorina littorea* is both herbivorous and carnivorous, feeding on algae, seaweeds and small molluscs and crustacea (Ostracods). The majority of the species seem to be found in the Laminaria and Fucus zones of the sea shore. The eggs of these molluscs are deposited either singly or in masses Some species (*e g., L. rudies* and *neritoides*) are viviparous and the free-swimming larval stages are suppressed

Periwinkles are to be reckoned among the most common edible molluscs. In 1922, 3,245 tons were delivered in Billingsgate fish market.

See M. Caullery and P Pelseneer, *Bull Sci France et Belgique* (1911); W. M Tattersall, "Fisheries, Ireland," *Sci. Invest* (1920).

(G. C. R.)

PERIWINKLE, the name given to various species of the botanical genus *Vinca*, of the dog-bane family (Apocynaceae) The name periwinkle is possibly taken from *pervinka*, the Russian name of the flower, which in turn is derived from *pervi*, "first," as it is one of the first flowers of spring The lesser periwinkle (*V. minor*) with lilac-blue flowers, ¾ in. across, an evergreen, trailing perennial, native to Europe and found in the British Isles, has run wild throughout eastern North America. The similar greater periwinkle (*V major*), with purplish-blue flowers, 1 to 2 in. across, native to continental Europe, has become naturalized in England. The Madagascar periwinkle (*V. rosea*), grown as a garden annual for its rose-purple or white flowers, is of world-wide distribution in the Tropics. (*See* APOCYNACEAE.)

PERJURY. The law now relating to perjury is to be found in the Perjury Act 1911, a statute passed "to consolidate and simplify." That Act in its schedule repeals no fewer than 132 enactments that formerly dealt with the subject By s. 1 of the Perjury Act 1911: "If any person lawfully sworn as a witness or as an interpreter in a judicial proceeding wilfully makes a statement material in that proceeding, which he knows to be false or does not believe to be true, he shall be guilty of perjury, and shall, on conviction thereof or indictment, be liable to penal servitude for a term not exceeding seven years, or to imprisonment with or without hard labour for a term not exceeding two years, or to a fine or to both such penal servitude or imprisonment and fine." The expression "judicial proceeding" includes a proceeding before any court, tribunal or person having by law power to hear, receive and examine evidence on oath. Where a statement made for the purposes of a judicial proceeding is not made before the tribunal itself, but is made on oath before a person authorized by law to administer an oath to the person who makes the statement, and to record or authenticate the statement, it shall, for the purposes of this section, be treated as having been made in a judicial proceeding. A statement made by a person lawfully sworn in England for the purposes of a judicial proceeding—(*a*) in another part of his majesty's dominions; or (*b*) in a British tribunal lawfully constituted in any place by sea or land outside his majesty's dominions; or (*c*) in a tribunal of any foreign State, shall, for the purposes of this section, be treated as a statement made in a judicial proceeding in England Where, for the purposes of a judicial proceeding in England, a person is lawfully sworn under the authority of an Act of parliament—(*a*) in any other part of his majesty's dominions, or (*b*) before a British tribunal or a British officer in a foreign country, or within the jurisdiction of the Admiralty of England, a statement made by such person so sworn as aforesaid (unless the Act of parliament under which it was made otherwise specifically provides) shall be treated for the purposes of this section as having been made in the judicial proceeding in England for the purposes whereof it was made The question whether a statement on which perjury is assigned was material is a question of law the determination of which rests solely upon the court of trial

False statements on oath made otherwise than in a judicial proceeding, false statements with reference to marriage; false statements as to births or deaths; false statutory declarations and other false statements without an oath, and false declarations to attain registration for carrying on a vocation are declared misdemeanours and are punishable on indictment by punishments varying from seven years penal servitude to 12 months hard labour with the alternative or addition of a fine

Offences as to making false declarations as to marriages, births and deaths and false statutory declarations can be dealt with summarily (Criminal Justice Act 1925), but all offences declared to be perjury, punishable as perjury or as subornation of perjury must be tried on indictment at assizes, except those relating to false statutory declarations.

Subornation of Perjury is procuring a person to commit a perjury which he actually commits in consequence of such procurement If the perjury is not actually committed the offence is incitement and now by s 7 of the Perjury Act 1911 every person who aids, abets, counsels, procures, or suborns another person to commit an offence against the Act shall be liable to be proceeded against, indicted, tried and punished as if he were a principal offender, and every person who incites or attempts to procure or suborn another person to commit an offence against the Act is guilty of a misdemeanour, and, on conviction thereof on indictment, is liable to imprisonment, or to a fine, or to both

Before the Act was passed corroboration was required and now by s 13 it is provided that "a person shall not be liable to be convicted of any offence against this Act, or of any offence declared by any other Act to be perjury or subornation of perjury,

or to be punishable as perjury or subornation of perjury solely upon the evidence of one witness as to the falsity of any statement alleged to be false." An "oath" includes an "affirmation," or "declaration," and the expression "swear" likewise includes "affirm" or "declare."

In the United States perjury has been made a felony in most States by statute. These statutes generally embody the common law definition of the crime, though commonly extending the more ancient conception of the judicial proceeding in which the perjury had to be committed to all situations where the administration of an oath is made lawful. Statutes also embrace as a distinct offense that of false swearing. This differs from perjury principally in that it is not an essential ingredient of false swearing that the testimony need be, as to fact, material to the inquiry.

PERKIN, SIR WILLIAM HENRY (1838–1907), English chemist, the discoverer of aniline dyes, was born in London on March 12, 1838. He attended the City of London school and devoted all his spare time to chemistry; in 1853 he entered the Royal college of chemistry and studied under A. W. von Hofmann (*q.v.*) to whom he later became an assistant. He devoted his evenings to private investigations in a rough home-laboratory, and was inspired by some remarks of Hofmann's to undertake the artificial production of quinine. In the course of his experiments (1856) he oxidized impure aniline with potassium bichromate, and obtained a black product from which he was able to extract a bluish substance with excellent dyeing properties; this was the first artificial, or aniline, dye to be prepared, and it subsequently became known as "aniline purple" or "mauve." A patent for the process of manufacturing the dye was taken out in 1856 (Eng. Pat. 1884) and, with the aid of his father and brother, Perkin set up in 1857 works at Greenford Green, near Harrow, for the commercial production of "mauve." In this way the great aniline dye industry, which has assumed such large proportions, was founded. (*See* ANILINE DYES.) Perkin also had an important share in the development of artificial alizarin (*q.v.*), which has now entirely replaced the red dye of the madder root. C. Graebe and C. T. Liebermann in 1868 prepared the substance synthetically from anthracene, but their process was not practicable on a large scale; soon afterwards Perkin patented a commercial process which secured for his Greenford Green works a monopoly of alizarin manufacture for several years. He also carried out investigations on other dyes and on flavouring materials, in the course of which he synthesized coumarin (*q.v.*), the odoriferous principle of woodruff and the tonka bean. About 1874 he abandoned manufacture and devoted himself exclusively to research. In 1878 he discovered the "Perkin reaction," for the preparation of unsaturated acids, *e.g.*, cinnamic acid (*q.v.*) which depends on the condensation of aromatic aldehydes with the salt of a fatty acid. Later he made a comprehensive study of the relation between chemical constitution and the rotation of the plane of polarization of light in a magnetic field (*see* ISOMERISM) and calculated the "magnetic rotatory power" of various elements and radicles. Perkin was awarded the Royal medal of the Royal Society in 1879 and the Davy medal in 1889; he also received many other English and foreign honours. He was knighted in 1906 and died at Harrow on July 14, 1907. *See Jour. Chem. Soc.*, 1908, p. 2,214; L. Meldola, A. G. Green and J. C. Cain, *Jubilee of the Discovery of Mauve and of the Foundation of the Coal Tar Colour Industry by Sir W. H. Perkin* (Perkin Memorial Committee, 1908).

PERLITE or **PEARLSTONE,** a glassy volcanic rock which, when hammered, breaks into small rounded masses often of a pearly lustre, the reason being the many small cracks traversing its glassy substance. These cracks mostly take a circular course, and often occur in groups, one within another; they bound the little spheres into which the rock falls when it is struck, and the concentric fissures reflecting light from enclosed films of air, are the cause of the pearly lustre. Longer straight cracks run across the sections separating areas in which the circular fissures preponderate. By decomposition the fissures may be occupied by secondary minerals; the glass itself often undergoes change along the cracks by becoming finely crystalline or devitrified, dull in appearance and slightly opaque in section. In polarized light the perlitic glass is usually isotropic, but sometimes the interior of some of the spheres has a slight double refraction, apparently due to strain. Many rocks which are cryptocrystalline or felsitic, and not glassy, have perfect perlitic structure, and it seems probable that these were originally vitreous obsidians or pitchstones and have in time been devitrified to a finely crystalline state. Occasionally in olivine and quartz rounded cracks not unlike perlitic structure may be observed.

Many perlitic rocks contain well-developed crystals of quartz, felspar, augite or magnetite, etc., and in the fine glassy base minute crystallites often abound. Some have the resinous lustre and the high percentages of combined water which distinguish the pitchstones; others are bright and fresh obsidians, and nearly all the older examples are dull, cryptocrystalline felsites. According to their chemical compositions they range from very acid rhyolites to trachytes and andesites, and the dark basaltic glasses or tachylytes are sometimes highly perlitic. It is probable that most perlites are of intrusive origin, as indicated by the general absence of steam cavities, but some perlitic Hungarian rhyolites are believed to be lavas. Rocks of this kind are found in Meissen, Saxony, as dikes of greenish and brownish pitchstone. Other examples are furnished by the Tertiary igneous rocks of Hungary (Tokay, etc.), the Euganean Hills (Italy) and Ponza Island (Mediterranean).

In mineralogical collections rounded nodules of brown glass varying from the size of a pea to that of an orange may often be seen labelled *Marekanite.* They are found at Okhotsk, Siberia, in association with a large mass of perlitic obsidian, and are the more coherent portions of a perlite. They are subject to considerable internal strain, and when struck with a hammer or sliced with a lapidary's saw they often burst into fragments—as do "Prince Rupert's drops." In their natural condition the marekanite spheres are doubly refracting, but when they have been heated and very slowly cooled they lose this property and no longer exhibit any tendency to sudden disintegration.

In Great Britain Tertiary vitreous rocks are not common, but the pitchstone which forms the Scuir of Eigg is a dark andesitic porphyry with perlitic structure in its glassy matrix. A better example, however, is provided by a perlitic dacitic pitchstone porphyry that occurs near the Tay Bridge; the tachylytic basalt dikes of Mull are occasionally highly perlitic. (J. S. F.)

PERM, a town of Russia in the Uralsk area, on the left bank of the Kama river in 58° N., 56° 15′ E. Pop. (1926) 84,761. It has an important position on the railway since the products of the Urals converge on the town, partly by rail and partly by river. It is planned to continue the line north of Perm, now terminating at Kotlas, to Sorok on the west of Lake Onega and thus link Perm and the Urals with Murmansk. The town manufactures agricultural machinery, especially separators for the Siberian dairy industry, and has sawmills and timber works, cardboard, match and leather factories. The Perm district was formerly occupied by a Finnish tribe, the Permyaks, speaking a language closely related to that of the Komi (Zirians), and they are still to be found on the upper Kama. In 1568 the Russian merchant princes, the Stroganovs, established a settlement here named Brukhanovo, which received the name Perm in the 17th century. In 1723 copper works were founded near the town, which under the official name of Perm became an administrative centre in 1781. The former government of Perm is now merged in the Uralsk administrative area.

PERMALLOY: *see* ALLOYS and TELEPHONE.

PERMANENT COURT OF INTERNATIONAL JUSTICE. The Permanent Court of International Justice was created by an international agreement concluded at Geneva, Dec. 16, 1920, and consisted of a statute for the establishment of the court and a protocol of signature by which 52 states have declared their acceptance of the statute and of the jurisdiction of the court. At the close of 1927 this protocol had been ratified by 40 of the 52 signatories, including all the principal powers, except Russia and the United States of America. On Jan. 28, 1926, the Senate of the United States, upon the formal initiative

of the President, advised and consented that the United States adhere to the protocol of Dec. 16, 1920, with certain reservations designed to put the United States upon an equal footing in respect of the court with the several members of the League of Nations. Germany signed the protocol on Dec. 10, 1926, and ratified it on March 11, 1927.

I. CONSTITUTION AND JURISDICTION

Judges.—The court consists of 11 judges and four deputy judges, who are elected for terms of nine years and may be re-elected. The seat of the court is at The Hague. It holds regular annual sessions, and, unless otherwise provided by rules of the court, the regular session begins on June 15 of each year and continues as long as may be deemed necessary to finish the cases on the list. It elects its own president and vice-president, appoints its own registrar and makes its own rules regulating procedure The president and registrar are required to reside at the seat of the court. If at any time the full number of 11 judges cannot be present, the deputy judges are called upon to make up the number; nine judges being necessary to make a quorum. The statute requires that the members of the court shall be a body of independent judges elected regardless of their nationality from amongst persons of high moral character who possess the qualifications required in their respective countries for appointment to the highest judicial offices, or are jurisconsults of recognized competence in international law.

Not more than one national of any state at one time may be member of the court. The members receive regular salaries and are not permitted to exercise any political or administrative function, or to act as agent, counsel or advocate in any case of an international nature. Every member is required, before taking up his duties, to make a solemn declaration in open court that he will exercise his powers impartially and conscientiously.

Litigants.—Only states or members of the League of Nations can be parties to cases before the court. The rights of a private person, therefore, can be brought before the court, only by the Government of the state or quasi-state of which he is a citizen The court is open unconditionally to the members of the League of Nations and also to the states mentioned in the annexe to the League Covenant, and it is open to other states upon condition of their accepting the jurisdiction of the court and undertaking to carry out in good faith its decisions and not to resort to war against a state complying therewith. The jurisdiction of the court comprises all cases which the parties refer to it and all matters specially provided for in treaties and conventions in force.

There was much discussion whether this jurisdiction should be made generally compulsory, so that whenever one party to any international controversy wished to bring the case into court, the other party would be bound to submit to the jurisdiction Many states being unwilling to subject themselves to so comprehensive an obligation, the question was disposed of by including in the protocol and statute an optional clause, which the several states were at liberty to sign or refrain from signing, and under which the states signing recognized as compulsory, in relation to each other, the jurisdiction of the court in legal disputes concerning (*a*) the interpretation of a treaty, (*b*) any question of international law, (*c*) the existence of any fact which, if established, would constitute a breach of an international obligation, (*d*) the nature or extent of the reparation to be made for the breach of an international obligation. At the close of the year 1927, this optional clause had been signed by 27 states. France and Germany were the only great powers included in this list. Since the court began its work, its jurisdiction under the head of "matters specially provided for in treaties and conventions" has been enlarged by many new treaties and conventions providing that disputes between the parties shall be submitted to the court

Procedure and Practice.—The statute requires the court to apply in its decisions (1) international conventions, whether general or particular, establishing rules expressly recognized by the contesting states; (2) international custom as evidence of a general practice accepted as law; (3) the general principles of law recognized by civilized nations; (4) judicial decisions and the teaching of the most highly qualified publicists of the various nations, not as binding, but as subsidiary means for the determination of rules of law.

The official languages of the court are French and English. The hearings are public. Every decision is by a majority of the judges present at the hearing. The judgments are required to state the reasons on which the decisions are based. They are delivered in open court, and are printed and published in a regular series of reports. They are final and without appeal, but a judgment is binding only between the parties and in the particular case. Dissenting judges are entitled to deliver separate opinions.

Special chambers of five judges each are appointed by the court for three years to hear and determine labour cases arising under Pt. XIII. of the Treaty of Versailles and cases relating to transit and communications under Pt. XII. of the Treaty of Versailles. In such cases the judges are assisted by technical assessors With a view to the speedy dispatch of business, the court forms annually a chamber of three judges, who, at the request of the contesting parties, may hear and determine cases by summary procedure.

Special pains are taken in the statute to ensure that in each case there shall be in the court some judge familiar with the laws, customs and peculiarities of each country which is a party to the controversy, and if in any case there is no member of the court coming from the country which is a party litigant, that party may name an additional judge to sit in the court in that case. For this purpose several parties in the same interest are reckoned as one party only.

Advisory Opinions.—The court has provided by rules for giving an advisory opinion upon written request from the Assembly or the Council of the League of Nations containing an exact statement of the question accompanied by all documents likely to throw light upon it When such a request is received, the registrar is required to give notice to the members of the court, to the members of the League of Nations, to the states mentioned in the annexe to the Covenant and to any international organizations which are likely to be able to furnish information on the question Opinions are given only after hearing all parties concerned and after deliberation by the full court; and the requests and opinions are printed and published in a special collection of reports

II. ELECTION OF JUDGES

The judges and deputy judges of the court are elected by separate concurrent votes of the Council and the Assembly of the League of Nations, a majority vote of the members of each of those bodies being necessary to an election The voting is confined to a list of eligible candidates nominated by the members of the old Permanent Court of Arbitration at The Hague established by the Hague Conferences of 1899 and 1907. That Court of Arbitration was made up by each power signatory to the Hague Convention for the Pacific Settlement of International Disputes selecting not more than four persons who were required to be "of known competency in questions of international law, of the highest moral reputation and disposed to accept the duties of arbitrators " The persons thus selected were inscribed as members of the Court of Arbitration in a list which was sent to all the contracting powers.

When a controversy was to be brought before the Court of Arbitration, five persons were to be selected from this list by the parties to constitute the tribunal to hear and determine the case. The list of members of the Court of Arbitration accordingly really constitutes a panel from which in each case the arbitral tribunal is selected, and this panel is composed of as many little national groups as there were states signing the Hague Convention and making appointments under it Under the statute of 1920 creating the Permanent Court of International Justice, when a judge of the new court is to be elected, each of these national groups in the old court is called upon to nominate not more than four candidates, not more than two being of their own nationality. All the nominations thus made are entered in a single list to which the votes of the Council and the Assembly for the new judges are

confined.

The experience of many years has shown that the character of the men appointed to the old Court of Arbitration has been such as to withdraw them to a great degree from the most disturbing influences of local politics and to make them specially familiar with the persons who would be fitted for judges of the new court, and the statute conferring the power of nomination upon them contains an express provision that "before making these nominations, each national group is recommended to consult its highest court of justice, its legal faculties and schools of law, and its national academies and national sections of international academies devoted to the study of law." The statute creating the new court also lays down for the guidance of the Assembly and Council in casting their votes the following rule: "At every election the electors shall bear in mind that not only should all the persons appointed as members of the court possess the qualifications required, but the whole body also should represent the main forms of civilization and the principal legal systems of the world."

If after three meetings there remains a vacancy for which no candidate shall have obtained an absolute majority of votes both in the assembly and in the council, then a joint conference committee is provided for, which shall endeavour to agree and report upon a candidate, and the conference committee may, by unanimous agreement, go out of the list of nominations for a candidate. If the conference fails, then the judges of the court already elected may proceed to fill the vacancy by selection from amongst the candidates voted upon in the assembly or in the council.

III. ORGANIZATION AND WORKING

The first election of judges to constitute the court was held at Geneva on Sept. 14–16, 1921. The list of eligible candidates proposed by the members of the old Court of Arbitration included 89 names, and from this list 11 judges and three deputy judges were elected by concurrent ballots of the Council and Assembly, and a fourth deputy judge was chosen upon the report of a conference committee accepted by both bodies. The judges elected were respectively citizens of France, Great Britain, Spain, Denmark, the Netherlands, Switzerland, Italy, Japan, Brazil, Cuba and the United States of America. The deputy judges were citizens of Norway, Rumania, the Serb-Croat-Slovene state and China. The members elected met at The Hague on Jan. 30, 1922, and proceeded to organize the court by electing Judge Loder (Holland) as president and Judge Weiss (France) as vice-president, appointing Mr. Ake Hammarskjold (Norway) as registrar, and adopting rules regulating the constitution and working of the court and procedure before it.

The first session for the transaction of judicial business opened on June 15, 1922. The regular sessions provided for were held thenceforward, and during the years 1922–27 there were six regular and six extraordinary sessions. During the same period the court heard, considered and gave decisions in ten contested international cases and upon 13 requests for advisory opinions. Most of the questions considered were novel, difficult and important, and many of them presented differences of opinion which required an authoritative decision if the establishment of peace and order in Europe on a reasonable working basis was to proceed after the extensive rearrangements caused by the Treaty of Versailles. The 23 judgments and opinions rendered were accepted as final. The existence of the court is manifestly beginning to affect international discussion of disputes and to be recognized as affording a means of escape from those international deadlocks which have seemed insoluble because neither party felt willing to humiliate itself by surrendering its position.

IV. EVOLUTION OF THE COURT

The Permanent Court of International Justice is not a product of any one mind or group or negotiation. It is a growth of many years during which a multitude of men familiar with international affairs have collaborated in an effort to adapt to the conditions of international controversy the idea of justice under which in civilized communities judicial decision has superseded private war. Many projects designed to accomplish this result were devised and published by individuals from the 16th down to the close of the 19th century without much apparent effect. In the meantime, however, provisions for arbitration became more frequent in international treaties and the practice of settling international disputes by arbitration increased. Nineteen international arbitrations are registered during the first half of the 19th century and 117 during the second half. The Hague Conference of 1899 greatly facilitated the practice of international arbitration by providing a general system with well considered forms of procedure, an established secretariat and an available list of suitable arbitrators.

Justiciable and Non-justiciable Questions.—The next step in development was a realization of the distinction between the arbitration of controversies between nations and the judicial decision of justiciable questions. Arbitrators selected *ad hoc* by the parties for the decision of a controversy proved quite likely to negotiate a settlement. Men of the highest character in such a position had a tendency to act under a sense of diplomatic obligation, according to which the legal rights of the parties were merely elements in determining what it would be wise to do. By the time the second Hague Conference of 1907 met, a considerable opinion had arisen that for the decision of international questions of legal right it was necessary to create a permanent tribunal composed of judges who were judicial officers and nothing else, and who would devote their entire time to the trial and decision of international causes by judicial methods and under a sense of judicial responsibility, and who were so selected that the different systems of law and procedure should be fairly represented.

After very full discussion, the conference of 1907 declared itself in favour of this view. It adopted a draft project for such a court which, however, remained incomplete because it proved impossible to reach an agreement on the mode of selecting the permanent judges. The numerous smaller powers were insistent upon their rights of equal and independent sovereignty and upon an equal voice in the selection of judges as a logical incident to that sovereignty. The great powers were unwilling to agree to a court in the constitution of which they would have practically no voice commensurate with their populations and interests, as against the overwhelming majority of smaller states. Throughout the conference and during the seven years that elapsed between 1907 and the outbreak of the World War, there were constant but unavailing negotiations for an agreement upon some mode of electing the judges.

At the close of the War, the 14th article of the Covenant of the League of Nations required the newly created Council of the League to resume this effort and to formulate and submit to the members of the League for adoption plans for the establishment of a Permanent Court of International Justice. In pursuance of that instruction, 12 international lawyers, resident in as many different countries, were invited by the Council to act as a committee to prepare plans for the establishment of the proposed court. Upon this invitation such a committee met at The Hague (June 16, 1920), consisting of members from Great Britain, France, Spain, Belgium, Holland, Norway, Italy, Japan, Brazil and the United States. After long discussion, this committee, on July 24, 1920, reported a plan containing the arrangements for the election of judges above described. With some amendments in the Council and Assembly, particularly regarding jurisdiction, that plan was incorporated in the statute of Dec. 16, 1920.

Many of the provisions embodied in the statute creating this court had their origins during these long years of discussion in the necessity of reconciling the opinions of a great number of nations differing in their circumstances, in their modes of thought and feeling and in their conceptions of what would contribute to international justice. The statute probably does not conform to what would be produced in any single country, but it probably does include substantially all the useful provisions upon which the members of the community of nations were willing to agree in the year 1920.

Hudson, *The Permanent Court of International Justice and the Question of American Participation* (Harvard Univ. Press, 1925); Antonio Sanchez de Bustamante, *The World Court* (1925); several pamphlets on the court were issued by the World Peace Foundation between 1920 and 1926. (E. R.)

PERMEABILITY, MAGNETIC. The force between two magnetic poles varies as the product of the strengths of the poles, and inversely as the square of the distance between them. It depends also on the nature of the intervening medium. In the C.G.S. electro-magnetic system of units, unit pole is defined as one which repels an equal pole at a distance of one centimetre in empty space with a force of one dyne. Let F be the force between two poles of strengths m_1, m_2 at a distance r apart. Then, in a vacuum, $F=\frac{m_1m_2}{r^2}$. More generally, $F=\frac{m_1m_2}{\mu r^2}$. The constant μ depends on the medium, and is known as the permeability. The permeability may also be defined as the ratio of the magnetic induction, B, to the magnetizing force, H; the induction being a measure of the magnetic force which would be exerted on unit pole placed in a narrow crevasse in the medium perpendicular to the direction of the magnetic force. Thus $\mu=\frac{B}{H}$. The conception of permeability is due to Faraday, who spoke of it as "conducting power for magnetism," and the term was introduced by Kelvin in 1872.

Substances are divided into two main magnetic classes—diamagnetics, with the permeability, μ, less than 1, and paramagnetics with μ greater than 1. In diamagnetics the directions of the magnetization and the magnetizing force are opposite, in paramagnetics the same. For most substances the permeability differs very little from 1, and does not vary with the magnetizing field. A few paramagnetic substances, below certain critical temperatures, are ferromagnetic, having magnetic properties resembling those of iron. The permeability of ferromagnetics (which include iron, nickel and cobalt and some of their alloys) is a function of the magnetic force, and generally depends on the previous history of the specimen. The permeability may be very large; the maximum for some dynamo steels, and iron-nickel alloys being greater than 10,000. A knowledge of the permeability characteristics of iron and iron alloys, in particular, is of great technological importance. Material having a high permeability for definite ranges of magnetic force is generally required in the construction of electrical machinery. (*See* MAGNETISM.)

PERMEAMETER, an instrument for measuring the permeability of a sample of iron or steel, and more generally for examining the magnetic characteristics. The name was first applied by S. P. Thomson to an apparatus devised by himself in 1890. In this the sample, in the form of a rod, is surrounded by a magnetizing coil, and the mechanical force required to detach one end from an iron yoke of special form is measured by a spring balance. The force varies as the square of the induction, so that the induction, and hence the permeability for a known magnetizing field can be calculated. The measurement of the tractive force is also the basis of the du Bois magnetic balance permeameter.

In commercial routine magnetic testing measurements of a number of corresponding values of the induction, B, and of the magnetic field, H, are required. The Thomson and du Bois permeameters are rapid, and have been much used, but they are unsatisfactory for accurate work. The most accurate method of magnetic testing is the ballistic method using ring-shaped specimens. It is, however, desirable to carry out tests with ordinary bars, and a number of permeameters have been devised in which the same general method is extended to bar shaped specimens. The induction through a bar can be readily measured in the usual way by surrounding it by a search coil connected to a ballistic galvanometer (or fluxmeter); but the calculation of the magnetizing field is usually a matter of difficulty owing to the demagnetizing effects of the ends of the bar. By clamping the bar in a massive yoke of iron, a condition of approximate endlessness is attained, the bar and yoke together forming a magnetic circuit. This is done in the pioneer bar and yoke method of Hopkinson. In the crude arrangement, the joints (between the bar and yoke) and the yoke itself introduce great uncertainties. In Ewing's double bar and yoke test these errors are eliminated by a method involving a double series of measurements with two lengths of the bars. (*See* MAGNETISM.)

One of the most accurate permeameters is the double bar permeameter of C. W. Burrows. In this, two approximately equal bars are clamped in yokes at their ends. The bars are surrounded by magnetizing coils, and on reversing the magnetizing current, by means of a series of search coils connected to a galvanometer, a test can be made as to whether the induction remains uniform along the bar under test. There will generally be variations along the bar owing to the action of the joints and yokes; but this may be compensated by adjusting the current in subsidiary magnetizing coils. When uniformity of induction along the bar is attained, the magnetic field is that corresponding to the current in the main magnetizing coil, so that the field corresponding to the measured induction is accurately known.

For details of this permeameter, and of others, such as that of F. P. Fahy, which have come into general use, the technical literature should be consulted.

PERMIAN, a geological term designating the uppermost system of rocks of the Palaeozoic era and suggested by Sir R. Murchison in 1841, from their great development in the Russian Province of Perm.

Towards the close of the Carboniferous period a great diastrophic revolution of the earth's surface resulted in the upheaval of many parts of the crust and rearrangements of large areas of land and sea. In certain regions the movements were simple, either up or down; whilst in others they gave rise to mountain building accompanied and followed by denudation. Thus in some cases Permian rocks are conformable to the Carboniferous whilst in others they are separated from them or still older rocks by an unconformity. In western Europe, for example, mountain ranges known as Armorican (Armorica, Brittany); in central Europe the Variscian Alps; in North America the Appalachians, and in Russia the Urals, were elevated at this time.

On the other hand in parts of eastern and southern Europe, central Asia, Australia and America the Carboniferous seas were persistent and there is a continuous suite of marine sediments bridging the interval between the Carboniferous and Permian of western Europe. Such intervening or transition beds whether of marine or continental type, are termed "Permo-Carboniferous."

Confusion has arisen, and still persists to some extent, by the inclusion in the Permian of deposits which are really Carboniferous or Triassic in age, especially in areas where the continental type of deposit was prevalent. Such areas were characterized by their aridity and resembled the Aralo-Caspian region, the Arizona desert and similar tracts of the present-day, *i.e.*, inland drainage basins embracing in places inland seas, salt-lakes and lagoons. The sandy plains or depressions were bordered by mountains gashed by cañons, usually dry but occasionally flushed by torrential rains.

In Europe the Permian consists of (1) the twofold, or "Dyas" type of Germany and (2) the Russian type. The Dyas occurs in great thickness flanking the Harz mountains and in the Rhine provinces, Thuringia, Saxony, Bavaria and Bohemia (Czechoslovakia). Two major divisions are recognized, of which the upper overlaps the lower and covers a greater area. They are as follows:—

Zechstein (Marine series): *Upper.*—Anhydrite, gypsum, rock salt, dolomite, marl, foetid shale and limestone; *Middle.*—Dolomite (*Stinkschiefer* and Great Dolomite) and gypsum; *Lower.*—Zechstein Limestone, Kupferschiefer and conglomerate.

Rothliegende (Terrestrial Series): *Upper.*—Red sandstones and shales with melaphyre and conglomerate; *Lower.*—Sandstones and conglomerates on black shales, poor coals and clay-ironstones, and sheets of melaphyre (lava). Red and grey sandstones with

impure limestones at base.

The clay-ironstones of the Rothliegende (Lower Lebach beds of the Saar region) have yielded a rich fauna (*Archegosaurus*, etc.) and flora (*Walchia, Callipteris*).

Overlying the Zechstein conglomerate is the Kupferschiefer, a thin black marly shale containing bitumen, copper ore, plant and fish remains. Copper ore amounts to no more than 3%, but has given rise to the chief copper mines in Germany (Mansfeld, etc.)

Of animals' remains in the Zechstein the limestone, 30–33 ft. thick, contains the greater number, although they show signs of poverty; fewer occur in the Great Dolomite.

In Thuringia a Bryozoa reef in the Lower and Middle Zechstein extended for miles along the western and southern margin of the Zechstein sea, and in addition to Bryozoa contains a rich fauna which bears witness to the gradual desiccation of the sea and the dying out of individual species.

Beds of salt occur in the Upper Zechstein north of the Harz and are worked, amongst other places, at Stassfurt, where rock-salt, 1,200 ft. thick, is followed by 150 ft. of potash and magnesia salts.

Eastwards the Zechstein extends into the Baltic provinces and the eastern Alps.

In south-eastern Russia the same types are recognized but there is an alternation of terrestrial and marine beds throughout the whole system. They cover an enormous tract, chiefly in the province of Perm (and extend into Nova Zemlya and Spitsbergen). Following the Carboniferous conformably they consist of sandstones, marls, shales, conglomerates and limestones—the latter containing a fauna similar to that of the Zechstein. Intercalated with these are beds of rock-salt, gypsum and coal. At the base are terrestrial beds with plants chiefly of Permian affinities.

On both sides of the Alps the Permian is represented mainly by thick red sandstones and conglomerates which pass up imperceptibly into the Trias. In the eastern Alps are the Grödner Sandstones (with a Zechstein dolomite), and the Verrucano Conglomerate, also found in the Appenines. Rothliegende plants appear in the Brescian Alps, whilst Kupferschiefer plants occur at Neumarkt (Tirol), in the Venetian Alps and in Hungary.

In England the Permian is represented mainly by the German facies, but to some extent also by that of southern Russia, and is everywhere unconformable to the Carboniferous; whilst in France only the Rothliegende is definitely recognizable, its lower members passing up gradually from the Coal Measures (Autun).

Durham and the south-east corner of Northumberland provide the classic area in England, the sequence being as follows:—

Passage Beds (Permo-Trias)—Red marls with sandstones, gypsum or anhydrite, and, in lower part:
- Marls with salt and thin magnesium limestone—170–500 ft.

Magnesian Limestone Series (Zechstein):
- Upper Magnesian Limestone—up to 250 ft. (Hartlepool Anhydrite Bed).
- Middle Magnesian Limestone with reefs—300 ft.
- Lower Magnesian Limestone—up to 240 ft.
- Marl Slate (=Kupferschiefer).

Yellow Sands, quartzose (?Rothgeliegende).

The yellow quartz sands are unfossiliferous, but the Marl slate contains fish remains of Kupferschiefer type.

The Middle Magnesian Limestone comprises a broad chain of Bryozoa reef knolls, flanked by bedded dolomites. This reef affords an example of a fauna locked in a sea in which the forms were dwarfed and gradually exterminated as the conditions of life became unfavourable. According to Trechmann the reef resembles that of Pössnach and other localities in the Gera district of Thuringia (*see* above) and may be continuous with it beneath cover.

Traced southwards into Nottinghamshire the Magnesian Limestone Series becomes thinner by the successive disappearance of its higher members, and what is left takes on a shore facies. The Zechstein sea shrank by desiccation, its margin in Durham moving south and east, in Nottinghamshire north and east, in Thuringia north and west.

Sherlock has recently argued that the upper part of the Magnesian Limestone Series of Durham is equivalent—by lateral passage to Bunter deposits in Nottinghamshire (*see* TRIAS). There is certainly a frequent upward passage from many British Permian deposits into those which are Triassic. Hence the probability is that certain beds classed as high Permian may be equivalent to others classed as low Bunter.

In central England various deposits—red marls, sandstones, conglomerates and breccias—which succeed the Carboniferous rocks conformably and were previously allotted to the Rothliegende have been relegated to the Carboniferous. Certain overlying unconformable deposits are still considered to be of Lower Permian age, as in places (*e.g.*, Collyhurst Sandstone, south Lancashire) they are succeeded by fossiliferous marls and bands of magnesian limestone representing part of the Zechstein.

A branch of the Zechstein sea penetrated into parts of Lancashire, west Cumberland and the Vale of Eden (Westmorland), and into Ireland near Belfast (Cultra), in Tyrone and the Lagan valley.

The Penrith Sandstone of the Vale of Eden, with its included sheets of limestone breccia ("brockrams") is usually attributed to the Rothliegende. It has its approximate counterpart in the sandstones, conglomerates and breccias of Arran (Ballymichael and Lamlash Sandstones, ? Upper Permian), the Brodick Breccia and Sandstone and the Dumfries and Mauchline Sandstones of south Scotland. In Ayrshire and south Lanarkshire they comprise basic lavas, tuffs and volcanic necks.

The Hilton Plant beds of the Vale of Eden are correlated with the Marl Slates, or the Kupferschiefer of Germany, whilst the Magnesian Limestones of west Cumberland (associated with brockrams and gypsiferous shales of Permo-Triassic age) and Ireland, and possibly the Vale of Eden, point chiefly to a Middle Magnesian Limestone age, although the Upper may also be present in Ireland.

Deposits of supposed Permian age, intimately connected with the Trias, occur in Devonshire.

In southern Europe, central and southern Asia marine sediments of Permian age were deposited in a central ocean, named by E. Suess "Tethys," which from time to time had connection with the Atlantic, and of which the present Mediterranean is a shrunken remnant.

In the Karawanken and Carinthian mountains limestones with swollen *Fusulina* and some species recalling the Permo-Carboniferous of Nebraska, follow directly on, or are in intimate connection with, the marine Carboniferous. A *Bellerophon* limestone with a rich Permo-Carboniferous fauna occurs in southern Tyrol. *Fusulina* limestones with an extraordinary number of Ammonoidea, some similar to those of the Artinsk stage, others of newer genera, occur in Sicily. In Asia a similar rich Permian fauna occurs near Djulfa in the valley of the Araxes and the Artinsk fauna appears again at Bokhara.

The lowest part of the Productus Limestone of the Indian Salt Range represents approximately the Artinsk stage. The higher part is Middle and Upper Permian. At the top (which is succeeded by Triassic formations) is a rich fauna of Ammonoidea, Nautili, Productidae, etc., some of the forms being common to the Zechstein. Marine Permian deposits occur also in the northern zone of the Himalayas, in Burma and at Timor in the Moluccas; whilst in the northern part of the Malay Peninsula the Permo-Carboniferous (and probably Permian) consists of marine limestones which become more shaly towards the east and south (Raub Series).

Beds equivalent to a part of the Permian of Russia occur in North America, but as there is frequently a complete upward transition from Coal Measures there is some disagreement as to where the line between the two should be drawn. The flooding by the sea northward and eastward, of the continent, continued throughout Pennsylvanian (Upper Coal Measure) times; it then began to retreat south-westward and in early Permian times the continent had again nearly emerged. Thus the greater part of the marine development in Kansas and south-west Texas is replaced by continental red beds in Oklahoma, northern Texas, and the southern Great Plains country. In Oklahoma tremendous amounts

of gypsum are incorporated in the red beds.

In Texas the beds classed as Permian (7,000 ft.) in the suite are the Wichita (or Wreford of Kansas) followed by the Clear Fork, Double Mountain and Capitan of Trans-Pecos: in Pennsylvania, the Dunkard: in Prince Edward Island, Nova Scotia and New Brunswick Permo-Carboniferous beds consist of soft-red shales and sandstones.

To the south of the Tethys the dominant feature of the southern hemisphere (and a smaller part of the northern) at this period is a vast pile of shales and coals of a deltaic and terrestrial facies, comprising what is known in India as the "Gondwana System," which ranges in age from Permo-Carboniferous to Jurassic.

In Peninsular India the coal-bearing Damuda series (about 10,000 ft.) contains the peculiar "Glossopteris" flora, with such forms as *Glossopteris, Gangamopteris* and *Sagenopteris.* At the base is the Talchir series, including a fossil boulder-clay or "tillite." A glacial boulder bed occurs also at the base of the speckled sandstones beneath the Productus Limestone of the Salt Range. Similar formations have been found in Afghanistan.

In Africa the thick Dwyka series, at the base of the Permo-Triassic Karroo system, extends from the southern to the central parts of the continent, with a horizontal range of 800 miles. The Dwyka conglomerate at or near its base is a tillite (maximum 1,500 ft.) which forms a sheet encircling the Karroo basin. It is succeeded by the Upper Dwyka shales and these by the coal-bearing Ecca beds, both with the *Glossopteris* flora.

At Bacchus Marsh and other places in Victoria coal-bearing beds with the *Glossopteris* flora are interstratified with the glacial deposits (which occur also as moraines in South Australia and Tasmania); whilst in Western Australia the Lyons Conglomerate analogous to similar deposits in New South Wales—associated with a marine Permo-Carboniferous fauna—can be traced without break from south-south-east to north-north-west through 3° of latitude.

In New Zealand the Permian (said to be 7,000–10,000 ft. thick) contains neither coal nor evidence of ice-action, but includes lava-flows.

Glacial conglomerates, associated with rocks of Permo-Carboniferous age, occur in many parts of South America typically Brazil and Argentina, in both cases with strata containing *Glossopteris.*

In the Falkland Islands Permo-Carboniferous beds with *Glossopteris* overlie a tillite, and with these the coal-bearing Beacon Sandstone of South Victoria Land (Antarctica), which also contains *Glossopteris* is tentatively correlated.

The Gondwana continent, margined by sediments with the *Glossopteris* flora, was probably traversed by alpine chains with valley glaciers spreading out as piedmonts on the shores of inland basins and land-locked seas. The movement of ice in India was apparently northward, in South Africa southward.

Certain tillites occur also in North America about Boston, Mass., but here the movement was from north to south, as in the Pleistocene period.

Glacial moraines are said to occur in the Lower Rothliegende of Westphalia in Germany.

The fauna of the continental types of the Permian generally possesses a terrestrial facies and comprises insects, molluscs, crustaceans, fish, amphibians (Labyrinthodonts) and reptiles (*Palaeohatteria, Proterosaurus,* etc.), the latter now making their first appearance. The richest and most varied fauna of amphibians and reptiles is that of America, especially Texas and Oklahoma, where it had an independent and isolated development.

The fauna of the inland seas shows signs of degeneration, but forms living in the open seas, such as Tethys, flourished and followed a normal course of development and new forms made their appearance. Ammonites (*Medlicottia, Wagenoceras,* etc.), so characteristic of the Mesozoic era, began to appear and are associated with Bryozoa, corals and molluscs. The last representatives of the trilobites occur in the Permian of North America.

Plants are represented by many survivors from the Carboniferous (e.g., *Calamites*); others show that a change of type was in progress. The distinctive Glossopteris flora was that of a cool climate. (B. Sm.)

PERN, a name sometimes given to the honey-buzzards. (*See* BUZZARD.)

PERNAMBUCO, a north-eastern Atlantic State of Brazil. Area, 38,312 sq.m.; pop. (1920) 2,154,835. It comprises a comparatively narrow coastal zone, a high inland plateau, and an intermediate zone formed by the terraces and slopes between the two. Its surface is much broken by the remains of the ancient plateau which has been worn down by erosion, leaving escarpments and ranges of flat-topped mountains, called *chapadas,* capped in places by horizontal layers of sandstone. The coastal zone is low, well wooded and fertile. It has a hot, humid climate, relieved to some extent by the south-east trade winds. This region is locally known as the *mattas* (forests). The middle zone, called the *caatinga* or *agreste* region, has a drier climate and lighter vegetation. The inland region, called the *sertão,* is high, stony, and dry, and frequently devastated by prolonged droughts (*sêccas*). The climate is characterized by hot days and cool nights, and is considered healthy, though the daily change tends to provoke bronchial, catarrhal and inflammatory diseases. There are two clearly defined seasons, a rainy season from March to June, and a dry season for the remaining months. The rivers of the State include a number of small plateau streams flowing southward to the São Francisco river, and several large streams in the eastern part flowing eastward to the Atlantic. The largest of the coastal rivers are the Goyanna, which is formed by the confluence of the Tracunhaem and Capibaribemirim, and drains a rich agricultural region in the north-east part of the State; the Capibaribe, which has its source in the Serra de Jacarará and flows eastward to the Atlantic at Recife with a course of nearly 300 m.; the Ipojuca, which rises in the Serra de Aldeia Velha and reaches the coast south of Recife; the Serinhaen and the Una.

The State of Pernambuco is, for the most part, agricultural, the lowlands being devoted to sugar and fruit, with coffee in some of the more elevated localities, the *agreste* region to cotton, tobacco, Indian corn, beans and stock, and the *sertão* to grazing and in some localities to cotton. Sugar, molasses, rum (*aguardiente* or *cachaça*), tobacco and fruit are largely exported. Coconuts, cacao, bananas, mangoes and other tropical fruits are produced in profusion, but the production of foodstuffs (beans, Indian corn, mandioca, etc.) is not sufficient for local consumption. Mangabeira rubber is collected to a limited extent, and piassava fibre is an article of export. Orchids are also collected for export in the districts of Garanhuns and Timbaúba. Cotton-weaving and cigar-making are the principal manufacturing industries, after the large *engenhos* devoted to the manufacture of sugar and rum. The railways of the State are parts of the Great Western of Brazil railway. All these lines concentrate at the port of Recife.

The capital of the State is Recife, a city that is commonly known among foreigners as Pernambuco. There is a number of large towns in the State, but the 1920 census returns include their populations in those of the *municipios* (communes) to which they belong. The most important are: Bezerros (48,190), Bom Jardim (92,515), Brejo da Madre de Deus (48,784), a town of the higher *agreste* region, Cabo (31,911), Caruarú (61,636), Escada (63,723), Garanhuns (21,135, covering six towns and villages), Gloria de Goytá (33,626), Goyanna (53,854), Limoeiro (52,573), Olinda (52,199), the old colonial capital and episcopal see, Rio Formoso (16,126), Timbaúba (52,526) and Victoria (59,572).

Pernambuco, at its inception in 1526, was settled by Christovão Jacques, who founded a settlement on the Rio Iguarassú that was afterwards abandoned. The first permanent settlement was made by Duarte Coelho Pereira at Olinda in 1530, and four years later he was granted a *capitania* of 50 leagues extending from the mouth of the São Francisco northward to that of the Iguarassú. Adjacent to this grant on the north was the *capitania* of Itamaracá, granted to Pero Lopes de Souza, which covered the remainder of the present State. The *capitania* of Pernambuco was ably governed and took an active part in the expulsion of the French from the trading posts established along the coast northward to Maranhão, and in establishing Portuguese colonies in their places.

In 1630 Pernambuco was occupied by the Dutch and continued under their rule until 1654. Although an active guerrilla warfare was waged against the Dutch during a large part of that period, they did much to promote the agricultural and commercial interests of the colony, especially under the wise administration of Maurice of Nassau.

In 1817 Pernambuco was the scene of a revolutionary outbreak, which resulted in the separation of the present States of Alagôas and Rio Grande do Norte, Ceará and Parahyba having been detached in 1799. There was another insurrection in 1822 when the Portuguese captain general, Luiz de Rego, and his garrison were expelled, and in 1824 dissatisfaction with the arbitrary proceedings of Dom Pedro I. at Rio de Janeiro led to a separatist revolution for the formation of a new State, to be called the Federação do Equador. There was another outbreak in 1831 and frequent disorders down to 1848, when they culminated in another unsuccessful revolution. The population of the Pernambuco *sertão* has always been noted for its turbulent, lawless character, due partly to distance from the coast where the bulk of the population is concentrated, partly to difficult means of communication, and partly to the fact that this remote region has long been the refuge of criminals from the coast towns.

PERNAU: *see* PÄRNU.

PERNERSTORFER, ENGELBERT (1850–1918), Austrian politician, was born in Vienna on April 27, 1850 Acquainted since childhood with Viktor Adler, Pernerstorfer studied and sympathized with the young Austrian labour movement since his earliest days as a teacher In 1870, together with Adler, Friedjung, the historian, and others, he formed a league for the study of social movements His first political activities were, however, linked with Schonerer's extreme German Nationalist movement He was one of the authors of the German Nationalist *Linzer Programm* (1880), but he left this party and entered parliament in 1889 as an independent As deputy he enjoyed the right of free speech and began to act as the mouthpiece of the Social Democrat party, to which he was of the greatest service He joined the party in 1896, and sat for it in parliament from 1901 until his death, in latter days being president of its parliamentary faction and vice-president of the House (1909, 1911) Pernerstorfer was rather an advanced liberal, who adopted Socialism from love of humanity and hatred of absolutism and clericalism His own principal interests were literary and educational His fearless and generous personality did much for the poorer classes of his fellow men in days when they were practically political and social outcasts He died in Vienna on Jan 6, 1918

PERNICIOUS ANAEMIA: *see* ANAEMIA; BLOOD, PATHOLOGY OF

PÉRONNE, a town of northern France, capital of an arrondissement of the department of Somme, on the right bank of the Somme, at its confluence with the Cologne, 35 m E by N of Amiens by rail Pop (1926), 4,087 The Frankish kings had a villa at Péronne and a monastery was founded here in the 7th century by, or for, Scottish monks; a collegiate church was built and dedicated to St Fursy, the first abbot By about 1200 it had escheated to the French crown, and Philip Augustus gave it a charter (1209). By the treaty of Arras (1435) it was given to the Burgundians, bought back by Louis XI, it passed again into the hands of Charles the Bold in 1465 On the death of Charles, however, in 1477, Louis XI resumed possession In 1536 the emperor Charles V besieged Péronne without success It was the first town after Paris at which the League was proclaimed in 1577 Wellington took Péronne in 1815, the Germans captured it in 1871 and again in 1914; the French retook it, March, 1917, lost it again March, 1918, and took it finally, with Australian help, in Sept. 1918.

PEROVSKITE, a mineral consisting of calcium titanate, $CaTiO_3$, usually with a small proportion of the calcium replaced by iron, discovered in 1839 at Achmatovsk in the Urals, and named in honour of Count L. A. Perovsky. The crystals when found in schistose rocks have the form of cubes, but when occurring as an accessory constituent of eruptive rocks are octahedral in form and microscopic in size; although geometrically cubic, they are always doubly refracting, and sometimes show evidence of complex mimetic twinning; their structure as shown in polarized light is very similar to that of the mineral boracite, and they are therefore described as pseudo-cubic. The colour varies from pale yellow to blackish-brown and the lustre is adamantine to metallic. In the Urals large cubes occur with calcite and magnetite in a chlorite-schist, and similar crystals are found in talc-schist at Zermatt, Switzerland The microscopic octahedral crystals are characteristic of melilite-basalt and nepheline-basalt; they have also been found in peridotite and serpentine

PEROWNE, JOHN JAMES STEWART (1823–1904), English bishop, was born, of Huguenot ancestry, at Burdwan, Bengal, on March 13, 1823. He was educated at Norwich and at Corpus Christi college, Cambridge, becoming a fellow in 1849. After holding a chair in King's college, London, he was appointed vice-principal at St. David's college, Lampeter (1862–72) He was elected canon of Llandaff in 1869, dean of Peterborough 1878, and in 1891 succeeded Henry Philpott as bishop of Worcester Perowne was a good Hebrew scholar and sat on the Old Testament Revision Committee. He resigned his see in 1901, and died on Nov. 6, 1904

PĒRŌZ, Sassanid king of Persia, A.D. 457–484, son of Yazdegerd II He rebelled against his brother Homizd III, and in 459 defeated and killed him with the help of the Ephthalites, or White Huns, who had invaded Bactria He also killed most of his other relatives, and persecuted the Christians But he favoured the introduction of Nestorianism, in opposition to the orthodox creed of Byzantium With the Romans he maintained peace, but he tried to keep down the Ephthalites, who began to conquer eastern Iran The Romans supported him with subsidies; but all his wars were disastrous Once he was himself taken prisoner and had to give his son Kavadh as hostage till after two years he was able to pay a heavy ransom Then he broke the treaty again and advanced with a large army But he lost his way in the eastern desert and perished with his whole army (484). (ED M)

PERPENDICULAR PERIOD, in architecture, the latest style of English Gothic, roughly embracing the period from 1375 to the introduction of the Renaissance, during the 16th and 17th centuries It gains its name from the dominance of vertical lines in window tracery and wall panelling; in windows the vertical mullions sometimes carry unbroken from the sill to the under side of the arch and the upper part of the window is further sub-divided by additional, smaller, vertical mullions carried by the apex of arches connecting the larger mullions Continuous horizontal lines of arches and cornices are sometimes carried across high windows to divide the whole into many small arched lights, in each one of which could be placed the effigy of a saint in stained glass In structure the tendency is toward the reduction of wall surface, the increase of window area, the continuity of vertical lines and supports and the lavish development of decorative vaulting by means of liernes and, later, the elimination of structural vaulting ribs altogether, and the substitution of cut-stone, traceried fan vaults (*q v*)

Timber-trussed ceilings and roofs were developed to a point of great perfection and richness as in that of Westminster hall, London (1395–99) and in countless simpler parish churches, *e g*, Chipping Norton, Holy Trinity, Hull The period also saw the construction of many beautifully outlined and lavishly detailed church towers, usually square and without spires Those of Gloucester cathedral (1450–57), Magdalen college, Oxford (1492–1505), the central tower at Canterbury (1495) and the west towers of York (1432–70) are typical In decorative detail the period is marked by the introduction of the four-centred or Tudor arch, the covering of wall surfaces with ranges of traceried panels, chiefly rectangular, the general flatness of moulding profiles, diminished importance of the capital, the enclosing of door and window arches within a rectangular hood mould and the replacement of the earlier naturalism in carved ornament by a rather dry, incisive and, at times, mechanical, conventionalism.

The Perpendicular Period appears first in work in Gloucester cathedral about 1360, but the spread of the style was so rapid that by 1380 Perpendicular work was being built throughout the

country. It was a style so vital that it yielded but slowly to the influx of Renaissance ideas, and, particularly in Oxford, its effect is felt in building well into the 17th century. Characteristic examples are: the choir (1347–77) and cloister (1351–1412) of Gloucester cathedral; nave and west transepts of Canterbury cathedral (1378–1411); choir of York (1389–1407); King's college chapel, Cambridge (1447–1512); St. George's chapel, Windsor (completed 1508); Henry VII chapel, Westminster (completed 1512) and the hall of Christ Church college, Oxford (1630). (T F H)

PERPETUAL MOTION or PERPETUUM MOBILE, in its usual significance, not simply a machine which will go on moving for ever, but a machine which, once set in motion, will go on doing useful work without drawing on any external source of energy, or a machine which in every complete cycle of its operation will give forth more energy than it has absorbed Briefly, a perpetual motion usually means a machine which will create energy in the form of motion.

The earlier seekers after the "perpetuum mobile" did not always appreciate the exact nature of their quest; for we find among their ideals a clock that would periodically rewind itself, and thus go without human interference as long as its machinery would last. The energy created by such a machine would simply be the work done in overcoming the friction of its parts, so that its projectors might be held merely to have been ignorant of the laws of friction and of the dynamic theory of heat Most of the perpetual motionists, however, had more practical views, and explicitly declared the object of their inventions to be the doing of useful work, such as raising water, grinding corn, and so on Like the exact quadrature of the circle, the transmutation of metals and other famous problems of antiquity, the perpetual motion has now become a venerable paradox. Still, like these others, it retains a great historical interest for as a result of the vain quest, there grew up the greatest of all the generalizations of physical science, the principle of the conservation of energy.

There was a time when the problem of the perpetual motion was one worthy of the attention of a philosopher. Before that analysis of the action of ordinary machines which led to the laws of dynamics, and the discussion of the dynamical interdependence of natural phenomena which accompanied the establishment of the dynamical theory of heat, there was nothing plainly unreasonable in the idea that work might be done by the mere concatenation of machinery. It had not then been proved that energy is uncreatable and indestructible in the ordinary course of nature; even now that proof has only been given by induction from long observation of facts. There was a time when wise men believed that a spirit, whose maintenance would cost nothing, could by magic art be summoned from the deep to do his master's work; and it was just as reasonable to suppose that a structure of wood, brass and iron could be found to work under like conditions

The principle of the conservation of energy, which in one sense is simply denial of the possibility of a perpetual motion, rests on facts drawn from every branch of physical science; and, although its full establishment only dates from the middle of the 19th century, yet so numerous are the cases in which it has been tested, so various the deductions from it that have been proved to accord with experience, that it is now regarded as one of the best-established laws of nature. Consequently, on any one who calls it in question is thrown the burden of proving his case. If any machine were produced whose source of energy could not at once be traced, a man of science (complete freedom of investigation being supposed) would in the first place try to trace its power to some hidden source of a kind already known; or in the last resort he would seek for a source of energy of a new kind and give it a new name.

If a man likes to indulge the notion that, after all, an exception to the law of the conservation of energy may be found, then provided he submits his idea to the test of experiment at his own charges without annoying his neighbours, all that can be said is that he is engaged in an unpromising enterprise. The case is otherwise with the projector who comes forward with some machine which claims by the mere ingenuity of its contrivance to multiply the energy supplied to it from some of the ordinary sources of nature and sets to work to pester scientific men to examine his supposed discovery, or attempts therewith to induce the credulous to waste their money. This is by far the largest class of perpetual-motion-mongers nowadays.

It was no doubt the barefaced fallacy of most of the plans for perpetual motion that led the majority of scientific men to conclude at a very early date that the "perpetuum mobile" was an impossibility. We find the Paris Academy of Sciences refusing, as early as 1775, to receive schemes for the perpetual motion, which they class with solutions of the duplication of the cube, the trisection of an angle and the quadrature of the circle. Stevinus and Leibnitz seem to have regarded its impossibility as axiomatic; and Newton at the beginning of his *Principia* states a principle which virtually amounts to the same thing

The famous proof of P de la Hire simply refers to some of the more common gravitational perpetual motions. The truth is that, if proof is to be given, or considered necessary, it must proceed by induction from all physical phenomena.

By far the most numerous class of perpetual motions is that which seeks to utilize the action of gravity upon rigid solids We have not read of any actual proposal of the kind, but the most obvious thing to imagine in this way would be to procure some substance which intercepts gravitational attraction. If this could be had, then, by introducing a plate of it underneath a body while it was raised, we could elevate the body without doing work, then, removing the plate, we could allow the body to fall and do work; eccentrics or other imposing device being added to move the gravitation intercepter, behold a perpetual motion complete! The great difficulty is that no one has found the proper material for an intercepter.

Fig. 1 represents one of the most ancient and oftenest-repeated of gravitational perpetual motions The idea is that the balls rolling in the compartments between the felloe and the rim of the wheel will, on the whole, so comport themselves that the moment about the centre of those on the descending side exceeds the moment of those on the ascending side Endless devices, such as curved spokes, levers with elbow-joints, eccentrics, etc, have been proposed for effecting this impossibility The student of dynamics at once convinces himself that no machinery can effect any such result; because if we give the wheel a complete turn, so that each ball returns to its original position, the whole work done by the ball will, at the most, equal that done on it. We know that if the laws of motion be true, in each step the kinetic energy given to the whole system of wheel and balls is equal to that taken from the potential energy of the balls less what is dissipated in the form of heat by frictional forces, or vice versa, if the wheel and balls be losing kinetic energy—save that the friction in both cases leads to dissipation. So that, whatever the system may lose, it can, after it is left to itself, never gain energy during its motion

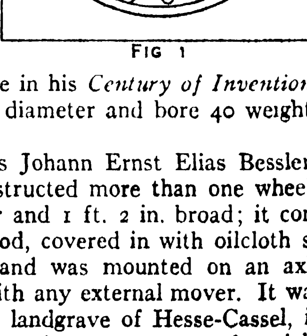

FIG 1

The two most famous perpetual motions of history, viz., the wheels of the marquis of Worcester (d 1667) and of Councillor Orffyreus, were probably of this type The marquis of Worcester alludes to the marvellous performance of his machine in his *Century of Inventions* (1663): the wheel was 14 feet in diameter and bore 40 weights of 50 pounds apiece!

Orffyreus (whose real name was Johann Ernst Elias Bessler) (1680–1745) appears to have constructed more than one wheel. his last one was 12 ft. in diameter and 1 ft. 2 in. broad; it consisted of a light framework of wood, covered in with oilcloth so that the interior was concealed, and was mounted on an axle which had no visible connection with any external mover. It was examined and approved of by the landgrave of Hesse-Cassel, in whose castle at Weissenstein it is said to have gone for eight

weeks in a sealed room. The most remarkable thing about this machine is that it evidently imposed upon the mathematician W. J. 'sGravesande, who wrote a letter to Newton giving an account of his examination of Orffyreus's wheel undertaken at the request of the landgrave, wherein he professes himself dissatisfied with the proofs theretofore given of the impossibility of perpetual motion, and indicates his opinion that the invention of Orffyreus is worthy of investigation. He himself, however, was not allowed to examine the interior of the wheel. The inventor seems to have destroyed it himself. One story is that he did so on account of difficulties with the landgrave's government as to a licence for it; another that he was annoyed at the examination by 'sGravesande, and wrote on the wall of the room containing the fragments of his model that he had destroyed it because of the impertinent curiosity of 'sGravesande.

The overbalancing wheel perpetual motion seems to be as old as the 13th century. Dircks quotes an account of an invention by Wilars de Honecort, an architect whose sketchbook is still preserved in the Écoles des Chartes at Paris. De Honecort says, "Many a time have skilful workmen tried to contrive a wheel that shall turn of itself; here is a way to do it by means of an uneven number of mallets, or by quicksilver." He thereupon gives a rude sketch of a wheel with mallets jointed to its circumference. It appears that Leonardo da Vinci worked with similar notions.

Another scheme of the perpetual motionist is a water-wheel which shall feed its own mill-stream. This notion is probably as old as the first miller who experienced the difficulty of a dry season. One form is figured in the *Mathematical Magic* (1648) of Bishop Wilkins (1614–1672); the essential part of it is the water-screw of Archimedes, which appears in many of the earlier machines of this class. Some of the later ones dispense with even the subtlety of the water-screw, and boldly represent a water-wheel pumping the water upon its own buckets.

Perpetual motions founded on the hydrostatical paradox are not uncommon; Denis Papin exposes one of these in the *Philosophical Transactions* for 1685. The most naïve of these devices is that illustrated in fig. 2, the idea of which is that the larger quantity of water in the wider part of the vessel weighing more will overbalance the smaller quantity in the narrower part, so that the water will run over at C, and so on continually.

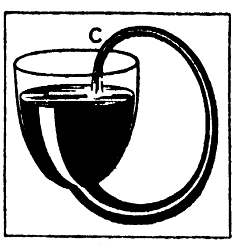

FIG. 2

Capillary attraction has also been a favorite field for the vain quest; for, if by capillary action fluids can be made to disobey the law of never rising above their own level, what so easy as thus to produce a continual ascent and overflow, and thus perpetual motion? Various schemes of this kind, involving an endless band which should raise more water by its capillary action on one side than on the other, have been proposed. The most celebrated is that of Sir William Congreve (1772–1828). EFG (fig. 3) is an inclined plane over pulleys; at the top and bottom travels an endless band of sponge, *abcd*, and over this again an endless band of heavy weights jointed together. The whole stands over the surface of still water. The capillary action raises the water in *ab*, whereas the same thing cannot happen in the part *ad*, since the weights squeeze the water out. Hence, inch for inch, *ab* is heavier than *ad;* but we know that if *ab* were only just as heavy inch for inch as *ad* there would be equilibrium, if the heavy chain be also uniform; therefore the extra weight of *ab* will cause the chain to move round continually in the direction of the arrow.

The more recondite vehicles of energy, such as electricity and magnetism, are more seldom drawn upon by perpetual-motion inventors than might perhaps be expected. William Gilbert, in his treatise *De Magnete*, alludes to some of them, and Bishop Wilkins mentions among others a machine "wherein a loadstone is so disposed that it shall draw unto it on a reclined plane a bullet of steel, which, still, as it ascends near to the loadstone, may be contrived to fall through some hole in the plane and so to return unto the place whence at first it began to move, and being there, the loadstone will again attract it upwards, till, coming to this hole, it will fall down again, and so the motion shall be perpetual." The fact that screens do exist whereby electrical and magnetic action can be cut off would seem to open a door for the perpetual-motion seeker. Unfortunately the bringing up and removing of these screens involves in all cases just that gain or loss of work which is demanded by the law of the conservation of energy. A shoemaker of Linlithgow called Spence pretended that he had found a black substance which intercepted magnetic attraction and repulsion, and he produced two machines which were moved, as he asserted, by the agency of permanent magnets, thanks to the black substance. The fraud was speedily exposed, but it is worthy of remark that Sir David Brewster thought the thing worth mentioning in a letter to the *Annales de chimie* (1818), wherein he states "that Mr. Playfair and Captain Kater have inspected both of these machines and are satisfied that they resolve the problem of perpetual motion."

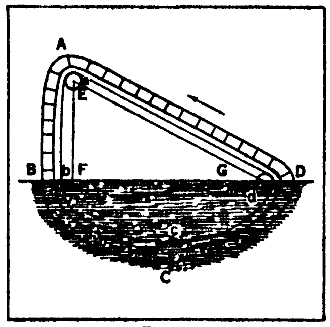

FIG. 3

One more page from this chapter of the book of human folly; the author is the famous Jean Bernoulli the elder. We translate his Latin, as far as possible, into modern phraseology. In the first place we must premise the following. (*See* fig. 4.) (1) If there be two fluids of different densities whose densities are in the ratio of G to L, the height of equiponderating cylinders on equal bases will be in the inverse ratio of L to G. (2) Accordingly, if the height AC of one fluid, contained in the vase AD, be in this ratio to the height EF of the other liquid, which is in a tube open at both ends, the liquids so placed will remain at rest. (3) Wherefore, if AC be to EF in a greater ratio than L to G, the liquid in the tube will ascend; or if the tube be not sufficiently long the liquid will overflow at the orifice E (this follows from hydrostatic principles). (4) It is possible to have two liquids of different density that will mix. (5) It is possible to have a filter, colander, or other separator, by means of which the lighter liquid mixed with the heavier may be separated again therefrom.

Construction.—These things being presupposed (says Bernoulli), I thus construct a perpetual motion. Let there be taken in any (if you please, in equal) quantities two liquids of different densities mixed together (which may be had by hyp. 4), and let the ratio of their densities be first determined, and be the heavier to the lighter as G to L, then with the mixture let the vase AD be filled up to A This done let the tube EF, open at both ends, be taken of such a length that $AC:EF > 2L:G+L$; let the lower orifice F of this tube be stopped, or rather covered with the filter or other material separating the lighter liquid from the heavier (which may also be had by hyp. 5); now let the tube thus prepared be immersed to the bottom of the vessel CD; I say that the liquid will continually ascend through the orifice F of the tube and overflow by the orifice E upon the liquid below.

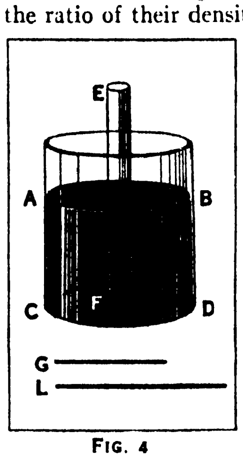

FIG. 4

Demonstration.—Because the orifice F of the tube is covered by the filter (by constr.) which separates the lighter liquid from the heavier, it follows that, if the tube be immersed to the bottom of the vessel, the lighter liquid alone which is mixed with the heavier ought to rise through the filter into the tube, and that, too, higher than the surface of the surrounding liquid (by hyp. 2), so that $AC:EF = 2L:G+L$; but since by constr. $AC:EF > 2L:G+L$ it necessarily follows (by hyp. 3) that the lighter liquid will flow over by the orifice E into the vessel below, and there will meet the heavier and be again mixed with it; and it will then penetrate the filter, again ascend the tube, and be a second time driven through the upper orifice. Thus, therefore,

will the flow be continued for ever.—Q.E.D.

Bernoulli then proceeds to apply this theory to explain the perpetual rise of water to the mountains, and its flow in rivers to the sea, which others had falsely attributed to capillary action—his idea being that it was an effect of the different densities of salt and fresh water.

One really is at a loss with Bernoulli's wonderful theory, whether to admire most the conscientious statement of the hypothesis, the prim logic of the demonstration, so carefully cut according to the pattern of the ancients, or the weighty superstructure built on so frail a foundation. Most of our perpetual motions were clearly the result of too little learning; surely this one was the product of too much. (G. Cl.)

The foregoing article by the distinguished mathematician George Chrystal, who died in 1911, is devoted to a delusion which is still distressingly prevalent. A certain number of weak heads genuinely succeed in deceiving themselves with the old fallacies, and often spend money which they can ill afford in taking out patents for patent absurdities. No man of science who has any susceptibilities can receive their communications without a certain compassion. On the other hand we have the conscious charlatans, who prey upon a class of people, by no means extinct, which possesses great cupidity, some money, a dangerous smattering of science and no sense. The form under which the perpetual motion is presented for the benefit of the credulous and affluent has been modified of recent years, to keep pace with the march of science. Whereas formerly the perpetual motion engine was usually a mechanical arrangement of weights, wheels and water-buckets, or such like, which did work without a supply of energy, to-day the form under which the invention is presented is usually an electrical one. Frequently the vendor or inventor makes no claim to create energy out of nothing, a point to which he directs special attention, admitting that this is known to be impossible by such shrewd and learned men as the prospective purchaser of shares, but states that his machine takes in a certain amount of electrical energy and turns out a greater amount of energy—a steady supply of 20 kilowatts is turned into an output of 37·5 kilowatts, say. The popular confusion between work and power, and between volts and amperes and electrical energy renders it easy to delude the self-satisfied victim, and the plausible denial of any creation of something out of nothing makes the creation of much out of little seem comparatively reasonable.

The latest scientific invention is often made the basis of a perpetual motion claim, in more or less good faith. For instance, shortly after the liquid air machine became a commercial success, claims are put forward—not by the inventor of the machine, of course—that part of the air liquefied by such a machine could be made to furnish a source of motive power which would run the machine itself, so that a continuous and increasing supply of liquid air could be produced without input of energy, once the machine was started.

The kind of perpetual motion which has been considered in Professor Chrystal's article is against all the ordered experience which is embodied in the first law of thermodynamics. This law states the equivalence of heat and work as alternative forms of energy, and denies that energy can be created. There is, however, nothing in the first law of thermodynamics against the following line of argument: Heat is equivalent to work. It is possible to build machines which turn heat into work. Therefore it must be possible to build a machine which will take heat from some ordinary body at atmospheric temperature, say a pond, and turn it into work. The pond will, of course, grow colder, but this need not disturb us, as for a very slight cooling we should obtain a large amount of work. For instance, a pond 200 yards across and of an average depth of 6 feet, cooling 1° centigrade, would yield 75,000 horse-power-hours if the heat lost could all be turned into work. It is usual to speak of a machine which could convert the heat of surrounding bodies into work as effecting a *perpetual motion of the second kind,* perpetual motion of the first kind being that which creates energy out of nothing. A perpetual motion of the second kind involves no creation of energy, but a conversion of energy under certain conditions.

The second law of thermodynamics (*see* Thermodynamics), which, like the first law, is an embodiment of the physical experience of generations of experimenters and observers of the first rank, denies that it is possible to derive mechanical energy from bodies by cooling them below the temperature of the surrounding object, that is, it denies precisely that a perpetual motion of the second kind is possible. For us to be able to convert heat into work we must have a source of heat above the temperature of the surrounding bodies, or, in the language of the engineer, we must have both a boiler and a condenser (although, of course, we need not actually build the condenser, but can use the surrounding air as condenser if for any reasons, such as exist in the case of the locomotive, a condenser is impracticable). The bigger the difference of temperature between the hot source of heat and the cold condenser, the bigger the fraction of the heat of the source which we can turn into work: when the temperature difference is zero we can turn none of the heat into work.

The impossibility of a perpetual motion, either of the first or of the second kind, is implicit, then, in the two great laws of Thermodynamics, which express our knowledge of the behaviour of matter in such quantities as are handled in ordinary mechanical and chemical processes. They are statistical laws, and do not apply to individual molecules, or to small collections of molecules, but to matter as we deal with it in engineering, where the smallest particle considered consists of millions of millions of millions of molecules! When we come down to microscopic and ultra-microscopic particles perpetual motion is possible, as exemplified by the ceaseless movement of tiny particles held in suspension in a fluid at a uniform temperature. (*See* Brownian Movement.) Such movement of microscopic particles, however, does not enable us to derive useful work from the heat agitation of the liquid, that is, from the perpetual motion of the molecules themselves. It does not contradict, but supplements our knowledge of the behaviour of matter in bulk, which tells us that perpetual motion is a mechanical impossibility. (E. N. da C. A.)

PERPETUAL PENSIONS: *see* Pensions: Perpetual or Hereditary.

PERPETUITY, in law the tying-up of an estate for a lengthened period for the purpose of preventing or restricting alienation. As being opposed to the interest of the State and individual effort, the creation of interests indefinite in time has been considerably curtailed, and the rule against perpetuities in Great Britain now forbids the making of an executory interest unless beginning within the period of any fixed number of existing lives and an additional period of 21 years (with a few months added, if necessary, for the period of gestation). The rule applies to dispositions of personal property (*see* Accumulations) as well as of real property. Section 163 of the Law of Property Act, 1925, enacts in effect that a remainder to children at an age in excess of 21 years is to be read as at 21 years, thereby making the remainder legal instead of void (*see* also ss. 164–166 of the Law of Property Act, 1925). There are certain exceptions to the rule, as in the case of limitations in mortmain and to charitable uses, and of a perpetuity created by act of parliament. In the United States the English common-law rule against perpetuities obtains in many of the States; in others it has been replaced or reinforced by statutory rules. (*See* Gray on *Alienation.*) The general tendency of American legislation is to favour tying up estates to a greater extent than was formerly approved.

PERPIGNAN, a town of France, capital of the department of Pyrénées-Orientales, on the Têt, 7 m. from the Mediterranean and 42 m. S. by W. of Narbonne by rail. Pop. (1926) 57,370. Perpignan dates at least from the 10th century. In the 11th and 12th centuries it was a capital of the counts of Roussillon, from whom it passed in 1172 to the kings of Aragon. In the 13th century it belonged to the kingdom of Majorca, and its sovereigns resided there until, in 1344, that small state reverted to the kings of Aragon, who in 1349 founded a university at Perpignan. When Louis XI. occupied Roussillon as security for money advanced by him to the king of Aragon, Perpignan resisted the French arms and yielded only in 1475. Roussillon was restored to Aragon by Charles VIII. and Perpignan was again unsuccessfully besieged

in 1542 under Francis I. Later on, however, the inhabitants, angered by the Spanish governor, surrendered the town to Louis XIII. The citadel held out until 1642, and the place was formally ceded to France by the treaty of the Pyrenees (1659). In 1602 the bishopric of Elne was transferred to Perpignan.

On the south the town is overlooked by a citadel enclosing a castle (13th century) of the kings of Majorca. The chapel is a mixture of the Romanesque, Pointed and Moorish styles. The ramparts surrounding the citadel are the work of Louis XI., Charles V. and Vauban. The cathedral of St. Jean (14th to 16th centuries) has a remarkable 17th century reredos.

Commanding the gateway of Notre-Dame (1481) is a curious machicolated stronghold of the 14th and 15th centuries.

Perpignan has tribunals of first instance and of commerce, a chamber of commerce and a board of trade-arbitrators. The higher tribunal of Andorra sits at Perpignan. Trade is in wine, iron, wool, oil and corks.

PERQUISITE, a term properly used of the profits which accrue to the holder of an office over and above the regular emoluments; also, in law, the casual profits, such as accrue by heriots, fines, reliefs, etc., to a lord of a manor above the yearly revenue from the copyholds. The word is used generally of the casual profits allowed by custom to servants or other employees.

PERRAULT, CHARLES (1628–1703), French author, was born in Paris on Jan. 12, 1628. His father, Pierre Perrault, was a barrister, whose four sons were all men of some distinction: Claude (1613–1688) was a physician and architect, and translated Vitruvius (1673). Charles was brought up at the Collège de Beauvais, and after quarrelling with his masters followed his own bent. He took his degree of *licencié en droit* at Orleans in 1651, and was called to the Paris bar, where he practised for a short time. In 1654 his brother became receiver-general of Paris, and made Charles his clerk. About ten years later he became Colbert's secretary. He was controller-general of the department of public works, member of the commission that afterwards developed into the *Académie des inscriptions,* and in 1671 he was admitted to the *Académie française.*

Colbert's death in 1683 put an end to Perrault's official career, and he then gave himself up to literature, beginning with *Saint Paulin évêque de Nole, avec une épître chrétienne sur la pénitence, et une ode aux nouveaux convertis.* The dispute of the ancients and moderns arose from a poem on the *Siècle de Louis le Grand* (1687), read before the Academy by Perrault, on which Boileau commented in violent terms. Perrault had a will of his own, and he published (4 vols., 1688–1696) his *Parallèle des anciens et des modernes.* The controversy that followed raged hotly both in France and England.

The first of Perrault's famous contes, *Grisélidis,* in verse, appeared in 1691, and was reprinted with *Peau d'âne* and *Les Souhaits ridicules,* also in verse, in a *Recueil de pièces curieuses* (The Hague, 1694). But Perrault was no poet, and the merit of these pieces is entirely obscured by that of the prose tales, *La Belle au bois dormant, Petit chaperon rouge, La Barbe bleue, Le Chat botté, Les Fées, Cendrillon, Riquet à la houppe* and *Le Petit poucet,* which appeared with the title of *Histoires ou contes du temps passé avec des moralités* (*c.* 1697). The frontispiece contained a placard with the inscription, *Contes de ma mère l'oie.* Perrault's other works include his *Mémoires,* giving much information on Colbert's ministry; an *Enéide travestie* written in collaboration with his two brothers, and *Les Hommes illustres qui ont paru en France pendant ce siècle* (2 vols., 1696–1700). He died on May 16, 1703, in Paris. His son, Perrault d'Arma-Court, was the author of *Contes des fées,* containing the story of Cinderella, etc.

Except the tales, Perrault's works have not recently been reprinted. Of these there are many modern editions, *e.g.,* by Paul Lacroix (1876), and by A. Lefèbvre ("Nouvelle collection Jannet," 1875); also *Perrault's Popular Tales* (Oxford, 1888), which contains the French text edited by Andrew Lang, with an introduction, and an examination of the sources of each story. *See* also Hippolyte Rigault, *Hist. de la querelle des anciens et des modernes* (1856).

PERRERS (or De Windsor), **ALICE** (d. 1400), mistress of the English king Edward III., belonged probably to the Hertfordshire family of Perrers, although it is also stated that she was of humbler birth. She entered the service of Edward's queen, Philippa, before 1366, and was married to Sir William de Windsor, deputy of Ireland (d. 1384). Her intimacy with the king began about 1366. Alice was accused of interfering in the courts of law to secure sentences in favour of her friends, and the parliament of 1376 forbade all women from practising in the law courts. Alice was banished, but John of Gaunt allowed her to return to court in June 1376, and the parliament of 1377 reversed the sentence against her. She was again banished in June 1377; but this sentence was annulled two years later, and Alice regained some influence at court.

PERROT, SIR JOHN (*c.* 1527–1592), lord deputy of Ireland, the son of Mary Berkley (afterwards wife of Thomas Perrot) was generally reputed to be a son of Henry VIII., and was attached to the household of William Paulet, 1st marquess of Winchester. Perrot was knighted at the coronation of Edward VI. and though imprisoned during Mary's reign on the charge of harbouring heretics, he received the castle and lordship of Carew in Pembrokeshire, and at the beginning of Elizabeth's reign was entrusted with the naval defence of South Wales. In 1570 Perrot became lord president of Munster, in which capacity he hunted down James Fitzmaurice Fitzgerald, whose submission he received in 1572. Perrot resented the reinstatement of Gerald Fitzgerald, 15th earl of Desmond, and after vainly seeking his own recall left Ireland without leave in July 1573, and presenting himself at court was allowed to resign his office, in which he was succeeded by Sir William Drury. He returned to his Welsh home, where he was occupied with his duties as vice-admiral of the Welsh seas.

In 1584 Perrot succeeded Arthur Grey, Lord Grey de Wilton, as lord deputy of Ireland, and was instructed to divide the confiscated estates of the earl of Desmond among English landlords who were to supply English labour. But his plans were disturbed by the raids of the Macleans and the MacDonnells, invited to Ulster by Sorley Boy, whom he reduced to submission in 1586. In 1585 Perrot succeeded in completing the "composition of Connaught," a scheme for a contract between Elizabeth and the landholders of the province by which the queen should receive a small quitrent. During his career as lord deputy he had established peace, and had deserved well of Elizabeth, but his indiscretions had made him numerous enemies. A plan for the conversion of the revenues of St. Patrick's Cathedral, Dublin, to provide funds for the erection of two colleges, led to a quarrel with Adam Loftus, archbishop of Armagh, and in Jan. 1588 he returned to London in disgrace. After his return a forged letter purporting to be from him to Philip II. of Spain gave colour to a charge of treason. He was found guilty, but died in the Tower in September 1592.

A life of Sir John Perrot from a MS. dating from the end of Elizabeth's reign was printed in 1728. Sir James Perrot (1571–1637), writer and politician, was his illegitimate son.

PERRY, BLISS (1860–), American author, was born at Williamstown (Mass.), on Nov. 25, 1860. He graduated from Williams college in 1881 (A.M., 1883), continuing his studies at the universities of Berlin and Strasbourg. He was professor of English at Williams college, 1886–93, and professor of oratory and aesthetic criticism at Princeton university, 1893–1900. In 1907 he became professor of English literature at Harvard university, and was Harvard lecturer at the University of Paris, 1909–10. He was the editor of the *Atlantic Monthly* for the decade beginning 1899. Although he has written some fiction, he is chiefly known as an essayist and critic.

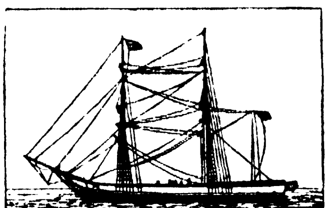
PERRY, MATTHEW CALBRAITH (1794–1858), American naval officer, was born in South Kingston, R.I., April 10, 1794. He became a midshipman in 1809, and served during the War of 1812, and in 1813 was made lieutenant. In 1826 he became a commander, and during 1826–30 was in the recruiting service at Boston, where he took a leading part in organizing the first naval apprentice system of the U.S. navy. He was promoted in 1837 to the rank of captain (then the highest actual rank in the U.S. navy), and in 1838–40 commanded the "Fulton II.," the first American steam war vessel. In 1843, with the honorary rank of commodore, he assumed command of a squadron sent to the African coast by the United States, under the Webster-Ash-

burton treaty, to aid in suppressing the slave trade. On Oct. 23–24, 1846, during the Mexican War, Perry, in command of six vessels, attacked and captured Frontera and Tobasco, thereby cutting off Mexico from Yucatan. He relieved Commodore David Conner at Vera Cruz on March 21, 1847, and after a two days' bombardment the city wall was breached sufficiently to admit the entrance of troops.

Perry's distinctive achievement was his negotiation of the treaty between the United States and Japan. On July 14, 1853, accompanied by his officers and by armed marines and sailors (in all about 300 men), he went ashore and presented to commissioners especially appointed by the *shōgun* to receive them, President Fillmore's letters to the emperor, and his own credentials. A few days later the American fleet sailed for Hong-Kong with the understanding that Perry would return in the following spring to receive the emperor's reply. Accordingly, on Feb. 11, 1854, he reappeared in the Bay of Yedo with his fleet of six vessels, and despite the protests of the Japanese selected an anchorage about 12m. farther up the bay, nearly opposite the present site of Yokohama, and within about 10m. of Yedo (Tōkyō). Here, on March 31, 1854, was concluded the first treaty (ratified at Simoda on Feb. 21, 1855, and proclaimed on June 22 following) between the United States and Japan. The more important articles of this treaty provided that the ports of Simoda and Hakodate were constituted as ports for the reception of American ships, where they could buy such supplies as they needed; that Japanese vessels should assist American vessels driven ashore on the coasts of Japan, and that the crews of such vessels should be properly cared for at one of the two treaty ports; that shipwrecked and other American citizens in Japan should be as free as in other countries, within certain prescribed limits; that ships of the United States should be permitted to trade at the two treaty ports under temporary regulations prescribed by the Japanese, and that privileges granted to other nations thereafter must also be extended to the United States. Commodore Perry died in New York city on March 4, 1858.

See the official record, *Narrative of the Expedition of an American Squadron to the China Seas and Japan* (1856). The first volume of this work, containing Commodore Perry's narrative, was also published separately. A brief biography of Perry is included in Charles Morris's *Heroes of the Navy in America* (Philadelphia, 1907). *See* also William E. Griffis's *Matthew Calbraith Perry, a Typical American Naval Officer* (Boston, 1887).

PERRY, OLIVER HAZARD (1785–1819), American naval officer, was born at South Kingston, R.I., on Aug. 23, 1785. He entered the navy as midshipman (1799) with his father, Christopher Raymond Perry (1761–1818), a captain in the navy, and saw service against the Barbary pirates. At the beginning of the War of 1812 he was in command of a flotilla at Newport, but was transferred (Feb. 1813) to the Lakes. He served with Commodore Chauncey, and then was sent from Lake Ontario to Lake Erie, where he took up the chief command at the end of March 1813. With the help of a strong detachment of officers and men from the Atlantic coast he equipped a squadron consisting of one brig, six fine schooners and one sloop, with which superior force he completely defeated the British squadron under Captain Barclay off Amherstburg. Perry commanded the "Java" in the Mediterranean expedition of 1815–16. He died of yellow fever at Port of Spain in Trinidad on Aug. 23, 1819.



BY COURTESY OF THE ERIE (N.Y.) CHAMBER OF COMMERCE
PERRY'S FLAGSHIP "THE NIAGARA"

See O. H. Lyman, *Commodore O. H. Perry and the War on the Lakes* (1905); James Cooke Mills, *Oliver Hazard Perry and the Battle of Lake Erie* (1913); and Charles Oscar Paullin (Ed.), *The Battle of Lake Erie* (1918).

PERRY, STEPHEN JOSEPH (1833–89), English astronomer, was born in London, Aug 26, 1833. He was educated as a priest but his mathematical interests led him into astronomy and in 1868 he assumed charge of the Stonyhurst College observatory. Perry devoted his energies chiefly to solar physics, discovered the phenomenon known as "veiled spots" and was a pioneer in photographing the spectra of sunspots. He journeyed to many parts of the world to observe transits of Venus and total eclipses of the sun. While off the coast of French Guiana on the latter errand he died, Dec. 27, 1889.

See A. L. Cortie, *Father Perry, the Jesuit Astronomer* (1890).

PERRY, a city of Dallas county, Iowa, U.S.A., 40 m. N.W. of Des Moines, on the Raccoon river; served by the Chicago, Milwaukee, St. Paul and Pacific, the Minneapolis and St. Louis, and electric railways. Pop. (1925 state census) 5,778. It has large railroad shops, packing plants, canneries and milk-condensing plants, and there are extensive nurseries in the vicinity.

PERRY, a village of Wyoming county, New York, U.S.A., on Silver lake, 35 m. S.W. of Rochester; served by the Buffalo, Rochester and Pittsburgh railway. Pop. (1925) 4,636 (State census). It has large knitting mills, a condensed-milk plant and other manufacturing industries. Silver lake is a summer resort. The village was founded about 1814 and was incorporated in 1830.

PERRY, an alcoholic beverage made from pears. Made by the vinous fermentation of pear juice, perry is a product bearing the same relation to the pear as cider (*q.v.*) to the apple. As in the latter case, special varieties of the fruit possessing vintage qualities which render them unsuitable for edible purposes are required for the preparation of a beverage of prime quality.

The districts noted for the making of perry are less numerous and extensive than those associated with cider production, and are in general specialized centres in the latter areas. Parts of Brittany and Normandy in France and the counties of Gloucester, Hereford and Worcester in England are the best known sources of the beverage. The acreage under perry pear trees is much less than that devoted to the culture of cider fruit and the total output of perry is insignificant in comparison with that of cider.

The varieties of perry pears do not fall into a natural classification according to chemical composition as in the case of cider apples. The following English varieties are most generally favoured: Aylton Red, Barland, Blakeney Red, Butt, Huffcap, Longland, Moorcroft, Oldfield, Taynton Squash, and Rock.

Most kinds of perry pears yield juices of a medium degree of acidity and a more or less marked astringency. The chief problem of perry making is the tendency of the beverage to develop a milky turbidity after the final clarification. (B. T. P. B.)

PERRYVILLE, a town of Boyle county, Ky., U.S.A., about 10 m. W. of Danville. Pop. (1920) 631. Here on Oct. 8, 1863 Gen. Braxton Bragg, in command of the Confederate army of the Mississippi of about 16,000 men, with which he had invaded Kentucky, faced about in his slow retreat across the State and gave battle to the Union army of the Ohio of about 40,000 (of whom only about 22,000 were actually engaged) commanded by Major-Gen. Don Carlos Buell. Bragg's order to attack was disregarded by Major-Gen. Leonidas Polk, who preferred adopting the "defensive-offensive" rather than engage the whole of Buell's force. At length after much delay on Polk's part the Confederate army joined battle with McCook's corps. The Confederate lines were broken and driven back through Perryville, where caissons, ammunition wagons and 140 officers and men were captured. Darkness had now come on, and in the night Bragg withdrew. His losses were reported as 510 killed, 2,635 wounded and 251 missing. The Union loss was 845 killed, 2,851 wounded and 515 captured or missing. The battle was drawn tactically, but strategically it was a Union victory and it virtually closed Bragg's Kentucky campaign, sometimes called the Perryville campaign.

PERSEPHONE was the daughter of Zeus and Demeter. In cult and in mythology Demeter and Persephone were closely associated, being known together as the two goddesses, the venerable or august goddesses, sometimes as the great goddesses. The latter is often called *Korē* ("the Maiden"); whether this results from the identification of two different goddesses, or not, is uncertain. She is the consort of Hades (*see* PLUTO), who carried her off as she was gathering flowers.

Demeter sought her in vain; in her sorrow, she caused a famine, and men would have died of hunger if Zeus had not

persuaded Hades to let Persephone go. But she had eaten, in the underworld, the seed of a pomegranate, and thus she could not stay away from him for ever. So it was arranged that she should spend two-thirds (according to later authors, one-half) of every year with her mother and the heavenly gods, and should pass the rest of the year with Hades beneath the earth. There can be little doubt that this is a mythological expression for the growth of vegetation in spring and its disappearance in autumn. As wife of Hades Persephone sent spectres, ruled the ghosts, and carried into effect the curses of men. From the head of a dying person she, or *Thanatos* (Death), was supposed to cut a lock of hair which had been kept sacred and unshorn through life (Virgil, *Aen.*, iv. 698 et seq., Eurip. *Alc.*, 74–76).

On the other hand, in her character of goddess of spring Persephone was honoured with flower-festivals in Sicily and at Hipponium in Italy. Sicily was a favourite haunt of the two goddesses, and ancient tradition affirmed that the whole island was sacred to them. The Sicilians claimed to be the first on whom Demeter had bestowed the gift of grain, and hence they honoured the two goddesses with many festivals. They celebrated the festival of Demeter when the grain began to shoot, and the descent of Persephone when it was ripe. Demeter and Persephone were worshipped together by the Athenians at the greater and less Eleusinian festivals, held in autumn and spring respectively (*see* MYSTERY). At Rome Persephone's name was corrupted into Proserpina (*q.v.*); she was sometimes identified with the native Latin goddess Libera. The pomegranate was Persephone's symbol, and the pigeon and cock were sacred to her. In works of art she appears with a cornucopia or with ears of wheat and a cock. As the wife of Hades she was represented with the insignia of royalty and a torch. The regular form of her name was Persephone, but various other forms occur: Phersephone, Persephassa, Phersephassa, Pherrephatta, etc.

For bibliography *see* under DEMETER.

PERSEPOLIS, an ancient city of Persia, situated some 40 m. N.E. of Shiraz, not far from where the small river Pulwar flows into the Kur (Cyrus). The site is marked by a large terrace with its east side leaning on *Kuh-i-Rahmet* ("the Mount of Grace"). The other three sides are formed by a retaining wall, varying in height with the slope of the ground from 14 to 41 ft.; on the west side a magnificent double stair, of very easy steps, leads to the top. On this terrace are the ruins of a number of colossal buildings, all constructed of dark-grey marble from the adjacent mountain. The stones were laid without mortar, and many of them are still *in situ*. Especially striking are the huge pillars, of which a number still stand erect. These ruins, for which the name "Sad-Sutun" ("the 100 columns"), can be traced back to the 4th century, are now known as *Takht-i-Jamshid* ("the throne of Jamshid"). That they represent the Persepolis captured and partly destroyed by Alexander the Great has been beyond dispute at least since the time of Pietro della Valle

Behind Takht-i-Jamshid are three sepulchres hewn out of the rock in the hillside, the façades, one of which is incomplete, being richly ornamented with reliefs. About 8 m. N.N.E., on the opposite side of the Pulwar, rises a perpendicular wall of rock, in which four similar tombs are cut, at a considerable height from the bottom of the valley. The modern Persians call this place Naksh-i-Rustum ("the picture of Rustam") from the Sassanian reliefs beneath the opening, which they take to be a representation of the mythical hero Rustam. That the occupants of these seven tombs were kings might be inferred from the sculptures, and one of those at Naksh-i-Rustam is expressly declared in its inscription to be the tomb of Darius Hystaspis, concerning whom Ctesias relates that his grave was in the face of a rock, and could only be reached by means of an apparatus of ropes. Ctesias mentions further, with regard to a number of Persian kings, either that their remains were brought "to the Persians," or that they died there. Now we know that Cyrus was buried at Pasargadae (*q.v.*) and if there is any truth in the statement that the body of Cambyses was brought home "to the Persians" his burying-place must be sought somewhere beside that of his father. In order to identify the graves of Persepolis we must bear in mind that Ctesias assumes that it was the custom for a king to prepare his own tomb during his lifetime. Hence the kings buried at Naksh-i-Rustum are probably, besides Darius, Xerxes I., Artaxerxes I. and Darius II. Xerxes II., who reigned for a very short time, could scarcely have obtained so splendid a monument, and still less could the usurper Sogdianus (Secydianus). The two completed graves behind Takht-i-Jamshid would then belong to Artaxerxes II. and Artaxerxes III. The unfinished one is perhaps that of Arses, who reigned at the longest two years, or, if not his, then that of Darius III. (Codomannus), who is one of those whose bodies are said to have been brought "to the Persians" (*see* Arian iii. 22, 1). Another small group of ruins in the same style is found at the village of Takht-i-Tā'us, on the Pulwar.

Since Cyrus was buried in Pasargadae, which moreover is mentioned in Ctesias as his own city, and since, to judge from the inscriptions, the buildings of Persepolis commenced with Darius I., it was probably under this king, with whom the sceptre passed to a new branch of the royal house, that Persepolis became the capital (*see* PERSIA: *Ancient History*) of Persia proper. As a residence, however, for the rulers of the empire, a remote place in a difficult alpine region was far from convenient, and the real capitals were Susa, Babylon and Ecbatana. This accounts for the fact that the Greeks were not acquainted with the city until it was taken and plundered by Alexander the Great. Ctesias must certainly have known of it, and it is probable that he may have named it simply Πέρσαι, after the people, as is undoubtedly done by certain writers of a somewhat later date. Sir H. Rawlinson and J. Oppert were right in assuming that the words *anā Pārsā*, "in this Persia," which occur in an inscription on the gateway built by Xerxes (D. l. 14), signify "in this *city* of Pārsā," and consequently prove that the name of the city is identical with the name of the country. The form Persepolis (with a play on πέρσις, destruction) appears first in Cleitarchus, one of the earliest annalists of the exploits of Alexander.

It has been universally admitted that "the palaces" or "the palace" (τά βασίλεια) burned down by Alexander are those now in ruins at Takht-i-Jamshid. Several of these bear evident traces of having been destroyed by fire. The locality described by Diodorus after Cleitarchus corresponds in important particulars with Takht-i-Jamshid, for example, in being supported by the mountain on the east. If Diodorus says that the rock at the back of the palace containing the royal sepulchres is so steep that the bodies could be raised to their last resting-place only by mechanical appliances, it is evident that he or his source (Cleitarchus), who can scarcely have visited the place, confounded the tombs behind the palaces with those of Naksh-i-Rustum.

In 316 B.C. Persepolis was still the capital of Persis as a province of the great Macedonian empire. The city gradually declined; but the ruins of the Achaemenidae remained as a witness to its ancient glory. It is probable that the principal town of the country, or at least of the district, was always in this neighbourhood. About A.D. 200 we find there the city Istakhr (properly *Stakhr*) as the seat of the local governors. There the foundations of the second great Persian empire were laid, and Istakhr acquired special importance as the centre of priestly wisdom and orthodoxy. The Sassanian kings have covered the face of the rocks in this neighbourhood, and in part even the Achaemenian ruins, with their sculptures and inscriptions, and must themselves have built largely here, although never on the same scale of magnificence as their ancient predecessors. The Romans knew as little about Istakhr as the Greeks had done about Persepolis, in spite of the fact that for four hundred years the Sassanians maintained relations, friendly or hostile, with the empire.

At the time of the Arabian conquest Istakhr offered a desperate resistance, but the city was still a place of considerable importance in the 1st century of Islam (*see* CALIPHATE), although its greatness was speedily eclipsed by the new metropolis Shiraz. In the 10th century Istakhr had become an utterly insignificant place, as may be seen from the descriptions of Istakhr, a native (*c.* 950), and of Mukaddasi (*c.* 985). During the following centuries Istakhr gradually declines, until, as a *city*, it ceased to

exist. This fruitful region, however, was covered with villages till the frightful devastations of the 18th century; and even now it is, comparatively speaking, well cultivated. The "castle of Istakhr" played a conspicuous part several times during the Mohammedan period as a strong fortress. It was the middlemost and the highest of the three steep crags which rise from the valley of the Kur, at some distance W. or N.W. of Naksh-i-Rustum.

PERSEUS, in Greek legend, son of Danaë and Zeus. When Perseus was grown to manhood Polydectes, king of Seriphus, cast his eye on Danaë, and, in order to rid himself of the son, exacted of him a promise that he would bring him the head of the Gorgon Medusa. The Gorgons (*q.v*) dwelt with their sisters the Graeae in the west. Guided by Hermes and Athena, Perseus came to the Graeae. They were three hags, with but one eye and one tooth between them. Perseus stole the eye and the tooth, and would not restore them till the Graeae had guided him to the Nymphs, from whom he received the winged sandals, a wallet (κίβισις, resembling a gamekeeper's bag) and the helmet of Hades, which rendered him invisible. Thus equipped and armed by Hermes with a curved sword (*harpe*), he came upon the Gorgons as they slept, and cut off Medusa's head, while with averted eyes he looked at her reflection which Athena showed him in the mirror of her shield. Perseus put the Gorgon's head in his wallet, and fled, pursued by Medusa's sisters, to Ethiopia, where he delivered Andromeda (*q v.*) from a sea-monster and afterwards married her With her he returned to Seriphus in time to rescue his mother from Polydectes, whom with all his court he turned to stone by showing them the Gorgon's head. Perseus then gave the head of Medusa to Athena, and, with Danaë and Andromeda, hastened to Argos to see his grandfather, Acrisius, once more But before his arrival Acrisius, fearing the oracle, had fled to Larissa in Thessaly. Thither Perseus followed him, and unwittingly slew his grandfather by the throw of a discus. Ashamed to return to Argos, Perseus gave his kingdom to Megapenthes (Acrisius's nephew) and received from him Tiryns in exchange. There he reigned and founded Mideia and Mycenae and became the ancestor of the Persides, amongst whom were Eurystheus and Heracles.

See E. S Hartland, *The Legend of Perseus* (1894–96).

PERSEUS, in astronomy, a constellation of the northern hemisphere, called after the Greek legendary hero. It contains a double cluster forming an interesting object for low-power telescopes. The second brightest star in the constellation is the famous eclipsing variable ALGOL (*q v*).

PERSEUS OF MACEDONIA (b. *c.* 212 B.C), the last king of Macedonia, eldest son of Philip V. He had his brother Demetrius killed, and thus cleared his way to the throne in 179. War broke out with Rome in 171 B.C. when P. Licinius Crassus was sent to attack him. Perseus defeated Crassus at Callinicus in Thessaly, but in 168 he was annihilated at Pydna by L. Aemilius Paulus. He died in captivity at Alba Fucens. (*See* MACEDONIA.)

PERSHING, JOHN JOSEPH (1860–), American soldier, was born near Laclede, Mo., on Sept 13, 1860—destined to as astonishing a rise from humble circumstances as Joffre, the first commander-in-chief in the World War of the other great republic. By teaching in a children's school he gained the means to study at the Kirksville, Mo., normal school and then seized the chance to compete for entry into the U.S. Military Academy, proving successful. Passing out in 1886, he was commissioned in the 6th Cavalry and saw immediate service against the Apaches in Arizona. In 1890, during an uprising of the Sioux, he served in Dakota, in charge of the Indian scouts. In 1891 he was appointed military instructor at the University of Nebraska, where he took the opportunity to graduate in the law school After being instructor in tactics at the U.S Military Academy, he served in Cuba through the Santiago campaign (1898), where he earned from his commander the tribute, "Pershing is the coolest man under fire I ever saw." Soon afterwards he had the chance to show that he was more than merely brave and energetic, for, sent to the Philippines, he pacified by 1903 the fanatical Moros of Mindanao through an apt blend of force and diplomacy. In 1905 he went to Japan as military attaché and witnessed part of the campaign in Manchuria. As a reward for his success in the Philippines, President Roosevelt in 1906 promoted him direct from captain to brigadier general, passing him over 862 senior officers Subsequently, he returned to the Philippines as commander of the department of Mindanao and governor of the Moro Province Returning in 1913, he was sent from San Francisco in 1916 to command the punitive expedition into Mexico against Francisco Villa, and after the death of Maj. Gen Funston in 1917 he succeeded him as commander on the Mexican border

On America's entrance into the World War Pershing was chosen to command the American Expeditionary Force in Europe, an honour gained perhaps not only by his record of achievement but also by his proofs in Mexico of extreme loyalty to Government authority under hampering circumstances With his staff he reached England on June 9, 1917, and four days later landed in France. To pass from guerilla expeditions in jungle, mountain and desert to the vast siege then in progress—or stagnation—on the western front was an extreme test, but in compensation for a military experience limited to petty expeditions he brought a trained administrative sense, with the will and knack of carrying through plans under difficulties. From the start Gen Pershing insisted that the integrity of the American army be preserved, making a firm stand against French tutelage and against the French desire to infuse the new blood of America's man-power into their own military system. And while the Washington war department was contemplating a limited liability war, Pershing in France was methodically laying the foundation for an army of 3,000,000 men—stamped with the Pershing seal If this plan, inevitably slow in fruition, imposed a severe strain on the exhausted Allies, it was justified not only by the proverbial warning against "putting new wine into old bottles"; for the alternative would have demanded an unprecedented sacrifice of national prestige If the realization of an independent American army would be, as Pershing felt, a serious blow to German morale, it was also likely to uplift the military spirit and self-confidence of the United States not only for the moment but for all time.

The disasters of early 1918 seemed to show that a great risk had been taken in pursuit of this ideal, and they led Pershing to place all his resources freely at Foch's disposal But directly the crisis began to pass he reverted to his policy, and at St. Mihiel in September it was consummated by the victory of the first American army in the first entirely American operation. This was followed by the Meuse-Argonne battle (*q v.; see* also WORLD WAR) under Pershing's direction. If the attainment of its aims was slower and more costly than had been expected, Pershing had accepted the actual battle-ground in deference to his allies and against his own preference for a blow towards Metz. Even so, it is probable that he underrated the difficulties of breaking through a strongly organized trench system, as well as the causes that had sapped the offensive spirit of the French. He had a Grant-like ruthlessness, similarly lacking the personal magnetism which leads men to lay down their lives gladly, but he had the character which compels men not only to die but to work, grumbling perhaps but respecting him.

It was a just recognition of his achievement in creating almost

from nothing the vast structure of the national army that, on Sept. 1, 1919, he was confirmed in the permanent rank of general, a grade held previously by only four Americans—Washington, Grant, Sherman and Sheridan. In 1921 he was appointed chief-of-staff, and during his tenure of office he designed the new permanent framework of the United States army. Subsequently, appointed by President Coolidge as the United States representative and *ex-officio* head of the commission to supervise the plebiscite under the Tacna-Arica arbitration award, he went to Arica in July, 1925, but, owing to health, had to resign. He returned home in Feb. 1926. (*See* TACNA-ARICA QUESTION.) (B. H. L. H.)

PERSHORE, market town, Evesham parliamentary division, Worcestershire, England, 113 m. N.W. of London and 8 m. S.E. of Worcester on the G.W. railway. Pop. (1921) 4,035. Market gardening and fruit-growing (especially plums) are carried on and agricultural implements are manufactured. The churches of Holy Cross and St. Andrew face one another across a road, the former being a mitred Benedictine abbey.

PERSIA, a kingdom of western Asia, bounded on the north by the Caspian sea and the Transcaucasian and Transcaspian territories of Russia; on the east by Turkistan, Afghanistan and Baluchistan; on the south by the Persian gulf, and the Oman gulf of the Arabian sea, and on the west by Turkey in Asia and the new State of Iraq.

Frontiers.—The frontier from Mt. Ararat to Astara on the Caspian sea is that laid down in the treaty of Turmanchai (Feb. 22, 1828) and further defined in a Convention of July 8, 1893. The boundary between Russia and Persia starts from the slopes of Mt. Ararat (Aghri Dagh) and runs north-east to the Aras river, which it follows to lat. 48° E. It then runs for about 35 m. south-east through the Mughan steppes to Pilsowar on the Bulgharu river and then south with a bend to the west, to the Astara river and port, whence it follows the shore of the Caspian until it touches the bay of Hasan Quli, north of Astarabad. East of the Caspian and beginning at Hasan Quli Bay the river Atrek serves as the frontier as far as Chat. It then extends east and south-east to Sarakhs on the Tején river. The frontier east of the Caspian was defined by the Akhal-Khurasan Boundary Convention of Dec. 21, 1881, and the Frontier Convention of July 8, 1893, which separates Persia from Afghanistan and British India.

The eastern frontier extends from Sarakhs on the north to a point on the coast of the Gulf of Oman near Gwattar, a distance of some 800 m. first following the river Tejen, or Hari Rud, to a point near Kuhsan, thence almost due south to the border of Seistan in Lat. 31 N. It then follows the line fixed by Sir F. Goldsmid in 1872 and by Sir A. H. MacMahon in 1903–05 to Kuh-i-Malik Siah. From this point to the sea the frontier separates Persian territory from British Baluchistan and runs south-east to Kuhak and then south-west to Gwattar. This last section was determined by Sir F. Goldsmid's Commission in 1871.

The south boundary is the coast line from the mouth of the Shatt-el-Arab to the vicinity of Gwattar, a distance of some 870 m. The islands in the Persian Gulf nearest to the Persian shore are Persian territory; they are, from east to west, Hormuz, Larak, Qishm, Henjam, Farur, Qais, Hinderabi, Shaikh Shu'aib Kharag and Kharagu.

Southwards from Mt. Ararat the frontier dividing Persia first from Turkey later from Iraq, extends for about 700 m. until it cuts the left bank of the river Shatt-el-Arab about 12 m. above Mohammerah, whence it follows the high-water mark line of the river to its mouth at Qasbah opposite Fao, leaving the fairway channel in Turkish, now Iraq, territory. This is the line referred to in the Treaty of Erzeroum of 1847, as finally demarcated in 1914 by Perso-Turkish Commissioners, assisted by British and Russian Commissioners with arbitral powers, appointed in virtue of a special agreement concluded in 1913 between Persian and Turkish plenipotentiaries at Constantinople. (P. Z. C.)

GEOLOGY

Persia lies within the great Alpine-Himalayan fold system, forming the connecting link between the Taurus structures and those of Afghanistan and Baluchistan. It may be divided into three major zones:—

1. The Elburz (Elbrus) mountains—folded mountains with a thick sedimentary series showing movement towards the north. Large volcanoes are situated in these ranges.
2. Central Persia—a high plateau region but with large depressions; old crystalline rocks, early Palaeozoics and Mesozoics poorly developed. Volcanoes active throughout the Tertiary.
3. The Zagros system—the mountain belt of S.W. and S. Persia, strongly folded and overthrust structures, the movement having been directed against the Arabian foreland. Some Palaeozoic rocks, thick Cretaceous and Tertiary series.

Geological History.—Nothing is known of the pre-Palaeozoic history of Persia. Ancient crystalline rocks, granite, gneiss and schists have been described from many localities, but they may represent in part metamorphosed Palaeozoic sediments.

The oldest marine rocks of Persia are of Cambrian age (probably Middle). A shallow sea seems to have transgressed over an old levelled surface in Central Persia and in the Gulf region. Near Kerman and at Narghun, 65 miles S.W. of Isfahan, a thin series of trilobite limestones, shales and sandstones has been found. Farther south the Middle Cambrian is developed in a lagoonal facies. Fossiliferous limestones and dolomites, together with sandstones with "salt pseudomorphs," shales and gypsum, have been carried up by intrusive salt masses. The salt is probably also of Cambrian age. The fossils include trilobites with *Ptychoparia* affinities in igneous intrusive rocks of post Cambrian and pre Cenomanian age are present.

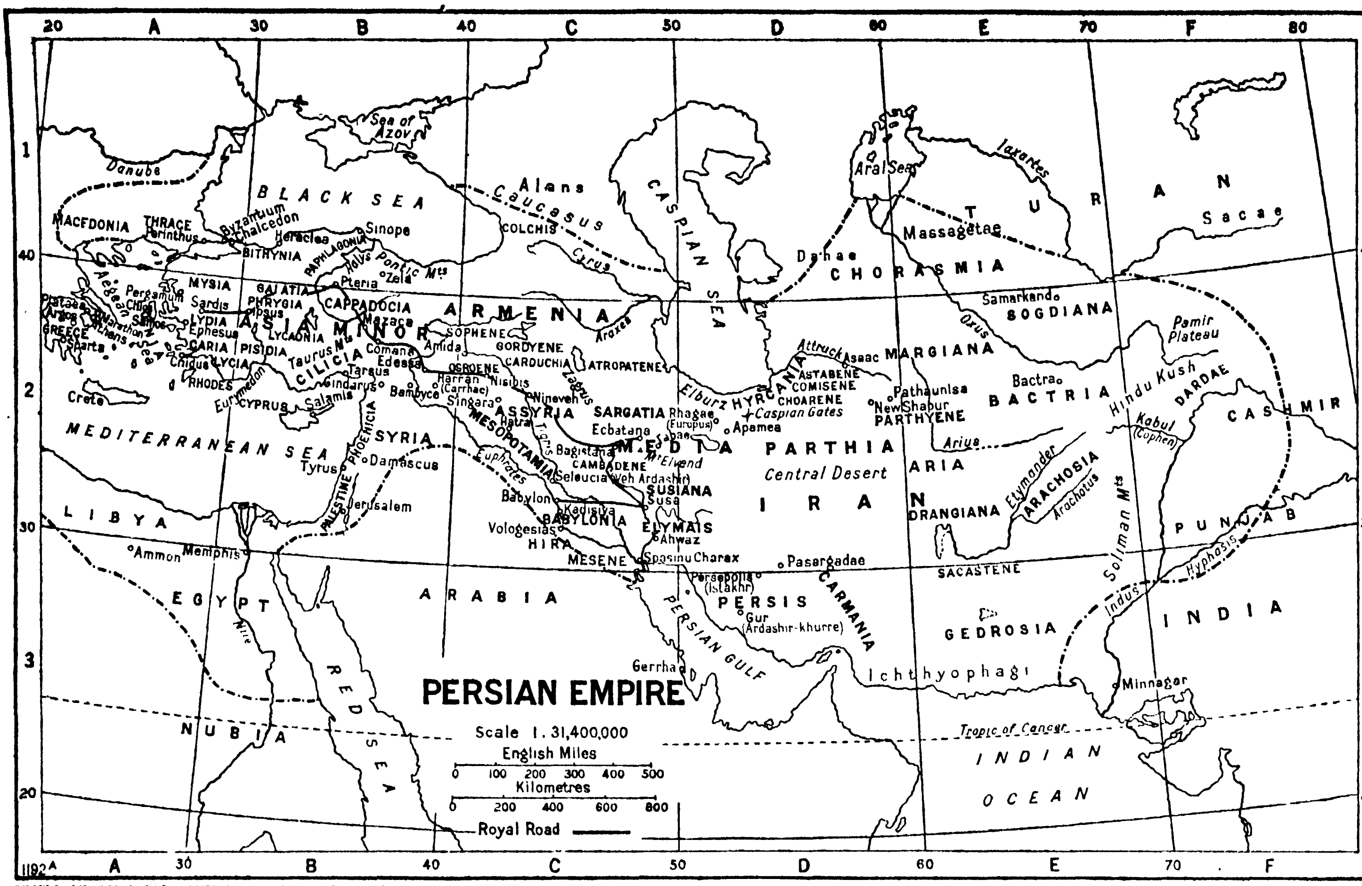
Ordovician and Silurian rocks are unknown in Persia, the next marine transgression being of Middle Devonian age. In the Araxes Valley, the Middle Devonian is represented by grey argillaceous limestone containing *Calceola sandalina* (L.), etc., the Upper by reddish limestones with *Spirifer verneuili* Murch. On the south flank of the Elburz mountains, the Devonian is developed in an Old Red Sandstone facies. Middle Devonian limestones are known near Isfahan. At Narghun a limestone of either Devonian or Lower Carboniferous age is separated from the Cambrian by only 100 ft. of white and pink spotted sandstones. No angular unconformity has been observed.

Carboniferous limestones extend in North Persia from the Araxes valley through the Elburz mountains. Along the Elwand range there is a great development of phyllites or grauwackes. An interbedded limestone has yielded an *Orionastraea* type of coral, probably Lower Carboniferous. Permo-Carboniferous limestones with a Punjabian fauna occur at Julfa and in Luristan, in the Kalian Kuh and Kuh-i-Kellar.

The Upper Permian and the Trias are unknown in Persia. A thick series of plant beds perhaps of Rhaetic age is present in the Elburz, followed by marine Lias and Bajocian. East of Lake Urmia, Upper Lias, Callovian and Lower Kimmeridgian fossils have been found. The Upper Jurassic is well developed in north Persia, extending from Armenia eastward to the Hindu Kush. In Central Persia, Lias plant-bearing shales are coal-bearing at several places along the line Hamadan, Isfahan, Kerman. Upper Lias is marine in the Grestener facies. No Jurassic fossils have been found in the Zagros, but a series of red and green radiolarian cherts, associated with basic intrusive and extrusive rocks may be of Upper Jurassic or Lower Cretaceous age.

Lower (Neocomian) and Upper Cretaceous rocks are widespread in the Elburz. In the Zagros mountains, Valanginian and Aptian are known in isolated localities. Upper Cretaceous is well developed and from this time onward to late Tertiary sedimentation was continuous in the Mesopotamian—south-west Persian geosyncline. Upper Cretaceous consists of limestones, locally hippuritic, and fossiliferous marls, often bituminous, which attain a thickness in places of about 3,000 ft. Cretaceous limestones form many of the highest ranges. In Central Persia, Upper Cretaceous is irregularly developed, in places resting with marked unconformity on older rocks.

Eocene is present throughout the greater part of North Persia, but it does not attain any great thickness. In Central Persia it overlies Upper Cretaceous or older rocks unconformably and consists of limestones and marls with interbedded tuffs and andesitic



lava flows. In the Zagros mountains Eocene is present as massive nummulitic limestones or as globigerina marls, up to 2,500 ft. in thickness.

Oligocene is probably represented by tuffs and lavas in North and Central Persia, in Zagros by limestones with Lepidocyclina or *Nummulites intermedius-Fichteli,* conformably overlying the Eocene.

Miocene unconformably overlies older rocks in North and Central Persia. It consists of limestones, marls and some gypsum. It is not a thick series except in some of the major depressions such as Dasht-i-Kavir. In the Zagros, the Lower Miocene is represented by a massive limestone known as the Asmari limestone and important as the main reservoir rock of the oil-fields. This is overlain by the Lower Fars gypsum group, then a Middle Miocene marine limestone group, the Middle Fars, followed by a thick series of marls, sands and conglomerates (Upper Fars and Bakhtiaris), extending in age up to Upper Pliocene. In Central Persia, Pliocene is present only in isolated basins. A Pontian bone deposit with *Hipparion gracile* has been found at Maragha in North Persia, also in Bakhtiari country where it is cemented with bitumen.

Tectonics.—Little is known of Palaeozoic earth movements. The lack of Ordovician and Silurian suggests Caledonian movement. During the Mesozoic-Tertiary movements, Central Persia acted as a "Zwischengebirge," while strong folding outwards took place in the Elburz on one side and in the Zagros on the other. The first folding phase is of Middle Cretaceous age and in Central Persia there was a Cretaceous Eocene phase. The greatest movements were in the late Tertiary continuing into the late Pliocene. In the Zagros, great overthrust nappes have been formed in the inner zones. Farther south-west is a belt of anticlinal folding, the intensity of which diminishes in the direction of the unfolded Arabian table-land. Cretaceous and Eocene limestones form the higher mountains, while the foothills are formed exclusively of Miocene and Pliocene sediments. Central Persia was elevated to form a great plateau, but isolated depressions were formed in which sedimentation and later folding took place.

Economic Geology.—Lack of modern transport facilities prevents the exploitation of the many ore deposits of Persia. The following metals are known:—Gold, silver, lead, copper, zinc, tin, mercury, nickel, chrome iron, and iron, also antimony and manganese. Lower Jurassic coal is worked on the flanks of Mt. Demavend for market in Tehran.

Minor indications of oil are very widespread, but as yet the only proved oil-fields are at Masjid-i-Sulaiman and Haft Kal, near Shushtar. The production of oil for 1927 was 4,831,800 tons. (*See* ANGLO-PERSIAN OIL CO., LTD.)

Large deposits of salt, gypsum and sulphur are common, but they are only exploited for local use. Precious stones are won on a small scale, rubies near Meshed, turquoise at Maadan near Nishapur and at Khun, south of Jewezm and north of Shahr-babek. Iron, ochre and rock salt mines are worked with profit in the Persian gulf.

See A. F. Stahl, *Persien, Handbuch der regionalen Geologie,* 1911; H. de Böckh and others, *Tectonics of Asia,* British Association, 1928. (*See* also PERSIAN GULF, *Geology.*) (G. M. L.)

Physical Geography.—The kingdom of Persia, excepting the lowlands of Khuzistan and the maritime plains bordering the Caspian sea and the Persian gulf, forms the western and larger half of what is known as the great *Iranian* plateau, raised aloft between the valleys of the Tigris and the Indus. To the north-west this plateau is united by the highlands of Armenia with the mountains of Asia Minor, while to the north-east the Paropamisus range and the Hindu Kush link it with the Himalayas and the highlands of Tibet. Between those zones of connection the plateau is bounded, on the north by the desert steppes of South Russia, Khiva and Bokhara, the scarp being formed by the Kuren and Kopet ranges to the east, and the main Caucasus range to the west, of the intervening depression formed by the Caspian sea. From Mount Ararat south-eastwards the wall of the plateau is formed by the Zagros range and its extensions, running more or less parallel to the course of the river Tigris and the lie of the Persian gulf until they reach the Indo-Persian frontier in Baluchistan. On the east the plateau is bounded by the ranges overhanging the valley of the Indus. The total area thus enclosed is somewhat over 1,000,000 square miles of which

Persia occupies upwards of 600,000. Its average height above sea-level is probably about 4,000 feet, varying from 8,000 ft. or even more in certain of the outer features to not more than 500 in the most depressed portions of the centre. This greatly increased elevation towards the rim clearly demonstrates the basin-like character of the plateau. The lie of the mountain ranges is for the most part from north-west to south-east. The main system, which extends almost unbroken for nearly 800 miles, from Azerbaijan to Baluchistan, may aptly be called the *Central Range*. It has many peaks 9,000 to 10,000 feet in height, and some of its summits rise to an elevation of 11,000 feet, and, near Kerman, of nearly 13,000 feet (Kuh-i-Jupar). The valleys and plains west of the Central Range, as for instance those of Mahallat, Joshekan, Isfahan, Sirjan, have an elevation of 5,000 to 6,500 feet; those within the range, as Jasp, Ardal, So, Pariz, are about 1,000 feet higher; and those east of it slope from an elevation of 5,000 to 6,000 feet down to the depressions of the central plateau which, east of Qum, are not more than 2,600 feet, and east of Kerman 1,500 to 1,700 feet above sea-level. Some of the ranges west of the Central Range, which form the highlands of Kurdistan, Luristan, Bakhtiari and Fars, and are parallel to it, end near the Persian gulf; others follow the Central Range, and take a direction to the east at some point between Kerman and the sea on the western frontier of Baluchistan. Some of the western ranges rise to considerable elevations; those forming the Turko-Persian frontier west of the lake of Urmia have peaks 11,000 feet in height, while the Sahand, east of the Lake and south of Tabriz, has an elevation of 12,000 feet. Farther south, the Takht-i-Bilkis, in the Afshar district, rises to 11,200 feet, and the Elvend (ancient Orontes) near Hamadan, to 11,600. The Shuturun Kuh south of Burujird is over 11,000 feet in height, the Shahan Kuh, Kuh-i-Gerra, Zardeh Kuh and Kuh-i-Karan, all in the Bakhtiari country west of Isfahan, are 12,800 to 13,000 feet in height.

Still farther south, towards Kerman, there are several peaks (Bid-Khan, Lalehzar, Shah-Kuh, Jamal Bariz, etc.) which rise to an elevation of 13,000 feet or more and the Kuh-i-Hazar, south of Kerman, is 14,700 feet in height. Beginning near Ardebil in Azerbaijan, where the cone of Savelan rises to an elevation of 15,792 feet (Russian trigonometrical survey), and ending in Khorasan, the great Elburz range presents on its southern or inward face a more or less abrupt scarp rising above immense gravel slopes, and reaches in some of its summits a height of nearly 13,000 feet; and the peak of Demavend, north-west of Tehran, has a height of 18,600 feet. There are several important ranges in Khurasan, and one of them, the Binalud, west of Meshed and north of Nishapur, has several peaks of 11,000 to 12,000 feet in height. In south-eastern Persia the Kuh-i-Basman, a dormant volcano, 11,000 to 12,000 feet in height, in the Basman district, and the Kuh-i-Taftan, an active triple-peaked volcano in the Sarhad district, 12,681 feet in height, are notable features.

Of the surface drainage of the Iranian plateau as a whole less than half flows outwards. Taking the area occupied by Persia at 628,000 sq. miles the drainage may thus be distributed: (1) into the Arabian Sea and the Persian Gulf, 135,000 sq. miles; (2) into the Caspian, 100,000; (3) into the Seistan depression, 43,000; (4) into the Urmia Lake, 20,000; (5) into the interior of Persia, 330,000. The first district comprises most of the south-western provinces and the whole of the coast region as far east as Gwattar; the second relates to the tracts west, south and east of the southern part of the Caspian sea. The tracts south of the Caspian are not more than 20 to 50 miles wide; those on the west widen out to a depth of 250 miles, meeting the watershed of the Tigris on the one side and that of the Euphrates and Lake Van on the other, and embracing between the two the basin of Lake Urmia. On the east the watershed of the Caspian gradually increases in breadth, the foot of the scarp extending considerably to the north of the south-eastern angle of that sea, three degrees east of which it turns to the south-east, parallel to the axis of the Kopet Dagh. The third drainage area comprises Persian Seistan with part of the Helmund basin and a considerable tract adjoining it on the west. The fourth is a comparatively small area on the western frontier containing the basin of Lake Urmia, shut off from the rest of the inland drainage, and the fifth area takes in a part of Baluchistan, most of Kerman, a part of Fars, all Yezd, Isfahan, Kashan, Qum, Iraq, Khamseh, Kazvin, Tehran, Samnan, Damghan, Shahrud, Khurasan and the central desert regions.

Four rivers belonging exclusively to Persia, in reference to the Caspian watershed, are the Safid Rud or Kizil Uzain on the south-west, the Herhaz on the south and the Gurgan and Atrek at the south-eastern corner of that inland sea. The Safid Rud rises in Persian Kurdistan in about 35° 50′ north, and 46° 45′ east, a few miles from Senendij. It has a very tortuous course of nearly 500 m. for the distance from its source to the Caspian, 58 m. east of Resht, is only 210 m. in a straight line. The Kizil Uzain takes up some important affluents and is called Safid Rud from the point where it breaks through the Elburz to the sea, a distance of 70 miles. It drains 25,000 to 30,000 square miles of country. The Herhaz, though not important in length of course, or drainage, also, like the Safid Rud, breaks through the Elburz range from the inner southern scarp to the north. It rises on the slopes of the Kasil Kuh, a peak 12,000 feet in height within the Elburz, and about 25 miles north of Tehran, flows easterly through the Lar plateau, where it is known as the Lar river, and takes up several affluents; turns to the north-east at the foot of Demavend, leaving that mountain to the left, and flows due north past Amol to the Caspian. Its length is about 120 miles. The Gurgan rises on the Armutlu plateau in Khurasan east of Astarabad, and enters the Caspian in 37° 4′ north, north-west of Astarabad, after a course of about 200 miles. The Atrek rises a few miles from Kuchan and enters the Caspian at the Bay of Hassan Kuli in 37° 21′ north, after a course of about 300 miles. From the sea to the Russian frontier-post of Chat the river forms the frontier between Persia and the Russian Transcaspian region.

The drainage of the rivers which have no outlet to the sea and form inland lakes and swamps (Kavîr) may be estimated at 350,000 square miles, including the drainage of Lake Urmia, which is about 20,000 square miles. Fourteen small rivers flow into the lake. During heavy rains and when the snows on the hills melt, thousands of streams flow from all directions into the innumerable depressions of inner Persia, or help to swell the perennial rivers which have no outlet to the sea. These latter are few in number, and some of them barely suffice for purposes of agricultural irrigation, and in summer dwindle to small rills.

"The great desert region of Persia," writes Le Strange (*Lands of the Eastern Caliphate*, 1905), "stretches right across the high plateau of Irah going from north-west to south-east, and dividing the fertile provinces of the land into two groups; for the desert is continuous, from the southern base of the Elburz mountains, which to the north overlook the Caspian, to the arid ranges of Makran, which border the Persian Gulf. Thus it measures nearly 800 miles in length, but in breadth varies considerably; for in shape this immense area of drought is somewhat like an hour-glass, with a narrow neck, measuring only some 100 miles across, dividing Kerman from Seistan, while both north and south of this the breadth expands and in places reaches to over 200 miles. At the present day the desert, as a whole, is known as the Lût or Dasht-i-Lût; the saline swamps and the dry salt area being more particularly known as the Dasht-i-Kavîr, the term Kavîr being also occasionally applied to the desert as a whole."

Climate.—In winter the prevailing winds are north-easterly, but in the north are interrupted three or four times a month by the eastward passage of depressions from the Mediterranean, bringing westerly winds and moderate rainfall. In summer a strong dust-laden northerly wind blows almost unceasingly for about four months. This wind is known as the *Shamal;* in June it often carries dust far out into the Persian Gulf, but in July the south-west monsoon sets in along the coast, and the northerly winds are mostly limited to the interior. Seistan, in Eastern Persia, is known as "The Land of the Winds," and is especially noted for the "Wind of 120 days" which sets in at the end of May and blows from a little west of north until the end of September, reaching a velocity of over 70 miles an hour.

The mean annual temperature reaches 80° F over the coast of Mekran and is 75° F at Bushire, but in the interior it is consid-

erably lower, owing to the greater altitude and the cold winds of winter. The annual variation of temperature is very great in the north, where July is more than 40° F warmer than January, but diminishes rapidly southward to 22° on the south coast. The highlands have very severe winters; thus Tehran, at a height of 4,000 feet, has a January mean of 35° F, while extreme temperatures below 0° F have been recorded in Isfahan. The most pleasant season on the highlands is spring, with a moderate temperature and ground still moist from the winter rain and snow. In autumn, though the temperature is moderate, the air is dry and dusty. Summer is everywhere very hot, the mean temperature in July and August exceeding 80° F over almost the whole country. The day temperature is very high, but the nights are cool. Maximum temperatures exceeding 110° F have occurred at elevations of 5,000 feet, and even at Dehbrid (8,000 feet) 93° F has been recorded. On the coast the nights are very warm and oppressive.

Annual Rainfall in Persia

Station	Lat. N.	Long. E.	Altitude	Period of observations	Annual rainfall
	° ′	° ′	Feet	Years	Inches
Lenkoran .	38 46	48 51	−66	50	41·62

Husseinabad	30 52	61 23	1,600	3–5	2·20
Bushire . .	28 59	50 53	14	44	10·39
Jask . .	25 44	57 47	13	28	4·51

The rainfall is small everywhere except on the Elburz mountains, which receive a heavy fall in winter owing to depressions which originate over the Caspian. At Resht, the annual average is 56 inches, but the amount decreases rapidly eastwards to less than 20 inches over the eastern end of the range. Over the plateau south of the mountains the annual total is about 9 inches in the north, but decreases southward and especially south-eastward, being only two inches a year at Husseinabad and Seistan. At the head of the Persian Gulf the rainfall is somewhat greater, slightly over ten inches, but the Mekran coast has again a very small amount, generally about 5 inches. The rainfall is almost entirely limited to the months of October to May inclusive and is heaviest from December to March, any one of which may be the wettest month. The rainfall is very spasmodic, and more than half the annual total may fall in a single day; thus 5·53 inches fell in one day at Bushire, and falls of more than an inch have been recorded at Husseinabad and Seistan. In consequence of this variability, disastrous droughts sometimes occur. Thunderstorms are experienced on a few days each year. Taking Persia as a whole the snowfall may be said to be very variable and uncertain. In the maritime areas a fall of snow is naturally a very rare occurrence. In the highlands, on the other hand, country over 4,000 feet in altitude is liable in any winter to be under snow for days and not infrequently weeks together, between December and April. During such periods of severe weather the passes leading from the plains to the plateau become closed to wheeled traffic, while during the ensuing thaw they are little less difficult for pack-animals. During the World War, when British troops were located along the Baghdad-Enzeli route and the line of communications had necessarily to be kept open, great labour was involved in keeping the track clear of snowdrifts, especially on either side of the Sultan Bulagh pass between Hamadan and Kazvin. An interesting account of the migration of a Bakhtiari tribe, from the plains of Arabistan to their summer quarters in the highlands near Isfahan under severe snow conditions, is to be found in *Grass* by C. Merian Cooper (1925).

Flora.—In the provinces of Gilan, Mazandaran and Astarabad on the Caspian, from the shore to an altitude of about 3,000 ft. on

†29° 58′ N., 48° 30′ E.— Height unknown.

the northern slopes of the great mountain range which separates those provinces from the highlands of Persia, the flora is similar to that of Grisebach's "mediterranean region." At higher altitudes many forms of a more northern flora appear. As we approach inner Persia the flora rapidly gives place to "steppe vegetation" in the plains, while the mediterranean flora predominates in the hills. The steppe vegetation extends in the south to the outer range of the hills which separate inner Persia from the Persian Gulf and the Indian Ocean. Beyond this outer range and along the shore of the sea the flora is that of the "Sahara region," which extends eastwards to Sind.

Generally speaking, everywhere, excepting in the northern lowlands and in a few favoured spots in the hilly districts, the vegetation is scanty. In inner Persia the hills and plains are bare of trees, and steppe and desert predominate. The date-palm thrives well as far north as Tabbas in latitude 33° 36′ and at an altitude of 2,000 ft. and in the south extensive date-groves, producing excellent fruit, exist at altitudes of 2,000 to 5,000 ft. The olive is cultivated at Rudbar south of Resht in Gilan, and a few isolated olive-trees have been observed in central and southern Persia.

Of fruits the variety is great, and nearly all the fruits of Europe are well represented. The common, yet excellent melons, watermelons, grapes, apricots, cherries, plums, apples, are within the reach of the poorest. Less common and picked fruits are expensive, particularly so when cost of transport has to be considered; for instance, a good orange costs 2d. or 3d. in Tehran, while in Mazandaran (only 100 m. distant), whence the oranges are brought, it costs ⅛d. Some fruits are famous and vie in excellence with any that European orchards produce; such are the peaches of Tabriz and Meshed, the sugar melons of Kashan and Isfahan, the apples of Demavend, pears of Natanz, figs of Kermanshah, etc. The strawberry was brought to Persia about 1859, and is much cultivated in the gardens of Tehran and neighbourhood; the raspberry was introduced at about the same time, but is not much appreciated. Currants and gooseberries are now also grown. The common vegetables also are plentiful and cheap, but only a few, such as the broad-bean, egg-plant (*Solanum melongena*), onion, carrot, beetroot, black turnip, are appreciated by the natives. Nearly all the European garden flowers can be seen.

Fauna.—W. T. Blanford, after a journey taken in 1872, divided Persia into five zoological zones: (1) the Persian plateau, from the Kopet Dagh southwards nearly to Lat. 28 N., including all Khorasan up to the Perso-Afghan border, its western limit being indicated by a long line to the north-west from near Shiraz, taking in the whole of northern Persia west of that line to the Elburz and the Russian frontier; (2) the provinces south and south-west of the Caspian; (3) a narrow strip of wooded country south-west of the Zagros range, from the Diyala R. (then in Turkey in Asia, now in Iraq) to Shiraz; (4) the Persian side of the Shatt-el-Arab, and Arabistan (now Khuzistan) east of the Tigris; and (5) the shores of the Persian Gulf and Baluchistan.

The fauna of (1) he described as "Palaearctic, with a great prevalence of desert forms; or perhaps more correctly, as being of the desert type with Palaearctic species in the more fertile regions."

In the Caspian provinces he found the fauna, on the whole, Palaearctic also, "most of the animals being identical with those of south-eastern Europe." Some, however, were essentially indigenous and he observed "a singular character given to the fauna by the presence of certain eastern forms, unknown in other parts of Persia, such as the tiger; a remarkable deer of the Indo-Malayan group, allied to *Cervus Axis;* and a pit viper (*Halys*)."

Coupling the oak-forests of Fars with the wooded slopes of the Zagros, he found as regards his third division that however little known was the tract, it appeared to contain, like the second, "a Palaearctic fauna with a few peculiar species."

As to the 4th division, Persian Mesopotamia, he considered its fauna, as far as he was in a position to judge, to belong to the same Palaearctic region as Syria. The 5th and last division, Baluchistan and the shores of the Persian gulf, presented, he considered, among those animals common to it and to the highlands, "for the most part desert types, whilst the characteristic Palaearctic species almost entirely disappear, their place being taken by Indian or Indo-African forms."

Blanford wrote in 1876, but his work is out of date only in matters of detail.

Among the mammals, it is to be feared that the lion, fairly plentiful in places, at the time he wrote, is now practically extinct (1929), no live specimen being in existence in captivity and no authoritative report of its occurrence having been received for some years past.

The Mazamdaran tiger though not so plentiful as of yore is still to be met with. There was at one time a disposition to regard it as a distinct race on the score of smallness of size and paleness of colour, but the character of specimens obtained in recent years by Colonel R. L. Kennion hardly supports that theory. The same officer's sporting activities have also demonstrated that the wild sheep of Persia are separable into two if not three races: one found on the southern slopes of the Elburz identical with the Armenian moufflon (*Ovis orientalis*); a second on the north of the range, of the urial or shapu type; and farther eastward in the Kopet Dagh range another race of the urial type but distinctly bigger and described by Dr. Lydkker as *Ovis vignei arkal.*

The Caspian red deer is now known to science as *Cervus elephus maral,* the type locality being the Caspian provinces of Persia. Of the axine deer and the fallow deer mentioned by Blanford no specimens have been forthcoming for many years.

A roe has been found to occur sparsely in the lower slopes of the Zagros in Southern Kurdistan, and in the neighbourhood of Kermanshah. This deer is distinguished from other known members of the genus *Capreolus* by the cold-grey coloration of its winter coat, and has accordingly been described as a distinct species (*Cervus capreolus coxi*), the nearest allied species being the roe-deer of normal dark colour found in the mountains of Talish and Mazandaran (*C.C. armenius*). Apart from the species referred to above the following occur in a wild state, in suitable localities: ibex, moufflon, wild ass, leopard, lynx, brown bear, hyaena, wolf, jackal, hog, badger, fox, hare, porcupine, polecat, weasel, marten. Lastly, Persia boasts an indigenous cat, with a world wide reputation. From it with careful breeding spring the beautiful creatures familiar as "Persian Cats."

In the domain of ornithology, over 400 species and races of birds are known in Persia. Since Blanford wrote his work much has been done both by British and Russian ornithologists. Zarudny, Witherby and Buxton in Persia and Cox and Cheesman in the Persian gulf have given a comprehensive account of the birds in those regions and have added largely to Blanford's list. Persia is essentially Palaearctic in its fauna and flora, but its Aves display a slight infiltration from the Oriental Region and perhaps one or two relic species from the Ethiopian Region, namely *Hypercolius ampelinus* and *Acrocephalus griseldis.* Within itself, Persia shows many marked differences in its Avian population. The Elburz mountains appear to have developed slight differences among the birds which inhabit them, and in many cases those living on the damper northern slopes differ from the same bird when living on the dry southern slopes. Again those birds living in South-west Persia, within any species, show marked differences from those living in the arid desert regions of East Persia, the latter country together with its birds more closely resembling conditions usual in Central Asia north of the Oxus. Of game birds (*Tetrogallus*), pheasant (*Phasianus colchicus*), black partridge (*Francolinus*), chukor (*Alectoris graeca*), the see-see or sand partridge (*Ammoperdix*), and Indian grey-partridge (*Francolinus pondicerianus*) occur in those parts of the country suitable to their habits. In winter large numbers of wildfowl, woodcock and snipe visit the country. Flamingoes and pelican breed on the northern shores of the Persian gulf. The dryness of the Persian climate favours the rearing of poultry which are of good quality, especially the turkey which can be seen in huge droves and can be purchased for comparatively small sums.

The fish principally caught along the southern shore of the Caspian are: the sturgeon, "sagmahi," literally "*dogfish,*" for which the word is also used (*Acipenser ruthenus* and *A. huso*); sheatfish or silure, "simm" or "summ" (*Silurus glanis*); salmon, "azadmahi" (*Salmo salar*); trout, "maseh" or "qizil" (*Salmo trutta*); carp, "kupur" (*Cyprinus ballerus* and *C. carpio*); bream, "subulu" (*Abramis brama*); pike-perch, "mahi-sufid" (*Perca lucioperca* or *Sandra lucioperca*). There is also a herring which frequents only the southern part of the Caspian, not passing over the shallow portion of the sea from Baku eastwards: as it was first observed near the mouth of the R.Kur it has been named *Clupea kurensis.* Our knowledge of the freshwater fish is meagre.

Population.—The population of Persia is estimated by recent competent authorities at about 12,000,000, which gives an average of about nineteen per sq.m. Various partial censuses have been taken in the past and, in 1927, a more complete and general census of the country was under way, but in 1928 was still incomplete. (*The Financial & Economic Situation in Persia.* By A. C. Millspaugh. Published by the Persian Government 1926.)

Towns.—With the exception of Tehran, only rough estimates of the population of towns—on which little reliance should be placed, as they cannot be substantiated by actual figures—are available. The principal towns of Persia with their estimated populations are:—Teheran [Tehran] (210,000, census of 1922); Tabriz (200,000); Isfahan (80–100,000); Meshed (60–80,000); Hamadan (70,000); Kerman, Kermanshah, Shiraz, Yezd (50–60,000); Kazvin (40–50,000); Barfurush, Kashan, Urmia (35–40,000); Resht, Senna (Sinandaj) (30–35,000); Zinjan (25,000); Burujird, Dizful, Khoi, Qum (20–25,000); Birjand, Bushire, Khunsar, Maragha, Sabzawar, Semnan, Shushter (15–20,000); Astarabad, Ardabil, Bandar Abbas, Bujnurd, Damghan, Kuchan, Lahijan, Minab, Nishapur, Sari, Saveh (10–15,000); Amol, Bam, Darab, Firuzabad, Gulpaigan, Kazerun, Khurramabad, Lar, Lingeh, Mohammerah, Nusratabad (Seistan), Niriz, Pahlavi (Enzeli), Qain, Saujbulaq, Sultanabad, Turbat-i-Haidari (4–10,000).

Constitution and Government.—Up to the year 1906 the government of Persia was an absolute monarchy, resembling in its principal features that of the Ottoman Empire; but with this exception, that the ruler was not the spiritual as well as the temporal head of the community. His powers were consequently qualified by the limitations imposed by the *Shara'a* or divine law of Islam. In 1905 however the public began to press for reform, more particularly in the administration of justice, and in 1906 went a step further and forced the reigning Shah to grant a Constitution, under which a Majlis or National Consultative Assembly should be established. This parliamentary body, now generally referred to as the Majlis was to be representative of various classes of the community; princes, clergy, chiefs, nobles, landowners, agriculturists, merchants and tradesmen, and racial and religious minorities. The number of elected deputies, who were to function during the sessions of 2 years, was fixed at 60 for the capital and 102 for the provinces, to be increased up to 200, as necessary; in 1928 there were 136. Electors must be males not less than 25 years of age, while the qualifications for membership of parliament were: age between 30 and 70, ability to read and write the Persian language and a good reputation in the constituency. Persons serving in the army, or navy, or other government employ, were to be considered ineligible, as well, of course,

as undischarged bankrupts and persons who had been convicted of criminal offences. Deputies were to be immune from prosecution, except with the consent of parliament.

By a rescript dated Feb. 2, 1907 Mohammed Ali Shah confirmed the previous ordinance of Dec. 1906, and on Oct. 8, 1907, signed the Constitution in its final form and took the oath of kingship prescribed therein, in the presence of the assembled Majlis. As time passed however this monarch, chafing under the unwonted trammels of constitutional government, rashly attempted to suppress the Majlis and overthrow the Constitution, but his effort proving abortive resulted in his enforced abdication and exile to Europe, and the accession of his son, Sultan Ahmed Shah (a child of 12 years of age), in accordance with the provision of the Constitution, perpetuating the Kajar dynasty.

During a precarious reign of 16 years this young potentate contrived to alienate the affections of his subjects completely and on Oct. 31, 1925, the Majlis voted by a large majority for his deposition and for the convening of a Constituent Assembly which should amend the articles of the existing Constitution dealing with the Kajar dynasty and appoint the then prime minister, Reza Khan Pahlavi, as head of a provisional government with authority to function until the Constituent Assembly had concluded its labours. This body having ultimately voted for the elevation of the said Reza Khan Pahlavi to the throne of Persia, the new Shah forthwith took the prescribed oath of kingship and ascended the throne on Dec. 16, 1925.

Under the Constitution, the Shah's powers are in general those ordinarily accorded to the ruler of a State under a Cabinet system of government. The prime minister, who is the constitutional executive, actually receives his appointment from the Shah, but is responsible to the Majlis, whose approval and support are of course a sine qua non. He, in turn, selects his ministers and introduces them to the Shah and to the Majlis. With his ministers he constitutes the Cabinet, or Council of Ministers, which possesses general executive powers, issues decrees for the enforcement of laws, and, during the usual parliamentary recesses, exercises a measure of provisional legislative power; but the sole right of imposing, reducing, or abolishing taxes, making appropriations, approving loans, or granting concessions, rests with the Majlis.

In 1928 the Council of Ministers was composed of the prime minister and eight ministers holding the following portfolios: War, Interior, Foreign Affairs, Finance, Justice, Posts and Telegraphs, Public Instruction and Public Works.

POLITICAL AND ADMINISTRATIVE DIVISIONS

Persia, for purposes of administration, was, in 1928, divided into twenty-six provinces, which are governed by Governors-General who, in many cases, are officers of high rank. The provincial governors are directly responsible to the Central Government and come under the jurisdiction of the Ministry of the Interior. Provinces are sub-divided, either wholly or in part, into districts (*buluk*) each under a deputy-governor (*naib-ul-hukumeh*), and comprising a number or group of villages rather than a definite area. The buluk, however, is usually only a name, the administrative unit being the village. Local government in the villages is simple, the principal authority in agricultural affairs being the *Kadkhuda*, or head-man. In addition to a Kadkhuda, many of the larger villages appoint as their representatives a number of elders or grey-beards who take the side of the villagers in the event of a dispute. In many districts, the distribution of water is in the special charge of a waterman. When a dispute arises over water or land, it is often submitted to the impartial decision of these elders. When any case requiring a legal judgment arises, appeal is made to the local *Mullahs,* to the deputy-governor, or even to the governor of the province.

The cities and towns are in general governed by municipal commissions. The last vestiges of the ancient satrapal system of local administration are rapidly disappearing in Persia; but for a long time after its forms had vanished its spirit prevailed and administrative services such as the post, telegraphs, the mint and the collection of various taxes were "farmed" out. As a result, administration became local and personal, and there were no uniform regulations applying to the whole country. To-day, modern and uniform principles of administration are becoming universal. The Constitution provides that, throughout the empire, provincial and departmental councils shall be established, the members of which shall be elected by the local inhabitants. Legal provision has accordingly been made for the election of rural and town councils.

In 1928, the 26 provinces of Persia were as follows:—

(1) Astarabad	(13) Kermanshah
(2) Azerbaijan (Tabriz)	(14) Khurasan
(3) Burujird	(15) Khuzistan
(4) Damghan (hitherto combined with Semnan, now separated)	(16) Kurdistan
	(17) Malayir
	(18) Mazanderan
(5) Fars and Southern ports	(19) Nehavend
(6) Gilan	(20) Qazwin (Kazvin)
(7) Gulpaigan	(21) Qum
(8) Hamadan	(22) Semnan
(9) Iraq	(23) Shah Rud
(10) Isfahan	(24) Tehran
(11) Kashan	(25) Yezd
(12) Kerman	(26) Zinjan

Armed Forces.—The Persian armed forces consisted in 1927 of a regular army of some 40,000 men, a Gendarmerie (Amnieh) of about 7,000 and a police-force of 5,000. The existing regular army is entirely the creation of Reza Shah Pahlavi, whose elevation to the throne of Persia was effected mainly through the instrumentality of the homogeneous force which he had created out of the motley military formations to which political exigencies and periodic aspirations in the direction of reform on the part of the Persian people had at various times given birth. The more important of these forces were the South Persia Rifles, organised and trained by British officers, the Persian Cossack Division, commanded by Russian officers, the Gendarmerie, which had made a promising start under Swedish officers during the few years preceding the World War, and the decrepit remnants of the Nizam, the old Persian regular army, formed and reformed by successive "missions" of European officers of French, British, Austrian and other nationalities, since the time when Abbas Mirza, the son of Fateh Ali Shah, first decided that drilled and disciplined troops could more effectively oppose Russia than the irregular masses of tribesmen upon which Persia had hitherto relied for her defence Reza Pahlavi, when he became minister of War in 1921, set himself in the first place to eliminate foreign influence entirely from the army, and in the second place to weld these various forces, with their different organisations, their diverse methods of training, even their different words of command, into a uniform and truly national Perisan army, obedient to himself and imbued with some spirit of patriotism. Under his leadership the army, officered entirely by Persians, rapidly established a mastery over the country, such as had been unknown for many years. A degree of security remarkable in comparison with the disorder of previous years was achieved and maintained with fair consistency; the tribes who for long had been almost a law unto themselves, were brought to submission, and the payment of revenue regularly enforced. The country was divided into six military districts, five of which, the Central, the North-Western, the Western, the Southern and the Eastern, with headquarters respectively at Tehran, Tabriz, Kermanshah, Shiraz and Meshed, are each garrisoned by a lashkar (a force approximating to a division), and the sixth by a strong independent brigade with headquarters at Resht. Each of these forces is composed of cavalry, artillery, and infantry with the essential ancillary services, in proportions and strengths varying according to local needs, the greatest strength and the most mobile troops being maintained at Tehran whence they are despatched as need arises to reinforce the provincial divisions. A small air force of 10 to 15 machines is located at the capital.

Recruitment for the ranks of the army is by conscription. Officers are recruited partly from the ranks and partly from the Military Cadet college at Tehran. A considerable number of officers have in recent years received further training in Europe. The Shah personally exercises the supreme command

and is assisted by a chief-of-staff, who controls the two branches of the army staff the general and the administrative. The gendarmerie (*Amnieh*) has for its principal duties the policing of the country outside the towns, and also the patrolling, and (in co-operation with the army) the protection of roads. It is organised in mixed units in the proportion, usually, of one of cavalry to four of infantry.

Navy.—The Persian Government possesses the following vessels: *Persepolis.* An old gunboat of 600 tons and 450 h.p. built in 1884; in bad condition and of no fighting value. *Mozafferi.* An old Belgian yacht of 379 tons, built in 1899. *Pehlevi.* An ex-minesweeper of German type, built in 1917. 200 tons 800 h.p. Burns oil fuel. *Ivy.* An English yacht formerly employed on the Niger. Acquired by the Shaikh of Mohammerah after the war. An old gunboat on the Caspian. Captured by Soviet forces in 1920, but understood to have been restored to the Persian Government. Several small river steamers.

Religion.—At the present day it may be said that with the exception of Persian Kurdistan which like the rest of the Kurdish element is Sunni, practically the whole of Persia is Shiah. Under this faith the power wielded by the priestly hierarchy has always been very great, owing no doubt to the fact that the foundations of Society were based almost exclusively on religious law. But there is no sacerdotal caste; any person capable of reading the Koran and interpreting its laws may function as a priest or *"mullah,"* and as soon as one of them has established a reputation for just interpretation of the *shari'a* or divine law, and a profound knowledge of the "traditions" and articles of faith (usually acquired only by many years of study at the Holy Places) he is accorded the title of *"Mujtahid."* This word which means literally "one who strives" (*i.e.,* after knowledge) was without any doubt intended to denote "a doctor of law," but as it is in fact the religious luminaries who interpret the law, it has become synonymous with "learned divine" or "chief priest." Time was when there were only 4 or 5 recognized mujtahids in Persia, but nowadays every large town boasts of one or more of them, as well as of several *mullahs* or *akhunds.* Nevertheless those of the highest eminence and repute seem to gravitate almost invariably to the Holy Places of Iraq, Karbala, and Najaf, where they live in a great odour of sanctity and whence their decisions are announced and accepted throughout Shiah Islam. It is to be noted that neither the Shah nor the government has any voice whatever in the appointment of these mujtahids or of the lesser lights; on the other hand in every large town where there are several mosques there is an important religious functionary called the *"Imam Juma"* who does receive his appointment from the Government and enjoys certain allowances. His function is to preach in the principal mosque and to read the Friday oration, or maintain a deputy for the purpose, known as a *"khătīb."* The leader of the congregation's prayers is called the *"Pishnamaz,"* and the crier who calls to prayers, the *"Muazzin."* Priests are often, but not necessarily, appointed guardians of the shrines or tombs of honoured scions of the Prophet's line; these are known as *"mutawalis"* and are responsible for the careful administration of the endowments. The shrines of some of the more famous or favourite saints are so richly endowed by pious testators as to be able to keep up an immense staff of attendant priests, servants, and miscellaneous retainers.

Zoroastrianism.—The few remaining Zoroastrians, commonly known in Persia as *"gabrs,"* are to be found principally round Yezd and Kerman, though small communities of them also inhabit Tehran, Kashan, Isfahan, and Shiraz. They are mostly engaged in commerce but have earned the reputation of being expert gardeners and individuals are in demand for that purpose throughout Persia. Their interests as a minority community are looked after by their co-religionists in India whose representative either resides in Tehran or pays periodical visits. They have their own deputy in the parliament.

The Armenians of Persia, numbering probably 60,000, are divided into two main communities, the one in Azerbaijan and the other at Isfahan, whither they were transplanted by Shah Abbas. The larger moiety appertain to the former centre and have their bishop located at Tabriz, with scattered communities at Tabriz, Khoi, Salmas, Urmia, and Maragha and in some 30 villages close to the Turco-Persian frontier. The other half, with headquarters and a bishop at Isfahan, have small colonies in Tehran, Hamadan, Isfahan (Julfa), Shiraz, Bushire, Resht, and other towns. The Armenian is an astute man of business and engages freely in trade and commerce, often possessing considerable capital, but the bulk of them live on the proceeds of agriculture. The prominent services of Yeprim and other Armenians during the Persian revolution of 1909 did a good deal to earn the good will of the Persian public and relations between the two nationalities improved considerably in consequence. The Armenians also are represented by a deputy in the Majlis.

The Nestorians (*q.v.*), whose church has been established in Persia since the year A.D. 435, possessed, at the time of the outbreak of the World War, a large community numbering from 50,000 to 60,000 souls, occupying the city of Urmia and numerous towns and villages in that neighbourhood. As a Christian community their sympathies were naturally with the Allies, and as long as Russia was one of them they had little to fear; but on Russia's defection in the spring of 1918 they were left in the air in a position of great danger. In May 1918 a Turkish force moving on Tabriz via Urmia was effectively checked for the time by the gallant and stubborn opposition of the "Jelus" (as they were called by British troops) but later in the summer, during the absence of 2,000 of their best men who had been sent to Bijar to bring back a convoy of ammunition supplied by the British army in Iraq, the Turks made a determined attack on Urmia, and the Christian inhabitants feeling that resistance was useless poured out of the town and fled towards Bijar after their absent comrades. They suffered very great losses on the way, both from the pursuing enemy and from sickness and privation. The enemy pursuit was indeed checked at Sain Kala by the British 14th Hussars, but only some 50,000 reached Bijar out of 80,000 who were believed to have started on the trek. These were gradually evacuated in batches to a large refugee camp prepared for them at Baquba near Baghdad and maintained there at British expense until peace had been declared and they could, as far as possible, be repatriated. It will be realised that this small nation was badly shattered and it is difficult yet to ascertain precisely to what extent and in what numbers they have been able to re-establish themselves.

Protestants, Roman Catholics, Jews and Baha'is, including Europeans and converted Armenians and Nestorians, probably number about 7,000. The religious missions administering to their welfare are:

(1) The Board of Foreign Missions of the Presbyterian Church of America, established since 1835. (2) The Church Missionary Society established since 1869. (3) The Anglican Mission established by the Archbishop of Canterbury for work among the Nestorians. (4) The London Society for promoting Christianity among the Jews. (5) The British and Foreign Bible Society.

Roman Catholics, European and natives (mostly Armenians) number from 4 to 5 thousand and have churches at Tehran, Julfa, and Tabriz, served by members of the French Lazariste Mission.

The Jews in Persia number about 40,000 and are to be found in nearly all the chief cities in the country, but communities with synagogues and priests exist only in the larger cities.

Baha'ism formerly Babiism (*q.v.*) is a creed of recent origin which only made its appearance in 1844. Though for many years past the followers of the Bab have been immune from persecution by the Persian Government, they have from time to time been made the target of violent fanaticism on the part of the Shiah population. There was a bad outbreak in 1903 in Yezd and several other towns in Persia, and a serious outbreak against them at Sultanabad in 1920. Owing to this liability to persecution, the majority of Baha'is still think it prudent to conceal their beliefs, so that it is not possible to make any satisfactory estimate of their numbers. There is no doubt however that the movement is gaining steadily in force. In so far as it is possible in these circumstances to speak of the Baha'is as a community they are friends of progress and reform and ready to co-operate towards

their attainment.

Instruction.—Public instruction, properly so-called, is a plant of comparatively recent growth in Persia. Previous to the reign of H.M. Nasr-ud-Din Shah the people of Persia were lamentably uneducated. Each town and village, it is true, has generally some sort of school, but it was often nothing more than a class held by a Mullah in the local mosque, where children were taught the rudiments of the Persian equivalent of "the three R's" and a parrot knowledge of the Koran. Comparatively few ever mastered the art of writing and anyone who could read and write passably styled himself "*mirza*." Such as it was however this measure of education could be had cheaply, the fees amounting to less than two shillings per month for each child. At that period there were no higher schools, the only form of secondary education, and that of a very limited extent, being provided by the *Madressehs,* or religious colleges, which catered for those aspiring to the professions of religion, law, or medicine. Every town of importance boasted of one or more of these, many of them richly endowed by pious testators, but none of them in any way subject to the control of the Government. Realising how backward his kingdom was in this respect, one of Nasr-ud-Din's first acts on ascending to the throne was to found an institution in the capital, styled the "Madresseh-i-Shah" or King's college, to be maintained by the State through a Ministry of Public Instruction. Pupils for this college could be entered at all ages and remained as a rule for 6 or 7 years. Colleges, nominally on the same basis, were opened in due course at Tabriz and Isfahan; excellent in their way but on too small a scale to make any appreciable impression on the general conditions of illiteracy. In the reign of Muzaffar-ud-Din Shah (1898), a further advance was made by the transfer of a number of private establishments to State control and the opening of new schools in Tehran and other towns. From that time onwards education fared better, mainly owing to the activities of foreign missions. All these were supported by voluntary subscriptions and donations and provided instruction for boys and girls alike. Educational institutions are still gravely inadequate but under the progressive régime of Reza Khan Shah Pahlavi the educational system of the country is being improved from year to year and greater facilities for education provided for both sexes. In addition to the Government schools, educational establishments are also maintained by the following foreign missions: the English Church Missionary Society; the American Presbyterian Mission; the Alliance Française; the Alliance Israelite; and the French Roman Catholic Mission; and there are schools run by the Russian and German Governments. The figures of the Ministry of Public Instruction show that for the year 1927 there were in the country 298 Government schools, 272 national schools, 112 private schools, 279 religious schools and 245 foreign schools, providing instructions for about 250,000 individuals of both sexes.

The religious schools still subsist on their liberal endowments, but the Government pays the whole of the budget of the Government schools and also makes grants to the public, private and foreign institutions. Apart from general education technical colleges or schools have been founded for the study of medicine, fine arts, pedagogy, engineering, and mechanical science and chemistry, law and political science, agriculture, and military subjects. The agricultural school has an American director, while the law, medical, and political schools are under the supervision of foreign experts of various nationalities. A scheme is understood to have been recently approved under which a number of promising young students will be sent to Europe annually to complete their studies; 100 in 1928, 200 in 1929, and so on until a maximum contingent of 600 is reached. An account of the educational position in Persia at the present epoch would be incomplete without reference to the educational work of the Anglo-Persian Oil Company in southern Persia. At Masjid-i-Sulaiman two elementary schools have been inaugurated, for the sons of employees; at Ahwaz the Company maintains a primary and a secondary school, and at Abadan an elementary school; these latter institutions offer education free to all suitable boys whether sons of employees or not.

Judicial System.—There exist at present in Persia two mutually contradictory judicial systems, that of the State, as expressed in legislation, and in decrees, and that of the Islamic law, as traditionally interpreted and administered in Persia. This dualism is an essential part of the fundamental laws of 1906 and 1907, by which the present constitutional system is regulated, and its abolition is an indispensable preliminary to any serious improvement in the judicial and legislative system, which is indisputably the least satisfactory branch of governmental activity in Persia, and that in which the least progress has been made.

Under the fundamental laws of 1906 and 1907, themselves contradictory and without logical structure, all legislation whatever passed by the Majlis must conform to Islamic law, and 5 doctors forming a committee of religious law (*ulama*) are empowered to veto any law or part of any law which in their view contravenes this principle. Though this veto has been seldom exercised, many laws have been enforced without submission to such a committee, and there is always a possibility that they may be declared unconstitutional by a judicial tribunal, or by the committee itself.

Apart from Islamic law, and from the fundamental laws above mentioned, the *corpus* of Persian legislation consists in the main of the following enactments:—

1. *Penal Code.* This is based on French law, but is subject (under Act 1) to Islamic law, which treats crimes dealt with therein on wholly different lines. This fundamental contradiction inevitably renders the application of the law by the Courts inconsistent and uncertain. The law itself leaves much to be desired.

2. *Civil Code* is still under preparation. It is understood to be based on Islamic law, with some adaptations from French and Egyptian legislation.

3. *Code of Civil Procedure* is based on the Russian law of 1910 and is now under revision, but no improvement seems possible so long as the dualism referred to above is maintained and enforced.

4. *Code of Criminal Procedure.* This is based on the Russian Code of 1910, and is likewise under revision.

5. *Commercial Code* is an incomplete adaptation of French law, which is considered by experts to be defective, especially as regards limited liability companies.

6. *Civil Service Law.* Under revision.

7. *Registration of Lands and Documents.* It is understood that it is intended to revise this law, which is in many respects highly defective.

Jurisdiction over Foreigners.—Until 1920 most foreigners resident in Persia were subject to the jurisdiction of their respective Consular authorities in matters exclusively affecting them. Thus suits between foreigners of the same nation were heard and decided in a Consular Court, subject, in certain cases, to appeal to the Courts of the country concerned. Matrimonial and testamentary cases and similar matters were dealt with in like manner. This system of extraterritoriality, which is frequently, but incorrectly, referred to as "the capitulations" on the analogy of Turkey, originated in a voluntary grant made by Shah Abbas in 1600 to Sir Anthony Sherley, an English knight, as an inducement to British merchants to enter Persia for purposes of trade. These and cognate privileges were, in course of time, extended to other foreigners, but were not formally recognised until, as part of the settlement of Russia arising out of the disastrous war of 1827, they were embodied, with certain limitations, in the Treaty of Turkmanchai. Other nations, including Great Britain, were accorded, under later treaties, most favoured nation treatment. In May 1928 extraterritorial jurisdiction over foreigners came to an end, but the Persian Government agreed to introduce certain safeguards in respect of British subjects, which may be briefly summarised as follows:—

The rules of international law will be followed by the Persian Government in all its relations with foreigners.

In all civil or commercial cases to which one of the parties is a foreigner, only written evidence will be admitted. All judg-

ments will be in writing and will contain the considerations of law and fact on which they are based. Copies of evidence and judgment will be obtainable.

Only the Courts subordinate to the Ministry of Justice will be competent to deal with cases in which one of the parties is a foreigner. In the event, however, of the proclamation of martial law when a case brought before a special tribunal has been established, such a tribunal may take cognizance of the case.

Foreigners can only be tried by non-religious tribunals.

Persons will only be sentenced to imprisonment by a police-court who ask for imprisonment in lieu of fine. Such imprisonment shall not exceed a week in duration. No sentence of corporal punishment shall be inflicted on foreigners.

No foreigner may be arrested or imprisoned without a warrant save *flagrante delictu,* nor may he be kept imprisoned for more than 24 hours without being brought before a magistrate. No entry or search of foreigners' houses or offices may be undertaken without a warrant.

Foreigners arrested and imprisoned shall have the right to communicate with their nearest consul, who shall be permitted to visit them.

Facilities for release on bail shall be granted save in cases of serious crime.

Trials will be held in public save in very exceptional cases.

The accused is free to choose his own counsel, who need not be a Persian.

Prisons "fulfilling the necessary hygienic conditions" are to be constructed. A foreigner sentenced to more than a month's imprisonment may claim transfer to one of these.

In affairs of succession, divorce, and status non-Muslim British subjects in Persia shall have recourse to their own Courts, if they so wish. Muslim British subjects will be subject to Persian religious Courts "till the question is definitely settled."

No tax or impost shall be levied on foreigners which is not levied on Persian subjects.

All judgments given by the former tribunals shall stand.

Questions relating to security for costs, orders for the payment of costs and expenses, execution of judgments, etc., shall be regulated by separate conventions.

British subjects are permitted to acquire, occupy, or possess such property in Persia "as is necessary for their dwelling and for the exercise of their commerce and industry."

British subjects cannot be arrested or suffer restraint in their individual liberty in order that civil claims of a pecuniary nature against them may be provisionally safe, except where there would seem to be a serious risk that distraint to be made, owing to any act on the part of a debtor, upon that debtor's possessions which are actually in Persia, would not be effective and could not otherwise be assured.

Similar safeguards over other foreign subjects will doubtless be embodied in due course by the Persian Government in treaties with other foreign powers.

AGRICULTURAL PRODUCTS

Generally speaking agriculture, in extent, yield, diversity and method, has changed little in the past half-century—or, indeed—for centuries, in all probability. There is no disposition, on the part of the sons of landlords and gentry, to go on the land and apply their education to the development of their properties. They prefer to remain town-dwellers or absentee landlords, rarely putting back into their properties a proportion of the rents received except it be in the form of repairs to *qanats.*

The method of cultivation of cereals is governed—geographically for the most part—by the division into irrigated and unirrigated lands; the Caspian zone, with a rainfall which may exceed 50 inches and produces great humidity, being to some extent an exception, though even there the rice-fields need irrigation. The rivers of Persia capable of being worked for irrigation by gravitation are few; on the northern seaward slopes, the Safid Rud, Harhaz, Gurgan and Atrak; in the S. the Karun, Jarrahi and Qara Agach, which reach the Gulf. The main Iranian plateau is watered by a number of streams, mostly of inconsiderable length, which in some years when swollen by snow or excessive rainfall, run away to waste in marshes or lakes, but are ordinarily dry watercourses for eight months of the year. In such conditions agriculture relies for the most part on irrigation, drawn either by (i.) gravitation from those rivers holding a supply from spring to autumn, or more commonly by (ii.) *"qanats,"* artificial subterranean canals starting from the foot hills and collecting water for long distances, possibly 12–20 miles till they are brought to the surface, and the stream led above-ground to the lands to be irrigated.

Cereal and other crops raised by means of such irrigation are watered at regular intervals from March to June, and what are known as "summer crops" from May till September. The return on irrigated land for wheat and barley sown is rarely more than ten-fold, usually much less. Side by side with this irrigation in some districts, and exclusively in some of the higher altitudes on the central Iranian plateau, between 6,000 and 8,000 feet, dry cultivation, dependent entirely on the rainfall, is practised. Dry cultivation is indeed the sole resource of the great alluvial Persian Gulf plain extending from the province of Khuzistan to the southern extremity of Dashti district, and in the Sistan belt in the east. On the shores of the northern end of the Gulf the rainfall may average 12 inches at Bushire; and at Shiraz, 120 miles inland across the mountains, 13 inches, as compared with a bare 3 inches in the year at Isfahan on the central plateau.

Wheat and barley are sown after the ground, hard baked by the powerful summer sun, is sufficiently softened by the first rain which may be as early as the first week in November, or as late as the first week in January. In the case of barley reaping will not be later than the 15th to 20th of April, while wheat is harvested from the end of April to the first days of May, roughly one month earlier than in upper Fars, and 2½ months earlier than harvesting in the altitudes above 6,000 ft. A full ploughing season is reckoned by the peasants as 40 days. The all-important factor, in the dry cultivation as distinct from the irrigated crop, is a succession of regular and soaking rainfalls between February 15th and April 1st, particularly about March 21st. If such timely rains occur (even if sowing should have been delayed till late December or early January), a yield of 20 times the quantity of seed sown is common, as compared with up to 12-fold in the transmontane districts of Fars. On the other hand, excellent rains during November to January, are often followed by a hold-off of rain in late February and March, the result of which is a meagre harvest hardly returning the seed sown. Harvest records in the Persian Gulf zone may be summarized over cycles of 11 years as 1 good year, 2 to 3 medium, 4 poor and 2 or 3 extremely bad. In years of penury numbers of peasants migrate, from spring to autumn, to work in the date-gardens of the Shatt-el-Arab.

A law for re-assessment of the land-tax due from private properties, on a basis of 3½ per cent of the average yield of four years, was passed in 1926; but such re-assessment by 1928 had covered only a small portion of the country. In 1925 the Ministry of Finance estimated the total production of wheat in Persia at the equivalent of some 1,092,000 standard tons (of which Khurasan province 145,000; Azerbaijan province 145,000; Fars 87,500; Kerman 72,500; Kermanshah 72,500; Kurdistan 58,000); and of barley at 568,000 tons, while the figures of the Customs administration, for the year March 1925–26 give the total export from Persia as wheat 2,460, barley 430 standard tons, nearly all to Russia. Export duty 1 kran per 130 lb.

In years of fair harvest the price of wheat in provincial towns may be the equivalent of 5s. 6d. per cwt. and upwards, rarely much less.

The usual ploughing implement is of rough hewn wood with an iron shoe for share, drawn by a pair of bullocks or donkeys, furrows being rarely more than 3 to 4 inches deep; the seed is ploughed in, in most cases, on sandy soil not prepared by a preliminary cleaning or manure. Reaping is by sickles, and the grain is trodden out from the straw by bullocks or asses on the threshing-floors of the Bible. Ridging in the European sense is not practised. By 1928, except perhaps for a few machines in the Karun valley, in the whole country south of Isfahan only two

tractors had been introduced (and these by European farmers). The experience of the latter is that the deeper ridging by machinery, and ploughing before the rains begin make both for economy in seed, and a stronger, heavier crop. In the Tehran district the Government since 1921 has instituted farms for training students, and given exhibitions of farming machinery, while certain of the great magnates have imported tractors for their estates; but, in general, agricultural machinery is rarely in use. The peasants, particularly in the south, look with no kindly eye on such improvements, and are inclined to thwart experiments or changes, the absence of skilled or reliable mechanics being an additional obstacle to the use of agricultural machines.

Rice cultivation flourishes above all in the Caspian provinces, Gilan and Mazandaran, production there being estimated by the Ministry of Finance at the equivalent of some 230,000 standard tons. But, though this was considered eight-ninths of the whole production of Persia, in all parts where there is irrigation from rivers and springs (*i.e.*, except in the Persian Gulf zone, Baluchistan and the east), and in the higher altitudes rice is grown mainly for local consumption, in the form of *pilau* chiefly, it being almost as much a staple food as bread, especially in the Caspian zone.

In the Persian year 1925–26 the export of rice—almost all to Russia—amounted to 61,450 standard tons; while on the Persian shore of the Gulf 20,380 tons were imported from India.

In Gilan sowing takes place in March, transplanting and pricking out in May, and after two or three hoeings harvest in August or September. In South Persia (Fars) early in April the seed is put in a wet cloth or a pit and left for some 36 days to sprout, then into a bed till the seedlings are well up where they are finally transplanted into large squares and kept regularly flooded till the end of September, when water is cut off; cutting takes place in late October and the stalks are then put under the feet of cattle for the paddy to be separated. The yield in some southern districts is given as high as 60-fold, but is generally from 15 to 20. Prices in the south of Persia are about 26s. 8d. per cwt. for the best quality ("*champa*") and less than 20s. for second grades.

Other cereals grown as "summer crops" (*saifi*) for local consumption are: maize (*Zea mays*), sown at the end of May and harvested in September: beans (*Faba vulgaris*): lentils (*Ervum lens*): millet or sorgo (*Sorghum vulgare*). Peas (*Pisum sativum*) are grown as a winter crop (*shitwi*).

Among agricultural products for commerce are:—

Opium.—From 1880 cultivation greatly increased with the demand from the Far East, both landowners and peasants finding it more profitable to put part of their corn-land under poppy (*Papaver somniferum*, L. var. *album* D.C.). It has become one of the chief methods for financing the payment of imported goods by merchants, for in the districts of production the opium season releases large sums in cash, which, passing through a number of hands—cultivator pedlars, petty merchants, brokers or landowners—till the opium reaches the merchant and is paid for by bills on the ports or abroad, enable purchases of all kinds of goods to be made and impart activity to trade. The export of the prepared drug weighed 770,516 lb. in 1913–14: 875,166 lb. in 1914–15 and, after falling to 255,697 lb. in 1921–22, rose again to 660,647 lb. in 1922–23, 1,077,290 lb. in 1924–25 and 1,130,057 lb. in 1925–26. (The prepared drug includes *gunjideh* gum, and other solvents used for adulterating opium to the percentage of morphine desired.) This represented an export invoice value of £698,416 in 1913–14, £1,565,121 in 1925–26. The crude sap coming under government excise control in 1923–24 weighed 1,340,000 lb., but the Persian Government estimated that total production in that year was not less than 1,950,000 lb. Though a proportion is doubtless smuggled, consumption in the country mainly accounts for this difference, between 5 and 10 per cent of the population in the interior being reckoned as addicts to opium smoking.

Cotton (*Gossypium herbaceum*) is grown, in nearly all provinces of Persia for home consumption (and the total production has been estimated as high as 30,000 tons), but for export preponderantly on the Caspian seaboard, and in the Khorassan, Isfahan and Yazd provinces. In the year 1925–26, 17,728 tons, of which eleven-twelfths to Russia, one-twelfth to British India, were exported. It is too short in the staple, too weak and uneven in quality, and contains too many impurities owing to the absence of ginning machinery, to find a market in western or central Europe. An American variety, acclimatized in Asiatic Russia, has been introduced to Khorassan of recent years, and experiments have been made since 1925 in Fars with American cotton acclimatized in Iraq. It is sown after the danger of frost is considered past, *i.e.*, from the end of March to early May, flooded by surface irrigation water about six times, and picked from October to November, according to the climate of the province.

Dried and fresh fruits form an important export and source of wealth to the country. In the year March 1925–26 the Customs gave the total weight as 88,811 tons, of a total approximate value of £1,762,090. Of this Russia took 26,370 tons of dried raisins, 4,094 tons of dried apricots, 2,752 tons of oranges and limes, 1,853 tons of almonds and other nuts, 3,102 tons of other fresh or dry fruit; while 43,709 tons of dates were exported, from Khuzistan province almost entirely, to the British Empire and Protectorates, and 2,280 tons of almonds and pistachio nuts. Scientific fruit-growers in Europe think that the parents of many of the cultivated fruits of Europe are to be found in north Azerbaijan and the Caucasus region; but little or no attempt through the centuries has been made to improve stocks by grafting.

The vine grows well in all regions except the Gulf littoral and, apart from the exports of raisins mentioned above, there is a very large consumption in the country of the fruit in the fresh or dried state. The making of wine (and of arak, a spirit distilled from grapes), forbidden to Muslims, is limited to the requirements of the country, chiefly the Jewish and Armenian communities: it probably has not increased much since 1666 when Tavernier, the French traveller, noted that the wine of Shiraz (the best-known in Persia, almost entirely made nowadays from grapes of the Khullar district) weighed 200,025 mans.

Silk.—The mulberry is grown for sericulture chiefly in Gilan and Mazandaran, to a lesser extent in Yazd and Kashan. In the 16th and 17th centuries the finding of a market for the silk trade of Persia was a source of preoccupation and profit for the Safavi monarchs, and up to 1860 the total production annually was valued at £1,000,000. The breeding of silk-worms from 1864–1890 declined to small proportions (about 90 tons of cocoons) owing to the disease "pebrine"; but, at the end of the 19th century, an import to Gilan of selected silk-worm eggs from Brusa in Turkey led to a revival of the industry, the output of dried cocoons in 1911 being nearly 1,700 tons, while in the year 1925–26 some 216 tons were exported, chiefly to Italy and Russia, besides about 1,000 tons of raw floss and waste silk. One factory for spinning silk exists at Resht. The hand weaving of silk carpets and other stuffs in Kashan, Yazd and other places accounts for the balance production. "Pebrine" is considered to have died out, but another disease "flacherie" is endemic.

Wool.—In a country where the rearing and maintenance of flocks of sheep is the principal occupation of the nomad tribes in particular and of the peasantry in general it is perhaps remarkable that the export of raw wool did not exceed 5,420 tons in 1925–26. But the explanation is to be sought in the requirements of the carpet-weaving industry, which in addition to home needs in that year exported 3,840 tons of non-aniline and 1,086 tons of aniline-dyed carpets and rugs, valued respectively at £2,163,765 and £449,140. In 1925–26, in order of importance, the chief centres where the exported carpets were woven, were Sultanabad, Hamadan, Tabriz, Qum, Shiraz, Kerman, Khorassan, Fars. Further, 653,043 lambskins were exported, nearly all to Russia.

Tobacco.—In recent years excise taxation and the growing habit of cigarette smoking have been responsible for the reduced acreage under cultivation of that distinct species of tobacco known as *Nicotiana Persica* ("Tambaku") for smoking in water-pipes, *i.e.*, kalians or hookahs. Some 1,028 tons were exported, almost entirely to Egypt, in 1925–26, whereas about 1885 some 4,000 tons were exported annually, and in Isfahan province alone in 1900 the crop was about 3,000 tons, and in 1911 1,500 tons. "Tutun"

(*Nicotiana rustica*) is cultivated in the Urmia and other districts near the Turkish frontier, and was introduced to Gilan about 1875; several varieties of it are now grown for cigarette smoking. "Tambaku" for export comes chiefly from Isfahan and Kashan districts; that from the Simakan, Jahrum and other parts of south and east Fars is favoured for home consumption.

Forests and Timber.—The main forest belt still existing in Persia lies on the northern slopes of the Elburz range towards the Caspian, in particular the provinces of Gilan and Mazandaran. Little use has been made of them industrially, except in the case of boxwood, which from 1865 began to be bought by traders from Russia and Europe, and from 1886–1909 was exploited to such an extent under a monopoly that the lower lands have been largely denuded of this valuable wood. The export of this, walnut and other woods has exceeded £50,000 in value in some years, though since 1920 of small account. Kurdistan, Luristan and the Bakhtiari are also well wooded in parts. South Persia, except for the northern portion of the Kuhgilu tribal district, and a few miles of dwarf oaks in central Fars, is practically de-forested, although ample supplies for the needs of towns and villages in firewood and charcoal still exist. No replacement of this cut wood by afforestation on the part of the landowners or Government is apparently taking place. Since 1926 however a German forest expert has been employed to report on these matters, and supervise the forests of Mazandaran. Trees flourishing in Persia are, among others:—Alder (*Alnus glutinosa, A. barbata, A. cordifolia*), Ash (*Fraxinus excelsior*), Beech (*Fagus sylvatica*), Elm (*Ulmus campestris, U. effusa, U. pedunculata*), Wych-elm (*U. montana*), Hornbeam (*Carpinus betulus*), Juniper (*Juniperus excelsa, J. communis, J. sabina*), Maple (*Acer campestre, A. pseudo-platanus*), Oak (*Quercus ballota, Q. castaneaefolia, Q. sessiliflora, Q. pedunculata*), Walnut (*Juglans nigra*), Tamarisk (*Tamarix*), various kinds of poplar, Jujube (*Zizyphus*), etc.

Manufactures.—The State is nowadays primarily an agricultural rather than an industrial one. If we exclude oil products, bullion and re-exports, 68% of her exports during the year 1926–27 consisted of agricultural products and only 25% of articles of home manufacture. Owing, no doubt, in a great measure to the fact that their wealth is mainly in the form of property and kind, Persians themselves cannot readily find money for investment in industrial enterprise, while practically all attempts made during the past half-century to finance Persian industries with foreign capital have ended in failure. Manufactures of gas, glass, sugar, matches, and cotton textiles have all been tried but have all succumbed in turn from one cause or another. It is encouraging however to note that some signs of industrial revival are now apparent. An enterprising Kazvini, who for some time has had a cotton-spinning factory in operation at Tabriz has achieved sufficient success there to enable him (in 1928) to erect works for wool-spinning in his native town; silk is being spun at Resht; a defunct cotton and wool-spinning factory has been restarted in Tehran; while a new spinning and weaving factory, equipped with German machinery, which was erected in Isfahan in 1926 is said to be turning out excellent blankets and rough cloth. It is perhaps questionable however whether it could continue to thrive but for the accord of strenuous support on the part of the Central Government, in the shape of cash and contracts and the issue of decrees making it incumbent on officials to wear home-made cloth. So much for machine made goods. The hand-made carpets and rugs of Persia which have been so famous for the last 5 centuries still constitute her most important and valuable industry and in 1925–26 were exported to the value of nearly 2½ millions sterling. Nevertheless experts are not without misgiving for the future of the industry, owing partly to the appearance of new and more accessible sources of manufacture but also, unfortunately, to the increasing employment of the aniline dye, which has done so much to harm the time-honoured reputation of the Persian carpet. Other countries, it is true, make use of aniline dyes, but with them the yarn is dyed faster and the colours are superior in quality to the crude shades of red and fuchsine which the Persian weaver is prone nowadays to use in such abundance. At the same time Chinese and Italian production is making rapid progress; Anatolia is once more becoming a serious competitor, and the looms set up in Greece by the Greek and Armenian weavers expelled from Turkish territory during the War are also beginning to make their influence felt. Another interesting industry is the calico-printing of Isfahan and the neighbourhood—Manchester calico block-printed in colours. As a rule one block-design is used for the whole piece, and the resulting prints are popular for use as summer curtains, bed-coverlets, and table-cloths. The material is also used locally for shrouds for the dead, for which purpose special designs are used bearing suitable inscriptions from the Koran. During the summer the dry bed of the Zindeh Rud at Isfahan may be seen covered with bright and freshly printed fabrics laid out to dry in the sun. Space forbids more than brief mention of several other minor arts and industries such as the pierced brass-work of Isfahan, used especially for lamps, of beautiful design; the repousse silver-work of Shiraz and Isfahan; the wood-carving of Abadeh and Gulpaigan; the mosaic and tile-work of Shiraz and Kerman; and last but not least, the beautiful decorative painting work carried out on lacquered papier-maché which the pictorial artists of Persia have found a facile medium for the expression of their art in the form of Qalamdans (reed-pen boxes), mirror backs, book-covers, Koran-stands, and such like articles; while inseparable from the Qalamdan is the finely engraved seal.

Fisheries.—The fisheries of the Persian littoral of the Caspian are a valuable asset and source of revenue to the State. In 1868 they were leased, as a monopoly, to a Russian firm, the concession being renewed for short periods from time to time until 1906 when a long extension was granted to 1925. The upheaval caused by the World War having, however, resulted in failure on the part of the concessionnaire to pay the royalties, the concession was withdrawn by the Persian Government in 1918 and leased to another Russian firm. This lease was short-lived, for the port of Enzeli (Pahlavi), which is the headquarters of the industry, soon afterwards fell into the hands of the Soviet authorities and with it the control of the fisheries. It is hoped however as the result of negotiations which have been in progress (1928) that this rich industry will shortly be restored to the control of the Persian Government.

No such concession or regularized fisheries have been in vogue in the case of the Persian shore of the Persian Gulf. Here the ordinary fishing is unrestricted, and a considerable element of the riparian population take part in the famous pearl fisheries of the Gulf, the small port of Lingah being the chief distributing centre for the Persian shore.

Roads.—The existing roads in Persia may be placed very roughly into four categories:—

(a) Metalled, *i.e.*, consisting of stones loosely thrown on the surface which the passage of transport is expected to crush into permanent condition—about 700 m.

(b) Partially metalled, *i.e.*, with a light surfacing of stone or gravel—about 1,700 m.

(c) Unmetalled tracks, but passable for light motor traffic, at most seasons, though sometimes with difficulty—about 3,300 m.

(d) Natural caravan tracks.

Till the Road-tax law was enacted in 1926, various tolls and municipal taxes were levied on merchandise in transport and supposedly spent on the roads; but in that year the various imports were replaced by a compounded road-tax leviable at the frontiers on all exports and imports, and the road administration placed under an American engineer. In 1926–27, the Persian Government spent £240,000 on the construction of new roads and £200,-000 on the repair and maintenance of existing roads. The number of motor lorries in operation had increased from 103 in 1925 to 492 in 1926 and 967 in 1927, while motor cars had increased from 529 to 1,330 in the same period. Motor transport is thus tending to replace pack transport on a few of the principal roads.

The principal constructed roads more or less suitable for heavy as well as light motor-traffic, are as follows:—

(1) Tehran–Kazvin–Resht–Pahlavi (Enzeli) = 230 m. (This road was constructed by the Russians, but ceded to the Persian Government by treaty in 1921.)

(2) Kazvin–Hamadan–Kirmanshah–Qasr Shirin = 380 m.

(3) Tehran–Hamadan, via Nubaran = 204 m.

(4) Tabriz–Julfa–Khoi = 140 m. The first section of this road runs alongside the Tabriz–Julfa railway and would lose some of its utility should the latter be put into running order.

The principal roads of categories (b) and (c), *i.e.*, lightly metalled, or unmetalled, or partly the one and partly the other, but generally passable for light motor traffic, are the following:—

(1) Tehran–Semnan–Damghan–Shah Rud–Nishapur–Meshed = 58 m.

(2) Tehran–Firuzkuh–Aliabad–Meshed-i-Sar; and Aliabad–Sari–Bandar Jaz–Astarabad.

(3) Meshed-Kuchan-Ashgabad (Trans-Caspian railway) = 160 m.

(4) Tehran–Qum–Nazar–Dalijan–Isfahan = 287 m.

(5) Isfahan–Yezd-i-Khast–Shiraz = 290 m.

(6) Isfahan–Nain–Yezd–Kerman = 400 m

(7) Isfahan–Sultanabad–Gulpaigan–Hamadan = 267 m.

(8) Kazvin–Zinjan–Mianeh–Tabriz = 270 m.

(9) Meshed–Turbet-i-Haidari–Birjand–Duzdab (Indian railhead) = 600 m.

(10) Bushire–Borasjun–Kazerun–Shiraz = 180 m.

(11) Bushire–Bandar Dilam–Hindiyan–Khalafabad–Ahwaz = 550 m. (The Khalafabad and Hindiyan rivers are crossed by pontoon bridges erected by the A P.O Co)

(12) Hamadan–Malayer–Khurramabad = 190 m.

(13) Mohammerah–Ahwaz (90 m)–Dizful (190 m.).

(14) Mohammerah–Abadan = 10 m.

Railways.—In 1892 the only railway in operation was a metre-gauge line connecting the capital with the shrine of Shah Abdul Azim 5 miles away, used solely for conveying pilgrims to the mosque. Since then there has been a measure of concrete progress. Firstly, a line 85 miles in length has been built from Tabriz to the Perso-Russian frontier, making connection at Julfa with the Russian Caucasus system. From Sofian station on this line a branch 30 miles in length takes off to the shores of Lake Urmia at Sharifkhaneh. These two sections were built by a Russian company, opened to traffic in 1916, and transferred to the Persian Government in 1921. Secondly, a short length of 7½ miles of narrow-gauge line has been brought into operation between Resht and Pir-i-Bazar on the Enzeli lagoon, whence goods are taken by water to Pahlavi Port on the Caspian. In addition to the foregoing, 104 miles of rail were laid by the Government of India during the World War from their railhead at Mirjawa to Duzdab. This is at present a part of the North-western Railway system of India, but its future, at all events as regards the portion in Persian territory, is uncertain. Another stretch of about 35 miles of narrow-gauge line was built by the Anglo-Persian Oil Company in 1923, from Dir-i-Kazineh on the Karun to the oilfields at Musjid-i-Sulaiman, but as it is privately owned and is employed only for transport to and from the oil-fields it hardly comes within the category of national railway development The history of the railway problem in Persia during the past quarter of a century does not however begin and end with the execution of the above modest projects. A considerable amount of negotiation and survey work has at any rate taken place with an eye to more ambitious schemes. Thus, in 1911 a British company, "The Persian Railways Syndicate," was formed for the purpose of constructing railways in Southern Persia, the first of which was to be a line from Mohammerah, on the Shatt-el-Arab, to connect with a line to be built under Russian auspices from Khurrumabad to Tehran via Hamadan and Kazvin, with an extension from Kazvin to Resht, which would have given through communication between the Caspian and the Persian Gulf and from Tehran to the north and south. This project was the outcome of negotiations carried on early in 1911 between the British group and the Persian Government during the regency of Nasir-ul-Mulk, the Russian representative being brought into the discussion later, in respect of that portion of the line, between Burujird and Tehran, lying within the Russian sphere of influence.

As the result a comprehensive scheme of railway construction was evolved covering the main transport routes throughout Persia, it being agreed (1) that the railways within the Russian sphere should be built with Russian capital, and (2) that the first railway to be undertaken should be that from the Persian Gulf to the Caspian, with a branch from Kazvin to Tehran, because of its greater importance in Persian eyes and the greater prospects of remunerative working which it offered. These arrangements were upset by the fall of M. Shuster, the Treasurer General of the Persian Government (*see* later, *History*) and then by the World War. In 1920, the Persian Government intimated to the Syndicate that they had now come to the decision that the most needed line for construction at the moment was one from Khanikin to Tehran, connecting with the Iraq line from Khanikin to Baghdad and so providing speedier communication between Tehran and the Mediterranean, especially in the event of the contemplated Baghdad to Haifa railway taking shape. Such a line they considered would also be of great service to Shiah pilgrims travelling to Kerbela. They asked the Syndicate to undertake the survey of this line on the same terms as in the case of the previous survey. The invitation was accepted by the Syndicate and the survey duly carried out; it is the more disappointing therefore to have to record that the services thus rendered by the British syndicate and their constantly expressed readiness to exercise their options for the execution of the projects contemplated have borne no fruit, and that even their claims for survey work done remain unsettled (1928). Meanwhile a concession for the construction of the southern line above referred to, but with its terminus on the Khor Musa instead of at Mohammerah as previously contemplated, has been given to a German-American syndicate. Preparations for construction work are understood to be in train and the prospective terminus has been officially styled "Bandar Shahpur." It is clear that the realisation of this project, traversing as it will the mountainous region of Luristan, will be no mean engineering achievement, and its execution must occupy several years, but Persia is much to be congratulated on having an important trunk railway at last in sight, which when completed will materially promote the development of her rich natural resources

Posts.—The past history of postal services in Persia has been one of considerable interest Down to 1874 there were no regular post-offices in the interior of Persia, nor indeed any at all except those maintained by the Government of India in the Persian ports of the Persian Gulf. Previous to that time, arrangements for the carriage of letters had been "farmed out," the head farmer being known as the *Chaparchi-bashi*, and letters and small parcels being conveyed by him and his agents at high and arbitrary rates and without any responsibility. But as one of the results of Nasir-ud-Din Shah's visit to Europe in 1873, two officials of the Austrian postal service were engaged (1874) and in the course of the 3 years following postage stamps were brought into use (1875) and some modest experimental services inaugurated between the capital and outlying districts. The general organisation gradually improved and in 1877, with the support of the Government of India, Persia was admitted to membership of the International Postal Union

In the meantime in 1864 on the urgent representations of its local agents the Government of India had decided, in the interests of the British communities concerned, to establish a postal service of its own between Bombay and the ports on both shores of the Persian Gulf and in Turkish Arabia, mails being conveyed under contract by the British India Steam Navigation Co , whose vessels plied regularly to the Persian Gulf ports and Basrah Under these arrangements post-offices of the Indian inland system were successively installed in the British consular agencies at Bushire, Lingeh, Bandar Abbas and Jask, British Indian stamps being used for franking the letters. On the entry of Persia into the International Postal Union the existence of these post-offices assumed a somewhat anomalous aspect, and became a fruitful source of friction with the local Persian authorities. At the same time their safe and efficient amenities had been a great boon to the British and Indian communities in the Persian Gulf and they were naturally loth to be deprived of the time-honoured privilege. However in 1920, as the result of friendly negotiations between the Indian and the Persian postal authorities, on behalf of their Governments, the British Indian offices were withdrawn.

Since the engagement of the two Austrians above mentioned Persian postal services have been administered under the supervision of European experts, and, assisted by the gradual improvement of road-communications and an increasing public demand for facilities, have made substantial progress. Thus, a weekly mail-service is in operation (1928) between Tehran and Pahlavi, and between Tehran and the rail-head of the Iraq system at Khanikin, connecting with the weekly trans-desert service between Baghdad and Beirut. An air-mail service has also been inaugurated, the German Junkers Company having taken a contract for a subsidised weekly mail service between Tehran and Pahlavi, Tehran and Bushire, and Tehran and Kuraitu (on the Iraq frontier); but this service is still in its infancy. The Tehran-Pahlavi section of the above service links up with a Pahlavi-Baku section, operated by Russians and Persians, but included, it is understood, in the contract with Junkers. From Baku the Russian air lines communicate with Moscow.

Telegraphs.—Lying, as she does, across the most direct course from Europe to India, Persia finds herself exceptionally well equipped in this respect and the history of the country in the sphere of telegraphy is one of no little interest. In addition to a net-work of some thousands of miles of local lines belonging to the Persian Government, worked by Persian telegraphists in the Persian character, for internal traffic, two important trunk lines traverse the country, owned by the Indo-European Telegraph Company and the Indo-European Telegraph Department of the Government of India, and worked by British personnel in the Roman character.

The first length of line to be constructed in Persia was a domestic one, from Tehran, 160 miles in the direction of Tabriz. This was commenced in 1859 and finished in 1862, but in the year following it was extended to the Russian frontier at Julfa, where junction was effected with the Russian system. In the same year a Convention was concluded between the British and Persian Governments for the construction of a land-line through Persia with the object of linking up the Indian and the European systems, the project being carried out by British engineers at the cost of the British Government. The alignment chosen was from Baghdad, the last station on the Turkish system, to Kermanshah, Hamadan, Tehran, Isfahan, Shiraz and Bushire on the Persian Gulf, from whence there was a cable to India But experience showed that this line was so liable to interruption that it was unsafe to rely on it for international work, and an alternative route was accordingly provided by an extension of the Turkish land-line from Baghdad to Fao, at the mouth of the Shatt-el-Arab, and the laying of a short length of cable onwards to Bushire. Communication with India was effected for the first time in January 1865 on completion of this project, but the service still failed to give complete satisfaction owing to the frequent delays which occurred in the passage of messages between India and Europe. The complaints which arose led in 1866 to the formation of committee of the British Parliament which considered various proposals put before it for the improvement of the service, with the result that the firm of Siemens and Company of London and Berlin offered to construct a double line from London to Tehran, provided that they enjoyed the effective support of H.M.'s Government. This being duly accorded the Company was able to obtain the necessary concessions from Germany, Russia and Persia for the passage of the line through their territories, and an English organisation, the "Indo-European Telegraph Company," was formed to work the section London-Tehran, while the section Tehran-Karachi, via Bushire, was undertaken by the Indo-European Telegraph Department of the Government of India. Through communication by this route was established on January 31, 1870, and worked satisfactorily. Towards the end of the century the largely increased volume of traffic pointed to the need for a supplementary line between Tehran and Karachi and accordingly in 1901 a further Convention was concluded with Persia which provided for the construction of a 3-wire line from Tehran via Yezd and Kerman to the Indo-Persian frontier at Hurmak, there to meet an extension constructed by the Indo-European Telegraph Department from Quetta. This line, which was designated the "Central Persian Line," was opened for traffic in 1907. By the terms of the current Convention, which continues until January 31, 1945, the Persian Government are entitled to the use of one of the three wires for messages between stations in Persia, while the 2 remaining wires remain available for international traffic. Revenue derived from messages originating or terminating in Persia is shared between Persia and the British organisations, while for international messages in transit a fixed royalty is paid to the Persian Government. If we except the occasional local depredations of irresponsible tribal riflemen on migration, to whom the insulators form an irresistible attraction, the telegraph lines and operating staff are treated with universal respect and goodwill by the inhabitants, while as a service the personnel have earned a deservedly high reputation as well as the gratitude of numberless travellers who have enjoyed their hospitality and co-operation when in difficulty. At the present time this modest system of 700 to 800 miles is probably as efficiently run as any line in the world.

Until 1909 the domestic lines of the Persian Government were ordinarily farmed out to individuals under contract, but since that date they have been operated directly by the Ministry of Posts and Telegraphs for the Government. There were in 1928 about 150 offices in the country with a total length of nearly 10,000 miles. Persia became a member of the International Telegraph Union as far back as 1860.

Wireless.—In the spring of 1925 a high power wireless plant purchased by the Ministry of War from the Soviet, was erected outside Tehran. This developed into "The Pahlavi Radiotelegraph Station" notified by the Persian Telegraph Administration in December 1927 to the International Telegraph Bureau at Berne, as having been installed and opened for international telegraphic correspondence. It is understood to work on the continuous wave system with a wave-length of 4,000 metres.

Telephones.—A Persian limited company has held a monopoly from the Central Government for some 25 years past for the establishment of telephone systems in the towns of Persia, except those of the Gilan province wherein telephones have been installed by a local firm. Tehran, which boasts of some 1,500 subscribers, and the other principal towns are now equipped and the service generally is being improved. In addition to these urban services communication has also been established in some localities between one town and another, but 100 miles is about the limit of distance in these cases.

The British telegraph lines are of course fitted with telephone attachments for use between control stations.

Currency and Weights and Measures.—The coinage of the country is a silver one, and it fluctuates in value according to the market price of silver.

The monetary unit is called a "Kran," with its decimal variations, of higher and lower value, viz., the "Toman" (=10 krans) and the "Shahi" ($=\frac{1}{20}$ kran). The superscription in Persian is "Yek Hazar dinar" (=1,000 dinars), a conservative employment of the ancient title appearing on the coin when first established in the country.

The subsidiary coins to the kran are the 1-shahi and 2-shahi pieces: One shahi=·05 of a kran (5 cents); two shahis=·10 of a kran (10 cents), there being 20 shahis to one kran. These are represented by a good type of nickel coin struck in Birmingham

Two-kran "Do Hazar dinar" and 5-kran "Panj Hazar dinar" silver coins are also in circulation, the 2-kran piece being more universally in demand.

The kran weighs one miscal or 71·04 grains, and is of 900 fineness, and taking silver at its present (1928) price of 26¼d. and allowing for all charges of minting, etc., it would bring the present day intrinsic value of the kran in sterling to 4·8d.

In recent years the currency has been greatly improved, a good deal of it being struck in Russia and in England, while through the good offices of the Imperial Bank of Persia in assisting the Government, the currency has been cleansed by persistent withdrawals from circulation of the short weight, short value and badly minted coins struck at the Tehran mint.

For all practical purposes there are no gold coins in circulation, though a few gold coins are specially minted each year.

Note Issue.—Supplementary to the silver coinage, a cumbersome medium of currency owing to its weight, is the note issue of the Imperial Bank of Persia. These circulate throughout all the large cities of the country in denominations of 1, 2, 5, 10, 20, 50 and 100 tomans.

Weights and Measures are not uniform throughout the country. The Tabriz maund is the unit more universally in use, and is equal to approximately 6 lb. 9 oz. or 2·970 kilogrammes. For weighing heavy solids the Kharvar (donkey load) is generally commercially used, equivalent to about 650 lb.

There are various new weights and measures under an act passed by Parliament on May 31, 1926, based on the decimal system, to be brought into force within three years of its passing, the Government to create the machinery necessary for its enforcement four months previously, by giving notice in every district of the impending change.

Finance.—Of recent years the Persian Government has devoted much attention to the reform of the methods of collection of its revenues and to the presentation of annual financial statements on the lines adopted by all European States. Considerable progress has been made in both directions, and even more would have been achieved but for frequent changes in the administration of the Ministry of Finance. Doctor A. C. Millspaugh, a U.S. citizen nominated in 1922 at the request of the Persian Government by the U.S. Government, as administrator general of Persian finances, was the third westerner to hold that office. On the expiry of his contract in 1927 his place was taken by a German citizen, who was simultaneously appointed as treasurer general.

The receipts from all sources for the year ending March 21, 1927, were officially estimated as follows:—

	Millions of krans
Direct and indirect taxes	126
Customs	92
Royalties	70
Crown domains and road taxes	49
Post and telegraphs	20
	357

Expenditure for the same period was estimated at 243 million krans, made up as follows:—

	Millions of krans
Army and police	100
Civil list	80
Public works	18
Post and telegraphs	18
Education	11
Interest on public debt	7
Municipal grants	6
Parliamentary expenses and salaries	3
	243

Receipts thus show a surplus over expenditure of 113 million krans, apart from a sum of about £1,000,000 p.a., the proceeds of a special surtax on imported tea and sugar, the proceeds of which are earmarked for railway construction.

It will be seen from the foregoing that land taxes and customs are the most important sources of revenue, closely followed by the royalties on oil paid by the Anglo-Persian Oil Co., Ltd. (16% on net profits), the total thus paid for the year 1926–1927 being nearly £1,400,000.

The re-survey of taxable areas has been attempted, but in the absence of an accurate cadastral survey and of skilled officials, little progress has been made; it is moreover open to question whether the results likely to be obtained would justify the heavy expenditure involved and the mentally unsettling effect of the operations upon the peasant population and on landowners.

The collection of land revenue has been systematised and is now effected by agents of the central Government posted throughout the country, with satisfactory results.

The Customs Department is efficiently administered by Belgians who have been in charge of this department since 1902: but the proportion of Persians appointed to responsible posts is being steadily increased.

The national debt of Persia cannot be precisely stated, as various claims arising out of the War are unsettled, but it is estimated at between 3 and 4 million pounds, or not much more than 7s. 6d. per head of the population and is being steadily reduced: the Persian Government has at all times scrupulously fulfilled its admitted obligations, and its financial status since the War has been correspondingly satisfactory. The action of the Government of the U.S.S.R. in officially cancelling the Persian debt to Russia, amounting to 32½ million gold roubles, and the large sums expended in Persia by the belligerents, including the British Government during the World War, greatly contributed to the sound financial position in which Persia finds herself to-day.

Banking.—No banking system existed in Persia till 1899 when Baron Julius de Reuter obtained a concession for a State bank. The concession primarily conveyed to the bank a monopoly of the issue of notes, and mining rights, and contained also other privileges, such as exemption from taxation, stamp duties, etc., but subject to payment by the Bank of a royalty of 6% on its net profits. In the same year the Imperial Bank of Persia was formed in London under a British royal charter with an authorised capital of £4,000,000 in £10 shares, of which £1,000,000 was issued at £12 per share and fully paid up. Despite the conditions under which it has had to conduct its business and its varying fortunes, it has continued to progress, and is the repository for the Government's funds. It has 24 branches in Persia, with its chief office at Tehran.

Other banks established in the country include branches of the New Oriental Banking Corporation at Bushire, Isfahan, Tehran and Tabriz, which were latterly (1890) absorbed by The Imperial Bank of Persia; the Banque de Prêts de Perse, a Russian institution which disappeared with the Russian tsarist régime, and although its assets (and liabilities) were handed over to the Persian Government by the Soviet as a free gift, it has never functioned under its new owners, who restyled it the Bank-i-Iran (Bank of Persia); and has confined itself to the collection of outstanding loans.

The *Bank-i-Pahlavi* formed as a convenience for Persian army officers was established in 1925, but its activities are now confined to minor matters connected with military movements and transport of mails, etc.

A National Bank is also in process of formation constituted by an act of the Majlis in May, 1927. It is to be an entirely Persian national institution, and the direction of its affairs is to be controlled by officials selected by ministers of State. A German citizen was appointed in 1928 as director.

A Soviet-owned bank, "Ruspers" is also established in Northern Persian towns, its activities being restricted to financing Russo-Persian trade. The Imperial Ottoman Bank has also some agencies in the country.

The main function of the Imperial Bank of Persia is to finance the requirements of the Persian Government and the trade of the country, both local and foreign. In this latter sphere extreme caution is necessary, in view of the special circumstances of the country. Insistence upon European standards and principles of banking has done much to improve conditions, yet there is still a great deal of room for improvement. For example up to quite recently there has been no proper safeguard for bills of exchange and no machinery exists by which an irregular bill of exchange can be noted or protested, but an improvement in this respect is foreshadowed by discussions in Parliament of a commercial code, the compilation of which has been entrusted to Continental jurists.

Commerce.—Persia was formerly a much more generally self-supporting country than at present and produced almost all she needed, leaving a surplus of certain of her products for export. Since the introduction of cheap machine-made articles, many of the home industries of Persia have languished and to-day Persia is dependent largely on external sources for the supply of many of her manufactured necessities, *e.g.*, cotton goods and yarns,

metal goods, machinery, etc. Among food commodities, largely imported, are tea and sugar. The principal exports of Persia are natural products: mineral oils, raw materials (cotton, silk, wool), fruits, opium, rice, skins and hides, gums and tobacco. Almost the only manufactured product exported by Persia is carpets. The principal centres of active trade are Tabriz, Tehran, Kermanshah, Resht, Shiraz, Kerman, Meshed and Duzdab; the chief ports are Pahlavi (Enzeli), Bushire, Mohammerah, Abadan and Bandar Abbas.

The value (in thousands of krans) of Persia's foreign trade, including oil shipments and bullion and specie, for the fiscal years ending March 20, for which complete customs statistics are available, is as follows:—

Year	Imports	Exports	Total
1911–12	570,208	420,785	990,993
1912–13	567,576	436,333	1,003,909
1913–14	647,165	455,840	1,103,005
1914–15	499,322	396,058	895,380
1915–16	464,108	377,135	841,243
1916–17	494,771	433,895	928,666
1917–18	468,066	338,714	806,780
1918–19	476,287	270,869	747,156
1919–20	629,793	367,817	997,610
1920–21	482,352	371,199	853,551
1921–22	609,775	502,045	1,111,820
1922–23	619,201	733,983	1,353,184
1923–24	681,322	768,392	1,449,714
1924–25	771,445	1,000,163	1,771,608
1925–26	881,025	1,059,390	1,940,415
1926–27 (approx.)	768,000	1,104,000	1,890,800

Excluding bullion and specie and oil shipments, the total trade of Persia amounted to 1,053,408 in 1913–14 (the year immediately preceding the War) and 1,340,969 in 1925–26.

It would be erroneous to regard this as necessarily indicating an *increase* in the volume of Persia's general trade, when the rise in prices is taken into consideration.

Table showing the *Balance of Trade* for the years 1925–26 and 1926–27 (in thousands of krans):—

	1925–26	1926–27
Imports—		
Merchandise	834,873	779,240
Bullion and specie	46,152	7,560
Total	881,025	786,800
Exports—		
Merchandise	505,983	441,386
Bullion and specie	8,719	8,264
A.P.O.C. shipments	544,688	654,350
Total	1,059,390	1,104,000
Total Trade (all categories)	1,940,415	1,890,800
Excess of *Exports* over *Imports* (all categories)	178,365	317,200
Excess of *Imports* over *Exports* (excluding bullion and specie and A.P.O.C.)	228,890	337,854

Thus if bullion and specie and oil products are excluded there is an adverse balance of trade. This adverse merchandise balance amounted in

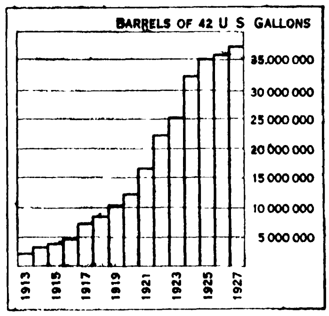
1919–20 to 442,403 krans (thousands).
1922–23 „ 313,544 „
1923–24 „ 298,827 „
1924–25 „ 286,083 „

showing in general a gradual downward tendency until 1925–26, when an upward tendency set in. It is probable, however, that Persian exports are under-valued as compared with imports, and that this adverse balance is largely fictitious.

Tables showing the principal *Articles of Import and Export*:—

Imports	Percentage of total 1926–27	Percentage of total 1925–26	Origin, in order of importance
Cotton tissues	28·1	29·5	G.Br., Br. Ind., Rus.
Sugar	15·7	15·7	Rus., Belg.
Tea	8·8	7·4	Br. Ind.
Cereals and flour	1·0	4·4	Rus., Br. Ind.
Mineral oils	4·0	2·8	Rus.
Cotton yarn	3·1	2·5	G.Br., Br. Ind., Japan
Rice	1·2	2·0	Br. Ind.
Carriages, motors and accessories	4·5	1·8	U.S.A., G.Br.
Machines, tools, iron manufs.	4·4	3·5	G.Br., Rus., Germ
Woollen tissues	2·6	1·6	G.Br., France
Exports			
Mineral oils	59·3	51·4	G.Br.,Br. Ind., Egypt
Carpets (woollen)	11·1	11·1	U.S.A., Turkey, G.Br.
Opium	8·7	6·6	Singap.,Rus.,Jap.,China
Fresh and dried fruits	2·9	7·3	Rus., Br. Ind.
Raw cotton	5·1	5·9	Rus., Br. Ind.
Rice	1·9	4·1	Rus.
Wool	2·1	2·1	Rus., Br. Ind.
Hides and skins	1·7	2·3	Rus., G.Br.
Gum tragacanth	1·3	·7	G.Br., Iraq., Rus.
Cotton tissues	·3	·6	Rus., Afgh.
Tobacco	·3	·4	Egypt

Two of the items of export call for special comment. Regarding mineral oils, although Persia possesses enormous oil resources—this product forming from 50–60% of her annual exports—the country nevertheless until recently supplied its needs almost entirely from Russia, as the difficulties and cost of transport from S. W. Persia of this commodity made it impossible to supply the markets of Central and N. Persia from Abadan. Energetic steps are now being taken by the Anglo-Persian Oil Co., with the benevolent assistance of the Persian Government, to place its products on the market in N. and Central Persia in competition with those of Russia.



GRAPH SHOWING THE PRODUCTION OF CRUDE PETROLEUM IN PERSIA
Figures for 1927 are preliminary

Next to oil production the manufacturing of carpets forms the most important of Persian industries, the export of this commodity constituting about 11% of the total export trade. The value of carpets exported amounted in 1924–25 to 101,881,000 krans, 1925–26 to 117,581,000 krans and 1926–27 to 122,563,000 krans. Despite the apparent increase in the trade during the past three years, there are indications that this special industry of Persia is meeting with increasing competition from the Indian, Chinese, Armenian and Greek productions of a similar nature. The looms set up in Greece in particular, by Greek and Armenian weavers, expelled from Turkey after the Great War, are already making their influence felt.

Table showing *Percentage of Total Trade* (including bullion and specie and oil shipments) of Persia with the principal countries:—

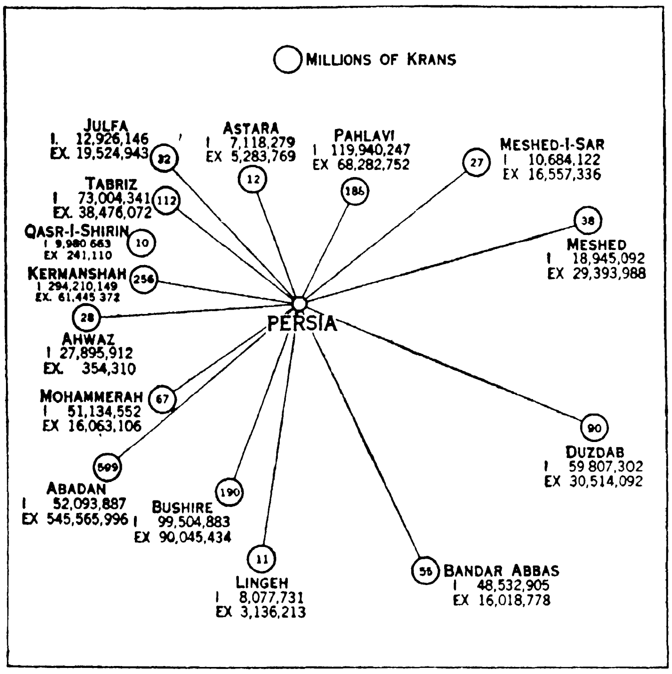
	Percentages 1926–27	Percentages 1913–14
Great Britain	32	12
India	18	9
Russia	18	60
Egypt	7	.
United States	5	1
France	4	2
Iraq	3	(Included in Turkey)
Germany	2	3
Italy	2	1
Turkey	2	5
All other countries	7	7

Thus in the year before the World War the trade of Russia reached 60% of the total trade as against 21% for the British Empire To-day the position is reversed, being British Empire 57% and Russia 18% in 1925–26, and 60% and 18% respectively in 1926–27

Table showing the *Principal Lines of Trade,* into and out of Persia, in 1925–26:—

Direction	Centre	Percentage of	
		Total trade	Excluding oil products
W.	Kermanshah	13·2	19
N.W.	Tabriz (and Julfa)	7 4	10 7
N.	Pahlavi (Enzeli)	9·7	14·0
N.E	Meshed	2·0	2·8
S.E	Duzdab (Indian railhead)	4 6	6·7
S.	Bandar Abbas	2 8	4·1
S.W.	Bushire	9 8	14·1
S.W.	Mohammerah	3·4	5
S.W.	Abadan	30	

Diagram showing the principal lines of trade into and out of Persia—with amount of imports, exports and total trade



The total *Tonnage of Trade*, in 1925–26, at all the ports of Persia, amounted to 4,241,000 tons, of which 299,000 tons represent imports and 3,942,000 tons exports. This trade was distributed as follows.—

	Imports	Exports	Total
Caspian Sea	(tons)	(tons)	(tons)
Pahlavi	79,000	55,000	134,000
Meshed i Sar	10,000	9,000	19,000
Astara	7,000	9,000	16,000
Bandar Jaz	9,000	7,000	16,000
Other ports	8,000	28,000	36,000
Total Caspian Sea	113,000	108,000	221,000
Persian Gulf			
Abadan	64,000	3,770,000	3,834,000
Mohammerah	44,000	22,000	66,000
Bushire	44,000	8,000	52,000
Bandar Abbas	14,000	5,000	19,000
Lingeh	10,000	5,000	15,000
Other ports	10,000	24,000	34,000
Total Persian Gulf	186,000	3,834,000	4,020,000
Total all ports of Persia	299,000	3,942,000	4,241,000

Excluding Abadan (the trade of which consisted almost wholly of oil shipments), the total trade, by way of the Gulf ports was 186,000 tons, as compared with 221,000 tons through the ports of the Caspian sea. The Caspian Sea trade was entirely Russian; of the Persian Gulf trade, 70% was British, the bulk of the remainder being Persian, German, and Japanese.

ARCHAEOLOGY

The fact that the archaeology of the Iranian plateau is scarcely known before an advanced period in the Iron Age is due mainly to insufficient exploration and an absence of excavation In Elam, geographically a part of Mesopotamia, but politically attached to Persia in modern times as in the 6th century B C , civilization began as early as in Babylonia, and the two countries were using related types of painted pottery before 3000 B C. Some of this Elamite pottery, found at Susa (*see* SUMERIANS) has counterparts in a district of Turkestan contiguous to the north-east frontier of modern Persia, and in Sistan on the borders of Persia, Baluchistan and Afghanistan, hence the progress of exploration may be expected to reveal traces of this very ancient culture at many places in the intervening plateau, if not in the Caspian depression.

Of life on the plateau in the third and second millennia B C , practically nothing can be stated, but it may be inferred that dissimilar physical features prevented such a development as took place in Elam, which followed in the wake of Mesopotamia Perhaps the older portions of the Avesta, which may have been composed in Northern Persia early in the first millennium, describe the conditions prevalent throughout Iran during the early Iron Age, these reveal an insecurity, resulting from an absence of large communities, which left the small settled population to the mercy of nomads and rival chieftains Significant material remains could not be expected from such a society, especially since unbaked brick and small timber would normally be used for building. A pair of fire-altars of the Zoroastrian cult, cut from the rock near Persepolis, perhaps antedate the Achaemenian period, for their mouldings offer no known parallel; the only other monuments of early type, rock-cut tombs and reliefs in the Zagros mountains which separate the plateau from Mesopotamia, might

conceivably be due to a local school of the Achaemenian age and in any case cannot be more than a few centuries older. On the routes from Mesopotamia towards the Caspian and Turkestan, already traversed by caravans and occasionally by Assyrian armies, the local chiefs were compelled to construct forts on patterns supplied from Nineveh, but of neither of these nor of the market-towns along the roads have traces yet been found. Fortified hill-tops, such as are frequently seen in Persia, must go back in many cases to remote antiquity: they were used in the Bronze Age by the megalithic people of the Caspian basin, but on the plateau the one familiar example is the fortress at Pasargadae, known as the *Takht-i-Suliman* or Throne of Solomon, which has been attributed to Cyrus but must have been built later in the Achaemenid dynasty or during the Hellenistic Age, because the regularity of the masonry indicates Greek influence of about the fourth century.

It is questionable whether there survives so much as a description of any work of the short-lived Median empire, which grew up in the Assyrian sphere of influence in North Persia, but the monuments of its Achaemenid successors are very numerous and represent practically every reign (550–331 B.C.). Two buildings at Pasargadae bear the inscriptions of a King Cyrus, almost certainly to be identified with Cyrus the Great, founder of the Persian empire, not with the ambitious prince in whose rebellion Xenophon took part. An oblong hall, supported by pillars, forms the main feature of each building, while small rooms or towers projected at the corners and were connected by pillared porches. The walls themselves were of mud brick, although stone was used for the foundations, for the pillars, for the door-ways and for tall blocks at the corner of each room, which are notched at the top to contain the beams of the wooden ceiling. No evidence exists for the presence of an upper storey in any Achaemenian building, indeed the exceptional slimness of the columns would render it impracticable; the roofs must have been flat, being formed no doubt of a thick bed of compressed earth, in accordance with the local conditions. The king must have required far more accommodation for his large retinue of servants and clerks, his harem and his guards, and these were doubtless housed in buildings entirely composed of mud-brick and therefore easily destroyed through the action of the weather, leaving only the stone portions of these two palaces, intended respectively for private business and for public audiences.

In shape the ruins bear a certain relation to the *bit hilani* or pillared house of Syria and Asia Minor, sometimes adopted by the Assyrians, but the type may possibly have been indigenous to the wooded hills of Anshan, the original principality of Cyrus. One of his palaces at Pasargadae was lined with a dado of carved slabs, the few scraps of which appear to represent foreigners bringing tribute to the king; both dado and subject are almost invariable features of the Assyrian palace. One side of a doorway is occupied with a relief of a winged genius, whose head bears a crown imitated from that of Egyptian deities; here again the composition and details have a clear similarity to Assyrian work, while the dress is identical with that worn by the last Elamite king on the Assyrian reliefs of the late seventh century, and by figures in the rock-carvings of the Zagros mountains. The inscription cut above the figure, "I, Cyrus, the king, the Achaemenid," misled former scholars into the belief that the sculpture was a portrait, but the formula recurs in various parts of both ruins and, like the similar inscriptions in Mesopotamia, refers merely to the author of the buildings.

The tomb of Cyrus, also at Pasargadae, was doubtless constructed during his lifetime. In a small court, surrounded by pillared cloisters, stands a stepped platform, surmounted by a little gabled building that resembles Lycian tombs in western Asia Minor, which in their details display Greek influence. It is, therefore, not surprising that the base, with horizontal flutings, of one of the columns of the cloister, resembled to a certain extent a type used at Ephesus, in the temple begun with the help of Croesus but probably completed during the reign of Cyrus. Professor Herzfeld, who minimises the Greek influence in Persia, has recently claimed that the only foreign elements in the tomb come from eastern Asia Minor or from the north; but it is impossible to deny that the Persian work offers fewer analogies to the scantily known architecture of those regions than to the architecture of western Asia Minor, the sphere of Greek influence. This remark applies also to the so-called fire-temples of Pasargadae and Nakht-i-Rustam (near Persepolis), tall, rectangular buildings of yellow limestone, supplied with a doorway and two tiers of blind windows in black limestone; the interior contains a small chamber, presumably for sepulchral purposes, since neither light nor air could be admitted except through the door, which was carefully constructed so that when closed it hermetically sealed the chamber. The two-colour scheme, reproducing the effect of brick and wood, characterises the buildings of Cyrus, so that these tombs may be assigned to Cambyses or other members of the family of Cyrus.

Darius commemorated his stormy accession by a great inscription and relief carved, perhaps in 516, upon the cliff at Behistun (Bisitun), near the scene of one of his victories. He is shown, attended by two nobles at his back, planting his foot upon the prostrate body of the Magian, behind whom comes a line of nine other rebels, standing in chains; the last, a Scythian wearing a tall, pointed hat, was carved later than the others, obliterating part of the inscription. The symbol of the god Ahuramazda, which floats in the air above the prisoners, is carved after the manner of the Assyrian Asshur, and many of the other details as well as the plan of the whole relief, are purely Assyrian. But the figures project further from the background, so that the forms require more rounding than was necessary in Mesopotamia, while the region of the eyes and the folds of the drapery are rendered in a more naturalistic style than had ever been seen in these countries. The nearest parallel to the drapery over the legs of Darius and his nobles occurs in a column-base from the temple at Ephesus, and the evident attempt to vary the facial types of the personages may likewise be due to Greek influence.

Later in his reign, Darius began the construction of a new capital at Persepolis, lower down the valley of the river which flows past Pasargadae. A low spur of rock, that projects into the valley from the bounding range of hills, was levelled into three terraces and strongly fortified. The buildings which arose upon the platform were composed, like the palaces of Cyrus, of unbaked brick reinforced with stone, but differ from them in many particulars. Thus the two-colour scheme is abandoned; the pillared rooms are square instead of oblong and much larger than those at Pasargadae (the Hall of the Hundred Columns actually measures two hundred and twenty-five feet in each direction); small rooms are interpolated round the main hall, in the palace for private audiences; walls had no dado of carved slabs but were broken by stone windows and by niches of the same size and shape, which served as cupboards or tables; doorways bear the feather-crowned cornice characteristic of Egyptian work, instead of a simple, flat-faced dripstone; the columns have their shafts invariably fluted instead of smooth, their bases and caps have elaborate floral ornaments, and they terminate in a heavy member topped by the fronts of two kneeling bulls, set back to back —a motive that occurs in older bronzes from Armenia, as a pedestal for figures of deities, while complete winged bulls seem to have been used in Assyria for the bases of columns. The palaces had ceilings of cedarwood, carried on thick baulks that rested on the backs of the bulls; the ends of the beams penetrated to the exterior of the building, and on the cornice above these ran a frieze of lions.

Sculpture within the palaces was otherwise confined to the door-jambs, on which the king is seen enthroned, walking or standing with his attendants, or unconcernedly stabbing a rampant monster in the traditional pose of Mesopotamian art. Greek influence was perhaps responsible for a change in the carving of the beard during the reign of Darius; at Behistun the king's beard is represented frontally on a profile head, following the Assyrian convention, while at Persepolis both are invariably seen in profile like the rest of the figure. Magnificent double staircases placed flat against the walls—an architectural innovation—are lined with a number of figures of the royal guards and also of several

foreign subjects bringing tribute (*see* Dress), in rows preceded by panels of an allegorical scene of a lion killing a bull. There remain at Persepolis, it is said, 1,200 figures, all monotonously applied to these few subjects, and although a space of 150 years intervenes between the earliest and the latest reliefs the difference in style is insignificant. The increase of Greek influence—official approval of which is now guaranteed by the statement that the sculptor Telephanes was employed by Darius and Xerxes (presumably the first two kings of those names)—results in greater grace and delicacy in the reign of Xerxes, to whom most of the buildings probably owe their construction or at least their completion The main gateway, guarded by pairs of enormous human-headed bulls at either side, bears only the name of Xerxes: it should also be noted that on the winged monsters of the east side the tips of the wings curl upwards, as in the art of Asia Minor and Greece, whereas the Assyrian colossi, which in other respects they so closely resemble, have straight wings.

Some of the buildings carry no inscriptions, perhaps because the death of a king left them incomplete, and it is therefore possible that these fill the gap of 465–358, between Xerxes and Artaxerxes III, the only other king whose works can be identified His name appears on a palace, with reliefs distinguished merely by their crudity, as well as on a staircase, bearing excellent reliefs, which was added to the side of a palace begun by Darius and continued by Xerxes, in the latter instance the sculptures possibly antedate the inscription by several generations.

The palace at Susa, built by Darius and rebuilt by Artaxerxes II. (404–358) after a fire, contains friezes in glazed and coloured bricks of lions, monsters and archers, reaching in the human figures a fairly high standard, but lacking the freshness of the best work at Persepolis, which indeed at the time of Xerxes had no peer in the world, but was soon eclipsed by the over-naturalistic work of Greece and declined rapidly throughout the fourth century Incidentally the Elamites had used glazed bricks at Susa, in other respects Mesopotamian influence in Persian art was derived from Assyrian rather than Babylonian sources, in spite of the fact that the Assyrian empire fell before the Medes, but the Babylonian empire before the Persians themselves. Whether or not the Median empire acted as an intermediary cannot yet be decided, and the states of Elam and Anshan may be suggested as an alternative; the Elamites are known, from an inscription of Assurbanipal, to have followed the Assyrian custom of placing guardian monsters at the gates, but in other relevant points the arts of these kingdoms remain obscure.

Further evidence of the decay of Achaemenian sculpture is obtained from the rock-cut tombs of the kings Of those at Nakht-i-Rustam near Persepolis, one bears the inscription of Darius, while the remaining three are usually connected with the names of his immediate successors, while the three similar tombs in the cliff behind the platform of Persepolis doubtless belong to later members of the dynasty and their sculptures exhibit inferior qualities In every case the central part of the sculpture, 60 ft in width, represents the façade of a palace, and above (as though upon the roof) is set a dais, supported by figures of subject races, upon which the king worships the gods, whose presence is indicated by the symbol of Auramazda and the Moon The interiors of the tombs are simple chambers with niches cut in the rock for the reception of bodies: but a skeleton has been found at Susa buried in a bronze tub and, from the Greek accounts of his tomb, the same practice seems to have been followed in the burial of Cyrus

Apart from the royal remains, nothing is known of the buildings of the age; houses must all have been of mud brick and it is questionable whether any temples existed The only private sculptures of the age are a couple of reliefs found near the capital of the satrap of northern Asia Minor The Achaemenid art was essentially dynastic, not national, confined to the king and his courtiers. The same condition extends to the minor arts; the gold and silver ornaments and vessels (such as comprise the British Museum's "Treasure of the Oxus"), the stone vases, the engraved gems, are all luxuries suited only to the houses of rich nobles. Here again, as in architecture and sculpture, Persian art reveals itself as a modification of Assyrian art, with elements drawn from Egypt and Asia Minor, and a varying measure of Greek influence in the style.

In some statuettes from the Oxus treasure the Greek influence is overwhelming, but these may be later than the destruction of the Achaemenid empire by Alexander, which brought with it the eclipse of Asiatic art. In Syria and north India, however, the Achaemenian palace was imitated during the Hellenistic age, while in Mesopotamia and Persia it was ignored in the fashion for Hellenism. Apparently under both Macedonian and Parthian rule, a Hellenistic style was adopted in Persian buildings, and in the Parthian rock-carvings of Behistun Hellenistic methods are applied to oriental subjects of royal glorification. no other sculptures of the Parthian age have been discovered in Persia, except a couple of satyr-heads by a Greek sculptor, which may have belonged to one of the numerous Greek settlers The art of the Parthian period has left more traces in Mesopotamia where lay the capital of the empire; in Persia itself there is obscurity

The Sassanids restored Persia to its former predominance in western Asia, with the result that art flourished once more within the borders of their ancestral principality. The traditions of the Parthian empire were, however, retained under the new rulers and it is possible that among the great mass of "Sassanian" material are included a few objects which in reality should be described as Parthian; this claim has been advanced both for buildings and for some pieces of silver plate Since the Sassanid monarchy was modelled on the Achaemenid, the main features of the Persepolitan palace were preserved—the great hall for public levées, the hall for private audiences with small adjacent offices—but these features were united into one and the same building. Moreover the method of construction was radically different from that of the pre-classical period; instead of mud-brick walls, carrying flat mud roofs on wooden ceilings, walls of small-cut stones or burnt bricks bound with mortar, carried barrel-vaults over the offices or corridors, and domes over the halls The barrel-vault had already been employed on a grand scale in the palace at Hatra, which dates from the first or second century A D The development of the dome is still obscure but it seems to have proceeded in the east rather than in the west the Pantheon in Rome has a hemispherical roof, constructed on the lines of a barrel-vault, over a building itself following the same curve, while the use of the dome over a square chamber was apparently a Sassanian invention.

The chronology of "Sassanian" buildings has been much disputed; indeed the two great ruins on Persian soil, the palaces at Firuzabad and Sarvistan, were described by Dieulafoy as Achaemenian, and the theory has not yet been completely abandoned in all quarters, although it is generally modified to a suggestion of Parthian date On archaeological grounds neither building can reasonably be ascribed to a period earlier than the palace at Hatra, and a date in the third century is more plausible. No sound objection can be reared against the view that Firuzabad was built by the first Sassanid king and that Sarvistan shows a further development of the same plan In the former, a large vaulted entrance flanked by side chambers, forms a block, which is connected with a triple row of domed rooms and these in turn lead to the small rooms that surround the great court The blank external walls are relieved by arcades and pilasters, of no structural import, as at Hatra and in Roman Syria, while arched doorways and niches break the line of inner walls, and a cornice with the Egyptian cavetto rises incongruously over the arch to emphasise the resemblance to Persepolis At Ctesiphon, in the palace built during the next reign, the entrance again serves as audience-hall, but at Sarvistan a shallow porch communicates with the great domed hall and this again leads into a court behind, while the smaller rooms to right and left form separate entities, which communicate with the outside as well as with the central block. The result has more the character of a residence than has Firuzabad, which might serve in case of need as a fortress

The walls bore no ornaments except perhaps of stucco or

other applied work; legend says that the walls of Ctesiphon were encrusted with precious stones, suggesting that some kind of coloured ornamentation, perhaps friezes, were present. Persian influence may be traced in pictures in the caves of Chinese Turkestan and presumably that influence was directly pictorial. Statues must have been as rare as under the Achaemenids and in the normal course of events Muslim prejudice would prevent their survival; indeed a statue near Shapur, the colossus of a standing king, is the sole example. There remain a few statuettes attributable to the Sassanian period but the characteristic sculpture of the epoch was the rock-cut relief, in which as in other forms of art the relationship to Achaemenian work is noticeable; moreover the carvings of the Sassanids were sometimes placed next to monuments of the earlier dynasty with the deliberate intention of provoking comparison. For instance, a relief of the first king, Ardashir is cut in the cliff of Nakht-i-Rustam, which holds the tombs of Darius and his successors. Here the god Auramazda (on the right) hands the king the symbol of sovranty, a large ring tied round with ribbons; a servant holds a fly-whisk over the king's head. Beneath the feet of each horse is a human figure, that on the right representing Ahriman, the Evil Spirit, the other the last of the Parthian kings. This relief, though less adept than later works, yet exemplifies most of the virtues and defects of Sassanian sculpture; in monumental power the style has had few rivals, but it suffers from laboured symmetry, heaviness, and a lack of grace in the minute details, in which, as with the coins and gems, the mixed classical and oriental art of the Parthians enjoys a renaissance after the Achaemenian model. The limitations of artists' knowledge led to distortions of the human body, though it is questionable whether these have a deleterious effect; thus the figure is represented in profile though the breast and the eye are seen from the front. The style grew more naturalistic with time, the more obvious errors being corrected: this was largely due to Roman influence, which rapidly becomes very marked; portions of the reliefs depicting the capture of the emperor Valerian, in 260, might even be mistaken for classical work, and lend colour to a legend that Roman prisoners were employed on the royal monuments.

Towards the latter end of the third century, sculpture reached its acme, simultaneously with the coins. Reliefs of the middle of the dynasty are inclined to be traditional and have less merit, but an interesting theory traces in some battle-scenes the influence of China, a country with which Persia had come into close contact through a mutual interest in the silk trade. Remarkably pictorial in treatment is the latest group of reliefs, cut by order of Khosru II. (590–629), in which an Indian influence seems to have provoked the large landscape scenes, while debased classical elements are conspicuous in other panels; the latter have parallels in the paintings of Chinese Turkestan and were probably derived from the Gandharan or Bactrian art of this region, instead of from the Mediterranean world, where they had long since passed out of fashion. Although contemporary coins are deplorable, the details of these reliefs are excellently carved; they give in particular much information as to the fine vestments worn by the Sassanians.

Muslim historians tell of a magnificent tapestry at Ctesiphon, but such work survives only in small scraps, which bear designs of flowers and animals (more or less fantastic), scenes of the king at the chase or in battle, etc. These silk tapestries travelled to the ends of the known world, to both the Merovingian and the Chinese courts, and were much imitated abroad. Equally wide was the vogue for Sassanian plate, showing the exploits of king Bahram Gur (420–438): the old treasuries of Europe contain other pieces, south and east Russia is full of such work, and it seems to have been extensively imitated round the Caspian sea, while a Persian shape of jug was adopted in eastern Asia. After the Muslim conquest, the manufacture of plate and textiles continued without appreciable alteration; moreover Sassanian motives were taken into the arts of nearly every region of the east and long survived the dynasty. Thus the characteristic recumbent animals, enclosed in the curling tendrils of plants, were used in the Caliphs' palace at Samarra, the Sassanian type of bird was adopted both in 'Iraq and in Chinese Turkestan. Turkish patterns have their exact Sassanian prototypes, and in many respects the decorative work of Persia has remained unchanged. Sassanian influence reached Europe when naturalism had ceased to satisfy, and the development of the Byzantine school must have been stimulated by contact with its formal ideals, while the Byzantine architects followed the Persians in the use of the dome.

HISTORY

A.—ANCIENT, TO THE FALL OF THE SASSANID DYNASTY

The Name.—"Persia," in the strict significance of the word, denotes the country inhabited by the people designated as Persians, *i.e.*, the district known in antiquity as Persis (*q.v.*), the modern Fars. Custom, however, has extended the name to the whole Iranian plateau; and it is in this sense that the term Persia is here employed.

Ancient Ethnography.—In historical times we find the major portion of Iran occupied by peoples of Indo-European origin, terming themselves Aryans (*Arya;* Zend, *Airya*) and their language Arvan—so in the inscriptions of Darius—the same name used by the consanguineous tribes of India who were their nearest relations. The whole country is designated Ariana (Zend, *Airyana*) —"the land of the Aryans"—the original of the Middle-Persian *Eran* and the modern *Iran;* the Greek geographers Eratosthenes and Strabo were in error when they limited the name to the eastern districts of Iran. Thus the name of Iranians is understood to comprehend all these people of Aryan nationality.

Besides the Iranians, numerous tribes of alien origin were found in Iran. In Baluchistan, even yet, we find side by side with the eponymous Iranian inhabitants, who only penetrated thither a few centuries ago, the ethnologically and philologically distinct race of the Brahui, who are probably connected with the Dravidians of India. In them we may trace the original population of these districts; and to the same original population may be assigned the tribes here settled in antiquity: the Paricanii and Gedrosii (Gadrosii), and the Myci (Herod. iii. 93, vii. 68; the *Maka* of Darius, the modern *Mekram*), to whom the name "Aethiopians" is also occasionally applied (Herod. iii. 94, vii. 70). In Media the Greek geographers mention a people of Anariacae (Strabo xi. 508, 514; Pliny, *Nat. Hist.* vi. 48; Ptolem. vi. 25; in Polyb. v. 44. 9, Ἀνιαρακαι) *i.e.*, "Non-Arians." To these the Tapuri, Amardi, Caspii, and especially the Cadusii or Gelae—situated in Ghilan on the Caspian—probably belonged. In the chain of Zagrus we find, in Babylonian and Assyrian times, no trace of Iranians; but numerous smaller tribes that we can refer to no known ethnological group, *e.g.*, the Gutaeans and Lulubaeans, the Cossaei and in Elymais or Susiana the Elymaeans (Elamites).

That the Iranians must have come from the East to their later home, is sufficiently proved by their close relationship to the Indians, in conjunction with whom they previously formed a single people, bearing the name *Arya*. Their residence must have lain chiefly in the great steppe which stretches north of the Black sea and the Caspian, through South Russia, to Turan (Turkestan) and the Oxus and Iaxartes. For here we continually discover traces of Iranian nationality. The names and words of the Scythians (*Scoloti*) in South Russia, which Herodotus has preserved, are for the most part perfectly transparent Iranian formations, identified by Zeuss and Müllenhoff; among them are many proper names in *Aria-* (Αριο-) and *aspa* (-horse, -ασπος; Zend, *aspa*). The predatory tribes of Turan (*e.g.*, the Massagetae) seem to have belonged to the same stock. These tribes are distinguished by the Iranian peasants as Daha (Gr. Δάαι), "enemies," robbers"; by the Persians as Sacae; and by the Greeks generally as Scythians.

From the region of the steppes the Aryans must have penetrated

into the cultivable land of Eastern Iran: thence one part spread over the district of the Indus, then on again to the Ganges; another moved westward to Zagrus and the borders of the Semitic world.

The date of this migration cannot yet be determined with certainty. We know only that the Aryans of India already occupied the Punjab in the Vedic era, *c.* 1600 B.C. On the other hand, Aryan names appear at first in contemporary documents from the 16th century downwards in Mesopotamia and Syria. In the kingdom of Mitanni (in northern Mesopotamia) the Aryan origin of the dynasty is proved by the names of the kings (Artatama, Shutarna, Artasumara, Dushratta); in a treaty the Indian gods Mithra and Varuna, Indra and the Nasatyas are invoked by the side of the Mitarnian gods, and in the archives of Boghazkeui a book on Norse races written by a Mitarnian, named Kikkuli, has been found, in which Indian numerals and other Indian words are used. Among the dynasts of Syria and Palestine whose correspondence to their sovereign, the Pharaoh of Egypt, is preserved in the archives of Tel-el-Amarna (about 1400 B.C.), many bear Iranian names, *e.g.*, Artamanya, Arzawiya, Shuwardata, and their portraits are represented in Egyptian reliefs (*e.g.*, in the tomb of Haremhab, now in Leyden), and whose features are of an European character, totally different from those of the Semites and of the Hittites. Later still, in the Assyrian inscriptions we occasionally meet with Iranian names borne by North-Syrian princes—*e.g.*, Kundaspi and Kustaspi (=Hystaspis).

It appears, then, that towards the middle of the second millennium before Christ, in the time of the Hyksos empire, Indian and Iranian tribes made a great forward movement to the West, at first probably in the rôle of mercenaries. In the Egyptian and Hittite texts they form a ruling military class under the Aryan name "Marianni" *i.e.*, warriors. Some of their leaders founded principalities of their own in Mesopotamia, Syria and Palestine, much as did the Germans under the Roman empire, the Normans, Turks, etc. With this we may probably connect the well known fact that it was about this very period (1700 B.C. approximately) that the horse made its appearance in Babylonia, Egypt and Greece, where for centuries subsequently its use was confined to war and the war-chariot. Before this it was as foreign to the Babylonians, even in the time of Khammurabi, as to the Egyptians under the XIIth Dynasty. On the other hand, it had been familiar to the Aryans from time immemorial: indeed they have always been peculiarly a people of riders. Thus it is quite conceivable that they brought it with them into Western Asia: and the quarter from which it came is sufficiently indicated by the fact that the Babylonians write the word "horse" with a group of signs denoting "ass of the East."

These Aryan warriors and dynasts in the West were extirpated in the many wars with the Egyptians, Hittites and Arryrians, or absorbed by the native population. At the same time, the great highland of Iran was occupied by the Iranians. They are divided into numerous tribes: these, again, being subdivided into minor tribes and clans. The principal, according to the inscriptions of Darius—which closely agree with Herodotus—are the following, several of them being also enumerated in the *Avesta*:—

1. The Medes (*Mada*) in the north-west (*see* MEDIA)

2. The Persians (*Parsa*) in the south (*see* PERSIS). To these belong the Carmanians and the Utians (*Yutiya*), who are mentioned expressly by Darius as inhabiting a district in Persis (*Beh.* III. 40).

3. The Hyrcanians (*Varkāna* in Darius, Zend *Vehrkāna*) on the eastern corner of the Caspian, in the fertile district of Astarabad

4. The Parthians (*Parthyaei;* Pers. *Parthava*) in Khurasan (*see* PARTHIA).

5. The Arīans (Ἀρεῖοι, Pers. *Haraiva*), in the vicinity of the river Arius (*Heri-rud*), which derived its name from them. This name, which survives in the modern Herat, has of course no connection with that of the Aryans.

6. The Drangians (*Zaranka* in Darius, *Sarangians* in Herod. ii. 93, 117, vii. 67), situated south of the Arians, in the north-west of Afghanistan (Arachosia) by the western affluents of Lake Hamun, and extending to the present Seistan.

7. Arachotians (Pers. *Harauvati*), in the district of the Helmand and its tributaries round Kandahar. They are mentioned in the lists of Darius and by the Greeks after Alexander. In Herodotus their place is taken by the Pactyans, whose name survives to the present day in the word *Pushtu*, with which the Afghans denote their language (Herod. iii. 102, iv. 44, vii. 67, 85). Probably it was the old tribal name, Arachosia being the local designation. The Thamanaeans, who appear in Herodotus (iii. 93, 117), must be classed with them.

8. The Bactrians (Pers. *Bākhtri*), on the northern declivity of the Hindu Kush, as far as the Oxus. Their capital was Bactra, the modern *Balkh* (*see* BACTRIA).

9. The Sogdians (Pers. *Sugudu*), in the mountainous district between the Oxus and Iaxartes.

10. The Chorasmians (Khwarizmians, Pers. *Uvarazmiya*) in the great oasis of Khiva, which still bears the name Khwarizm. They stretched far into the midst of the nomadic tribes.

11. The Margians (Pers. *Margu*), on the river Margus (Murghab); chiefly inhabiting the oasis of Merv, which has preserved their name. Darius mentions the district of Margu but, like Herodotus, omits them from his list of peoples; so that ethnographically they are perhaps to be assigned to the Arians.

12. The Sagartians (Pers. *Asagarta*); according to Herodotus (vii. 85), a nomadic tribe of horsemen; speaking, as he expressly declares, the Persian language. Hence he describes them (i. 125) as a subordinate nomad clan of the Persians. They, with the Drangians, Utians and Myci, formed a single satrapy (Herod. iii. 93). Ptolemy (vi. 2, 6) speaks of Sagartians in the Eastern Zagros in Media.

13. We have already touched on the nomadic peoples (*Dāha, Dahans*) of Iranian nationality, who occupied the steppes of Turkestan as far as the Sarmatians and Scythians of South Russia (about 700 B.C.). That these were conscious of their Aryan origin is proved by the names Ariantas and Ariapeithes borne by Scythian (Scolot) kings (Herod. iv. 76, 87). Still they were never counted as a portion of Iran or the Iranians. To the settled peasantry, these nomads of the steppe were always "the enemy" (*dana, daha,* Δάαι, Dahae). Side by side with this name we find "Tūrān" and "Turanian"; a designation applied both by the later Persians and by modern writers to this region. The origin of the word is obscure, derived perhaps from an obsolete tribal name. It has no connection whatever with the much later "Turks," who penetrated thither in the 6th century after Christ. Though found neither in the inscriptions of Darius nor in the Greek authors, the name Turan must nevertheless be of great antiquity; for not merely is it repeatedly found in the *Avesta*, under the form *Tura*, but it occurs already in a hymn, which, without doubt, originates from Zoroaster himself, and in which "the Turanian Fryāna" and his descendants are commemorated as faithful adherents of the prophet (*Yasna*, 46, 62).

The dividing line between Iranian and Indian is drawn by the Hindu Kush and the Soliman mountains of the Indus district. The valley of the Kabul (Cophen) is already occupied by Indian tribes, especially the Gandarians; and the Satagydae (Pers. *Thatagu*) there resident were presumably also of Indian stock. The non-Aryan population of Iran itself has been discussed above Of its other neighbours, we must here mention the Sacae, a warlike equestrian people in the mountains of the Pamir plateau and northward, who are probably also of Aryan origin. Herodotus relates that the Persians distinguished "all the Scythians"—*i.e.*, all the northern nomads—as Sacae; and this statement is confirmed by the inscriptions of Darius. The Babylonians employ the name Gimiri (*i.e.*, Cimmerians) in the same sense.

Beginnings of History.—A connected chain of historical evidence begins with the time when under Shalmaneser (Salmanassar II.), the Assyrians in 836 B.C. began for the first time to penetrate farther into the mountains of the east; and there, in addition to several non-Iranian peoples, subdued a few Median tribes. These wars were continued under successive kings, till the Assyrian power in these regions attained its zenith under Sargon (*q.v.*), who (715 B.C.) led into exile the Median chief Dayuku (*see* DEIOCES), a vassal of the Mini (Mannaeans), with all his family, and subjected the princes of Media as far as the mountain of Bikni

(Elburz) and the border of the great desert. At that time 28 Median "town-lords" paid tribute to Nineveh; two years later, (713 B.C.) no fewer than 46. Sargon's successors down to Assur-bani-pal (668–626 B.C.) maintained and even augmented their suzerainty over Media. Not till the last years of Assur-bani-pal, on which the extant Assyrian annals are silent, can an independent Median empire have arisen.

For the history of this empire *see* MEDIA. In 612 B.C. Nineveh and the other capitals of the Assyrian empire were conquered and destroyed by Cyaxares of Media and Nebopolassar of Babylon, and the provinces divided between the victors. The Median empire extended far over Iran; the kings of Persia also became their vassals. In the west Armenia and Cappadocia were subdued by Cyaxares; in a war with the Lydian empire the decisive battle was broken off by the celebrated eclipse of the sun on May 28, 585 B.C., foretold by Thales (Herod. i. 74). After this a peace was arranged by Nebuchadrezzar of Babylon and Syennesis of Cilicia, recognizing the Halys as the borderline. In this state of equilibrium the great powers of the Near East remained during the first half of the 6th century.

The Empire of the Achaemenids.—The balance, however, was disturbed when the Persian Cyrus, king of Anshan in Elam (*Susiana*), revolted against his suzerain Astyages, the son of Cyaxares, and three years later defeated him at Pasargadae (*q.v.*)[1]. Shortly afterwards Astyages was taken prisoner, Ecbatana reduced, and the Median empire replaced by the Persian. The Persian tribes were welded by Cyrus into a single nation, and now became the foremost people in the world (*see* PERSIS and CYRUS). At first Nabonidus of Babylon hailed the fall of the Medes with delight and utilized the opportunity by occupying Harran (Carrhae). But before long he recognized the danger threatened from that quarter. Cyrus and his Persians paid little heed to the treaties which the Median king had concluded with the other powers; and the result was a great coalition against him, embracing Nabonidus of Babylon, Amasis of Egypt, Croesus of Lydia, and the Spartans, whose highly efficient army seemed to the Oriental states of great value. In the spring of 546 B.C., Croesus opened the attack. Cyrus flung himself upon him, beat him at Pteria in Cappadocia and pursued him to Lydia. A second victory followed on the banks of the Pactolus; by the autumn of 546 Sardis had already fallen and the Persian power advanced at a bound to the Mediterranean. In the course of the next few years the Greek littoral towns were reduced, as also the Carians and Lycians. The king of Cilicia (Syennesis) voluntarily acknowledged the Persian suzerainty. In 539 Nabonidus was defeated and Babylon occupied, while, with the Chaldean empire, Syria and Palestine also became Persian (*see* JEWS). The east of Iran was further subdued, and, after Cyrus met his end (528 B.C.) in a war against the eastern Nomads (Dahae, Massagetae), his son Cambyses conquered Egypt (525 B.C.). Cyprus and the Greek islands on the coast of Asia Minor also submitted, Samos being taken by Darius. On the other hand, an expedition by Cambyses against the Ethiopian kingdom of Napata and Meroe came to grief in Nubia The usurpation of Smerdis (522–521 B.C.) and his death at the hands of Darius was the signal for numerous insurrections in Babylon, Susiana, Persis, Media, Armenia and many of the Eastern provinces. But, within two years (521–519), they were all crushed by Darius and his generals.

The causes of this astonishing success, which, in the brief space of a single generation, raised a previously obscure and secluded tribe to the mastery of the whole Orient, can only be partially discerned from the evidence at our disposal. The decisive factor was of course their military superiority. The chief weapon of the Persians, as of all Iranians, was the bow, which accordingly the king himself holds in his portraits, *e.g.*, on the Behistun rock and the coins (*darics*). In addition to the bow, the Persians carried short lances and short daggers. But it was not by these weapons, nor by hand-to-hand fighting, that the Persian victories were won. They overwhelmed their enemy under a hail of arrows, and never allowed him to come to close quarters. While the infantry kneeled to shoot, the cavalry swarmed round the hostile squadrons, threw their lines into confusion, and completed their discomfiture by a vigorous pursuit. In a charge the infantry also might employ lance and dagger; but the essential point was that the archers should be mobile and their use of the bow unhampered.

Consequently, only a few distinguished warriors wore shirts of mail. For purposes of defence the rank and file merely carried a light hide-covered shield, which the infantry, in shooting, planted before them as a sort of barrier against the enemy's missiles. Thus the Persian army was lost, if heavy-armed hoplites succeeded in gaining their lines. In spite of all their bravery they succumbed to the Greek phalanx, when once the generalship of a Miltiades or a Pausanias had brought matters to a hand-to-hand conflict; and it was with justice that the Greeks—Aeschylus, for instance—viewed their battles against the Persian as a contest between spear and bow. None the less, till Marathon, the Persians were successful in discomfiting every enemy before he could close, whether that enemy consisted of similarly accoutred bowmen (as the Medes), of cavalry armed with the lance (as the Lydians), or of heavily armoured warriors (as the Babylonians, Egyptians and Greeks).

To all this should be added the superiority of their leaders; Cyrus especially must have been an exceedingly able general. Obviously, also, he must have understood the art of organizing his people and arousing the feeling of nationality and the courage of self-sacrifice In his time the Persians were a strong manly peasantry, domiciled in a healthy climate and habituated to all hardships—a point repeatedly emphasized, in the tales preserved by Herodotus, as the cause of their successes (*e.g.*, Herod. ix. 122). Herodotus, however, also records (i. 135) that the Persians were "of all mankind the readiest to adopt foreign customs, good or bad," a sentence which is equally applicable to the Romans, and which in the case of both nations goes far to explain, not merely their successes, but also the character of their empires.

Organization of Darius.—The fundamental features of the imperial organization must have been due to Cyrus himself. Darius followed in his steps and completed the vast structure. His rôle, indeed, was peculiarly that of supplementing and perfecting the work of his great predecessor. The organization of the empire is planned throughout on broad, free lines; there is nothing mean and timorous in it. The great god Ahuramazda, whom king and people alike acknowledge, has given them dominion "over this earth afar, over many peoples and tongues"; and the consciousness is strong in them that they are masters of the world. Thus their sovereign styles himself "the king of kings" and "the king of the lands"—that is to say, of the whole civilized world. For the provinces remaining unsubdued on the extreme frontiers to the west, the north and the east are in their view almost negligible quantities. And far removed as the Persians are from disavowing their proud sense of nationality ("a Persian, the son of a Persian, an Aryan of Aryan stock" says Darius of himself in the inscription on his tomb)—yet equally vivid is the feeling that they rule the whole civilized world, that their task is to reduce it to unity, and that by the will of Ahuramazda they are pledged to govern it aright.

This is most clearly seen in the treatment of the subject races. In contrast with the Assyrians and the Romans the Persians invariably conducted their wars with great humanity. The vanquished kings were honourably dealt with, the enemy's towns were spared, except when grave offences and insurrections, as at Miletus and Athens, rendered punishment imperative; and their inhabitants were treated with mildness. Like Cyrus, all his successors welcomed members of the conquered nationalities to their service, employed them as administrators or generals and made them grants of land: and this not only in the case of Medes, but also of Armenians, Lydians, Jews and Greeks. The whole population of the empire was alike bound to military service. The subject-contingents stood side by side with the native Persian troops; and the garrisons—in Egypt, for instance—were composed of the most varied nationalities.

Among the subject races the Medes particularly stood high in favour. Darius in his inscriptions always names them immediately after the Persians. They were the predecessors of the Per-

[1]*See* further, BABYLONIA AND ASSYRIA: *History*.

sians in the empire and the more civilized people. Their institutions, court ceremonial and dress were all adopted by the Achaemenids. Thus the tribal distinctions began to recede, and the ground was prepared for that amalgamation of the Iranians into a single, uniform nation, which under the Sassanids was completely perfected—at least for the west of Iran

The lion's share, indeed, falls to the dominant race itself. The inhabitants of Persis proper—from which the eastern tribes of Carmanians, Utians, etc , were excluded and formed into a separate satrapy—pay no taxes. Instead, they bring the best of their possessions (*e.g* , a particularly fine fruit) as a gift to their king on festival days; peasants meeting him on his excursions do the same (Plut. *Artax* 4. 5; Dinon ap. Aelian *var. hist* i. 31; Xen. *Cyr.* viii. 5, 21, 7, 1). In recompense for this, he distributes on his return rich presents to every Persian man and woman—the women of Pasargadae, who are members of Cyrus's tribe, each receiving a piece of gold (Nic. Dam fr. 66. Plut *Alex* 69). In relation to his Persians, he is always the people's king At his accession he is consecrated in the temple of a warrior-goddess (Anaitis?) at Pasargadae, and partakes of the simple meal of the old peasant days —a mess of figs, terebinths and sour milk (Plut *Artax* 3) The Persians swear allegiance to him and pray to Ahuramazda for his life and the welfare of the people, while he vows to protect them against every attack, and to judge and govern them as did his fathers before him (Herod i 132; Xen *Cyr.* xviii. 5, 25, 27). For helpers he has at his side the "law-bearers" (*databara* Dan iii. 2, and in Babyl. documents; *cf.* Herod iii 31, v. 25, vii 194; Esther i. 13, etc.). These—the Persian judges—are nominated by the king for life, and generally bequeath their office to their sons. The royal decision is based on consultation with the great ones of his people; and such is the case with his officials and governors everywhere (*cf.* the Book of Ezra).

Every Persian able to bear arms is bound to serve the king—the great landowners on horseback, the commonalty on foot The noble and well-to-do, who need not till their fields in person, are pledged to appear at court as frequently as possible Their children are brought up in company with the princes "at the gates of the king," instructed in the handling of arms, in riding and hunting, and introduced to the service of the state and the knowledge of the law, as well as the commandments of religion. Then such as prove their worth are called to high office and rewarded, generally with grants of land

The highest rank was held by the descendants of the six great families, whose heads stood by Darius at the killing of the Magian The Greeks class them and the king together, under the name of "the seven Persians" These enjoyed the right of entering the presence unannounced, and possessed princely estates in the provinces Besides these, however, numbers of other Persians were despatched to the provinces, settled there, and endowed with lands. There existed, in fact, under the Achaemenids a strong colonizing movement, diffused through the whole empire, traces of this policy occur more especially in Armenia, Cappadocia and Lycia, but also in the rest of Asia Minor, and not rarely in Syria and Egypt These colonists formed the nucleus of the provincial military levy, and were a tower of strength to the Persian dominion They composed, moreover, the Persian council and vice-regal household of the Satraps, exactly as the Persians of the home-country composed that of the king

Though the world-empire of Persia was thus deeply impressed by a national character, care was nevertheless exercised that the general duties and interests of the subject races should receive due consideration We find their representatives, side by side with the Persians, occupying every sort of position in the regal and vice-regal courts They take their part in the councils of the satraps, precisely as they do in military service (*cf* the evidence of Ezra); and they, too, are rewarded by bounties and estates To wield a peaceful authority over all the subjects of the empire, to reward merit, and to punish transgression—such is the highest task of king and officials.

On his native soil Cyrus had built a town, with a palace and a tomb, in the district of Pasargadae (now the ruins of Murghab). This Darius replaced by a new capital, deeper in the centre of the country, which bore the name "Persian" (*Pārsa*), the Persepolis (*q.v.*) of the later Greeks. But the district of Persis was too remote to be the administrative centre of a world-empire. The natural centre lay, rather, in the ancient fertile tract on the lower Tigris and Euphrates The actual capital of the empire was therefore Susa, where Darius I. and Artaxerxes II. erected their magnificent palaces The winter months the kings chiefly spent in Babylon: the hot summer, in the cooler situation of Ecbatana, where Darius and Xerxes built a residence on Mt Elvend, south of the city From a palace of Artaxerxes II. in Ecbatana itself, the fragments of a few inscribed columns (now in the possession of Lindo Myers and published by Evetts in the *Zeitschr. f. Assyr. V*) have been preserved To Persis and Persepolis the kings paid only occasional visits especially at their coronations.

Method of Government.—Within the empire, the two great civilized states incorporated by Cyrus and Cambyses, Babylon and Egypt, occupied a position of their own After his defeat of Nabonidus, Cyrus proclaimed himself "king of Babel"; and the same title was borne by Cambyses, Smerdis and Darius. So, in Egypt, Cambyses adopted in full the titles of the Pharaohs In this we may trace a desire to conciliate the native population, with the object of maintaining the fiction that the old state still continued Darius went still farther. He encouraged the efforts of the Egyptian priesthood in every way, built temples, and enacted new laws in continuance of the old order In Babylon his procedure was presumably similar, though here we possess no local evidence But he lived to see that his policy had missed its goal. In 486 B C Egypt revolted and was only reduced by Xerxes in 484. It was this, probably, that induced him in 484 to renounce his title of "king of Babel," and to remove from its temple the golden statue of Bel-Marduk (Merodach), whose hands the king was bound to clasp on the first day of each year This proceeding led to two insurrections in Babylon (probably in 484 and 479 B C), which were speedily repressed After that the "kingship of Babel" was definitely abolished In Egypt the Persian kings still retained the style of the Pharaohs; but we hear no more of concessions to the priesthood or to the old institutions, and, apart from the great oasis of el-Kharga, no more temples were erected

At the head of the court and the imperial administration stands the commandant of the body-guard—the 10,000 "Immortals," often depicted in the sculptures of Persepolis with lances surmounted by golden apples. This grandee, whom the Greeks termed "Chiliarch," corresponds to the modern vizier In addition to him, we find seven councillors (Ezra vii. 14; *cf.* Esther i. 14) Among the other officials, the "eye of the king" is frequently mentioned To him was entrusted the control of the whole empire and the superintendence of all officials

The orders of the court were issued in a very simple form of the cuneiform script, probably invented by the Medes This comprised 36 signs, almost all of which denote single sounds In the royal inscriptions, a translation into Susan (Elamitic) and Babylonian was always appended to the Persian text In Egypt one in hieroglyphics was added, as in the inscriptions of the Suez canal; in the Grecian provinces, another in Greek (*e g* , the inscription of Darius on the Bosporus, Herod iv. 37, *cf* iv 91) The cuneiform script could only be written on stone or clay Thus there has been discovered in Babylon a copy of the Behistun (*q.v.*) inscription preserved on a block of dolerite (Weissbach. *Babylonische Miscellen* , p 24). For administrative purposes, however, it would seem that this inconvenient material was not employed, its place being taken by skins (διφθέραι, parchment), the use of which was adopted from the western peoples of the empire. On these were further written the journals and records kept at the court (*cf* Diod ii 22, 32; Ezra iv 15, v. 17, vi 2; Esther vi. 1, ii. 23). With such materials the cuneiform script could not be used; instead, the Persian language was written in Aramaic characters, a method which later led to the so-called Pahlavi, *i.e.*, Parthian script. This mode of writing was employed in the state-services since Darius I.; and so may be explained the fact that, under the Achaemenids, the Persian language rapidly declined, and, in the inscriptions of Artaxerxes III., only

appears in an extremely neglected guise (*see* CUNEIFORM INSCRIPTIONS; ALPHABET).

Side by side with the Persian, the Aramaic, which had long been widely diffused as the speech of commerce, enjoyed currency in all the western half of the empire as a second dominant language. Thus all deeds, enactments and records designed for these provinces were furnished with an official Aramaic version (Ezra iv. 7). To the three cuneiform inscriptions of his tomb at Nakshi Rustem Darius added an Aramaic version; and of the account of his deeds in the inscription in Behistun he distributed copies in Aramaic over his empire; of one of these, written in beautiful characters, large fragments have been preserved in the papyri of the Jewish garrison at Elephantine, together with numerous documents in the same tongue.[1] The coins minted by the satraps and generals usually bear an Aramaic inscription. (So, also, a lion-weight from Abydos, in the British Museum). The Demotic in Egypt was employed in private documents. In the Hellenic provinces only of the empire Greek replaced Aramaic (*cf.* the letter to Pausanias in Thuc. i. 129; an edict to Gadatas in Magnesia, Cousin et Deschamps, *Bulletin de corresp. hellénique,* xii. 530; Dittenberger, *Sylloge* 2; so, also, on coins)—a clear proof that the Persians had already begun to recognize the independent and important position of Greek civilization.[2]

Provincial Organization.—Darius I. divided the Persian empire into 20 great provinces, satrapies, with a "guardian of the country" (*khshathrapavan; see* SATRAP) at the head of each. A list is preserved in Herodotus (iii. 89 *sqq.*); but the boundaries were frequently changed. Each satrapy was again subdivided into several minor governorships. The satrap is the head of the whole administration of his province. He levies the taxes, controls the legal procedure, is responsible for the security of roads and property, and superintends the subordinate districts. The heads of the great military centres of the empire and the commandants of the royal fortresses are outside his jurisdiction: yet the satraps are entitled to a body of troops of their own, a privilege which they used to the full, especially in later periods. The satrap is held in his position as a subject by the controlling machinery of the empire, especially the "eye of the king"; by the council of Persians in his province with whom he is bound to debate all matters of importance; and by the army: while in the hands of the messengers (Pers. ἀστάνδαι or ἄγγαροι—a Babylonian word: *see* ANGARIA) the government despatches travel "swifter than the crane" along the great imperial highways, which are all provided with regular postal stations (*cf.* the description of the route from Susa to Sardis in Herod. v. 52).

Within the satrapies the subject races and communities occupied a tolerably independent position; for instance, the Jews, under their elders and priests, convened a popular assembly in Jerusalem (*cf.* the Books of Ezra and Nehemiah). Obviously also, they enjoyed, as a rule, the privilege of deciding lawsuits among themselves, their general situation being similar to the former situation of the Christian nationalities under the Ottoman empire, or to that of many tribes in the Russian empire before the revolution. The pressure of despotism was manifest, not so much in that the king and his officials consistently interfered in individual cases, but that they did so on isolated and arbitrary occasions, and then swept aside the privileges of the subject, who was impotent to resist.

The subject population can be divided into distinct groups. In the desert (as among the Arabian and Turanian nomads), in wild and sequestered mountains (as in Zagrus in north Media, and Mysia, Pisidia, Paphlagonia and Bithynia in Asia Minor), and also in many Iranian tribes, the old tribal constitution, with the chieftain as its head, was left intact under the imperial suzerainty. The great majority of the civilized provinces were subdivided into local administrative districts governed by officials of the king and his satraps. These the Greeks named ἔθνη, "peoples." Within these, again, there might lie large town settlements whose internal affairs were controlled by the elders or the officials of the community: as Babylon, Jerusalem, the Egyptian cities, Tarsus, Sardis and others. On the same footing were the dominions of the high priests, with their great temple-property; as Bambyce in Syria, the two Comanas in Cappadocia, and so forth. Vast districts were either converted into royal domains (παράδεισοι) with great parks and hunting grounds under royal supervision, or else bestowed by the king on Persians or deserving members of the subject-races (the "benefactors") as their personal property. Many of these estates formed respectable principalities: *e.g.*, those of the house of Otanes in Cappadocia, of Hydarnes in Armenia, Pharnabazus in Phrygia, Demaratus in Teuthrania, Themistocles in Magnesia and Lampsacus. They were absolute private property, handed down from father to son for centuries, and in the Hellenistic period not rarely became independent kingdoms. These potentates were styled by the Greeks δυνάσται or μόναρχοι.

The last class, quite distinct from all these organizations, was formed by the city-states (πόλεις) with an independent constitution—whether a monarchy (as in Phoenicia), an aristocracy (as in Lycia), or a republic with council and popular assembly (as in the Greek towns). The essential point was that they enjoyed a separate legalized organization (autonomy). This was only to be seen in the extreme western provinces of the empire, among the Phoenicians, Greeks and Lycians, whose cities were essentially distinct from those of the east; which, indeed, to Greek eyes, were only great villages (κωμοπόλεις). It is readily intelligible that their character should have proved practically incomprehensible to the Persians, with whom they came into perpetual collision. These sought, as a rule, to cope with the difficulty by transferring the government to individual persons who enjoyed their confidence: the "tyrants" of the Greek towns. Only Mardonius, after his suppression of the Ionic revolt—which had originated with these very tyrants—made an attempt to govern them by the assistance of the democracy (492 B.C.).

Coinage, Commerce and Civilization.—The provinces of the empire differed as materially in economy as in organization. In the extreme west, a money currency in its most highly developed form—that of coinage minted by the state, or an autonomous community—had developed since the 7th century among the Lydians and Greeks. In the main portion, however, of the Oriental world—Egypt, Syria, Phoenicia and Babylonia—the old mode of commerce was still in vogue, conducted by means of gold and silver bars, weighed at each transaction; a money currency only began to make headway in these districts in the 4th century B.C. In the eastern provinces, on the other hand, the primitive method of exchange by barter still held the field. Only in the auriferous and civilized frontier districts of India (the Punjab) did a system of coinage find early acceptance. There Persian and Attic money was widely distributed, and imitations of it struck, in the 5th and 4th pre-Christian centuries.

Thus the empire was compelled to grapple with all these varied conditions and to reconcile them as best it might. At the court, "natural economy" was still the rule. The officials and Oriental troops received payment in kind. They were fed "by the table of the king," from which 15,000 men daily drew their sustenance (*cf.* Heracleides of Cyme in Athen. iv. 145 B, etc.) and were rewarded by gifts and assignments of land. The Greek mercenaries, on the contrary, had to be paid in currency; nor could the satraps of the west dispense with hard cash. The king, again, needed the precious metals, not merely for bounties and rewards, but for important enterprises in which money payment was imperative. Consequently, the royal revenues and taxes were paid partly in the precious metals, partly in natural produce—horses and cattle, grain, clothing and its materials, furniture and all articles of industry (*cf.* Theopomp. fr. 124, 125, etc.). The satraps, also in addition to money payments, levied contributions "for their table," at which the officials ate (Nehem. v. 14).

The precious metals brought in by the tribute were collected in the great treasure-houses at Susa, Persepolis, Pasargadae and Ecbatana, where gigantic masses of silver and, more especially, of gold, were stored in the bullion or partially wrought into vessels

[2] Weissbach, *Die Keilinschriften der Achämeniden* (1911) (transscriptions and translation of all the texts).

(Herod. iii. 96; Strabo xv. 731, 735; Arrian iii. 16, etc.); exactly as was the case over 2,000 years later in the shah's treasure-chamber. When the king required money he minted as much as was necessary. A reform in the coinage was effected by Darius, who struck the *daric* (Pers. *Zariq, i.e.*, "piece of gold"; the word has nothing to do with the name of Darius), a gold piece of 130 grains (value about 23s.); this being equivalent to 20 silver pieces ("Median shekels," σίγλοι) of 86·5 grains (value according to the then rate of silver—$13\frac{1}{3}$ silver to 1 gold—about 1s. 2d.). The coinage of gold was the exclusive prerogative of the king; silver could be coined by the satraps, generals, independent communities and dynasts.

The extent of the Persian empire was, in essentials, defined by the great conquests of Cyrus and Cambyses. Darius was no more a *conquistador* than Augustus. The task he set himself was to round off the empire and secure its borders: for this purpose in Asia Minor and Armenia he subdued the mountain-tribes and advanced the frontier as far as the Caucasus, Colchis alone remaining an independent kingdom under the imperial suzerainty. So, too, he annexed the Indus valley and the auriferous hill-country of Kafiristan and Cashmir (Κάσπιοι or Κάσπειροι, Herod. iii. 93, vii. 67, 96; Steph. Byz.), as well as the Dardae in Dardistan on the Indus (Ctesias, *Ind. fr.* 12. 70, etc.). From this point he directed several campaigns against the Amyrgian Sacae, on the Pamir Plateau and northwards, whom he enumerates in his list of subject races, and whose mounted archers formed a main division of the armies despatched against the Greeks. It was obviously an attempt to take the nomads of the Turanian steppe in the rear and to reduce them to quiescence, which led to his unfortunate expedition against the Scythians of the Russian steppes (*c.* 512 B.C.; *see* DARIUS).

Side by side with these wars, we can read, even in the scanty tradition at our disposal, a consistent effort to further the great civilizing mission imposed on the empire. In the district of Herat, Darius established a great water-basin, designed to facilitate the cultivation of the steppe (Herod. iii. 117). He had the course of the river Indus explored by the Carian captain Scylax of Caryanda, who then navigated the Indian ocean back to Suez (Herod. iv. 44) and wrote an account of his voyage in Greek. The desire to create a direct communication between the seclusion of Persis and the commerce of the world is evident in his foundation of several harbours, described by Nearchus, on the Persian coast. But this design is still more patent in his completion of a great canal, already begun by Necho, from the Nile to Suez, along which several monuments of Darius have been preserved. Thus it was possible, as says the remnant of an hieroglyphic inscription there discovered, "for ships to sail direct from the Nile to Persia, over Saba." In the time of Herodotus the canal was in constant use (ii. 158, iv. 39): afterwards, when Egypt regained her independence, it decayed, till restored by the second Ptolemy. Even the circumnavigation of Africa was attempted under Xerxes (Herod. iv. 43).

Religion and Art.—It has already been mentioned, that, in his efforts to conciliate the Egyptians, Darius placed his chief reliance on the priesthood: and the same tendency runs throughout the imperial policy towards the conquered races. Thus Cyrus himself gave the exiled Jews in Babylon permission to return and rebuild Jerusalem. Darius allowed the restoration of the Temple; and Artaxerxes I., by the protection accorded to Ezra and Nehemiah, made the foundation of Judaism possible (*see* JEWS: §§19 *sqq.*). Analogously in an edict, of which a later copy is preserved in an inscription (*see* p. 569), Darius commands Gadatas, the governor of a domain (παράδεισος) in Magnesia on the Maeander, to observe scrupulously the privileges of the Apollo-sanctuary. With all the Greek oracles—even those in the mother-country—the Persians were on the best of terms. And since these might reasonably expect an enormous extension of their influence from the establishment of a Persian dominion, we find them all zealously mediatizing during the expedition of Xerxes.

For the development of the Asiatic religions, the Persian empire was of prime importance. The definite erection of a single, vast, world-empire cost them their original connection with the state, and compelled them in future to address themselves, not to the community at large, but to individuals, to promise, not political success nor the independence of the people, but the welfare of the man. Thus they became at once universal and capable of extension by propaganda; and, with this, of entering into keen competition one with the other. These traits are most clearly marked in Judaism; but after the Achaemenid period, they are common to all Oriental creeds, though our information as to most is scanty in the extreme.

In this competition of religions that of Iran played a most spirited part. The Persian kings—none more so than Darius, whose religious convictions are enshrined in his inscriptions—and, with the kings, their people, were ardent professors of the pure doctrine of Zoroaster; and the Persians settled in the provinces diffused his creed throughout the whole empire. Thus a strong Persian propagandism arose especially in Armenia and Cappadocia, where the religion took deep root among the people, but also in Lydia and Lycia. In the process, however, important modifications were introduced. In contrast with Judaism, Zoroastrianism did not enter the lists against all gods save its own, but found no difficulty in recognizing them as subordinate powers—helpers and servants of Ahuramazda. Consequently, the foreign creeds often reacted upon the Persian. In Cappadocia, Aramaic inscriptions have been discovered (1900), in which the indigenous god, there termed Bel the king, recognizes the "Mazdayasnian Religion" (*Din Mazdayasnish*)—*i.e.*, the religion of Ahuramazda personified as a woman—as his sister and wife (Lidzbarski, *Ephem. f. semit. Epigr.* i. 59 *sqq*).

The gorgeous cult of the gods of civilization (especially of Babylon), with their host of temples, images and festivals, exercised a corresponding influence on the mother-country. Moreover, the unadulterated doctrine of Zoroaster could no more become a permanent popular religion than can Christianity. For the masses can make little of abstractions and an omnipotent, omnipresent deity; they need concrete divine powers, standing nearer to themselves and their lot. Thus the old figures of the Aryan folk-religion return to the foreground, there to be amalgamated with the Babylonian divinities. The goddess of springs and streams (of the Oxus in particular) and of all fertility—*Ardvisura Anahita, Anaitis*—is endowed with the form of the Babylonian Ishtar and Belit. She is now depicted as a beautiful and strong woman, with prominent breasts, a golden crown of stars and golden raiment. She is worshipped as the goddess of generation and all sexual life (*cf.* Herod. i. 131, where the names of Mithras and Anaitis are interchanged); and religious prostitution is transferred to her service (Strabo xi. 532, xii. 559). At her side stands the sun-god Mithras, who is represented as a young and victorious hero. Both deities occupy the very first rank in the popular creed; while to the theologian they are the most potent of the good powers—Mithras being the herald and propagator of the service of Light and the mediator betwixt man and Ahuramazda, who now fades more into the background. Thus, in the subsequent period, the Persian religion appears purely as the religion of Mithras. The festival of Mithras is the chief festival of the empire, at which the king drinks and is drunken, and dances the national dance (Ctes. *fr.* 55; Duris *fr.* 13). This development culminated under Artaxerxes II., who, according to Berossus (*fr.* 16 *ap.* Clem. Alex. *prot.* i. 5, 65), first erected statues to Anaitis in Persepolis, Ecbatana, Bactria, Susa, Babylon, Damascus and Sardis. The truth of this account is proved by the fact that Artaxerxes II. and Artaxerxes III. are the only Achaemenids who, in their inscriptions, invoke Anaitis and Mithra side by side with Ahuramazda. Other gods, who come into prominence, are the dragon-slayer Verethraghna (Artagnes) and the Good Thought (Vohumano, Omanos); and even the Sacaean festival is adopted from Babylon (Berossus *fr.* 3; Ctes. *fr.* 16; Strabo xi. 512, etc.). The chief centres of the Persian cults in the west were the district of Acilisene in Armenia (Strabo xi. 532, etc.) the town of Zela in Cappadocia (Strabo xii. 559), and several cities in Lydia.

The position of the Persian monarchy as a world-empire is characteristically emphasized in the buildings of Darius and Xerxes in Persepolis and Susa. The peculiarly national basis, still

recognizable in Cyrus's architecture at Pasargadae, recedes into insignificance. The royal edifices and sculptures are dependent, mainly, on Babylonian models, but, at the same time, we can trace in them the influence of Greece, Egypt and Asia Minor; the last in the rock-sepulchres. All these elements are combined into an organic unity, which achieved the greatest creations that Oriental architecture has found possible. Nevertheless, the result is not a national art, but the art of a world-empire; and it is obvious that foreign craftsmen must have been active in the royal services—among them, the Greek sculptor Telephanes of Phocaea (Pliny xxxiv. 68). So, with the collapse of the empire, the imperial art vanishes also: and when some 500 years later, a new art arose under the Sassanids, whose achievements stand to those of Achaemenid art in much the same relation as the achievements of the two dynasties to each other, we discover only isolated reminiscences of its predecessor.

For the organization and character of the Persian empire, *see* Barnabas Brisson, *De regio Persarum principatu libri iii.* (1590); Heeren, *Ideen über Politik, Handel und Verkehr der alten Welt,* i.; G. Rawlinson, *History of Herodotus,* ii. 555 *sqq ; Five Eastern Monarchies,* iii.; Eduard Meyer, *Geschichte des Altertums,* iii. On the Satrapies, *cf.* Krumbholz, *De Asiae minoris satrapiis persicis* (1883). *See* also MITHRAS. The rock sculptures and part of the ruins of the Achaemenids and the Sassanids are published and analysed in the work of Sarre and Herzfeld, *Iranische Felsreliefs* (1910). *See* also Sarre, *Die Kunst der Alten Perser* (1925). Many ruins and inscriptions have since then been discovered by Herzfeld; *cf.* his preliminary account in *Zeitschrift d. deutschen Morgent. Ges.* (Bd. 80, 1926). *See* also MITHRAS.

The Achaemenids: Sources.—The history of the Persian empire was often written by the Greeks. The most ancient work preserved is that of Herodotus (*q.v.*), who supplies rich materials up to 479 B.C. These are drawn partly from sound tradition, partly from original knowledge—as in the account of the satrapies and their distribution, the royal highway, the nations in Xerxes' army and their equipment. They also contain much that is admittedly fabulous: for instance, the stories of Cyrus and Croesus, the conquest of Babylon, etc. Forty years later (*c.* 390 B.C.), the physician Ctesias of Cnidus, who for 17 years (414–398 B.C.) remained in the service of the Great King, composed a great work on the Persian history, known to us from an extract in Photius and numerous fragments. Ctesias (*q.v.*) possesses a more precise acquaintance with Persian views and institutions than Herodotus; and, where he deals with matters that came under his own cognizance, he gives much useful information. For the early period, on the other hand, he only proves how rapidly the tradition had degenerated since Herodotus; and here his narrations can only be utilized in isolated cases, and that with the greatest caution. Of more value was the great work of Dinon of Colophon (*c.* 340), which we know from numerous excellent fragments; and on the same level may be placed a few statements from Heraclides of Cyme, which afford specially important evidence on Persian institutions. To these must be added the testimony of the other Greek historians (Thucydides, Ephorus, Theopompus, etc., with the histories of Alexander), and, before all that of Xenophon in the *Anabasis* and *Hellenica.* The *Cyropaedia* is a didactic romance, written with a view to Greek institutions and rarely preserving genuine information on the Persian empire. Of Oriental sources, only the contemporary books of Ezra and Nehemiah are of much importance; also, a few statements in the much later Esther romance. Berossus's history of Babylon contained much valuable and trustworthy information, but next to nothing has survived. That the native tradition almost entirely forgot the Achaemenid empire, has been mentioned above. For a more detailed account of the empire of these sources *see* separate articles on HERODOTUS, etc.; EZRA; and NEHEMIAH. The scanty amount of original documents from the time of the Achaemenids (among them a large quantity of business contracts from Babylonia, dated after the years of the Kings) has been greatly increased by the Aramaic documents from Elephantine (*see* above) from the time of Darius II., which throw light on the administration and the judicial procedures in Egypt (*cf.* Eduard Meyer, *Zu den aram. Papyri am Elephantine, Sitzungsberichte der preuss. Akad.* 1911, 1026 *sqq.*). For the struggle of the Egyptians for independence in the 4th century we obtain some information from the so-called "Demotic Chronicle," published in 1914; *cf.* Eduard Meyer, *Aegyptische Documente aus der Perserzeit,* Sitzungsberichte der Berl. Ak. 1915, 287 *sqq.* (reprinted in *Kleine Schriften,* vol. II. 1924).

The external history of the empire is treated under the individual kings (*see* also history sections of articles GREECE; EGYPT; etc.). The order is as follows:—

CYRUS (558–528); conquered the Medes in 550; king of Babylon from 538.
CAMBYSES (528–521).
SMERDIS (521).
DARIUS I. (521–485).
XERXES I. (485–465).
ARTAXERXES I. (465–425).
XERXES II. and Secydianus or Sogdianus (425–424).
DARIUS II. Nothus (424–404).
ARTAXERXES II. (404–359).
ARTAXERXES III. Ochus (359–338).
ARSES (338–336).
DARIUS III. (336–330).

The chronology is exactly verified by the Ptolemaic canon, by numerous Babylonian and a few Egyptian documents, and by the evidence of the Greeks. The present article gives only a brief conspectus of the main events in the history of the empire.

The Wars Against Greece.—Though, unlike Cyrus and Cambyses, Darius made no new expeditions of conquest, yet a great empire, which is not bounded by another equally great, but touches on many small tribes and independent communities, is inevitably driven to expansion. We have already seen that the attempt of Darius to control the predatory nomads in the north led to his expedition against the Scythians; this, again, led to the incorporation of Thrace and Macedonia, whose king Perdiccas submitted. And since a great portion of the Mediterranean coast-line belonged to the empire, further complications resulted automatically. In contrast with the Greeks Carthage took the part of Persia. Darius, indeed, numbers the city—under the name of Karka—among his dominions; as also the Maxyans (Maciya) on the Syrtes (Andreas, *Verhandl. d. xiii. oriental. Congresses,* Hamburg, 1902, p. 97). But, above all, the Greek cities with their endless feuds and violent internal factions, were incessant in their appeals for intervention. Nevertheless, Darius left European Greece to itself, till the support accorded to the Ionian and Carian insurgents by Athens and Eretria (499 B.C.) made war inevitable. But not only the expeditions of Mardonius (492) and Datis (490), but even the carefully prepared campaigns of Xerxes, in conjunction with Carthage, completely failed (480–479). On the fields of Marathon and Plataea, the Persian archers succumbed to the Greek phalanx of hoplites; but the actual decision was effected by Themistocles, who had meanwhile created the Athenian fleet which at Salamis proved its superiority over the Perso-Phoenician armada, and thus precluded beforehand the success of the land-forces.

The wreck of Xerxes' expedition is the turning-point in the history of the Persian empire. The superiority of the Greeks was so pronounced that the Persians never found courage to repeat their attack. On the contrary, in 466 B.C. their army and fleet were again defeated by Cimon on the Eurymedon, the sequel being that the Greek provinces on the Asiatic coast, with all the Thracian possessions, were lost. In itself, indeed, this loss was of no great significance to such a vast empire; and the attempts of Athens to annex Cyprus and conquer the Nile valley, in alliance with the revolted Egyptians, ended in failure. Athens, in fact, had not sufficient strength to undertake a serious invasion of the empire or an extensive scheme of conquest. Her struggles with the other Hellenic states constrained her, by the peace of Callias (448), definitely to renounce the Persian war; to abandon Cyprus and Egypt to the king; and to content herself with his promise—not that he would surrender the littoral towns, but that he would abstain from an armed attack upon them. The really decisive point was, rather, that the disasters of Salamis and Plataea definitely shattered the offensive power of the empire; that the centre of gravity in the world's history had shifted from Susa and Babylon

to the Aegean sea; and that the Persians were conscious that in spite of all their courage they were henceforward in the presence of an enemy superior in arms as well as in intellect whom they could not hope to subdue by their own strength.

Decay of the Empire.—Thus the great empire was reduced to immobility and stagnation—a process which was assisted by the deteriorating influences of civilization and world-dominion upon the character of the ruling race. True, the Persians continued to produce brave and honourable men. But the influences of the harem, the eunuchs, and similar court officials, made appalling progress, and men of energy began to find the temptations of power stronger than their patriotism and devotion to the king. Thus the satraps aspired to independence, not merely owing to unjust treatment, but also to avarice or favourable conditions. As early as 465 B C., Xerxes was assassinated by his powerful vizier (chiliarch) Artabanus, who attempted to seize the reins of empire in fact, if not in name. A similar instance may be found in Bagoas (*q v*) after the murder of Artaxerxes III. (338 B C.). To these factors must be added the degeneration of the royal line —a degeneration inevitable in Oriental states Kings like Xerxes and more especially Artaxerxes I and Artaxerxes II, so far from being gloomy despots, were good-natured potentates, but weak, capricious and readily accessible to personal influences. The only really brutal tyrants were Darius II., who was completely dominated by his bloodthirsty wife Parysatis, and Artaxerxes III who, though he shed rivers of blood and all but exterminated his whole family, was successful in once more uniting the empire, which under the feeble sway of his father had been threatened with dissolution.

The upshot of these conditions was, that the empire never again undertook an important enterprise, but neglected more and more its great civilizing mission In considering, however, the subsequent disorders and wars, it must be borne in mind that they affected only individual portions of the empire, and only on isolated occasions involved more extensive areas in long and serious strife. To most of the provinces the Achaemenid dominion was synonymous with two centuries of peace and order Naturally, however, the wild tribes of the mountains and deserts, who could be curbed only by strict imperial control, asserted their independence and harassed the neighbouring provinces. Among these tribes were the Carduchians in Zagrus, the Cossaeans and Uxians in the interior of Elam, the Cadusians and other non-Aryan tribes in northern Media, the Pisidians, Isaurians and Lycaonians in the Taurus, and the Mysians in Olympus. All efforts to restore order in these districts were fruitless; and when the kings removed their court to Ecbatana, they were actually obliged to purchase a free passage from the mountain tribes (Strabo xi 524; Arrian iii. 17, 1). The kings (*e g.*, Artaxerxes II.) repeatedly took the field in great force against the Cadusians, but unsuccessfully. When, in 400 B C. Xenophon marched with the mercenaries of Cyrus from the Tigris to the Black sea, the authority of the king was non-existent north of Armenia, and the tribes of the Pontic mountains, with the Greek cities on the coast, were completely independent. In Paphlagonia, the native dynasts founded a powerful though short-lived kingdom, and the chieftains of the Bithynians were absolutely their own masters. The frontier provinces of India were also lost. Egypt, which had already revolted under Libyan princes in the years 486–484, and again with Athenian help in 460–454, finally asserted its independence in 404. Henceforward the native dynasties repelled every attack, till they succumbed once more before Artaxerxes III. and Mentor of Rhodes

In the other civilized countries the old passion for freedom had been completely obliterated; and after the days of Darius I.—apart from the Greek, Lycian and Phoenician towns—not a single people in all these provinces dreamed of shaking off the foreign dominion All the more clearly, then, was the inner weakness of the empire revealed by the revolts of the satraps. These were facilitated by the custom—quite contrary to the original imperial organization—which entrusted the provincial military commands to the satraps, who began to receive great masses of Greek mercenaries into their service Under Artaxerxes I. and Darius II., these insurrections were still rare. But when the revolt of the younger Cyrus against his brother (401 B.C.) had demonstrated the surprising ease and rapidity with which a courageous army could penetrate into the heart of the empire—when the whole force of that empire had proved powerless, not only to prevent some 12,000 Greek troops, completely surrounded, cut off from their communications, and deprived through treachery of their leaders, from escaping to the coast, but even to make a serious attack on them—then, indeed, the imperial impotence became manifest. After that, revolts of the satraps in Asia Minor and Syria were of everyday occurrence, and the task of suppressing them was complicated by the foreign wars which the empire had to sustain against Greece and Egypt.

At this very period, however, the foreign policy of the empire gained a brilliant success. The collapse of the Athenian power before Syracuse (413 B C.) induced Darius II. to order his satraps Tissaphernes and Pharnabazus, in Asia Minor, to collect the tribute overdue from the Greek cities. In alliance with Sparta (*see* PELOPONNESIAN WAR), Persia intervened in the conflict against Athens, and it was Persian gold that made it possible for Lysander to complete her overthrow (404 B C). True, war with Sparta followed immediately, over the division of the spoils, and the campaigns of the Spartan generals in Asia Minor (399–395) were all the more dangerous as they gave occasion to numerous rebellions. But Persia joined the Greek league against Sparta, and in 394 Pharnabazus and Conon annihilated the Lacedaemonian fleet at Cnidus Thus the Spartan power of offence was crippled; and the upshot of the long-protracted war was that Sparta ruefully returned to the Persian alliance, and by the Peace of Antalcidas (*q.v.*), concluded with the king in 387 B C, not only renounced all claims to the Asiatic possessions, but officially proclaimed the Persian suzerainty over Greece. Ninety years after Salamis and Plataea, the goal for which Xerxes had striven was actually attained, and the king's will was law in Greece. In the following decades, no Hellenic state ventured to violate the king's peace, and all the feuds that followed centred round the efforts of the combatants—Sparta, Thebes, Athens and Argos—to draw the royal powers to their side (*see* GREECE. *Ancient History*).

But, for these successes, the empire had to thank the internecine strife of its Greek opponents, rather than its own strength. Its feebleness, when thrown on its own resources, is evident from the fact that, during the next years, it failed both to reconquer Egypt and to suppress completely King Evagoras of Salamis in Cyprus. The satrap revolts, moreover, assumed more and more formidable proportions, and the Greek states began once more to tamper with them. Thus the reign of Artaxerxes II ended, in 359 B C, with a complete dissolution of the imperial authority in the west. His successor, Artaxerxes Ochus, succeeded yet again in restoring the empire in its full extent. In 355 B C, he spoke the fatal word, which, a second—or rather a third—time demolished the essentially unsound power of Athens In 342 he reduced Egypt, and his generals Mentor and Memnon, with his vizier Bagoas (*q.v.*), crushed once and for all the resistance in Asia Minor. At his death in 338, immediately before the final catastrophe, the empire to all appearances was more powerful and more firmly established than it had been since the days of Xerxes.

Progress of Greek Influence.—These successes were won only by means of Greek armies and Greek generals. And simultaneously the Greek civilization—diffused by mercenaries, traders, artists, prostitutes and slaves,—advanced in ever greater force. In Asia Minor and Phoenicia we can clearly trace the progress of Hellenism (*q v*), especially by the coinage. The stamp is cut by Greek hands and the Greek tongue predominates more and more in the inscription We can see that the victory of Greek civilization had long been prepared on every side. But the vital point is that the absolute superiority of the Hellene was recognized as incontestable on both hands. The Persian sought to protect himself against danger by employing Greeks in the national service and turning Greek policy to the interests of the empire. In the Greek world itself the disgrace that a people, called to universal dominion and capable of wielding it, should be dependent on the mandate of an impotent Asiatic monarchy, was keenly felt by all who were not yet absorbed in the rivalry of city with city. The

spokesman of this national sentiment was Isocrates; but numerous other writers gave expression to it, notably, the historian Callisthenes of Olynthus. Union between Greeks, voluntary or compulsory, and an offensive war against Persia, was the programme they propounded.

Nor was the time for its fulfilment far distant. The new power which now rose to the first rank, created by Philip of Macedon, had no ingrained tendency inimical to the Persian empire. Its immediate programme was rather Macedonian expansion, at the expense of Thrace and Illyria, and the subjection of the Balkan peninsula. But, in its efforts to extend its power over the Greek states, it was bound to make use of the tendencies which aimed at the unification of Greece for the struggle against Persia: and this ideal demand it dared not reject.

Thus the conflict became inevitable. In 340, Artaxerxes III. and his satraps supported the Greek towns in Thrace—Perinthus and Byzantium—against Macedonian aggression; in 338 he concluded an alliance with Demosthenes. When Philip, after the victory of Chaeroneia, had founded the league of Corinth (337) embracing the whole of Greece, he accepted the national programme, and in 336 despatched his army to Asia Minor. That he never entertained the thought of conquering the whole Persian empire is certain. Presumably, his ambitions would have been satisfied with the liberation of the Greek cities, and, perhaps, the subjection of Asia Minor as far as the Taurus. With this his dominion would have attained much the same compass as later under Lysimachus; farther than this the boldest hopes of Isocrates never went.

But Philip's assassination in 336 fundamentally altered the situation. In the person of his son, the throne was occupied by a soldier and statesman of genius, saturated with Greek culture and Greek thought, and intolerant of every goal but the highest. To conquer the whole world for Hellenic civilization by the aid of Macedonian spears, and to reduce the whole earth to unity, was the task that this heir of Heracles and Achilles saw before him. This idea of universal conquest was with him a conception much stronger developed than that which had inspired the Achaemenid rulers, and he entered on the project with full consciousness in the strictest sense of the phrase. In fact, if we are to understand Alexander aright, it is fatal to forget that he was overtaken by death, not at the end of his career, but at the beginning, at the age of 33.

The Hellenistic Dominion.—How Alexander conquered Persia, and how he framed his world-empire,[1] cannot be related in detail here. The essential fact, however, is that after the victory of Gaugamela (Oct. 1, 331 B.C.) and, still more completely, after the assassination of Darius—avenged according to the Persian laws, on the perpetrators—Alexander regarded himself as the legitimate head of the Persian empire, and therefore adopted the dress and ceremonial of the Persian kings.

With the capture of the capitals, the Persian war was at an end, and the atonement for the expedition of Xerxes was complete—a truth symbolically expressed in the burning of the palace at Persepolis. Now began the world-conquest. For an universal empire, however, the forces of Macedonia and Greece were insufficient; the monarch of a world-empire could not be bound by the limitations imposed on the tribal king of Macedon or the general of a league of Hellenic republics. He must stand as an autocrat, above them and above the law, realizing the theoretical doctrines of Plato and Aristotle, as the true king, who is a god among men, bound no more than Zeus by a law, because "himself he is the law." Thus the divine kingship of Alexander derives in direct lines, not from the Oriental polities—which (Egypt apart) know nothing of royal apotheosis—but from these Hellenic theories of the state. Henceforward it becomes the form of every absolute monarchy in a civilized land, being formally mitigated only in Christian states by the assumption that the king is not God, but king "by the grace of God." The expedition of 332 B.C. to the shrine of Ammon was a preliminary to this procedure, which, in 324, was sealed by his official elevation to divine rank in all the republics of Greece. To this corresponds the fact that, instead of acting on the doctrines of Aristotle and Callisthenes, and treating the Macedonians and Greeks as masters, the Asiatics as servants, Alexander had impartial recourse to the powers of all his subjects and strove to amalgamate them. In the Persians particularly he sought a second pillar for his world-empire. Therefore, as early as 330 B.C., he drafted 30,000 young Persians, educated them in Greek customs, and trained them to war on the Macedonian model. The Indian campaign showed that his Macedonian troops were in fact inadequate to the conquest of the world; and in the summer of 326 they compelled him to turn back from the banks of the Hypasis. On his return to Persia he consummated at Susa (February, 324 B.C.) the union of Persian and Macedonian by the great marriage-feast, at which all his superior officers, with some 10,000 more Macedonians, were wedded to Persian wives. The Macedonian veterans were then disbanded, and the Persians taken into his army. Simultaneously, at the Olympian festival of 324, the command was issued to all the cities of Greece to recognize him as god and to receive the exiles home.[2] In 323 B.C. the preparations for the circumnavigation and subjection of Arabia were complete: the next enterprise being the conquest of the West, and the battle for Hellenic culture against Carthage and the Italian tribes. At that point Alexander died in Babylon, on June 13, 323 B.C.

The Diadochi.—Alexander left no heir. Consequently, his death not only ended the scheme of universal conquest, but led to an immediate Macedonian reaction. The army, which was considered as the representative of the people, took over the government under the direction of its generals. The Persian wives were practically all discarded and the Persian satraps removed—at least from all important provinces. But the attempt to maintain the empire in its unity proved impracticable; and almost immediately there began the embittered war, waged for several decades by the generals (diadochi), for the inheritance of the great king.[3] It was soon obvious that the eastern rulers, at all events, could not dispense with the native element. Peucestas, the governor of Persis, there played the rôle of Alexander and won the Persians completely to his side; for which he was dismissed by Antigonus in 315 (Diod. xix. 48). A similar position was attained by Seleucus—the only one of the diadochi who had not divorced his Persian wife, Apama—in Babylonia, which he governed from 319 to 316 and regained in the autumn of 312. While Antigonus, who, since 315, had striven to win the kingdom of Alexander for himself, was detained by the war with his rivals in the west, Seleucus, with Babylon as his headquarters, conquered the whole of Iran as far as the Indus. In northern Media alone, which lay outside the main scene of operations and had only been partially subject to the later Achaemenids, the Persian satrap Atropates, appointed by Alexander, maintained his independence and bequeathed his province to his successors. His name is borne by north Media to the present day—Atropatene, modern Azerbaijan or Adherbeijan (*see* MEDIA). So, too, in Armenia the Persian dynasty of the Hydarnids held its ground; and to these must be added, in the east of Asia Minor, the kingdoms of Pontus and Cappadocia, founded *c.* 301, by the Persians Mithradates I. and Ariarathes I. These states were fragments of the Achaemenid empire, which had safely transferred themselves to the Hellenistic state-system

The annexation of Iran by Seleucus Nicator led to a war for the countries on the Indian frontier; his opponent being Sandracottus or Chandragupta Maurya (*q.v.*), the founder of the great Indian empire of Maurya (Palimbothra). The result was that Seleucus abandoned to the Indian king, not merely the Indian provinces, but even the frontier districts west of the Indus (Strabo

[1]*See* ALEXANDER THE GREAT; MACEDONIAN EMPIRE; HELLENISM (for later results).

[2]We can accept neither the discussion of these events by Hogarth, "The Deification of Alexander the Great," in the English *Historical Review*, ii. (1887) (*cf.* E. Meyer, *Kleine Schriften* i. 330) nor the article of W. Tarn, "Alexander's ὑπομνήματα and the World-Kingdom" *Journ. of Hellenic Studies*, XLI. 1921, who tries to prove that the account of Diodorus 18, 4 H. about Alexander's plans and their cessation by the army after his death is not taken from Hieronymus of Cardia and is quite untrustworthy.

[3]*See* PTOLEMIES; SELEUCID DYNASTY.

xv. 689–724) receiving as compensation 500 elephants, with other presents (Appian, *Syr.* 55; Justin xv. 4; Plut. *Alex.* 62; Athen. i. 18 D.). His next expedition was to the west to assist Lysimachus, Ptolemy and Cassander in the overthrow of Antigonus.

The battle of Ipsus, in 301, gave him Syria and the east of Asia Minor; and from then he resided at the Syrian town of Antiochia on the Orontes. Shortly afterwards he handed over the provinces east of the Euphrates to his son Antiochus, who, in the following years, till 282, exercised in the East a very energetic and beneficial activity, which continued the work of his father and gave the new empire and the Oriental Hellenistic civilization their form. In his campaigns Alexander had founded several cities in Bactria, Sogdiana and India, in which he settled his veterans, and before his death he had begun or planned the foundation of Greek cities in Media and other parts of Iran. These plans were now executed by the Seleucids on the largest scale. Most of the new cities were based on older settlements; but the essential point is, that they were peopled by Greek and Macedonian colonists, and enjoyed civic independence with laws, officials, councils and assemblies of their own; in other words, an autonomous communal constitution, under the suzerainty of the empire. A portion, moreover, of the surrounding land was assigned to them. Thus a great number of the country districts—the ἔθνη above mentioned—were transformed into municipal corporations, and thereby withdrawn from the immediate government of the king and his officials (satraps or *strategi*), though still subject to their control, except in the cases where they received unconditional freedom and so ranked as "confederates." The native population of these villages and rural districts, at first, had no civic rights, but were governed by the foreign settlers. Soon, however, the two elements began to coalesce; in the Seleucid empire, the process seems generally to have been both rapid and complete. Thus the cities became the main factors in the diffusion of Hellenism, the Greek language and the Greek civilization over all Asia as far as the Indus. At the same time they were the centres of commerce and industrial life: and this, in conjunction with the royal favour, and the privileges accorded them, continually drew new settlers (especially Jews), and many of them developed into great and flourishing towns (*see* further under HELLENISM) (*cf.* Eduard Meyer, *Blüte und Niedergang des Hellenismus in Asien,* 1925).

Shortly after his conquest of Babylonia, Seleucus had founded a new capital, Seleucia (*q.v.*), on the Tigris: his intention being at once to displace the ancient Babylon from its former central position, and to replace it by a Greek city. This was followed by a series of other foundations in Mesopotamia, Babylonia and Susiana (Elam). "Media," says Polybius (x. 27), "was encircled by a sequence of Greek towns, designed as a barrier against the barbarians." Among those mentioned are: Rhagae (Rai), which Seleucus metamorphosed into a Hellenic city, Europus, Laodiceia, Apamea and Heraclea (Strabo xi. 525; Plin. vi. 43: *cf.* MEDIA). To these must be added Achaea in Parthia, and, farther to the east, Alexandria Arion in Aria the modern Herat: also Antiochia Margiana (Strabo xi. 514, 516; Plin. 46, 93), now Merv, and many others; further, Alexandria in Arachosia, near Kandahar, and the towns founded by Alexander on the Hindu-Kush and in Sogdiana.

Thus an active Hellenic life soon arose in the East; and Greek settlers must have come in numbers and founded new cities which afterwards formed the basis of the Graeco-Bactrian kingdom. Antiochus's general Demodamas crossed the Iaxartes and set up an altar to the Didymaean Apollo (Plin. vi. 49). Another general, Patrocles, took up the investigation of the Caspian, already begun by Alexander. In contrast with the better knowledge of an older period, he came to the conclusion that the Caspian was connected with the ocean, and that it was possible to reach India on shipboard by that route (Strabo ii. 74, xi. 518; Plin. vi. 38). A project of Seleucus to connect the Caspian with the Sea of Azov by means of a canal is mentioned by Plin. (vi. 31). To Patrocles is due the information that an active commerce in Indian wares was carried on with the shores of the Black sea, *via* the Caspian (Strabo xi. 509).

While Hellenism was thus gaining a firm footing in all the East, the native population remained absolutely passive. Apart from the rude mountain tribes, no national resistance was dreamed of for centuries. The Iranians quietly accepted the foreign yoke, and the higher classes adopted the external forms of the alien civilization even though they were unable to renounce their innate characteristics. Eratosthenes, for instance, speaks (*ap.* Strabo i. 66) in high terms of the Iranians (*Ariani*), ranking them (as well as the Indians, Romans, and Carthaginians) on a level with the Greeks as regards their capacity for adopting city civilization. The later Parsee tradition contends that Alexander burned the sacred books of Zoroaster, the *Avesta,* and that only a few fragments were saved and afterwards reconstructed by the Arsacids and Sassanids. This is absolutely unhistorical. The Persian religion was never attacked by the Macedonians and Greeks. Under their dominion, on the contrary, it expanded with great vigour, not only in the west (Armenia, north Syria and Asia Minor, where it was the official religion of the kings of Pontus and Cappadocia), but also in the east, in the countries of the Indian frontier. That the popular gods—Mithras, Anaitis, etc.—had come to the forefront has already been mentioned. This propagandism, however, was void of all national character, and ran on precisely the same lines as the propagandism of the Syrian, Jewish and Egyptian cults. Only in Persis itself the national character of the religion survived side by side with the memory of their old imperial position; here a local Persian dynasty was allowed to rule in the centre of the province at Istakhr (*cf.* PERSIS).

Decline of the Seleucids.—In 282 B.C. Seleucus took the field against Lysimachus, and annexed his dominions in Asia Minor and Thrace. In 281 he was assassinated in crossing to Europe, and his son Antiochus I. was left supreme over the whole empire. From that time onward the Seleucid empire was never at rest. Its gigantic extent, from the Aegean to the Indus, everywhere offered points of attack to the enemy. The Lagidae, especially, with their much more compact and effective empire, employed every means to weaken their Asiatic rivals; and auxiliaries were found in the minor states on the frontier—Atropatene, Armenia, Cappadocia, Pontus and Bithynia, the Galatians, Pergamum, Rhodes and other Greek states. Moreover, the promotion of Greek civilization and city life had created numerous local centres, with separate interests and centrifugal tendencies, struggling to attain complete independence, and perpetually forcing new concessions from the empire. Thus the Seleucid kings, courageous as many of them were, were always battling for existence (*see* SELEUCID DYNASTY).

These disturbances severely affected the borders of Iran. While the Seleucid empire, under Antiochus II. Theos (264–247), was being harried by Ptolemy II. Philadelphus, and the king's attention was wholly engaged in the defence of the western provinces, the Greeks revolted in Bactria, under their governor Diodotus (*q.v.*). Obviously, it was principally the need of protection against the nomadic tribes which led to the foundation of an independent kingdom; and Diodotus soon attained considerable power over the provinces north of the Hindu-Kush. In other provinces, too, insurrection broke out (Strabo xi. 575; Justin, xli. 4); and Arsaces, a chief of the Parni or Aparni—an Iranian nomad tribe (therefore often called Dahan Scythians), inhabiting the steppe east of the Caspian—made himself master of the district of Parthia (*q.v.*) in 248 B.C. He and his brother Tiridates (*q.v.*) were the founders of the Parthian kingdom, which, however, was confined within very modest limits during the following decades. Seleucus II. Callinicus (247–226) successfully encountered Arsaces (or Tiridates), and even expelled him (*c.* 238); but new risings recalled Seleucus to Syria, and Arsaces was enabled to return to Parthia.

Greater success attended Antiochus III. the Great (222–187). At the beginning of his reign (220) he subdued, with the help of his minister Hermias, an insurrection of the satrap Molon of Media, who had assumed the royal title and was supported by his brother Alexander, satrap of Persis (Polyb. v. 40 *sqq.*). He further seized the opportunity of extorting an advantageous peace from King Artabazanes of Atropatene, who had considerably extended his power (Polyb. v. 55). After waging an

unsuccessful war with Ptolemy IV. for the conquest of Coele-Syria, but suppressing the revolt of Achaeus in Asia Minor, and recovering the former provinces of the empire in that quarter, Antiochus led a great expedition into the East, designing to restore the imperial authority in its full extent. He first removed (211) the Armenian king Xerxes by treachery (Polyb. viii. 25; John of Antioch, *fr.* 53), and appointed two governors, Artaxias and Zariadris, in his place (Strabo xi. 531). During the next year he reduced the affairs of Media to order (Polyb x 27); he then conducted a successful campaign against Arsaces of Parthia (209), and against Euthydemus (*q v.*) of Bactria (208–206), who had overthrown the dynasty of Diodotus (Polyb x 28 *sqq*, 48 *sqq.*, xi. 34; Justin xli. 5). In spite of his successes he concluded peace with both kingdoms, rightly considering that it would be impossible to retain these remote frontier provinces permanently. He next renewed his old friendship with the Indian king Sophagasenus (Subhagasena), and received from him 150 elephants (206 B C). Through Arachosia and Drangiane, in the valley of the Etymander (Helmand), he marched to Carmania and Persis (Polyb xi. 34) Both here and in Babylonia he re-established the imperial authority, and in 205 undertook a voyage from the mouth of the Tigris, through the Arabian gulf to the flourishing mercantile town of Gerrha in Arabia (now Bahrein) (Polyb xiii 9)

Shortly afterwards, however, his successful campaign against Ptolemy V. Epiphanes led to a war with Rome in which the power of the Seleucid empire was shattered (190 B C), Asia Minor lost, and the king compelled to pay a heavy contribution to Rome for a long term of years In order to raise money he plundered a wealthy temple of Bel in Elam, but was killed by the inhabitants, 187 B C (Diod. xxviii 3, xxix 15, Strabo xvi 744; Justin xxxii 2, S Jerome [Hieronymus] on *Dan* xi. 19, Euseb, *Chron.* i. 253) The consequence of this enfeeblement of the empire was that the governors of Armenia asserted their independence. Artaxias founded the kingdom of Great Armenia; Zariadris, that of Sophene on the Euphrates and the sources of the Tigris (Strabo xi 531). In other districts also, rebellions occurred; and in the east, Euthydemus and his successors (Demetrius, Eucratidas, etc) began the conquest of the Indus region and the Iranian borderland (Arachosia, Aria) (*See* BACTRIA, EUTHYDEMUS, EUCRATIDES, DEMETRIUS, MENANDER)

But the energetic Seleucids fought desperately against their fate. Antiochus IV Epiphanes (176–163) restored once more the Eastern dominion, defeated Artaxias of Armenia (Appian, *Syr.* 45; Diod xxxi. 17a; S. Jerome on *Dan* xi 40), restored several towns in Babylonia and subdued the Elymaeans His attempt, however, to plunder the sanctuary of Nanaia failed (Polyb. xxxi 11; *cf.* Maccab i 6, ii 1, 13; App *Syr.* 66). Persis, also, and Media were still subject to him He tried to strengthen Hellenism throughout his empire by settling Greek colonists and mercenaries in the native towns—then, also, in Babylon and Jerusalem—and granting them the right of Greek cities But after his death at Gabae (Isfahan) in Persis (163 B C; *cf* Polyb xxxi. 11; Maccab i. 6, ii 9; Jos *Ant Jud* xii 9. 1), the Romans took advantage of the dynastic broils to destroy the Seleucid empire. They reduced its army and fleet, and favoured every rebellion: among others, that of the Jews In spite of all, Demetrius I Soter (161–150) succeeded in suppressing (159) a revolt of Timarchus of Miletus, governor of Babylon, who had occupied Media, assumed the title of "great king," and had been recognized by the Romans (Appian, *Syr* 45–47; Trogus, *Prol.* 34; Diod xxxi 27 A; *cf.* the coins of Timarchus).[1]

The Parthian Empire.—Meanwhile, in the east, the Arsacids had begun their expansion Phraates I (*c.* 175–170) subdued the Mardians in Elburz. His brother Mithradates I. (*c.* 170–138) had to sustain a difficult war with Eucratides of Bactria, but eventually succeeded in wresting from him some districts on the Turanian frontier. Indeed, he penetrated as far as, and farther than, the Indus (Diod. xxxiii. 18; Oros. v. 4, 16). In the west he conquered Media, and thence subdued Babylonia. He further reduced the Elymaeans, sacked their temple in the mountains, and captured the Greek city of Seleucia on the Hedyphon (Strabo xvi. 744; Justin xli. 6). The Seleucids, meanwhile, were harassed by aggravated disorders and insurrections. Nevertheless, in 140, Demetrius II Nicator took the field in order to save the east, but was defeated and captured. Shortly afterwards Mithradates I. died. His son Phraates II. (*c.* 138–127) was attacked in 130 by Antiochus VII. Sidetes, the brother of Demetrius II., on which the Parthian king released the latter Antiochus pressed successfully on, and once more recovered Babylonia, but in 129 was defeated in Media and fell in a desperate struggle With this battle the Seleucid dominion over the countries east of the Euphrates was definitely lost The Babylonian towns, especially Seleucia (*q v*), were handed over by Phraates to his favourite, the Hyrcanian Himerus, who punished them severely for their resistance

During these wars great changes had taken place in eastern Iran In 159 Mongolian tribes, whom the Chinese call Yue-chi and the Greeks Scythians, forced their way into Sogdiana, and, in 139, conquered Bactria (Strabo xi 571, Justin xlii 1; Trog *Prol* 41, *see* BACTRIA) From Bactria they tried to advance farther into Iran and India Entering into an alliance with Antiochus VII, they assailed the Parthian empire Phraates II marched to encounter him, but was himself defeated and slain, and his country ravaged far and wide His successor Artabanus I (*c* 127–124), the uncle of Phraates, also fell in battle against the Tocharians, the principal Scythian tribe (Justin xlii 1, 2; Johannes Antiochen. *fr.* 66); but his son Mithradates II, surnamed "The Great" (*c.* 124–88), defeated the Scythians and restored for a while the power of the Arsacids He also defeated Artavasdes, the king of Great Armenia; his son Tigranes, a hostage in the hands of the Parthians, was only redeemed by the cession of 70 valleys (Strabo xi 532). When Tigranes attempted to seize Cappadocia, and the Roman praetor P Cornelius Sulla advanced against him, Mithradates in 92 B C. concluded the first treaty between Parthia and Rome (Plut *Sulla*, v; Liv *epit* 70) The dynastic troubles of the Seleucids in Syria gave him an opportunity for successful intervention (Jos *Ant Jud* xiii 13, 4, 14, 3). Shortly afterwards he died, and, with his death, the Arsacid power collapsed for the second time The possession of the western provinces and the dominant position in western Asia passed to the Armenian Tigranes (*q v*), who wrested from the Parthians Mesopotamia and the suzerainty of Atropatene, Gordyene, Adiabene, Osroene Simultaneously began a new and severe conflict with the Scythians. Parthian coins, probably dating from this period (Wroth *Catal. of the Coins of Parthia,* 1903, p xxx and p. 40), mention victorious campaigns of Parthian kings and a conquest of the provinces of Aria, Margiane and (?) Traxiane (*cf* Strabo xi. 505) But how confused the situation was is shown by the fact that in 76 B C the octogenarian king Sanatruces was seated on the Parthian throne by the Scythian tribe of the Sacaraucians (*cf* Strabo xi 511; Trog *Prol* 42) The names of his predecessors are not known to us Obviously this period was marked by continual dynastic feuds (*cf.* Trog *Prol* 42) Not till Sanatruces's successor Phraates III (70–57) do we find the kingdom again in a settled state

A fact of decisive significance was that the Romans now began to advance against Tigranes In vain Mithradates of Pontus and Tigranes turned to the Parthian king, the latter even proffering restitution of the conquered frontier provinces Phraates, though rightly distrusting Rome, nevertheless concluded a treaty with Lucullus (69 B C) and with Pompey, and even supported the latter in his campaign against Tigranes in 66 But after the victory it was manifest that the Roman general did not consider himself bound by the Parthian treaty. When Tigranes had submitted, Pompey received him into favour and extended the Roman supremacy over the vassal states of Gordyene and Osroene; though he had allured the Parthian king with the prospect of the recovery of his old possessions as far as the Euphrates Phraates complained, and simultaneously attacked Tigranes, now a Roman vassal (64 B C.). But when Pompey refused reparation Phraates recognized that he was too weak to begin the struggle

PARTHIA THE THICKER BROKEN LINE MARKS THE BOUNDARIES OF PROVINCES UNDER CONTINUOUS PARTHIAN RULE THE BOUNDARIES OF THE EMPIRE CONTINUALLY VARIED, AND THE OUTLINES OF CERTAIN VASSAL PROVINCES ARE SHOWN

with Rome, and contented himself with forming an alliance with Tigranes, in hopes that the future would bring an opportunity for his revenge (Dio Cass. xxxvi. 3, 5; xxxvii. 5 *sqq.;* Plut. *Luc.* 30; *Pomp.* 33, 38; *cf.* Sallust's letter of Mithradates to Arsaces)

Although Phraates III. had not succeeded in regaining the full power of his predecessors, he felt justified in again assuming the title "king of kings"—which Pompey declined to acknowledge—and even in proclaiming himself as "god" (Phlegon, *fr* 12 *ap* Phot. *cod.* 97; and on part of his coins), but in 57 B C. the "god" was assassinated by his sons Orodes and Mithradates.

Organization—The Parthian empire, as founded by the conquests of Mithradates I. and restored, once by Mithradates II. and again by Phraates III., was, to all exterior appearance, a continuation of the Achaemenid dominion. Thus the Arsacids now began to assume the old title "king of kings" (the *shahanshah* of modern Persia), though previously their coins, as a rule, had borne only the legend "great king." The official version, preserved by Arrian in his *Parthica* (*ap.* Phot. *cod.* 58: *see* PARTHIA), derives the line of these chieftains of the Parnian nomads from Artaxerxes II In reality, however, the Parthian empire was totally different from its predecessor, both externally and internally. It was anything rather than a world-empire. The countries west of the Euphrates never owned its dominion, and even of Iran itself not one-half was subject to the Arsacids. There were indeed vassal states on every hand, but the actual possessions of the kings—the provinces governed by their satraps—consisted of a rather narrow strip of land, stretching from the Euphrates and north Babylonia through southern Media and Parthia as far as Arachosia (north-west Afghanistan), and following the course of the great trade-route which from time immemorial had carried the traffic between the west of Asia and India. We still possess a description of this route by Isidore of Charax, probably dating from the Augustan period (in C. Müller, *Geographi graeci minores,* vol. i.), in which is contained a list of the 18 imperial provinces, known also to Pliny (vi. 112; *cf.* 41) Isidore, indeed, enumerates 19, but, of these, Sacastene formed no part of the Parthian empire, as has been shown by von Gutschmid

The lower provinces (*i.e.* the districts west of Parthia) are. (1) Mesopotamia, with northern Babylonia, from the Euphrates bridge at Zeugma to Seleucia on the Tigris, (2) Apolloniatis, the plain east of the Tigris, with Artemita; (3) Chalonitis, the hill-country of Zagrus; (4) Western Media, (5) Cambadene, with Bagistana (Behistun) the mountainous portions of Media, (6) Upper Media, with Ecbatana; (7) Rhagiane or Eastern Media Then with the Caspian Gates—the pass between Elburz and the central desert, through which lay the route from west Iran to east Iran—the upper provinces begin; (8) Choarene and (9) Comisene, the districts on the verge of the desert; (10) Hyrcania; (11) Astabene, with the royal town Asaac on the Attruck (*see* PARTHIA); (12) Parthyene with Parthaunisa, where the sepulchres of the kings were laid; (13) Apavarcticene (now Abiward, with the capital Kelat); (14) Margiane (Merv); (15) Aria (Herat); (16) Anauon, the southern portion of Aria; (17) Zarangiane, the country of the Drangians, on the lake of Hamun; (18) Arachosia, on the Etymander (Helmand), called by the Parthians "White India," extending as far as Alexandropolis (Kandahar), the frontier city of the Parthian empire

On the lower Etymander, the Sacae had established themselves—obviously on the inroad of the Scythian tribes—and after them the country was named Sacastene (now Sejistan, Seistan). Through it lay the route to Kandahar; and for this reason the district is described by Isidore, though it formed no part of the Parthian empire.

Round these provinces lay a ring of numerous minor states, which as a rule were dependent on the Arsacids. They might, however, partially transfer their allegiance on the rise of a new power (*e.g.* Tigranes in Armenia) or a Roman invasion. Thus it is not without justice that the Arsacid period is described, in the later Persian and Arabian tradition, as the period of "the kings of the part-kingdoms"—among which the Ashkanians (*i.e.*

the Arsacids, from Ashak, the later pronunciation of the name *Arshak*=Arsaces) had won the first place. This tradition, however, is nebulous in the extreme; the whole list of kings, which it gives, is totally unhistorical; only the names of one Balash (=Vologaeses) and of the last Ardewan (=Artabanus) having been preserved. The period, from the death of Alexander to the Sassanid Ardashir I., is put by the Persian tradition at 266 years; which was afterwards corrected, after Syro-Grecian evidence, to 523 years. The actual number is 548 years (*i.e.* 323 B.C. to A.D. 226). The statements of the Armenian historians as to this period are also absolutely worthless.

The ten most important of the vassal states were:—

1. The kingdom of Osroene (*q.v.*) in the north-east of Mesopotamia with Edessa as capital, founded about 130 B.C. by the chieftain of an Arabian tribe, the Orrhoei, which established itself there.

2. To this must be added, the numerous Arabian tribes of the Mesopotamian desert, under their chiefs, among whom one Alchaudonius comes into prominence in the period of Tigranes and Crassus. Their settlement in Mesopotamia was encouraged by Tigranes, according to Plutarch (*Luc.* 21) and Pliny (vi. 142). In later times the Arabic town Atra in an oasis to the west of the Tigris, governed by its own kings, gained special importance.

3 and 4. To the east of the Tigris lay two kingdoms: Gordyene (or Cordyene), the country of the Carduchians (now Bohtan), a wild mountainous district south of Armenia; and Adiabene (Hadyab) the ancient Assyria, on either side of the Zab (Lycus).

5. On the farther side of Zagrus, adjoining Adiabene on the east, was the kingdom of Atropatene in north Media, now often simply called Media (*q.v.*).

While the power of Armenia was at its height under Tigranes (86–69 B.C.) all these states owned his rule. After the victories of Pompey, however, the Romans claimed the suzerainty, so that, during the next decades and the expeditions of Crassus and Antony, they oscillated between Rome and Parthia, though their inclination was generally to the latter. For they were all Orientals and, consciously or unconsciously, representatives of a reaction against that Hellenism which had become the heritage of Rome. At the same time the loose organization of the Parthian empire, afforded them a greater measure of independence than they could hope to enjoy under Roman suzerainty.

6. In the south of Babylonia, in the district of Mesene (the modern *Maisan*), after the fall of Antiochus Sidetes (129 B.C.), an Arabian prince, Hyspaosines or Spasines (in a cuneiform inscription of 127, on a clay tablet dated after this year, he is called Aspasine) founded a kingdom which existed till the rise of the Sassanian empire. Its capital was a city (mod. Mohammerah), first founded by Alexander on an artificial hill by the junction of the Eulaeus (Karun) with the Tigris, and peopled by his veterans. The town, which was originally named Alexandria and then rebuilt by Antiochus IV. as Antiochia, was now refortified with dikes by Spasines, and named Spasinu Charax ("the wall of Spasines"), or simply Charax (Plin. vi. 138 *seq.*). In the following centuries it was the main mercantile centre on the Tigris estuary.

The kingdom of Mesene, also called Characene, is known to us from occasional references in various authors, especially Lucian (*Macrobii*, 16), as well as from numerous coins, dated by the Seleucian era, which allow us to frame a fairly complete list of the kings.[1] The Arabian dynasty speedily assimilated itself to the native population; and most of the kings bear Babylonian—in a few cases, Parthian—names. The official language was Greek, till, on the destruction of Seleucia (A.D. 164), it was replaced on the coinage by Aramaic. Another Babylonian dynast must have been Hadadnadinaches (*c.* 100 B.C.), who built in Tello the fortified palace which has been excavated by de Sarzec.

[1]*See* Saint-Martin, *Recherches sur la Mésène et la Characène* (1838); Reinaud, *Memoires sur le royaume de la Mésène* (1861); E. Babelon, "Numism. et chronol. des dynastes de la Characène" in *Journ. Internat. d'Archeol. numism.* vol. 1. (1898).

7. East of the Tigris lay the kingdom of Elymais (Elam), to which belonged Susa and its modern representative Ahwaz, farther down on the Eulaeus. The Elymaeans, who had already offered a repeated resistance to the Seleucids, were subdued by Mithradates I., as we have mentioned above; but they remained a separate state, which often rebelled against the Arsacids (Strabo xvi. 744; *cf.* Plut. *Pomp.* 36; Tac. *Ann.* vi. 50). Of the kings who apparently belonged to a Parthian dynasty, several bearing the name Cammascires are known to us from coins dated 81 and 71 B.C. One of these is designated by Lucian (*Macrobii*, 16) "king of the Parthians"; while the coinage of another, Orodes, displays Aramaic script (Allotte de la Fuÿe, *Rev. num.*, 4me serie, t. vi. p. 92 *sqq.*, 1902). The kingdom, which is seldom mentioned, survived till Ardashir I. In its neighbourhood Strabo mentioned "the minor dynasties of the Sagapenians and Silacenians" (xvi. 745). The Uxians, moreover, with the Cossaeans and other mountain tribes, maintained their independence exactly as under the later Achaemenids (Strabo xvi. 744; Plin. vi. 133).

8. The district of Persis, the local dynasts, became independent after the time of Antiochus IV. They perpetuated the Achaemenian traditions, and on their coins—which bear the Persian language in Aramaic characters, *i.e.*, the so-called Pahlavi—appear as zealous adherents of Zoroastrianism and the Fire-cult (*see* PERSIS). They were forced, however, to acknowledge the suzerainty of Parthia, to which they stood in the same position as the Persians of Cyrus and his forefathers to the Median empire (*cf.* Strabo xv. 728, 733, 736; Lucian, *Macrob.* 15). In later times, before the foundation of the Sassanid dominion, Persis was disintegrated into numerous small local states. Even in Carmania we find independent kings, one of whom gave his name to a town Vologesocerta (*Balashkert*).

9. The east of Iran—Bactria with Sogdiana, Eastern Arachosia and Gedrosia—was never subject to the Arsacids. Here the Graeco-Bactrian and Graeco-Indian kingdoms held their own, till, in 139 B.C., they succumbed before the invading Mongolian and Scythian tribes (*see* BACTRIA and works quoted there). But in the Indus district the Greek kings held their ground for an appreciably longer period and, for a while, widely extended their power (*see* MENANDER OF INDIA). Among the kings then following, only known to us from their coins, there appears a dynasty with Iranian and sometimes peculiarly Parthian names which seems to have reigned in the Punjab and Arachosia. Its best-known representative, Gondophares or Hyndopherres, to whom legend makes the apostle Thomas write, reigned over Arachosia and the Indus district about A.D. 20. Further, about A.D. 70, the *Periplus* of the Erythraean sea mentions that the great commercial town of Minnagar in the Indus Delta was under Parthian kings, "who spent their time in expelling one another." Here, then, it would seem there existed a Parthian dynasty, which probably went back to the conquests of Mithradates I. (*cf.* Vincent A. Smith, "The Indo-Parthian Dynasties from about 120 B.C. to A.D. 100," in the *Zeitschr. der deutschen morgenl. Gesellsch.* 60, 1906). Naturally, such a dynasty would not long have recognized the suzerainty of the Arsacids. It succumbed to the Indo-Scythian empire of the Kushana, who had obtained the sovereignty of Bactria as early as about A.D. 50, and thence pressed onward into India. In the period of the *Periplus* (*c.* A.D. 70) the Scythians were already settled in the Indus valley (pp. 38, 41, 48), their dominion reaching its zenith under Kanishka (*c.* A.D. 123–153).

This empire of the Kushana merits special mention here, on account of its peculiar religious attitude, which we may gather from the coins of its kings, on which an alphabet taken from the Greek is employed (*cf.* Aurel Stein, "Zoroastrian Deities on Indo-Scythian Coins," in *The Babylonian and Oriental Record*, vol. i., 1887). Kanishka, as is well known, had embraced Buddhism, and some of his coins bear the image and name of Buddha. Iranian divinities, however, predominate on his currency: Mithras (*Mihro* or *Helios*); the Moon *Mah* (also Selene); *Athro*, the Fire; *Orthragno* (Verethragna); *Pharro*=Farna (hvarena), "the majesty of kingship"; *Teiro*=Tir (Tistrya "the archer"); *Nana* (Nanaia); and others. Here, then, we have a

perfect example of syncretism; as in the Mithras cult in Armenia, Asia Minor, and still further in the Roman empire. Buddhism and Zoroastrianism have been wedded in the state religion, and, in characteristic Indian fashion, are on the best of terms with one another, precisely as, in the Chinese empire at the present day, we find the most varied religions, side by side, and on an equal footing.

10. Originally, a part of the Turanian steppe belonged to the Arsacids; it was the starting-point of their power. Soon, however, the nomads (Dahae) gained their independence, and, as we have seen, repeatedly attacked and devastated the Parthian empire in conjunction with the Tocharians and other tribes of Sacae and Scythians. In the subsequent period, again, we shall frequently meet them.

Character of the Empire.—It may appear surprising that the Arsacids made no attempt to incorporate the minor states in the empire and create a great and united dominion, such as existed under the Achaemenids and was afterwards restored by the Sassanids. This fact is the clearest symptom of the inner weakness of their empire and of the small power wielded by the "king of kings." In contrast alike with its predecessors and its successors, the Arsacid dominion was peculiarly a chance formation—a state which had come into existence through fortuitous external circumstances, and had no firm foundation within itself, or any intrinsic *raison d'être*.

Three elements, of widely different kinds, contributed to its origin and defined its character. It was sprung from a predatory nomad tribe (the Parnian Dahae, Scythians) which had established itself in Khorasan (Parthia), on the borders of civilization, and thence gradually annexed further districts as the political situation or the weakness of its neighbours allowed. Consequently, these nomads were the main pillar of the empire, and from them were obviously derived the great magnates, with their huge estates and hosts of serfs, who composed the imperial council, led the armies, governed the provinces and made and unmade the kings (Strabo xi. 515; Justin xli. 2; the former terming them συγγενεῖς "kinsmen" of the king, the latter *probuli*). Of these great families that of Surenas held the privilege of setting the diadem on the head of the new king (Plut. *Crass.* 21; Tac. *Ann.* vi. 42).

The military organization, moreover, was wholly nomadic in character. The nucleus of the army was formed of armoured horsemen, excellently practised for long-distance fighting with bow and javelin, but totally unable to venture on a hand-to-hand conflict, their tactics being rather to swarm round the enemy's squadrons and overwhelm them under a hail of missiles. When attacked they broke up, as it seemed, in hasty and complete flight, and having thus led the hostile army to break its formation, they themselves rapidly reformed and renewed the assault. How difficult it was for infantry to hold their own against these mounted squadrons was demonstrated by the Roman campaigns, especially in broad plains like those of Mesopotamia. In winter, however, the Parthians were powerless to wage war, as the moisture of the atmosphere relaxed their bows. The infantry, in contrast with its earlier status under the Persians, was wholly neglected. On the other hand, every magnate put into the field as many mounted warriors as possible, chiefly servants and bought slaves, who, like the Janissaries and Mamelukes, were trained exclusively for war. Thus Surenas, in 53 B.C., is said to have put at the king's disposal 1,000 mailed horsemen and, in all, 10,000 men, including the train, which also comprised his attendants and harem (Plut. *Crass.* 21; description of the military organization in Dio Cass. 40, 15; Justin xli. 2). In the army of 50,000 mounted men which took the field against Mark Antony there were, says Justin, only 400 freemen.

How vital was the nomadic element in the Parthian empire is obvious from the fact that, in civil wars, the deposed kings consistently took refuge among the Dahae or Scythians and were restored by them. But, in Parthia, these nomads were amalgamated with the native peasantry, and, with their religion, had adopted their dress and manners. Even the kings, after the first two or three, wear their hair and beard long, in the Iranian fashion, whereas their predecessors are beardless. Although the Arsacids are strangers to any deep religious interest (in contrast to the Achaemenids and Sassanids), they acknowledge the Persian gods and the leading tenets of Zoroastrianism. They erect fire-altars and even obey the command to abandon all corpses to the dogs and fowls (Justin xli. 3). The union, moreover, recommended by that creed, between brother and sister—and even son and mother—occurs among them. Consequently, beside the council of the nobility, there is a second council of "Magians and wise men" (Strabo xi. 515).

Again, they perpetuate the traditions of the Achaemenid empire. The Arsacids assume the title "kings of kings" and derive their line from Artaxerxes II. Further, the royal apotheosis, so common among them and recurring under the Sassanids, is probably not so much of Greek origin as a development of Iranian views. For at the side of the great god Ahuramazda there stands a host of subordinate divine beings who execute his will—among these the deified heroes of legend, to whose circle the king is now admitted, since on him Ahuramazda has bestowed victory and might.

This gradual Iranianization of the Parthian empire is shown by the fact that the subsequent Iranian traditions, and Firdousi in particular, apply the name of the "Parthian" magnates (*Pahlavan*) to the glorious heroes of the legendary epoch. Consequently, also, the language and writing of the Parthian period, which are retained under the Sassanids, received the name *Pahlavi, i.e.*, "Parthian." The script was derived from the Aramaic.

But to these Oriental elements must be added that of Hellenism, the dominant world-culture which had penetrated into Parthia and Media. It was indispensable to every state which hoped to play some part in the world and was not so utterly secluded as Persis and Atropatene; and the Arsacids entertained the less thought of opposition as they were destitute of an independent national basis. All their external institutions were borrowed from the Seleucid empire: their coinage with its Greek inscriptions and nomenclature; their Attic standard of currency; and, doubtless, a great part of their administration also. In the towns Greek merchants were everywhere settled. Mithradates I. even followed the precedent of the Seleucids in building a new city, Arsacia, which replaced the ancient Rhagae (Rai, Europus) in Media. The further the Arsacids expanded the deeper they penetrated into the province of Hellenism; the first Mithradates himself assumed, after his great conquests, the title of *Philhellen*, "the protector of Hellenism," which was retained by almost all his successors. Then follow the surnames *Epiphanes* "the revealed god," *Dikaios* "the just," *Euergetes* "the benefactor," all of them essentially Greek in their reference, and also regularly borne by all the kings. After the conquest of the Euphrates and Tigris provinces it was imperative that the royal residence should be fixed there. But as no one ventured to transfer the royal household and the army, with its hordes of wild horsemen, to the Greek town of Seleucia, and thus disorganize its commerce, the Arsacids set up their abode in the great village of Ctesiphon, on the left bank of the Tigris, opposite to Seleucia, which accordingly retained its free Hellenic constitution (*see* CTESIPHON AND SELEUCIA). So also Orodes I. spoke good Greek, and Greek tragedies were staged at his court (Plut. *Crass.* 33).

In spite of this, however, the rise of the Arsacid empire marks the beginning of a reaction against Hellenism—not, indeed, a conscious or official reaction, but a reaction which was all the more effective because it depended on the impetus of circumstances working with all the power of a natural force. The essential point is that the east is completely divorced from the Mediterranean and the Hellenic world, that it can derive no fresh powers from that quarter, and that, consequently, the influence of the Oriental elements must steadily increase. This process can be most clearly traced on the coins—almost the sole memorials that the Parthian empire has left. From reign to reign the portraits grow poorer and more stereotyped, and the inscriptions more neglected, till it becomes obvious that the engraver himself no longer understood Greek but copied mechanically the signs before his eyes, as is the case with the contemporary Indo-

Scythian coinage, and also in Mesene. Indeed, after Vologaeses I. (51–77), the Aramaic script is occasionally employed. The political opposition to the western empires, the Seleucids first, then the Romans, precipitated this development. Naturally enough the Greek cities beheld a liberator in every army that marched from the west, and were ever ready to cast in their lot with such—a disposition for which the subsequent penalty was not lacking. The Parthian magnates, on the other hand, with the army, would have little to do with Greek culture and Greek modes of life, which they contemptuously regarded as effeminate and unmanly. They required of their rulers that they should live in the fashion of their country, practise arms and the chase, and appear as Oriental sultans, not as Grecian kings.

These tendencies taken together explain the radical weakness of the Parthian empire. It was easy enough to collect a great army and achieve a great victory; it was absolutely impossible to hold the army together for any longer period, or to conduct a regular campaign. The Parthians proved incapable of creating a firm, united organization, such as the Achaemenids before them, and the Sassanids after them gave to their empire The kings themselves were toys in the hands of the magnates and the army who, tenaciously as they clung to the anointed dynasty of the Arsacids, were utterly indifferent to the person of the individual Arsacid Every moment they were ready to overthrow the reigning monarch and to seat another on his throne. The kings, for their part, sought protection in craft, treachery and cruelty, and only succeeded in aggravating the situation. More especially they saw an enemy in every prince, and the worst of enemies in their own sons. Sanguinary crimes were thus of everyday occurrence in the royal household; and frequently it was merely a matter of chance whether the father anticipated the son, or the son the father The conditions were the same as obtained subsequently under the Mohammedan caliphate (*q v*) and the empire of the Ottomans The internal history of the Parthian dominion is an unbroken sequence of civil war and dynastic strife

For the literature dealing with the Parthian empire *see* PARTHIA.

The Wars with Rome.—These conditions elucidate the fact that the Parthian empire, though founded on annexation and perpetually menaced by hostile arms in both the east and the west, yet never took a strong offensive after the days of Mithradates II. It was bound to protect itself against Scythian aggression in the east and Roman aggression in the west To maintain, or regain, the suzerainty over Mesopotamia and the vassal states of that region, as also over Atropatene and Armenia, was its most imperative task Yet it always remained on the defensive and even so was lacking in energy. Whenever it made an effort to enforce its claims, it retreated so soon as it was confronted by a resolute foe

Thus the wars between Parthia and Rome proceeded, not from the Parthians—deeply injured though they were by the encroachments of Pompey—but from Rome herself. Rome had been obliged, reluctantly enough, to enter upon the inheritance of Alexander the Great; and, since the time of Pompey, had definitely subjected to her dominion the Hellenistic countries as far as the Euphrates Thus the task now faced them of annexing the remainder of the Macedonian empire, the whole east from the Euphrates to the Indus, and of thereby saving Greek civilization (*cf.* Plut. *Comp. Nic et Crass* 4) The aristocratic republic quailed before such an enterprise, though Lucullus, at the height of his successes, entertained the thought (Plut *Luc.* 30). But the ambitious men, whose goal was to erect their own sovereignty on the ruins of the republic, took up the project. With this objective M. Licinius Crassus, the triumvir, in 54 B C, took the aggressive against Parthia, the occasion being favourable owing to the dynastic troubles between Orodes I, the son of Phraates III, and his brother Mithradates III Crassus fell on the field of Carrhae (June 9, 53 B C). With this Mesopotamia was regained by the Parthians, and King Artavasdes of Armenia now entered their alliance. But, apart from the ravaging of Syria (51 B C.) by Pacorus the son of Orodes, the threatened attack on the Roman empire was carried into effect neither then nor during the civil war of Caesar and Pompey. At the time of his assassination Caesar was intent on resuming the expedition of Crassus. The Parthians formed a league with Brutus and Cassius, as previously with Pompey, but gave them no support, until in 40 B.C. a Parthian army, led by Pacorus and the republican general Labienus, harried Syria and Asia Minor. But it was easily repulsed by Ventidius Bassus, the lieutenant of Mark Antony. Pacorus himself fell on June 9, 38 B.C. at Gindarus in northern Syria. Antony then attacked the Parthians in 36 B C., and penetrated through Armenia into Atropatene, but was defeated by Phraates IV—who in 37 B C. had murdered his father Orodes I. —and compelled to retreat with heavy losses The continuation of the war was frustrated by the conflict with Octavian. Armenia alone was again subdued in 34 B C by Antony, who treacherously captured and executed King Artavasdes.

Roman opinion universally expected that Augustus would take up the work of his predecessors, annihilate the Parthian dominion, and subdue the east as far as the Indians, Scythians and Seres (*cf* Horace and the other Augustan poets) But Augustus disappointed these expectations. His whole policy and the needs of the newly organized Roman empire demanded peace His efforts were devoted to reaching a *modus vivendi*, by which the authority of Rome and her most vital claims might be peacefully vindicated This the weakness of Parthia enabled him to effect without much difficulty. His endeavours were seconded by the revolt of Tiridates II, before whom Phraates IV was compelled to flee (32 B C), till restored by the Scythians. Augustus lent no support to Tiridates in his second march on Ctesiphon (26 B C), but Phraates was all the more inclined on that account to stand on good terms with him Consequently in 20 B C, he restored the standards captured in the victories over Crassus and Antony, and recognized the Roman suzerainty over Osroene and Armenia. In return, the Parthian dominion in Babylonia and the other vassal states were left undisputed

Thus it was due not to the success and strength of the Parthians but entirely to the principles of Roman policy as defined by Augustus that their empire appears as a second great independent power, side by side with Rome The precedence of the Caesars, indeed, was always admitted by the Arsacids; and Phraates IV. soon entered into a state of dependency on Rome by sending (9 B C) four of his sons as hostages to Augustus—a convenient method of obviating the danger threatened in their person, without the necessity of killing them In 4 B C, however, Phraates was assassinated by his favourite wife Musa and her son Phraates V In the subsequent broils a Parthian faction obtained the release of one of the princes interned in Rome as Vonones I. (A D 8) He failed, however, to maintain his position for long He was a stranger to the Parthian customs, and the feeling of shame at dependency on the foreigner was too strong So the rival faction brought out another Arsacid, resident among the Scythian nomads, Artabanus II, who easily expelled Vonones —only to create a host of enemies by his brutal cruelty, and to call forth fresh disorders

Similar proceedings were frequently repeated in the period following In the intervals the Parthians made several attempts to reassert their dominion over Armenia and there install an Arsacid prince; but on each occasion they retreated without giving battle so soon as the Romans prepared for war Only the dynasty of Atropatene was finally deposed and the country placed under an Arsacid ruler Actual war with Rome broke out under Vologaeses I (51–77), who made his brother Tiridates king of Armenia After protracted hostilities, in which the Roman army was commanded by Cn Domitius Corbulo, a peace was concluded in A D 63, confirming the Roman suzerainty over Armenia but recognizing Tiridates as king (*see* CORBULO) Tiridates himself visited Rome and was there invested with the diadem by Nero (A D. 66) After that Armenia continued under the rule of an Arsacid dynasty.

These successes of Vologaeses were counterbalanced by serious losses in the east. He was hampered in an energetic campaign against Rome by attacks of the Dahae and Sacae Hyrcania, also, revolted and asserted its independence under a separate line of kings. A little later the Alans, a great Iranian tribe in the south

of Russia—the ancestors of the present-day Ossets—broke for the first time through the Caucasian passes, and ravaged Media and Armenia—an incursion which they often repeated in the following centuries.

On the other side, the reign of Vologaeses I. is characterized by a great advance in the Oriental reaction against Hellenism. The line of Arsacids which came to the throne in the person of Artabanus II. (A.D. 10) stands in open opposition to the old kings with their leanings to Rome and, at least external, tinge of Hellenism. The new régime obviously laid much more stress on the Oriental character of their state, though Philostratus, in his life of Apollonius of Tyana (in reality a fantastical romance which contains scarcely any historical information), states that Vardanes I. (A.D. 40–45), the rival king to the brutal Gotarzes (A.D. 40–51), was a cultivated man (*Vit. Ap.* i. 22, 28, 31 *sqq.*); and Vologaeses I. is distinguished by the excellent relations which subsisted all his life between himself and his brothers Pacorus and Tiridates, the kings of Media and Armenia. But the coins of Vologaeses I. are quite barbarous, and for the first time on some of them appear the initials of the name of the king in Aramaic letters by the side of the Greek legend. The Hellenism of Seleucia was now attacked with greater determination. For seven years (A.D. 37–43) the city maintained itself in open rebellion (Tac. *Ann.* xi. 8 *seq.*), till at last it surrendered to Vardanes, who in consequence enlarged Ctesiphon, which was afterwards fortified by Pacorus (A.D. 78–105: v. Ammian, 23, 6, 23). In the neighbourhood of the same town Vologaeses I. founded a city Vologesocerta (Balashkert), to which he attempted to transplant the population to Seleucia (Plin. vi. 122: *cf.* Th. Nöldeke in *Zeitschr. d. deutsch. morgenl. Gesellschaft,* xxviii., 100). Another of his foundations was Vologesias (the Arabian *Ullaish*), situated near Hira on the Euphrates, south of Babylon, which did appreciable damage to the commerce of Seleucia and is often mentioned in inscriptions as the destination of the Palmyrene caravans.

After Vologaeses I. follows a period of great disturbances. The literary tradition, indeed, deserts us almost entirely, but the coins and isolated literary references prove that during the years A.D. 77 to 147, two kings, and sometimes three or more, were often reigning concurrently (Vologaeses II. 77–79, and III.–147; Pacorus 78–*c.* 105; Osroes 106–129; Mithradates V. 129–147; also Artabanus III. 80–81; Mithradates IV. and his son Sanatruces II. 115; and Parthamaspates 116–117). Obviously the empire can never have been at peace during these years, a fact which materially assisted the aggressive campaigns of Trajan (113–117). Trajan resuscitated the old project of Crassus and Caesar, by which the empire of Alexander as far as India was to be won for western civilization. In pursuance of this plan he reduced Armenia, Mesopotamia and Babylonia to the position of imperial provinces. On his death, however, Hadrian immediately reverted to the Augustan policy and restored the conquests. Simultaneously there arose in the east the powerful Indo-Scythian empire of the Kushana, which doubtless limited still further the Parthian possessions in eastern Iran.

An era of quiet seems to have returned with Vologaeses III. (147–191), and we hear no more of rival kings. With the Roman empire a profound peace had reigned since Hadrian (117), which was first disturbed by the attack of Marcus Aurelius and Aelius Verus in 162. This war, which broke out on the question of Armenia and Osroene, proved of decisive significance for the future development of the east, for, in its course, Seleucia was destroyed by the Romans under Avidius Cassius (164). The downfall of the great Greek city sealed the fate of Hellenism in the countries east of the Euphrates. Henceforward Greek culture practically vanishes and gives place to Aramaic; it is significant that in future the kings of Mesene stamped their coinage with Aramaic legends. This Aramaic victory was powerfully aided by the ever-increasing progress of Christianity, which soon created, as is well known, an Aramaic literature of which the language was the dialect of Edessa, a city in which the last king of Osroene, Abgar IX. (179–214), had been converted to the faith. After that Greek culture and Greek literature were only accessible to the Orientals in an Aramaic dress. Vologaeses III. is probably also the king Valgash, who, according to a native tradition, preserved in the *Dinkart,* began a collection of the sacred writings of Zoroaster—the origin of the *Avesta* which has come down to us. This would show how the national Iranian element in the Parthian empire was continually gathering strength.

The Roman war was closed in 165 by a peace which ceded north-west Mesopotamia to Rome. Similar conflicts took place in 195–202 between Vologaeses IV. (191–209) and Septimius Severus, and again in 216–217 between Artabanus IV. (209–226) and Caracalla. They failed, however, to affect materially the position of the two empires.

The Sassanian Empire.—That the Arsacid empire should have endured some 350 years after its foundation, was a result, not of internal strength, but of chance working in its external development. It might equally well have so existed for centuries more. But under Artabanus IV. the catastrophe came. In his days there arose in Persis—precisely as Cyrus had arisen under Astyages the Mede—a great personality. Ardashir (Artaxerxes) I., son of Papak (Babek), the descendant of Sasan, was the sovereign of one of the small states into which Persis had gradually fallen. His father Papak had taken possession of the district of Istakhr, which had replaced the old Persepolis, long a mass of ruins. Thence Ardashir I., who reigned from about A.D. 212, subdued the neighbouring potentates—disposing of his own brothers among the rest. This proceeding quickly led to war with his suzerain Artabanus IV. The conflict was protracted through several years, and the Parthians were worsted in three battles. The last of these witnessed the fall of Artabanus (A.D. 224), though a Parthian king, Artavasdes—perhaps a son of Artabanus IV.—who is only known to us from his own coins, appears to have retained a portion of the empire for some time longer. The members of the Arsacid line who fell into the hands of the victor were put to death; a number of the princes found refuge in Armenia, where the Arsacid dynasty maintained itself till A.D. 429. The remainder of the vassal states—Carmania, Susiana, Sakastan (Seistan), Mesene—were ended by Ardashir; and the autonomous desert fortress of Hatra in Mesopotamia was destroyed by his son Shapur (Sapor) I., according to the Persian and Arabian traditions, which, in this point, are deserving of credence. The victorious Ardashir then took possession of the palace of Ctesiphon and assumed the title "King of the kings of the Iranians" (*βασιλεὺς βασιλέων Ἀριανῶν*).

The new empire founded by Ardashir I.—the Sassanian, or Neo-Persian empire—is essentially different from that of his Arsacid predecessors. It is, rather, a continuation of the Achaemenid traditions which were still alive on their native soil. Consequently the national impetus—already clearly revealed in the title of the new sovereign—again becomes strikingly manifest. The Sassanian empire, in fact, is once more a national Persian or Iranian empire. The religious element is, of course, inseparable from the national, and Ardashir, like all the dynasts of Persis, was an ardent devotee of the Zoroastrian doctrine, and closely connected with the priesthood. In his royal style he assumed the designation "Mazdayasnian" (*Μασδάσνας*), and the fire-cult was everywhere vigorously disseminated. Simultaneously the old claims to world dominion made their reappearance. After the defeat of Artabanus, Ardashir, as heir of the Achaemenids, formulated his pretensions to the dominion of western Asia (Dio. Cass. 80, 3; Herodian vi. 2, 4; Zonar xii. 15; similarly under Shapur II.: Ammian. Marc. xvii. 5, 5). He attacked Armenia, though without permanent success (*cf.* von Gutschmid in *Zeitschr. d. d. morgenl. Ges.* xxxi. 47, on the fabulous Armenian account of these wars), and despatched his armies against Roman Mesopotamia. They strayed as far as Syria and Cappadocia. The inner decay of the Roman empire, and the widespread tendency of its troops to mutiny and usurpation, favoured his enterprise. Nevertheless, the armies of Alexander Severus, supported by the king of Armenia, succeeded in repelling the Persians, though the Romans sustained severe losses (231–233). Towards the end of his reign Ardashir resumed the attack; while his son Shapur I. (241–272) reduced Nisibis and Carrhae and penetrated into

Syria, but was defeated by Gordian III. at Resaena (243). Soon afterwards, however, the Roman empire seemed to collapse utterly. The Goths defeated Decius (251) and harried the Balkan peninsula and Asia Minor, while insurrections broke out everywhere and the legions created one Caesar after the other Then Shapur resumed the war, subdued Armenia and plundered Antioch. The emperor Valerian, who marched to encounter him, was overthrown at Edessa and taken prisoner (260). The Persian armies advanced into Cappadocia; but here Ballista or Balista (d. *c.* 264) beat them back, and Odenathus (Odainath), prince of Palmyra (*q v.*), rose in their rear, defeated Shapur, captured his harem, and twice forced his way to Ctesiphon (263–265). Shapur was in no position to repair the defeat, or even to hold Armenia; so that the Sassanid power failed to pass the bounds of the Arsacid empire. Nevertheless Shapur I., in contrast to his father, assumed the title "King of the kings of the Iranians and non-Iranians" (βασιλεὺς βασιλέων Ἀριάνων καὶ Αναριάνων; *shah an shah Iran we Aniran*), thus emphasizing his claim to world dominion His successors retained the designation, little as it corresponded to the facts, for the single non-Iranian land governed by the Sassanids was, as under the Parthians, the district of the Tigris and Euphrates as far as the Mesopotamian desert; western and northern Mesopotamia remained Roman

Organization—The Sassanid ruler is the representative of the "Kingly Majesty," derived from Ormuzd, which appears in the *Avesta* as the angel Kavaem Hvareno, "the royal glory," and, according to legend, once beamed in the Iranian kings, unattainable to all but those of royal blood A sculpture, which frequently recurs in the rock-reliefs of Ardashir I and Shapur I, represents the king and the god Ormuzd both on horseback, the latter in the act of handing to his companion the ring of sovereignty Thus it is explicable that all the Sassanids, as many of the Arsacids before them, include the designation of "god" in their formal style From this developed (as already under the Arsacids) that strict principle of legitimacy which is still vigorous in Firdousi It applies, however, to the whole royal house, precisely as it did later in the Ottoman empire. The person of the individual ruler is a matter of indifference He can readily be removed and replaced by another, but no usurper who was not of the legitimate blood can hope to become the genuine king Therefore the native tradition carries the Sassanid line back to the Achaemenids and, still further, to the kings of the legendary period.

Officially the king is all-powerful, and his will, which is guided by God and bound up in His law, unfettered Thus, externally, he is surrounded by all the splendour of sovereignty; on his head he wears a great and resplendent crown, with a high circular centre-piece, he is clothed in gold and jewels, round him is a brilliant court, composed of his submissive servants He sits in dazzling state on his throne in Ctesiphon All who would approach fling themselves to the ground, life and death depend on his nod Among his people he is accounted the fairest, strongest and wisest man of the empire; and from him is required the practice of all piety and virtue, as well as skill in the chase and in arms—especially the bow Ardashir I, moreover, and his successors endeavoured to establish the validity of the royal will by absorbing the vassal states and instituting a firmer organization Nevertheless they failed to attain the complete independence and power of the Achaemenids Not strong enough to break up the nobility, with its great estates, they were forced to utilize its services and still further to promote its interests; while their dependence on its good-will and assistance led inevitably to incessant gifts of money, lands and men This state of affairs had also prevailed under the later Achaemenids, and had materially contributed to the disintegration of the empire and the numerous insurrections of the satraps.

But the older Achaemenids held an entirely different position; and hardly a single Sassanid enjoyed even that degree of power which was still retained by the later Achaemenids. It was of fundamental importance that the Sassanian empire could not make good its claim to world dominion; and, in spite of the title of its kings, it always remained essentially the kingdom of Iran—or rather West Iran, together with the districts on the Tigris and Euphrates This fact, again, is most closely connected with its military and administrative organization. The external and internal conditions of the empire are in mutual reaction upon one another. The empire, which in extent did not exceed that of the Arsacids with its vassal states, was protected on the east and west by the great deserts of central Iran and Mesopotamia. For the defence of these provinces the mounted archers, who formed the basis of the army, possessed adequate strength; and though the Scythian nomads from the east, or the Romans from the west, might occasionally penetrate deep into the country, they never succeeded in maintaining their position But the power of the neo-Persian empire was not great enough for further conquests, though its army was capable and animated by a far stronger national feeling than that of the Parthians It still consisted, however, of levies from the retinue of the magnates led by their territorial lords; and, although these troops would stream in at the beginning of a war, they could not be kept permanently together. For, on the one hand, they were actuated by the most varied personal interests and antipathies, not all of which the king could satisfy; on the other hand he could not, owing to the natural character and organization of his dominions, maintain and pay a large army for any length of time Thus the great hosts soon melted away, and a war, begun successfully, ended ingloriously, and often disastrously Under such circumstances an elaborate tactical organization employing different species of arms, or the execution of a comprehensive plan of campaign, was out of the question The successes of the Sassanids in the east were gained in the later period of their dominion; and the Roman armies, in spite of decay in discipline and military spirit, still remained their tactical and strategical superiors A great victory might be won—even an emperor might be captured, like Valerian—but immediately afterwards successes, such as those gained against Shapur I (who was certainly an able general) by Ballista and Odenathus of Palmyra, or the later victories of Carus, Julian and others, demonstrated how far the Persians were from being on an equality with the Romans That Babylonia permanently remained a Sassanian province was due merely to the geographical conditions and to the political situation of the Roman empire, not to the strength of the Persians

Among the magnates six great houses—seven, if we include the royal house—were still regarded as the foremost, precisely as under the Achaemenids, and from these were drawn the generals, crown officials and governors (*cf* Procop *Pers* i 6, 13 *sqq*) In the last of these positions we frequently find princes of the blood, who then bear the royal title (shah) Some of these houses —whose origin the legends derive from King Gushtasp (*i e* Vishtaspa), the protector of Zoroaster (Marquart, *Zeitschr d d morgenl Ges* xlix 635 *sqq*)—already existed under the Arsacids, *e g*, the Suren (Surenas, *vide supra*, p 798) and Karen (Carenes, Tac. *Ann* xii 12 *sqq*), who had obviously embraced the cause of the victorious dynasty at the correct moment and so retained their position The name *Pahlavan*, moreover, which denoted the Parthian magnates, passed over into the new empire Below these there was an inferior nobility, the *dikhans* ("village-lords") and the "knights" (*aswar*); who, as among the Parthians, took the field in heavy scale-armour To an even greater extent than under the Arsacids the empire was subdivided into a host of small provinces, at the head of each being a *Marzban* ("boundary-lord," "lord of the marches") These were again comprised in four great districts With each of these local potentates the king could deal with as scant consideration as he pleased, always provided that he had the power or understood the art of making himself feared But to break through the system or replace it by another was impossible In fact he was compelled to proceed with great caution whenever he wished to elevate a favourite of humbler origin to an office which custom reserved for the nobility. Thus it is all the more worthy of recognition that the Sassanian empire was a fairly orderly empire, with an excellent legal administration, and that the later sovereigns did their utmost to repress the encroachments of the nobility, to protect the

commonalty, and, above all, to carry out a just system of taxation.

Religious Development.—Side by side with the nobles ranked the spiritual chiefs, now a far more powerful body than under the Arsacids. Every larger district had its upper Magian (*Magupat, mobed, i.e.,* "Lord of the Magian"). At their head was the supreme Mobed, resident in Rhagae (Rai), who was regarded as the successor of Zoroaster. In the new empire, of which the king and people were alike zealous professors of the true faith, their influence was extraordinarily strong (*cf.* Agathias ii. 26)—comparable to the influence of the priesthood in later Egypt, and especially in Byzantium and mediaeval Christendom. As has already been indicated, it was in their religious attitudes that the essential difference lay between the Sassanid empire and the older Iranian states. But, in details, the fluctuations were so manifold that it is necessary at this point to enter more fully into the history of Persian religion (*cf.* especially H. Gelzer, "Eznik u. d. Entwickel. des pers. Religions-systems," in the *Zeitschr. f. armen. Philol.* i. 149 *sqq.*).

The Persian religion, as we have seen, spread more and more widely after the Achaemenian period. In the Indo-Scythian empire the Persian gods were zealously worshipped; in Armenia the old national religion was almost entirely banished by the Persian cults (Gelzer, "Zur armen. Götterlehre," in *Ber. d. sächs. Gesch. d. Wissensch.*, 1895); in Cappadocia, North Syria and the west of Asia Minor, the Persian gods were everywhere adored side by side with the native deities. It was in the 3rd century that the cult of Mithras, with its mysteries and a theology evolved from Zoroastrianism, attained the widest diffusion in all Latin-speaking provinces of the Roman dominion; and it even seemed for a while as though the *Sol invictus Mithras*, highly favoured by the Caesars, would become the official deity-in-chief of the empire. But in all these cults the Persian gods are perfectly tolerant of other native or foreign divinities; vigorous as was their propagandism, it was yet equally far removed from an attack on other creeds. Thus this Parseeism always bears a syncretic character; and the supreme god of Zoroastrian theory, Ahuramazda (*i e.* Zeus or Jupiter), in practice yields place to his attendant deities, who work in the world and are able to lead the believer, who has been initiated and keeps the commendments of purity, to salvation.

But meanwhile, in its Iranian home and especially in Persis, the religion of Zoroaster lived a quiet life, undisturbed by the proceedings of the outside world. Here the poems of the prophet and fragments of ancient religious literature survived, understood by the Magians and rendered accessible to the faithful laity by versions in the modern dialect (Pehlevi). Here the opposition between the good spirit of light and the demons of evil—between Ormuzd and Ahriman—still remained the principal dogma of the creed; while all other gods and angels, however estimable their aid, were but subordinate servants of Ormuzd, whose highest manifestation on earth was not the sun-god Mithras, but the holy fire guarded by his priests Here all the prescriptions of purity—partly connected with national customs, and impossible of execution abroad—were diligently observed; and even the injunction not to pollute earth with corpses, but to cast out the dead to vulture and dog, was obeyed in its full force. At the same time Ahuramazda preserved his character as a national god, who bestowed on his worshippers victory and world dominion. In the sculptures of the Sassanids, as also in Armenian traditions, he appears on horseback as a war-god. Here, again, the theology was further developed, and an attempt made to annul the old dualism by envisaging both Ormuzd and Ahriman as emanations of an original principle of infinite time (Zervan), a doctrine which long enjoyed official validity under the Sassanids till, in the reign of Chosroes I., "the sect of Zervanites" was pronounced heretical.[1] But, above all, the ritual and the doctrine of purity were elaborated and expanded, and there was evolved a complete and detailed system of casuistry, dealing with all things allowed and forbidden, the forms of pollution and the expiation for each, etc., which, in its arid and spiritless monotony, vividly recalls the similar prescriptions in the Pentateuch. The consequences of this development were that orthodoxy and literal obedience to all priestly injunctions now assumed an importance far greater than previously; henceforward, the great commandment of Zoroastrianism, as of Judaism, is to combat the heresies of the heathen, a movement which had already had an energetic representative in the prophet himself. Heathenish cults and forbidden manners and customs are a pollution to the land and a deep insult to the true God. Therefore the duty of the believer is to combat and destroy the unbeliever and the heretic. In short, the tolerance of the Achaemenids and the indifference of the Arsacids are now replaced by intolerance and religious persecution.

Such were the views in which Ardashir I. grew up, and in their energetic prosecution he found a potent instrument for the building up of his empire. It has previously been mentioned that Vologaeses III. had already begun a collection of the holy writings; and the task was resumed under Ardashir. At his order the orthodox doctrines and texts were compiled by the high priest Jansar; all divergent theories were prohibited and their adherents proscribed. Thus arose the *Avesta*, the sacred book of the Parsees. Above all, the sacred book of laws, the *Vendidad*, breathes throughout the spirit of the Sassanian period, in its intolerance, its casuistry degenerating into absurdity, and its soulless monotony. Subscription to the restored orthodox doctrine was to the Iranian a matter of course. The schismatics Ardashir imprisoned for a year; if, at its expiration, they still refused to listen to reason, and remained stiff-necked, they were executed. It is even related that, in his zeal for uniformity of creed, Ardashir wished to extinguish the holy fires in the great cities of the empire and the Parthian vassal states, with the exception of that which burned in the residence of the dynasty. This plan he was unable to execute. In Armenia, also Ardashir and Shapur, during the period of their occupation, sought to introduce the orthodox religion, destroyed the heathen images—even those of the Iranian gods which were here considered heathen,—and turned the shrines into fire-altars (Gelzer, *Ber. sachs. Ges.* p. 135, 1895). Shapur I., who appears to have had a broader outlook, added to the religious writings a collection of scientific treatises on medicine, astronomy, mathematics, philosophy, zoology, etc., partly from Indian and Greek sources.

A short time afterwards, the Roman empire followed the example of the Sassanids and attempted to enforce unity of creed on all subjects: with Decius (A.D. 250) began the systematic persecution of the Christians. For, meanwhile, the Christian religion had spread far in east and west with an equally zealous propagandism and an equal exclusiveness and intolerance. In the countries of the Tigris and Euphrates, now altogether Aramaic, Christianity had everywhere gained a firm footing.[2] But its missionary enterprise stretched over the whole of Iran, and even farther. The time was come when, in the western and eastern worlds alike, the religious question was for large masses of people the most important question in life, and the diffusion of their own creed and the suppression of all others the highest and holiest of tasks. The man who thinks thus knows no compromise, and so Zoroastrianism and Christianity confronted each other as mortal enemies. Still the old idea that every religion contained a portion of the truth, and that it was possible to borrow something from one and amalgamate it with another, had not yet lost all its power. From such a conception arose the teaching of Mani or Manes. Our knowledge of Manichaeism (*q.v.*) has been greatly increased by the discovery of many fragments of its literature in Eastern Turkistan (Turfan); but they all are surpassed in importance by a large Chinese manuscript in the British Museum containing translations of Manichaean hymns

[1]It may be observed that this innovation was also known to the Mithras-cult of the west, where Zervan appears as αἰών.

[2]For the propagation and history of the Christians in the Sassanid empire, *cf.* Labourt, *Le Christianisme dans l'empire perse sous la dynastie sassanide* (1904); Harnack, *Die Mission und Ausbreitung des Christenthums in den ersten drei Jahrhunderten*, 2. Aufl. (1906), Bd. II. p. 121 *seq.*; Chabot, *Synodicon orientale* (1902) (a collection of the acts of the Nestorian synods held under the rule of the Sassanids).

and ritual; the publication and explanation of it has been begun by Waldschmidt and Lenz (*Jr. As. Soc.* 1926, 116f. *Die Stellung Jesu im Manichaeismus,* Abh. Preuss. Akad. 1926). We can now clearly see that Manichaeism originated from a Gnostic sect. Mani, a Persian from Babylonia, proclaimed himself as the last and greatest apostle of Jesus and as the paraclete announced in the Gospel of John. But with the Gnostic interpretation of the Gospel he tried to combine the doctrine of Zoroaster and Jesus to create a new universal religion. He is said to have made his first appearance as a teacher on the coronation day of Shapur I. At all events he found numerous adherents, both at court and among the magnates of the empire. The king even inclined to him, till in a great disputation the Magians gained the predominance. None the less Mani found means to diffuse his creed far and wide over the whole empire. Even the heir to the throne, Hormizd I. (reigned 272–273), was favourably disposed to him; but Shapur's younger son, Bahram I. (273–276), yielded to sacerdotal pressure, and Mani was executed. After that Manichaeism was persecuted and extirpated in Iran. Yet it maintained itself not merely in the west, where its head resided at Babylon—propagating thence far into the Roman empire—but also in the east, in Khurasan and beyond the bounds of the Sassanian dominion. There the seat of its pontiff was at Samarkand; thence it penetrated into Central Asia, where, buried in the desert sands which entomb the cities of eastern Turkistan, numerous fragments of the works of Mani and his disciples, in the Persian language (Pahlevi) and Syrian script, and in an East Iranian dialect, called Sogdian, which was used by the Manichaeans of Central Asia, have been discovered.

Art and Literature.—Like the Arsacids the kings resided in Ctesiphon, where, out of the vast palace built by Chosroes I., a portion at least of the great hall is still erect. On the ruins of Seleucia, on the opposite bank of the Tigris, Ardashir I. built the city of Veh-Ardashir ("good is Ardashir"), to which the later kings added new towns, or rather new quarters. In Susiana Shapur I. built the great city of Gondev-Shapur, which succeeded the ancient capital of the Persian empire. At the same time the mother-country again gained importance; especially the capital of Persia, Istakhr, which had replaced the former Persepolis (now the ruins of Hajjiabad). Farther in the south-east, Ardashir I. built Gur (now Firuzabad), under the name of Ardashir-khurre ("the glory of Ardashir"). At these places and in Sarwistan, near Shiraz and elsewhere, lie ruins of the Sassanid palaces, which in their design go back to the Achaemenid architecture, blending with it, however, Graeco-Syrian elements and serving in their turn as models for the structures of the Caliphs (*see* ARCHITECTURE: *Sassanian*). After its long quiescence under the Arsacids native art underwent a general renaissance which, though not aspiring to the Achaemenian creations, was still of no small importance. Of the Sassanian rock-sculptures some have already been mentioned; besides these, numerous engraved signet-stones have been preserved. The metal-work, carpets and fabrics of this period enjoyed a high reputation; they were widely distributed and even influenced western art.

In the intellectual life and literature of the Sassanid era the main characteristic is the complete disappearance of Hellenism and the Greek language. Ardashir I. and Shapur I. still appended Greek translations to some of their inscriptions; but all of later date are drawn up in Pahlavi alone. The coins invariably bear a Pahlavi legend—on the obverse the king's head with his name and title; on the reverse, a fire-altar (generally with the ascription "fire of Ardashir, Shapur, etc.," *i.e.* the fire of the royal palace), and the name of the place of coinage, usually abbreviated. The real missionaries of culture in the empire were the Aramaeans (Syrians), who were connected with the west by their Christianity, and in their translations diffused Greek literature through the Orient. But there also developed a rather extensive Pahlavi literature, beginning with the translations of the sacred books (the *Avesta*) though not limited to religious subjects, but containing works in *belles lettres,* modernizations of the old Iranian sagas and native traditions, *e.g.*, the surviving fabulous history of Ardashir I., ethical tales, etc., with translations of foreign literature, principally Indian,—one instance being the celebrated book of tales *Kalilah and Dimmah* (*see* SYRIAC LITERATURE), dating from Chosroes I., in whose reign chess also was introduced from India.

BIBLIOGRAPHY.—Side by side with the accounts of Roman and Greek authors stands the indigenous tradition which, especially for the later years of the empire, is generally trustworthy. It goes back to a native work, the *Khudai nama* ("book of Lords"), compiled under Chosroes I. and continued to Yazdegerd III. Its narrations are principally preserved in Tabari, though there combined with numerous Arabian traditions; also in the poetical adaptation of Firdousi. To these may be added Syrian accounts, particularly in the martyrologies, which have been excellently treated by G. Hoffmann, *Auszüge aus syrischen Akten persischer Märtyrer* (1880); also the statements of the Armenian historians.

The fundamental work on Sassanian history is Theodor Nöldeke's *Gesch. der Perser u. Araber zur Zeit der Sassaniden, aus der arabischen Chronik des Tabari* (1879, trans. with notes and excursuses chiefly on the chronology and organization of the empire). On this is based Nöldeke's *Aufsätze zur pers. Gesch.* (1887), containing a history of the Sassanian empire, pp. 86 *sqq.* A. Christensen, *L'empire des Sassanids* (Mém. de l'acad. de Danemark 1907). For the geography and numerous details of administration: J. Marquart, "Eranshahr" (*Abh. d. götting. Ges. d. Wissensch.,* 1901). For the monuments: Flandin and Coste, *Voyage en Perse* (1851); Stolze, *Persepolis* (1882); Dalton, *The Treasure of the Oxus* (Brit. Mus. 1905); Fr. Sarre and E. Herzfeld, *Iran Felsreliefs* (1910); Fr. Sarre, *die Kunst der Alten Persien* (1923).

History of the Sassanian Empire.—In foreign policy the problems under the Sassanid kings[1] remained as of old, the defence and, when possible, the expansion of the eastern and western frontiers. In the first two centuries of the Sassanid empire we hear practically nothing of its relations with the east. Only occasional notices show that the inroads of the Oriental nomads had not ceased, and that the extent of the empire had by no means exceeded the bounds of the Parthian dominion—Sacastene (Seistan) and western Afghanistan. Far to the east, on both sides of the Indus, the Kushana empire was still in existence, though it was already hastening to decay, and about A.D. 320 was displaced from its position in India by the Gupta dynasty. In the west the old conflict for Osroene and northern Mesopotamia (now Roman provinces), with the fortresses of Edessa, Carrhae and Nisibis, still smouldered. Armenia the Sassanids were all the more eager to regain, since there the Arsacid dynasty still survived and turned for protection to Rome, with whom, in consequence, new wars perpetually broke out. In the reign of Bahram II. (276–293), the emperor Carus, burning to avenge the disaster of Valerian, penetrated into Mesopotamia without meeting opposition, and reduced Coche (near Seleucia) and Ctesiphon; but his sudden death, in December of 283, precluded further success, and the Roman army returned home. Bahram, however, was unable to effect anything, as his brother Hormuzd was in arms, supported by the Sacae and other tribes. (Mamertin, *Panegyr. Maximin.* 7. 10; *Genethl. Maximin.* 5, 17.) He chose, consequently, to buy peace with Diocletian by means of presents. After his death (293), his uncle Narses was forced by his magnates to rebel against Bahram III. and gained the crown. In memory of his victory he has erected a great tower in the mountains west of the upper Diyala, at Paikuli, discovered 1843 by Rawlinson and explored in three expeditions by Herzfeld (published by Herzfeld, *Pai Kuli* 1924; since then, he has cleared a great number of

further blocks of the inscription, which are not yet published). It is covered with his busts and with a large inscription in the two forms of Pahlavi writing, the Parthian and the Persian, of which many blocks have been preserved. It contained an account of the way in which he defeated his opponent, and gives at the end a long list of the kings and dynasts, who sent embassies of congratulation at his accession, headed by the Kushan-shah of India and the Caesar of Rome. From this list we see that the east of Iran did not belong to the empire, but was ruled by a great many local dynasts, some of whom, just as the kings of the Arabic tribes in Babylonia (the Lakhmids of Hira, etc.), may have acknowledged the suzerainty of the Sassanids. After his victory, Narses occupied Armenia and defeated the emperor Galerius at Callinicum (296). But in the following year he sustained a severe reverse in Armenia, in which he lost his war-chest and harem. He then concluded a peace, by the terms of which Armenia remained under Roman suzerainty, and the steppes of northern Mesopotamia, with Singara and the hill-country on the left bank of the Tigris as far as Gordyene, were ceded to the victor (Ammian. Marc. xxv. 7, 9; Petr. Patr. *fr.* 13, 14; Rufus *brev.* 25). In return Narses regained his household. This peace, ratified in 297 and completely expelling the Sassanids from the disputed districts, lasted for 40 years.

After the death of Hormuzd II. (302–310), the son of Narses, the magnates imprisoned or put to death his adult sons, one of whom, Hormisdas, later escaped to the Romans, who used him as a pretender in their wars. Shapur II., a posthumous child of the late king, was then raised to the throne, a proof that the great magnates held the sovereignty in their own hands and attempted to order matters at their own pleasure. Shapur, however, when he came to manhood proved himself an independent and energetic ruler.

Shapur II.—Meanwhile the Roman empire had become Christian, the sequel of which was that the Syro-Christian population of Mesopotamia and Babylonia—even more than the Hellenic cities in former times—gravitated to the west and looked to Rome for deliverance from the infidel yoke. On similar grounds Christianity, as opposed to Mazdaism enforced officially by the Sassanids, became predominant in Armenia. Between these two great creeds the old Armenian religion was unable to hold its own; as early as A.D. 294 King Tiridates was converted by Gregory the Illuminator and adopted the Christian faith. For this very reason the Sassanid empire was the more constrained to champion Zoroastrianism. It was under Shapur II. that the compilation of the *Avesta* was completed and the state orthodoxy perfected by the chief *mobed*, Aturpad. All heresy was proscribed by the state, defection from the true faith pronounced a capital crime, and the persecution of the heterodox—particularly the Christians—began (*cf.* Sachall, "Die rechtlichen Verhältnisse der Christen in Sassanidenreich," in *Mitteilungen des Seminars für orientalische Sprachen für Berlin*, Bd. X., Abt. 2, 1907). Thus the duel between the two great empires now becomes simultaneously a duel between the two religions.

In such a position of affairs a fresh war with Rome was inevitable.[1] It was begun by Shapur in A.D. 337, the year that saw the death of Constantine the Great. The conflict centred round the Mesopotamian fortresses; Shapur thrice besieged Nisibis without success, but reduced several others, as Amida (359) and Singara (360), and transplanted great masses of inhabitants into Susiana. The emperor Constantius conducted the war feebly and was consistently beaten in the field. But, in spite of all, Shapur found it impossible to penetrate deeper into the Roman territory. He was hampered by the attack of nomadic tribes in the east, among whom the Chionites now begin to be mentioned. Year after year he took the field against them (353–358), till finally he compelled them to support him with auxiliaries (Ammian. Marc. 14, 3, 16, 9; 17, 5; 18, 4, 6). With this war is evidently connected the foundation of the great town New-Shapur (Nishapur) in Khorasan.

By the resolution of Julian (363) to begin an energetic attack on the Persian empire, the conflict, after the lapse of a quarter of a century, assumed a new phase. Julian pressed forward to Ctesiphon but succumbed to a wound; and his successor Jovian soon found himself in such straits, that he could only extricate himself and his army by a disgraceful peace at the close of 363, which ceded the possessions on the Tigris and the great fortress of Nisibis, and pledged Rome to abandon Armenia and her Arsacid protégé, Arsaces III., to the Persian.

Shapur endeavoured to occupy Armenia and introduce the Zoroastrian orthodoxy. He captured Arsaces III. by treachery and compelled him to commit suicide; but the Armenian magnates proved refractory, placed Arsaces's son Pap on the throne, and found secret support among the Romans. This all but led to a new war; but in 374 Valens sacrificed Pap and had him killed in Tarsus. The subsequent invasions of the Goths, in battle with whom Valens fell at Adrianople (375), definitely precluded Roman intervention; and the end of the Armenian troubles was that (*c.* 390) Bahram IV. and Theodosius the Great concluded a treaty which abandoned the extreme west of Armenia to the Romans and confirmed the remainder in the Persian possession. Thus peace and friendship could at last exist with Rome; and in 408 Yazdegerd I. contracted an alliance with Theodosius II. In Armenia the Persians immediately removed the last kings of the house of Arsaces (430), and thenceforward the main portion of the country remained a Persian province under the control of a *marzban*, though the Armenian nobles still made repeated attempts at insurrection. The introduction of Zoroastrianism was abandoned; Christianity was already far too deeply rooted. But the sequel to the Roman sacrifice of Armenian interests was that the Armenian Christians now seceded from the orthodoxy of Rome and Constantinople, and organized themselves into an independent national church. This church was due, before all, to the efforts of the *Catholicos* Sahak (390–439), whose colleague Mesrob, by his translation of the Bible, laid the foundations of an Armenian literature (*see* ARMENIAN CHURCH).

From Yazdegerd I. to the Turks.—In the interior of the Sassanian empire the old troubles broke out anew on the death of Shapur II. (379). At first the magnates raised his aged brother Ardashir II. to the throne, then in 383 deposed him and enthroned Shapur's son as Shapur III. In 388, however, he was assassinated, as was also his brother, Bahram IV., in 399. But the son of the latter, Yazdegerd I. (399–420), was an energetic and intelligent sovereign, who held the magnates within bounds and severely chastised their attempts at encroachment. He even sought to emancipate himself from the Magian Church, put an end to the persecutions, and allowed the Persian Christians an individual organization. In the Persian tradition he is consequently known as "the sinner." In the end he was probably assassinated. So great was the bitterness against him that the magnates would admit none of his sons to the throne. One of them, however, Bahram V., found an auxiliary in the Arab chief Mondhir, who had founded a principality in Hira, west of the lower Euphrates; and, as he pledged himself to govern otherwise than his father, he received general recognition. This pledge he redeemed, and he is, in consequence, the darling of Persian tradition, which bestows on him the title of *Gor* ("the wild ass"), and is eloquent on his adventures in the chase and in love. This reversal of policy led to a Christian persecution and a new war with Rome. Bahram, however, was worsted; and in the peace of 422 Persia agreed to allow the Christians free exercise of their religion in the empire, while the same privilege was accorded to Zoroastrianism by Rome. Under his son, Yazdegerd II. (438–457), who once more revived the persecutions of the Christians and the Jews, a short conflict with Rome again ensued (441): while at the same time war prevailed in the east against the remnants of the Kushan empire and the tribe of Kidarites, also named Huns.

Here a new foe soon arose in the shape of the Ephthalites (*Haitab*), also known as the "White Huns," a barbaric tribe which shortly after A.D. 450 raided Bactria and terminated the Kushana dominion (Procop. *Pers.* i. 3), and soon began to extend their invasions into India, where they destroyed the Gupta

[1] For the succeeding events *see* also under ROME: *Ancient History*; and articles on the Roman emperors and Persian kings.

empire about A.D. 500. These Ephthalite attacks harassed and weakened the Sassanids, exactly as the Tocharians had harassed and weakened the Arsacids after Phraates II. Peroz (457–484) fell in battle against them; his treasures and family were captured and the country devastated far and near. His brother Balash (484–488), being unable to repel them, was deposed and blinded, and the crown was bestowed on Kavadh I. (488–531), the son of Peroz As the external and internal distress still continued he was dethroned and imprisoned, but took refuge among the Ephthalites and was restored in 499 by their assistance—like so many Arsacids by the arms of the Dahae and Sacae To these struggles obviously must be attributed mainly the fact that in the whole of this period no Roman war broke out But, at the same time, the religious duel had lost in intensity, since, among the Persian Christians, the Nestorian doctrine was now dominant Peroz had already favoured the diffusion of Nestorianism, and in 483 it was officially adopted by a synod, after which it remained the Christian Church of the Persian empire, its head being the patriarch of Seleucia-Ctesiphon

Kavadh proved himself a vigorous ruler. On his return he restored order in the interior In 502 he attacked the Romans and captured and destroyed Amida (mod Diarbekr), but was compelled to ratify a peace owing to an inroad of the Huns Toward the close of his reign (527) he resumed the war, defeating Belisarius at Callinicum (531), with the zealous support of the wild Arab Mondhir II of Hira On his death his son Chosroes I concluded a peace with Justinian (532), pledging the Romans to an annual subsidy for the maintenance of the Caucasus fortresses In his home policy Kavadh is reminiscent of Yazdegerd I. Like him he had little inclination to the orthodox church, and favoured Mazdak, the founder of a communistic sect which had made headway among the people and might be used as a weapon against the nobles, of whom Mazdak demanded that they should cut down their luxury and distribute their superfluous wealth. Another feature of his programme was the community of wives. The crown-prince, Chosroes, was, on the other hand, wholly orthodox; and, towards the close of his father's reign, in conjunction with the chief Magian, he carried through the condemnation of the Mazdakites, who were butchered in a great massacre (528). Chosroes I (531–579), surnamed Anushirvan ("the blessed"), then restored the orthodox doctrine in full, publishing his decision in a religious edict. At the same time he produced the official exposition of the *Avesta*, an exegetical translation in the popular tongue (Pahlavi), and declared its contents binding. Defection from Zoroastrianism was punished with death, and therefore also the proselytizing of the Christians, though the Syrian martyrologies prove that the kings frequently ignored these proceedings so long as it was at all possible to do so

Chosroes I was one of the most illustrious sovereigns of the Sassanian empire From him dates a new and equitable adjustment of the imperial taxation, which was later adopted by the Arabs. His reputation as an enlightened ruler stood so high that when Justinian, in 529, closed the school of Athens, the last Neoplatonists bent their steps to him in hopes of finding in him the true philosopher-king Their disillusionment, indeed, was speedy and complete, and their gratitude was great, when, by the conditions of the armistice of 549, he allowed their return From 540 onward he conducted a great war against Justinian (527–565), which, though interrupted by several armistices, lasted till the 50 years' peace of 562 The net result, indeed, was merely to restore the *status quo;* but during the campaign Chosroes sacked Antioch and transplanted the population to a new quarter of Ctesiphon (540) He also extended his power to the Black sea and the Caucasus; on the other hand, a siege of Edessa failed (544). A second war broke out in 577, chiefly on the question of Armenia and the Caucasus territory. In this Chosroes ravaged Cappadocia in 575; but the campaign in Mesopotamia was unsuccessful. In the interval between these two struggles (570) he despatched assistance to the Arabs of Yemen, who had been assailed and subdued by the Abyssinian Christians; after which period Yemen remained nominally under Persian suzerainty till its fate was sealed by the conquests of Mohammed and Islam.

The Turks and the Arabs.—Meanwhile, about A.D. 560, a new nation had sprung up in the East, the Turks Chosroes concluded an alliance with them against the Ephthalites and so conquered Bactria south of the Oxus, with its capital Balkh. Thus this province, which, since the insurrection of Diodotus in 250 B.C., had undergone entirely different vicissitudes from the rest of Iran, was once more united to an Iranian empire, and the Sassanid dominions, for the first time, passed the frontiers of the Arsacids. This, however, was the limit of their expansion Neither the territories north of the Oxus, nor eastern Afghanistan and the Indus provinces, were ever subject to them That the alliance with the Turks should soon change to hostility and mutual attack was inevitable from the nature of the case; in the second Roman war the Turkish Khan was leagued with Rome

Chosroes bequeathed this war to his son Hormuzd IV. (579–590) who, in spite of repeated negotiations, failed to re-establish peace Hormuzd had not the ability to retain the authority of his father, and he further affronted the Magian priesthood by declining to proceed against the Christians and by requiring that, in his empire, both religions should dwell together in peace Eventually, he succumbed to a conspiracy of his magnates, at whose head stood the general Bahram Cobin, who had defeated the Turks, but afterwards was beaten by the Romans Hormuzd's son, Chosroes II, was set up against his father and forced to acquiesce in his execution. But immediately new risings broke out, in which Bahram Cobin—though not of the royal line—attempted to secure the crown, while simultaneously a Prince Bistam entered the lists Chosroes fled to the Romans and the emperor Maurice undertook his restoration at the head of a great army. The people flocked to his standard, Bahram Cobin was routed (591) and fled to the Turks, who slew him, and Chosroes once more ascended the throne of Ctesiphon, Bistam held out in Media till 596 Maurice made no attempt to turn the opportunity to Roman advantage, and in the peace then concluded he even abandoned Nisibis to the Persians

Chosroes II (590–628) is distinguished by the surname of *Parvez* ("the conqueror"), though, in point of fact, he was immeasurably inferior to a powerful sovereign like his grandfather, or even to a competent general He lived, however, to witness unparalleled vicissitudes of fortune The assassination of Maurice in 602 impelled him to a war of revenge against Rome, in the course of which his armies—in 608 and, again, in 615 and 626—penetrated as far as Chalcedon opposite Constantinople, ravaged Syria, reduced Antioch (611), Damascus (613), and Jerusalem (614), and carried off the holy cross to Ctesiphon; in 619 Egypt was occupied Meanwhile, the Roman empire was at the lowest ebb The great emperor Heraclius, who assumed the crown in 610, took years to create the nucleus of a new military power. This done, however, he took the field in 623, and repaid the Persians with interest Their armies were everywhere defeated In 624 he penetrated into Atropatene (Azerbaijan), and there destroyed the great fire-temple, in 627 he advanced into the Tigris provinces. Chosroes attempted no resistance, but fled from his residence at Dastagerd to Ctesiphon. These proceedings, in conjunction with the avarice and licence of the king, led to revolution Chosroes was deposed and slain by his son Kavadh II. (628); but the parricide died in a few months and absolute chaos resulted A whole list of kings and pretenders—among them the General Sharbaraz and Boran, a daughter of Chosroes—followed rapidly on one another, till finally the magnates united and, in 632, elevated a child to the throne, Yazdegerd III, grandson of Chosroes In the interval—presumably during the reign of Queen Boran—peace was concluded with Heraclius, the old frontier being apparently restored The cross had already been given back to the emperor

Thus the 100 years' struggle between Rome and Persia, which had begun in 527 with the attack of the first Kavadh on Justinian, had run its fruitless course, utterly enfeebling both empires and consuming their powers. Room was given to a new enemy who now arose between either state and either religion—the Arabs and Islam. In the same year that saw the coronation of Yazdegerd III.—the beginning of 633—the first Arab squadrons made their

entry into Persian territory. After several encounters there ensued (637) the battle of Kadisiya (Qadisiya, Cadesia), fought on one of the Euphrates canals, where the fate of the Sassanian empire was decided. A little previously, in the August of 636, Syria had fallen in a battle on the Yarmuk (Hieromax), and in 639 the Arabs penetrated into Egypt. The field of Kadisiya laid Ctesiphon, with all its treasures, at the mercy of the victor. The king fled to Media, where his generals attempted to organize the resistance; but the battle of Nehavend (641) decided matters there. Yazdegerd sought refuge in one province after the other, till, at last, in 651, he was assassinated in Merv (*see* CALIPHATE: §A, §1).

Thus ended the empire of the Sassanids, no less precipitately and ingloriously than that of the Achaemenids. By 650 the Arabs had occupied every province to Balkh and the Oxus. Only in the secluded districts of northern Media (Tabaristan), the "generals" of the house of Karen (Spahpat, Ispehbed) maintained themselves for a century as vassals of the caliphs—exactly as Atropates and his dynasty had done before them.

The fall of the empire sealed the fate of its religion. The Muslims officially tolerated the Zoroastrian creed, though occasional persecutions were not lacking. But little by little it vanished from Iran, with the exception of a few remnants (chiefly in the oasis of Yezd), the faithful finding a refuge in India at Bombay. These Parsees have preserved but a small part of the sacred writings; but to-day they still number their years by the era which begins on June 16, A.D. 632, with the death of Yazdegerd III., the last king of their faith and the last lawful sovereign of Iran, on whom rested the god-given Royal Glory of Ormuzd.

B.—TRANSITION PERIOD: FROM THE FALL OF THE SASSANID DYNASTY TO THE DEATH OF TIMUR (1405)

Alien Rulers.—With the final defeat of the Sassanids under Yazdegerd III. at the battles of Kadisiya (Qadisiya) (637) and Nehavend (641) Persia ceased to exist as a single political unit. The country passed under a succession of alien rulers who cared nothing for its ancient institutions or its religion. For about 150 years it was governed, first from Medina and afterwards from Baghdad, by officers of the Mohammedan caliphs whose principal aim it was to destroy the old nationality by the suppression of its religion. The success of this policy was, however, only apparent, especially in Iran, the inhabitants of which adopted Islam only in the most superficial manner, and it was from Persia that the blow fell which destroyed the Omayyad caliphate and set up the Abbasids in its place (*see* CALIPHATE). Even before this event adventurers and dissatisfied Muslim officers had utilized the slumbering hostility of the Persian peoples to aid them in attacks on the caliphs, and the policy of eastern expansion brought the Arab armies perpetually into the Persian provinces.

In the reign of Merwan I. the Persians (who were mostly Shiahs) under a Muslim officer named Mokhtar (Mukhtar), whom they regarded as their mahdi, vainly attempted to assert their independence in Kufa, but were soon defeated. This rising was followed by many more (*see* CALIPHATE) in which the caliphs were generally successful, and Abdalmalik (d. 705) considerably strengthened the Muslim power by instituting a thorough system of Muslim currency and enforcing Arabic as the official language throughout the empire. In the succeeding reign Persia was further subdued by the great conqueror Qoteiba (Qotaiba) b. Moslim, the Arabic governor of Khorasan. Omar II., however, extended to non-Arabic Muslims immunity from all taxes except the *zakat* (poor-rate), with the result that a large number of Persians, who still smarted under their defeat under Mokhtar, embraced Islam and drifted into the towns to form a nucleus of sedition under the Shiah preachers. In the reign of Yazid II. (720–724) serious risings took place in Khorasan, and in spite of the wise administration of his successor Hisham (d. 743), the disorder continued to spread, fanned by the Abbasids and the Shiah preachers. Ultimately in the reign of Merwan II. the non-Arabic Muslims found a leader in Abu Moslim, a *maula* (client) of Persian origin and a henchman of Ibrahim b. Mohammed b. Ali, the Shiah imam, who raised a great army, drove the caliph's general Nasr b. Sayyar into headlong flight, and finally expelled Merwan. Thus the Abbasids became masters of Persia and also of the Arab empire. They had gained their success largely by the aid of the Persians, who began thenceforward to recover their lost sense of nationality. At the same time the Khorasanians had fought for the old Alid family, not for the Abbasids, and with the murder of Abu Moslim discontent again began to grow among the Shiahs (*q.v.*). In the reign of Harun-al-Rashid disturbances broke out in Khorasan which were temporarily appeased by a visit from Harun himself. Immediately afterwards Rafi' b. Laith, grandson of the Omayyad general Nasr b. Sayyar, revolted in Samarkand, and Harun on his way to attack him died at Tus (809). Harun's sons Amin and Mamun quarrelled over the succession; Amin became caliph, but Mamun by the aid of Tahir b. Ḥosain Dhu 'l-Yaminain ("the man with two right hands") and others succeeded in deposing and killing him. Tahir ultimately (820) received the governorship of Khorasan, where he succeeded in establishing a practically independent Muslim dynasty (the Tahirids) which ruled until about 873 in nominal obedience to Baghdad. From 825 to about 898 a similar dynasty, the Dulafids or Dolafids, reigned nominally as governors under the caliphs till they were put down by Motadid. In the reign of the caliph Motasim a serious revolt of Persian Mazdakite sectaries (the Khorrami) in alliance with Byzantium was with difficulty suppressed, as also a rising of Tabaristan under an hereditary chief Maziyar who was secretly supported by the Turkish mercenaries (*e.g.*, Afshin) whom the caliph had invited to his court. To another Turk, Itakh, the caliph Wathiq gave a titular authority over all the eastern provinces. In the reign of the tenth caliph Motawakkil the Tahirids fell before Yakub b. Laith al-Saffar, who with the approbation of the caliph founded a dynasty, the Saffarid in Seistan.

Minor Dynasties.—It is convenient at this point to mention several other minor dynasties founded by nominal governors in various parts of Persia and its borderland. From 879 to about 930 the Sajids ruled in Azerbaijan, while in Tabaristan an Alid dynasty (the Zaidites) was independent from 864 to 928, when it fell before the Samanids. Subsequently descendants of this house ruled in Dailam and Gilan. Throughout this period the caliphate was falling completely under the power of the Turkish officers. Mohtadi, the 14th Abbasid caliph, endeavoured vainly to replace them by Persians (the Abna). His successor Motamid was attacked by the Saffarid Yakub who however was compelled to flee (*see* CALIPHATE). Yakub's brother Amr (reigned 878–900) received the vacant position, but was taken prisoner by Isma'il b. Ahmad, the Samanid, and the Saffarids were henceforward a merely nominal dynasty under the Samanids (900–1229). The Samanids (*q.v.*) were the first really important non-Arabic Persian dynasty since the fall of Yazdegerd III. They held sway over most of Persia and Transoxiana, and under their rule scholarship and the arts flourished exceedingly in spite of numerous civil wars. Ultimately they fell before the Ghaznevid dynasty of Sabuktagin.

In the reign of Motadid who, as we have seen, put down the Dolafids, and also checked the Sajids of Azerbaijan in their designs on Syria and Egypt, the Kharijites of Mesopotamia were put down by the aid of the Hamdanites of Mosul, who were to become a dynasty of some importance. Subsequently the caliphate, which had temporarily recovered some of its authority, resumed its downward course, and the great families of Persia once again asserted themselves. In the reign of Qahir (d. 934), a new dynasty arose in Persia, that of the Buyids (Buwayhids). This

family was descended from one Abu Shaja Buya, who claimed to be of the old Sassanian house and had become a chieftain in Dailam. He had successively fought for the Samanids and the Ziyarids, a dynasty of Jorjan, and his son Imad addaula (eddowleh, originally Abu 'l Ḥasan Ali) received from Mardawij of the latter house the governorship of Karaj; his second son Rokn addaula (Abu Ali Ḥasan) subsequently held Rai and Isfahan, while the third, Moizz addaula (Abu 'l Ḥosain Ahmad) secured Kermān, Ahvaz and even Baghdad.

The reign of the caliph Mottaqi was a period of perpetual strife between the Dailamites, the Turks and the Hamdanid Nasir addaula of Mosul. In the next reign Moizz addaula took Baghdad (945) It was at this time that the three brothers took the titles Imad, Rukn (Rokn), and Moizz addaula The authority of the family was absolute, though they paid outward respect to the caliphs Moizz addaula repelled an attack of the Hamdanids of Mosul. The Buyids, and especially Adod addaula (Azud-ed-Dowleh, and similar forms), ruled Baghdad wisely and improved the city by great public works such as the great dike, still known as the Bend Amir on the Kur (Cyrus) near Persepolis Their sway extended from the Persian gulf to the Caspian sea Ultimately however, the Buyid dynasty grew weaker under the quarrels of its members and fell an easy prey to the Ghaznevids. In the meantime (999) the Sassanids fell before the Ilek-Khans of Turkestan, to the great advantage of the Ghaznevid princes

Ghaznevids and Seljuks.—The centre of force in Persian politics now changes from west to east Hitherto the ultimate power, at least nominally, had resided in the caliphate at Baghdad, and all the dynasties which have been noticed derived their authority formally from that source With the rise of the Ghaznevids and later the Seljuks, the Abbasid caliphate ceased to count as an independent power As we have seen, the Ghaznevid armies in a brief space destroyed most of the native dynasties of Persia The first of the house was Alptagin, a Turkish slave of the Samanid Mansur I, who, having quarrelled with his master, took refuge in Afghanistan and founded a semi-independent authority. After his death three unimportant governors of his house held sway, but in 977 the power fell to another former slave, Sabuktagin, who was recognized by the Samanid Nuh II His son and successor Mahmud (*q.v.*) was attacked by a brother, Isma'il, and retired from Khorasan (of which he had been governor). The Samanids then fell under the power of the Tatar Ilkhans, but Mahmud returned, triumphed over both the Samanids and the Tatars, and assumed the independent title of sultan with authority over Khorasan, Transoxiana and parts of northwest India Mahmud was a great conqueror, and wherever he went he replaced the existing religion by Mohammedanism He is described as the patron (if a somewhat ungenerous one) of literature, it was under his auspices that Firdousi collected the ancient myths of Persia and produced the great epic *Shahnama* (Book of the Kings) His descendants held a nominal rule till 1187, but in 1152 they lost all their extra-Indian territories to the Ghorids, and during the last 35 years reigned in diminished splendour at Lahore Even before this time, however, the supremacy which they enjoyed under Mahmud in Persia had fallen into the hands of the Seljuks who, in the reign of Mas'ud I, son of Mahmud, conquered Khorasan In 1037 Seljuk princes were recognized in Merv and Nishapur, and in the ensuing 18 years the Seljuks conquered Balkh, Jorjan, Tabaristan, Khwarizm, Hamadan, Rai, Isfahan, and finally Baghdad (1055) The Abbasid caliphs, who still enjoyed a precarious and shadowy authority at the pleasure of Turkish viziers, gladly surrendered themselves to the protection of the Mohammedan Seljuks, who paid them all outward respect

Thus for the first time since the Arab conquest of the Sassanian realm Persia was ruled by a single authority, which extended its conquests westward into Asia Minor, where it checked the rulers of Byzantium, and eastward to India and Central Asia. The history of this period is treated at length in the articles CALIPHATE and SELJUKS. The empire of the Seljuks was essentially military. Their authority over their own officers was so precarious that they preferred to entrust the command to Turkish slaves These officers, however, were far from loyal to their lords. In every part of the empire they gradually superseded the Seljuk princes and founded minor dynasties.

Khwarizm.—Before passing on to the Mongol conquerors of Persia it is necessary briefly to notice the shahs of Khwarizm, who have frequently been mentioned as overthrowing the minor dynasties which arose with the decay of the Seljuks These rulers were descended from Anushtajin, a Turkish slave of Ghazni, who became cupbearer to the Seljuk Malik Shah, and afterwards governor of Khwarizm (Khiva) in 1077 In 1138 the third of the line, Atsiz, revolted but was defeated and expelled by Sinjar. Shortly afterwards he returned, firmly established his power, and extended the Khwarizm empire as far as Jand on the Sihun The brief reigns of Il-Arslan and Sultan Shah Mahmud were succeeded by that of Tukush (1172–99) and Ala ed-din Mohammed (1199–1220) The former of these subdued Khorasan, Rai and Isfahan, while the latter brought practically all Persia under his sway, conquered Bokhara, Samarkand and Otrar, capital of the Karakitai, and had even made himself master of Ghazni when his career was stopped by the hordes of the Mongol Jenghiz Khan. In 1231 the last of his house, Jelal ud-din (Jalaluddin) Mangbarti, or Mango-berti, was banished, and thus the empire of the Khwarizm shahs, which for a brief period had included practically all the lands conquered by the Seljuks, passed away

Thus from the fall of the Samanids to the invasion of the Mongols five or at most six important dynasties held sway over Persia, while some 40 small dynasties enjoyed a measure of local autonomy. During the whole of this period the Abbasid caliphs had been nominally reigning throughout the Mohammedan world with their capital at Baghdad. But with hardly any exceptions they had been the merest puppets, now in the hands of Turkish ministers, now under the protection of practically independent dynasts The real rulers of Persia during the years 874–1231 were, as we have seen, the Samanids, the Buyids, the Ghaznevids, the Seljuks, the Salgharids and the Khwarizm shahs We now come to a new period in Persian history, when the numerous petty dynasties which succeeded the Seljuks were all swallowed up in the great Mongol invasion

Mongols.—In later years of the 12th century the Mongols began their westward march and, after the conquest of the ancient kingdom of the Karakitai, reached the borders of the territory of the Khwarizm shahs, which was at once overwhelmed Jenghiz Khan died in 1272, and the Mongol empire stretching from the Caspian to the Yellow sea was divided up among his sons Persia itself fell partly in the domain of Jagatai and partly in that of the Golden Horde The actual governor of Persia was Tului or Tule, whose son Hulagu or Hulaku is the first who can be rightly regarded as the sovereign of Persia His accession occurred in 1256 and henceforward Persia becomes after 600 years of spasmodic government a national unit Hulagu at once proceeded to destroy a number of nascent dynasties which endeavoured to establish themselves on the ruins of the Khwarizm empire; about 1255 he destroyed the dynasty of the Assassins by the capture of their stronghold of Alamut (Eagle's Nest), and finally in 1258 captured Baghdad The 38th and last Abbasid caliph, Mostasim, was brutally murdered, and thus the Mohammedan caliphate ceased to exist even as an emasculated pontificate The Persian empire under Hulagu and his descendants extended from the dominions of Jagatai on the north to that of the Egyptian dynasts on the south, and from the Byzantine empire on the west to the confines of China Its rulers paid a nominal homage to the Khakhan (Great Khan) in China, and officially recognized this dependence in their title of Ilkhan, *i e*, provincial or dependent khan From 1258 to 1335 the Ilkhans were not seriously challenged. Hulagu fixed his capital at Maragha (Meragha) in Azerbaijan, where he erected an observatory for Nasir ud-din Tusi, who at his request prepared the astronomical tables known as the *Zidj-i-Ilkhani* He died in 1265 and was succeeded by his son Abagha or Abaka, who married the daughter of Michael Palaeologus, the Byzantine ruler. Abagha was a peaceful ruler and endeavoured by wise administration to give order and prosperity to a country torn asunder by a

long period of intestine war and the Mongol invasion. He succeeded in repelling two attacks by other Mongolian princes of the house of Jenghiz Khan; otherwise his reign was uneventful. His brother Nikudar (originally Nicolas) Ahmad Khan succeeded him in 1281. This prince was converted to Islam, an event of great moment both to the internal peace and to the external relations of Persia. His persecution of the Christians led them into alliance with the Mongols, who detested Islam; the combined forces were too strong for Nikudar, who was murdered in 1284. The external results were of more importance. The Ilkhans, who had failed in their attempt to wrest Syria from the Mameluke rulers of Egypt had subsequently endeavoured to effect their object by inducing the European Powers to make a new crusade. The conversion of Nikudar put an end to this policy and Egypt was for some time free from Persian attack (*see* Egypt: *History*). The Mongol leaders put on the throne a son of Abagha, by name Arghun. His reign was troubled. His first minister Shams ud-din was suspected of having poisoned Abagha, and was soon put to death. His successor, the amir Bogha, conspired against Arghun and was executed. Under the third minister (1289–91), a Jewish doctor named Sa'd addaula (ed-Dowleh), religious troubles arose owing to his persecution of the Mohammedans and his favouring the Christians. The financial administration of Sa'd was prudent and successful, if somewhat severe, and the revenue benefited considerably under his care. But he committed the tactical error of appointing a disproportionate number of Jews and Christians as revenue officials, and thus made many enemies among the Mongol nobles, who had him assassinated in 1291 when Arghun was lying fatally ill. It is possible that it was Sa'd's diplomacy which led Pope Nicholas IV. to send a mission to Arghun with a view to a new crusade. The reign of Arghun was also disturbed by a rebellion of a grandson of Hulagu, Baidu Khan. Arghun died soon after the murder of Sa'd, and was succeeded by his brother Kaikhatu, or Gaykhatu, who was taken prisoner by Baidu Khan and killed (1295). Baidu's reign was cut short in the same year by Arghun's son Ghazan Mahmud, whose reign (1295–1304) was a period of prosperity in war and administration. Ghazan was a man of great ability. He established a permanent staff to deal with legal, financial and military affairs, put on a firm basis the monetary system and the system of weights and measures, and perfected the mounted postal service. Ghazan fought with success against Egypt (which country had already from 1293 to Dec. 1294 been ruled by a Mongol usurper Kitboga), and even held Damascus for a few months. In 1303, however, his troops were defeated at Merj al-Saffar, and Mongol claims on Syria were definitely abandoned. It was even suggested that the titular Abbasid caliphs (who retained an empty title in Cairo under Mameluke protection) should be reinstated at Baghdad, but this proposal was not carried into effect. Ghazan is historically important, however, mainly as the first Mongol ruler who definitely adopted Islam with a large number of his subjects. He died in 1304, traditionally of anger at the Syrian fiasco, and was succeeded by his brother Uljaitu (Oeljeitu). The chief events of his reign were a successful war against Tatar invaders and the substitution of the new city of Sultania as capital for Tabriz, which had been Ghazan's headquarters. Uljaitu was a Shiah and even stamped his coins with the names of the 12 Shiah imams. He died in 1316, and was succeeded by Abu Sa'id, his son. The prince, under whom a definite peace was made with Malik al-Nasir, the Mameluke ruler of Egypt, had great trouble with powerful viziers and generals which he accentuated by his passion for Bagdad-Khatun, wife of the amir Ḥosain and daughter of the amir Chupan. This lady he eventually married, with the result that Chupan headed a revolt of his tribe, the Selduz. Abu Sa'id died of fever in 1335, and with him the first Mongol or Ilkhan dynasty of Persia practically came to an end. The real power was divided between Chupan and Ḥosain the Jelair (or Jalair), or the Ilkhanian, and their sons, known respectively as the Little Ḥasan (Ḥasan Kuchuk) and the great Ḥasan (Ḥasan Buzurg). After a brief succession of obscure princes Ḥasan Buzurg definitely installed himself as the first khan of the Jelairid or Ilkhanian-Jelairid dynasty.

Practically from the reign of Abu Sa'id Persia was divided under five minor dynasties, (1) the Jelairids, (2) the Mozaffarids, (3) the Sarbadarids (Serbedarians), (4) the Beni Kurt and (5) the Jubanians, all of which ultimately fell before the armies of Timur. But the authority of Timur, which was dominant throughout Persia from at least as early as 1395 till his death in 1405, was never unchallenged. He passed from one victory to another, but the conquered districts were never really settled under his administration. Fresh risings of the defeated dynasties followed each new enterprise, and he had also to deal with the Mongol hordes whose territory marched with northern Persia. His descendants were for a brief period the overlords of Persia, but after Shah Rukh (reigned 1409–46) and Ala addaula (1447), the so-called Timurid dynasty ceased to have any authority over Persia. There were Timurid governors of Fars under Shah Rukh, Pir Mohammed (1405–09), Iskendar (1409–14), Ibrahim (1415–34) and Abdallah (1434); in other parts of Persia many of the Timurid family held governorships of greater or less importance.

Bibliography.—The works relating to Persia will be found under articles on the main dynasties (Caliphate; Seljuks; Mongols), and the great rulers (Jenghiz Khan; Mahmud of Ghazni; Timur). For general information and chronology *see* Stockvis, *Manuel d'histoire*, vol. i. (Leyden, 1888); Sir H. Howorth, *History of the Mongols* (1876–88); S. Lane Poole, *Mohammedan Dynasties* (1894).

C.—FROM THE DEATH OF TIMUR TO THE FALL OF THE SAFAVI DYNASTY, 1405–1736

Tamerlane died in harness. At the age of seventy, he actually started on a great expedition, which he had organised for the conquest of China, when he was taken ill and died.

Shah Rukh, 1404–1447.—There was a struggle for power after the death of the Great Conqueror, during which period his fourth son, Shah Rukh, who was Governor of Khorasan, consolidated his position. His rivals proved to be utterly incapable and he occupied Central Asia, but loving Herat, he continued to rule the empire from that city. Throughout his long reign, he worked incessantly to restore the prosperity of his empire and erected splendid buildings. He was also a successful soldier, defeating the Chief of the "Black Sheep" dynasty in three battles, and his empire stretched from Chinese Turkestan to Asia Minor.

Ulugh Beg, and Sultan Husayn.—His successor had ruled Samarcand under his father. Not only did he erect splendid buildings that still challenge our admiration, but, under his patronage, the astronomical tables were drawn up, which constitute the greatest legacy in that science that the East has bequeathed to the West. After his succession to the empire, the Turkoman sacked Herat, the Uzbegs looted Samarcand and, to complete the tragedy, he was murdered by his own son, in 1449. After the death of Ulugh, the Timurid dynasty rapidly broke up. The only remaining member of note was Sultan Husayn, who ruled over a much diminished empire from 1487 to 1506. He was the patron of a very great period, rivalling that of the Renaissance in Europe, the period of Jami the Poet, of Behzad the Painter, and of Mirkhond the historian.

The "Black Sheep" and "White Sheep" Turkoman.—During the decay of the Timurid dynasty, there was a fight for power between two families of Turkoman. Kara Yusuf, the Chief of the "Black Sheep" was, as mentioned above, defeated by Shah Rukh, but made peace with him and, at his death was a most powerful ruler in the country round Lake Van. His successor, Iskandar, the builder of the famous Blue Mosque of Tabriz, was captured and put to death by Uzun Hasan, the celebrated Chief of the "White Sheep." Hasan defeated the reigning Timurid Prince and was the virtual ruler of Persia.

After the capture of Constantinople by the Turks, in 1453, Venice attempted, albeit with scant success, to unite the Princes of Europe against the common foe. Uzun Hasan, who had been defeated by the Turks, sent an extremely welcome embassy to the Doge at this juncture. This step was probably inspired by his wife, Theodora, who was a daughter of one of the last Emperors of Trebizond. The return embassy was headed by Caterino Zeno, whose wife was a niece of Theodora. The ambassador was, in consequence, most kindly received and was able to induce Hasan to co-operate with the Venetian fleet in an attack on the

south coast of Asia Minor. In 1472, a body of Persian cavalry ravaged the province, but was defeated by a Turkish column. In the following year, a powerful Turkish force was repulsed in an attempt to cross the Euphrates, but Hasan who followed it up, suffered heavy losses. After this, he sent Caterino to rouse the rulers of Europe against the Turks, and wisely took no further direct action. Uzun Hasan died in 1478, and his successor was poisoned after a reign of seven years. The family then broke up, mainly owing to the struggle for power among its members, and thus made way for the coming national dynasty of the Safavi.

The Safavi Dynasty, 1499–1736.—The Persian nation was deeply attached to the Sasanian dynasty, overthrown by the Arabs early in the 7th century A.D. The religion founded by Mohammed was gradually adopted, but the national feeling found expression in the adoption as their spiritual leaders of the Caliph Ali and his descendants. They believed that Husayn, the son of Ali had married a daughter of their last king Yezdigird, and that his descendants inherited the divine right of the Sasanian monarchs. Mainly on this account, the Persians broke off from the "Sunnis" or "Traditionists," and termed themselves "Shiah" or "Separatists." Their chief doctrine was that of the *Imamate,* by which Ali and eleven of his descendants were considered to be sinless and to be spiritual and temporal leaders by divine right. The Safavi dynasty claimed unchallenged descent from the seventh *Imam* and was deeply venerated, especially Safi-u'-Din, from whom the family took its title of Safavi. Uzun Hasan gave one of his daughters to Haydar, later head of the family. She bore him three sons, the youngest of whom, Ismail, became the sole survivor and the founder of the dynasty. Raising a force of his adherents, he defeated the Chief of the "White Sheep" and marched on Tabriz, which surrendered. There, in 1499, he proclaimed himself Shah, this date marking the foundation of the dynasty. The coronation of Shah Ismail evoked a wave of national and religious sentiment of overwhelming force among his subjects who regarded Ismail as both Saint and Shah, and were ready to give their lives for him with fanatical devotion. Ismail spent the first years of his reign in extirpating the "White Sheep" dynasty and in annexing the provinces over which they had ruled. This was not accomplished without fighting, but Ismail was a formidable warrior and his activity was exceptional.

Defeat of the Uzbegs, 1510.—After making good his position in Western and Central Persia, Ismail determined to attack the Uzbegs, who devastated Khorasan every year. When he was ready, he marched with extreme rapidity towards Merv. His force was numerically weaker than that of Shaybani Khan, the Uzbeg Chief but, luring the enemy into an ambush, he cut them to pieces. The victory was crowned by the death of Shaybani Khan, whose skull was mounted in gold to serve as a goblet to the victor.

The Defeat of Ismail, 1514.—It was most unfortunate for Ismail that his contemporary on the throne of Turkey was Selim, the greatest soldier of the house of Othman. The rise of a Shiah family to the throne of Persia would naturally excite deep religious animosity and the Sultan determined to extirpate it before it struck roots. As a preliminary measure he sought out and put to death some forty thousand of his subjects, who were believed to belong to the heretical sect. He then marched to the Persian frontier.

Selim commanded the most formidable army of the period, consisting of thousands of long-service musketeers—the celebrated Janissaries—a strong artillery, and a division of cavalry. Ismail, on the other hand, depended entirely on his tribesmen, who were commanded by their chiefs. The Persian attempt to attack on both flanks was defeated by the deadly fire of the musketry and artillery. Ismail displayed the greatest gallantry, killing the Aga of the Janissaries, but he was wounded and nearly taken prisoner and, after suffering terrible losses, the survivors fled from the field. Selim massacred his prisoners and then marched on Tabriz, which submitted. Owing to the lack of supplies, which caused a mutiny, the victor was obliged to evacuate Tabriz, but he annexed Georgia, Diarbekr and Kurdistan. Of far greater importance was the deadly blow given to Persian *moral,* since it was realised that a force led by the Shah although able to defeat the Uzbegs, was no match for a Turkish army. It is stated that, after this defeat, Ismail never smiled again. He died in 1524, deeply regretted by his subjects. He is described by the Venetian Angiolello in the following words: "He is fair, handsome and pleasing; not very tall, but of a light and well framed figure. His hair is reddish, he only wears moustachios. He is as brave as a gamecock and stronger than any of his lords."

Shah Tahmasp, 1524–1576.—The eldest son of Ismail succeeded to the throne when a mere boy. Unfortunately for him he was a contemporary of Sulayman the Magnificent, who repeatedly invaded Persia, taking Tabriz and advancing as far into the interior as Sultania on one of his campaigns. He also captured Van, which was considered to be impregnable. Tahmasp followed an entirely defensive policy and is the theme of Milton's lines:

As when the Tartar from his Russian foe,
By Astracan, over the snowy plains,
Retires, or Bactrian Sophi, from the horns
Of Turkish crescent, leaves all waste beyond
The realm of Aladule, in his retreat
To Tauris and Casbeen.

(The *Sophi* is the Safavi monarch; Tauris and Casbeen are Tabriz and Kazvin.)

These lines reveal a remarkable knowledge of the political situation in Persia and there is every reason to believe that Milton gained his information from the account given by Anthony Jenkinson, who conceived the bold plan of trading with Persia across Russia. Descending the Volga, he crossed the Caspian Sea to Shamakha, where he was well received by the Persian Governor. At Kazvin, he presented the letters of Queen Elizabeth, but the fanatical Shah replied "Oh thou unbeliever, we have no need to have friendship with the unbelievers." The Shah, who was treating with Sulayman at the time, indeed thought of sending Jenkinson's head as a suitable gift to the Sultan, but the intrepid Englishman finally returned to England with good profits to show for the risks he had run.

Peace with Turkey, 1555.—As the years passed, fanaticism lessened and both powers grew weary of the constant warfare. Negotiations were opened and the Sultan laid down that "so long as the frontiers were respected, there would be no hostilities." Turkey considered that she was dealing with a defeated power. At the same time, the Sultan wished to reduce his commitments in Asia. It is of especial interest to note that Busbecq, the Ambassador of the Emperor at Constantinople, stated that: "It is only the Persian who stands between us and ruin."

The Death of Tahmasp.—In 1576, Tahmasp ended his long reign, leaving Persia much weaker than he had found it. After his death there was a period of anarchy, furious rivalries being unchained among the various rivals for power. At this period the position in Persia was one of anarchy, but it was destined to be followed by a reign, during which the dynasty reached its zenith.

Shah Abbas I., 1587–1629.—The 16th century was a wonderful epoch, alike in Europe and in Asia. It was an epoch of great rulers Charles V., Elizabeth, Sulayman and Akbar constituting a remarkable group, in which Shah Abbas can fittingly take his place. And yet, how unpromising were the prospects of the infant, who was destined to make Persia a great power. Left by his father, Khudabanda, in Khorasan, as its nominal ruler, he was a mere puppet throughout his boyhood in the hands of rival chiefs. His guardian, the Shamlu Chief fought the Chief of the Ustajlu, and Abbas took part in the fight, having his horse shot under him. The Ustajlu Chief, having won the day, stopped the pursuit to throw himself at the feet of young Abbas and secured his person. At this period Khudabanda, who was almost blind and entirely unfitted to reign, was attempting to enforce his authority in Fars, but Abbas was proclaimed Shah by his new guardian, who advanced on Kazvin and occupied it. The unfortunate Khudabanda was thereupon deserted by his followers and shortly afterwards died, and Abbas, who matured quickly, put his guardian to death and seized the reins of power.

Peace with Turkey, 1590.—In view of Turkish predominance, the position of Abbas was far from enviable. In 1587, a

Turkish force surprised and defeated a Persian army. This victory culminated in the occupation of the Western provinces of Persia, from Georgia in the north to Arabistan in the south. Abbas realised that he could not face the Turks and wisely decided to make peace with the Sultan as a temporary expedient, although it meant bringing Turkey on to the Caspian sea in the north and into the valley of the Karun in the south

Unfortunately for Abbas the Uzbegs attained the zenith of their power at this period under Abdulla II, who ruled an empire that stretched from Khotan to Balkh He raided Khorasan annually with impunity and even drove the Prince of Gilan, who was an ally of the Turks, from Astrabad. In Khorasan, Herat fell into his hands shortly after the accession of Abbas and the sacred city of Meshed was invested Abbas collected troops to relieve Meshed, but illness delayed his movements with the result that Meshed was also taken and sacked Finally the Shah appeared on the scene and, in 1597, inflicted a decisive defeat on the Uzbegs, who ceased their annual raids during his reign.

Sir Anthony and Sir Robert Sherley were typical adventurers, who had already distinguished themselves in various campaigns Upon the return of Abbas from his victory over the Uzbegs, they presented themselves (1598), as English knights who had heard of his fame and desired to serve him

Reorganisation of Army.—The young Shah was most favourably impressed by the brothers He realised, as did his advisers, that he could not defeat a Turkish army and expel the hated invaders from Persia, until he was master of a regular army, and he determined to utilise the services of the Englishmen for this purpose. His army consisted only of 60,000 light cavalry, who were brave but undisciplined, and would only obey their Chiefs, in whose hands the real power rested To meet this fundamental difficulty, Abbas reduced this force to one half and organised 10,000 cavalry, 10,000 infantry and some batteries of artillery, to be paid and officered by the crown. It is of interest to note that, in imitation of the Janissaries, the infantry and artillery were manned with Georgian and Armenian converts to Islam. As a still further counterpoise to the intriguing Chiefs, Abbas founded a tribe, termed Shah Savan or "Friends of the Shah." This step was entirely successful, thousands of men leaving their tribes to serve directly under the Shah, who was thus released from his dependence on the Chiefs

The Sherleys were well prepared for their task, having had the foresight to bring a cannon-founder among the members of their staff The Persian Commander-in-Chief and his officers all favoured the creation of a regular army, and their zeal seconded the knowledge of the Sherleys so well that, in a comparatively short time, a revolution was effected and, in place of an ill-organised mass of mounted tribesmen, an army consisting of cavalry, artillery and infantry was created

Persian Victories over the Turks.—Shah Abbas was eager to prove his new weapon, and fortunately, the Sultans who were his contemporaries were not great soldiers He broke the peace in 1603, and invested Tabriz, which surrendered and, after 18 years, again formed part of the Persian empire Abbas fully realised that, sooner or later, he would have to meet a powerful Turkish army. Nor was he mistaken for, upon the death of the voluptuary Mohammed III., the youthful Ahmad organised a large force, which marched to the Persian frontier Abbas like his predecessors, chose the plain in the vicinity of Lake Urmia for the trial of strength and, although the enemy were 100,000 strong against 62,000, they had lost much of their former efficiency whereas the Persians for the first time fought as a regular army. Abbas upset the Turkish plan of battle by detaching a considerable force of cavalry to make a wide detour, to demonstrate on the rear of the enemy, and to create the impression that this was the main force. The Turks were deceived and while they were countermarching, the Persians charged home and won a decisive victory, 20,000 heads being piled up in front of the Shah's tents. The fruits of this victory were the lost provinces of Persia, but, of greater importance, was the feeling that the Safavi dynasty was able to meet the hereditary foe in battle and defeat him.

Genius of Shah Abbas.—The fame of Abbas does not rest solely on his military exploits; it is also founded on his genius for administration. Realising the vital importance of communications, he built bridges and caravanserais on every main route. He repressed brigandage with merciless severity and encouraged trade, not only in Persia, but also with foreign countries, whose representatives were welcomed at his Court To prove his zeal for pilgrimages, he walked the entire distance of eight hundred miles from Isfahan to Meshed, to worship at the shrine of the *Imam* Riza His subjects, deeply influenced by the example of their beloved Shah, followed him by thousands, and these pilgrimages, perhaps more than anything else, welded the different races—Persians, Turks and Arabs—into a nation. The most striking administrative act of Shah Abbas was the creation of a new capital at Isfahan There, on almost the only river of the plateau, a superb city grew up, approached by stately bridges, which led past the luxurious gardens of the courtiers, to the Royal Square. The most important building was the *Chehel Sutun* or "Hall of Forty Columns" This great Hall of Audience was open in front, while the throne was set in a room opening out from it. Behind, was a gallery containing three immense oil paintings on each side

Capture of Hormuz, 1507.—One of the most important events in history was the rounding of the Cape of Good Hope by Bartholomew Diaz, in 1487, and the subsequent establishment of direct intercourse by sea between Europe and the East Greatest among the Portuguese captains was Alfonso D'Albuquerque who, with a squadron of six ships, captured the island emporium of Hormuz Owing to intrigues, D'Albuquerque was unable to retain his conquest on this occasion but, eight years later, he returned as Viceroy in command of a powerful fleet, and built the famous fort, which is almost as perfect to-day as at the date of its construction Throughout the 16th century, the Portuguese, owing to their sea-power, dominated the Persian Gulf, to the intense anger of the Shahs, whose ports were raided, and whose subjects were oppressed without mercy

Arrival of English, 1601.—The English appeared in Eastern waters just a century later than the Portuguese Their chief commodity was broadcloth, for which there was little demand in India, and it was consequently decided to open up relations with Persia, which was reported to have a cold climate In view of the position of the Portuguese in the Persian Gulf, it was decided to commence operations at Jask and, in 1616, a ship loaded with a trial cargo, was despatched to that port. The English were well received by Abbas Apart from the hope that they might help him to expel the Portuguese, he was most anxious to export silk, which was a royal monopoly, by the Persian Gulf, and thereby deprive the Turks of a large source of customs' revenue

The Portuguese viewed the arrival of the English with intense hostility They attempted to capture the pioneer ship, but were just too late However, when a second expedition appeared on the scene, they were waiting off Jask, and attacked the English In spite of their superior force, they were unable to capture the English ships, and were completely defeated The result of this action was most important The Shah realised that his hoped-for chance of expelling the Portuguese had come and, the English were induced to co-operate

As a preliminary operation, the English and their allies captured the fort of Kishm Island, on which the Portuguese depended for their supplies, Hormuz itself producing neither supplies nor fresh water, the entire surface of the island being covered with a salt efflorescence. The English then towed boats laden with Persian troops on the main objective The Portuguese squadron made no attack on the encumbered English and were tamely destroyed at anchorage. A battery was then set up on shore and a breach was effected. The garrison of the fort beat off a Persian assault, but their position was desperate and they surrendered to the English Thus fell Hormuz. This was the first great feat of arms performed by the English in the East and, since that date, their connection with Persia has been continuous.

Decline of Safavi Dynasty.—After the death of Shah Abbas,

his descendants occupied the throne for a century, but it was a period of decline, during which only the veneration in which the dynasty was held, prevented a powerful official from ousting his degenerate descendants. Thanks to the jealousy which Abbas had shown towards his sons, princes of the blood, instead of being trained to arms, were immured in harems under the tutelage of eunuchs. Shah Safi, who succeeded Abbas, not only put to death his own relations of both sexes, but he executed most of the generals and councillors, who had made the reign of his grandfather an illustrious epoch in Persian history The contemporary Sultan was Murad IV, the last of the warrior Sultans, who invaded Persia repeatedly, and massacred the inhabitants of Hamadan, Tabriz and Baghdad, which latter city was annexed Other monarchs reigned and displayed pomp and pageantry, which dazzled European travellers, until the accession of Sultan Husayn, in 1694. This monarch was both meek and pious, but was placed on the throne at a time when such qualities were as much out of place as they were in Edward the Confessor Under the Safavi dynasty, the province of Kandahar had been a bone of contention with the Moghul rulers of India It was in Persian hands when Sultan Husayn ascended the throne and, as the Ghilzais, whose chief city it was, were intriguing with Delhi, it was decided to send a Georgian Prince as Governor, supported by a strong Persian force Gurgin Khan, as the Persians called him, arrested Mir Wais, the Ghilzai Chief and instead of executing him, sent him as an exile to Isfahan There he won over the credulous Shah with a story that Gurgin Khan was conspiring to hand over Georgia to Peter the Great He was, thereupon, reinstated and, upon his return, successfully plotted against Gurgin Khan, who was killed, while his Persian escort was cut to pieces Mir Wais then strengthened his position at Kandahar until his death.

Ghilzai Invasion, 1722.—His successor, Mahmud, raided Persia in 1720, and captured Kerman, but was driven back to Kandahar by a capable Persian governor, who was subsequently dismissed Two years later, he again invaded Persia On this occasion he failed to take Kerman or Yezd, and was considering the advisability of retreating when envoys from the Shah offered him a large sum of money to leave the country. Encouraged by this proof of weakness, the raiders advanced on Isfahan and halted at Gulnabad, a village situated on the open plain, 11 miles from the capital

The Persian army was 50,000 strong and was provided with artillery Its base was the capital and it was fighting for the very existence of Persia The Ghilzais were 20,000 strong and their artillery consisted of one hundred camel guns They were in splendid training and despised their enemy The battle opened with a charge by the Persian right wing, which met with some success The Persian left wing also charged but suffered heavy losses from the Ghilzai guns The tribesmen then advanced and finding the Persian artillery without an escort, cut down the gunners and turned their guns on the infantry, who fled from the field in a panic Isfahan was then invested and, owing to the cowardice of its defenders, the Afghans were able to cut off its supplies During this investment, Tahmasp, the Heir-Apparent, left Isfahan and attempted to raise a force but failed Finally, famine compelled the Shah to surrender and Isfahan fell to a raiding band of Afghan tribesmen Although the dynasty was not actually ended until Nadir Kuli was crowned Shah, it ceased to rule when the meek Husayn surrendered and Persia fell, owing to the rule of Shahs who were trained by eunuchs

Action of Russia and Turkey.—The fall of Persia constituted the opportunity of Russia and Turkey Peter the Great was the first in the field He captured the key-fortress of Derbent in 1722 and, in the following winter, when the Afghans besieged Resht, he acceded to the prayer of its governor, and occupied not only the capital of Gilan, but also the province In the summer of 1723, he captured Baku

The Turks arrived on the scene rather late They, however, annexed Shirwan and Georgia They particularly coveted Baku, but were forestalled by Peter In 1724, the two powers agreed to the dismemberment of Persia, Russia to take the districts already occupied and the three Caspian provinces, while the share of Turkey was those western provinces, which she held at the accession of Shah Abbas. In the following year, the Turks enforced their claims by force of arms.

Ashraf, who had succeeded Mahmud, was a capable ruler, resembling his uncle Mir Wais. He enjoyed great prestige among his fellow-tribesmen, whose *moral* he increased. His position was one of difficulty. He held Isfahan, Shiraz and South-east Persia, but could hardly be said to administer the country. Indeed the Afghans were totally lacking in the art of administration Tahmasp was collecting a force in Mazanderan, Russia was determined to maintain her position, and Turkey had already seized Tabriz and Hamadan. Ashraf despatched an embassy to remonstrate at the action of a Sunni power uniting with Christians in hostile action against Persia, which was now governed by Sunni Afghans In spite of the feeling excited at Constantinople, the Turks declared war and an army captured Kazvin and marched on Isfahan The Afghan leader, who was a fine soldier, cut to pieces a Turkish detachment of two thousand men This success produced a considerable moral effect on the Turks and when Afghan *mullas* appeared in their camp and demanded of the Turkish Pasha how he dared to war on Muslims, who were obeying the divine law in subverting the power of the heretical Shiahs, there were serious desertions The Pasha determined to fight immediately and, although he outnumbered the Afghans by three to one, his sullen troops were defeated with heavy loss With consummate diplomacy Ashraf refused to pursue; moreover he released his prisoners and even restored their property to them This masterly moderation resulted in the Sultan making peace He recognized Ashraf as Shah of Persia, while the Afghan recognised him as Caliph Actually the Turks gained the provinces they had seized and Persia remained dismembered

Tahmasp and Nadir Kuli, 1727.—Ashraf was no sooner freed from the Turks than he was confronted with another serious danger. Tahmasp, at this juncture, was joined by Nadir Kuli leader of a robber band, who was destined to achieve fame as the conqueror of Delhi He brought with him some 5,000 of his Afshar tribesmen Tahmasp had previously collected some 3,000 Qajar Turks under their Chief, Fath Ali Khan, and recruits began to pour in who were determined to destroy the hated Afghans Nadir soon made away with the Qajar Chief and induced the Shah to secure Khorasan before attacking the Afghans This campaign was entirely successful, both Meshed and Herat being recaptured from the Chiefs who had occupied them

Expulsion of the Afghans, 1730.—Meanwhile Ashraf, who was seriously alarmed at the national revival, determined to attack before the Persian army became too strong The two armies met at Mehmandost in the vicinity of Damghan in 1729 The Afghans, whose *moral* was very high after their victory over the Turks, charged, but were met with a heavy musketry and artillery fire by Nadir, who then advanced and drove the Afghans from the field They stood again at Isfahan, and at Shiraz, but were finally crushed, and the survivors were hunted across Persia to the desert, where the Baluchis intercepted and killed Ashraf

The Afshar tribesman, Nadir Ḳuli, destined to restore the power and prestige of Persia, was born in a tent close to Mohammedabad in the district of Darragaz, in the province of Khorasan In the summer his father inhabited the village of Kupkan, situated on the route between Kuchan and Mohammedabad He died young, leaving his wife very poor and, when Nadir was eighteen, both he and his mother were carried off by a band of Uzbegs and sold as slaves Four years later, Nadir escaped and returning to Persia, entered the service of the Governor of Darragaz The times were troublous and Nadir soon won a reputation for bravery and so distinguished himself that his master gave him his daughter in marriage Upon his death Nadir succeeded to his post Summoned to Meshed by Malik Mahmud the ruler of Khorasan, he defeated a raiding force of Uzbegs but claiming what was considered to be an excessive reward, he was beaten and dismissed He soon reappeared on the scene at the head of a body of robbers But he aimed at higher things and capturing Nishapur, he occupied it in the name of Shah Tahmasp, whose service he entered

Turkish Campaigns.—Nadir fought three campaigns against the Turks at this period of his career. He lost one battle, but finally defeated the national enemy, and recovered the western provinces of Persia. The Russian Government, after the death of Peter the Great, decided to withdraw from Persia, and restored her Caspian provinces, in 1732. Three years later, war broke out between Russia and Turkey. Nadir took advantage of the situation to secure Baku and Derbent, by a threat to join Turkey unless these important fortresses were surrendered to him and Russia yielded Nadir had dethroned Tahmasp, who had made a disastrous treaty with the Turks, and his infant son had opportunely died Nadir had freed Persia from Afghans, Turks and Russians, and the Persian nation was profoundly grateful to him. At an assembly of the leading men in Persia, he was unanimously elected Shah.

D.—FROM NADIR SHAH TO THE REVOLUTION, 1736–1907

Nadir had settled accounts with Turkey and Russia, but the nation thirsted for vengeance on the Afghans, the recovery of whose country would restore to Persia all the territories ruled by Shah Abbas. Accordingly, in the year after his coronation, he led a powerful army 80,000 strong, towards Kandahar The city was ruled by Husayn, brother of the captor of Isfahan, who was quite unable to meet Nadir in the field, but decided to defend the city, trusting to its great strength. Nadir, who possessed no heavy guns, was reduced to a blockade, which operation he carried out with great thoroughness, building a wall, fortified with towers outside the perimeter of the city. For a year the blockade was continued with no decisive results Nadir then assaulted and captured some of the outworks, up which guns were dragged with great difficulty and Kandahar lay at his mercy. Having in mind further campaigns, the victor treated the Ghilzais with marked clemency, so much so that he enlisted a number of them in his army, and they served him loyally until his death.

Invasion of India, 1738.—During the tedious months spent outside Kandahar, Nadir prepared his plans for a campaign in India, which was the natural sequel to the recovery of the eastern provinces of Persia. The great Moghul dynasty had declined rapidly since the death of Aurungzeb, in 1707, and Mohammed Shah, his degenerate descendant "was never without a mistress in his arms and a glass in his hand." This despicable monarch and his effeminate troops were no match for virile Nadir and his warlike veterans. Treachery was also at work and more than one Indian noble had opened up relations with the Shah. With incredible folly, the Court at Delhi relied on Kandahar to repulse Nadir and, not only made no preparations for defence, but treated Nadir's requests that no fugitives should be granted asylum across the frontier with contempt.

After the capture of Kandahar, Nadir, whose prestige was greater than before, marched north, following in the footsteps of Alexander the Great, and captured Kabul, which was the key to the Khyber Pass, the main land-gate of India. There he secured a large sum of money, which enabled him to pay his troops, and also to arrange with the Afridis that his passage of the Khyber should not be opposed. Mohammed Shah was thoroughly alarmed by this time, but before the situation was really grasped by him or his councillors, Nadir had captured Peshawar and had crossed the Indus at Attock.

Battle of Karnal, 1738.—One of the historical battlefields of India is at Karnal, situated some sixty miles to the north of Delhi, on the right bank of the Jumna. There Mohammed Shah formed a strongly entrenched camp and supinely awaited the invaders. Nadir realised the strength of the Indian position and the fact that his men were unused to assault fortifications While he was considering the best course to pursue, Saadat Khan, a leading feudatory Prince, who had brought a reinforcement of 30,000 men, attacked a raiding party of Kurds Troops were brought up on both sides until the engagement became general. Nadir laid an ambush with complete success, Saadat Khan was taken prisoner and the panic-stricken Indians took refuge in their camp The Persians had killed 20,000 of the enemy; and part of the Indian artillery fell into their hands with rich spoils of every description Nadir wisely did not assault the Indian camp, but, he surrounded it, and prepared to bombard it.

Mohammed Shah realising that his troops would not fight again, decided to surrender before famine appeared among them He was received with courtesy by the victor, whose letter describing the battle and surrender have come down to us. Acting on the principle that Mohammed Shah was, like himself, of Turkoman descent, he commissioned his son Nasrulla to meet him outside the camp and when he entered his tent, "we delivered over to him the signet of our Empire " After paying this empty compliment, the victor, who marched in triumph into Delhi, determined to strip the people of all their portable wealth. In this he was successful and the value of his loot was estimated at £87,000,000 However that may be, it made Nadir a miser Had he employed this wealth wisely, it would have proved to be a blessing to impoverished Iran and the course of history would have run differently.

A rising in Delhi, suppressed with such pitiless severity that a "Nadir Shahi" is synonymous for a massacre in modern Delhi, and a marriage between Nasrulla and the daughter of the defeated Mohammed were the chief incidents of the stay at the capital Nadir, realising that he could not hold Delhi, restored it to Mohammed, who was, at any rate, utterly unwarlike. He, however, annexed the provinces on the right bank of the Indus, which, during the reign of Darius had formed part of the Persian Empire Thus, after a stay of only two months in India, he returned to Afghanistan with greater power, wealth and fame than any other Asiatic conqueror since Tamerlane It remains to add that he was the last great Asiatic conqueror

Campaign Against Bokhara, 1740.—During the siege of Kandahar, Nadir had despatched his eldest son and heir against Balkh, whose ruler had promised help to the Ghilzai Chief. Riza Kuli had proved himself worthy of the command, for his assault was so fierce and so continuous that the city was surrendered The young prince had then crossed the Oxus and defeated a strong army of Uzbegs Nadir, unwilling to attack Bokhara at this juncture, recalled his son and wrote to the Amir of Bokhara that he had ordered him "not to disturb countries ruled by descendants of the Turkoman." The situation was now entirely changed Nadir had not forgotten that he had been a slave at Khiva, and he realised that a campaign against the two Uzbeg states would form a natural corollary to the conquest of Northern India, and would protect Khorasan against raids for many years to come Finally, he anticipated rich spoils and little resistance Large quantities of grain had been collected at Balkh and loaded into boats, and the expedition commenced its march down the Oxus to Charjui, where a bridge of boats was constructed The Amir of Bokhara, realising that he could not resist Nadir's veterans, promptly submitted and proceeded to the Persian camp There, at first, he was treated with disdain, but he was finally restored to the throne on condition that the Oxus should again constitute the boundary of Persia, and that he should supply a contingent of troops for the Persian army The treaty, which was accompanied by the payment of huge sums of money, was cemented by a double marriage between the two monarchs

Conquest of Khiva, 1740.—After Bokhara it was the turn of Khiva. The Khan realised that Nadir depended entirely for his supplies on the boat-loads of grain and made a desperate effort to capture them. However, Nadir suddenly appeared on the scene and, although his men were suffering terribly from thirst, the charge he led was irresistible The army then advanced down the river, with the precious grain guarded by the entire force, but there was no further resistance and the Khan tamely surrendered Before the campaign he had put to death or mutilated the envoys of Nadir, who justly executed the barbarous ruler together with twenty of his councillors. Among the prisoners were two Englishmen, members of the staff of Jonas Hanway, the intrepid merchant, who attempted to trade with Persia and Central Asia across Russia, and has left us a most valuable account of the state of Persia at this period Nadir treated the Englishmen with kindness, giving them passports and a promise of redress for their losses One result of this campaign was the release of thousands

of Persian and Russian slaves. Many of the former were settled in Nadir's homeland of Darragaz, especially in a village which the Shah founded on the site of his birthplace.

The conquests of Nadir were now finished. He had restored the boundaries of Persia and made them wider than those of the Safavi dynasty. He had made Persia famous as a great fighting power and he had not only released the inhabitants of Khorasan who were slaves, but had ensured their safety in the future. Had he possessed any administrative capacity, he could have restored prosperity to Persia, but success and wealth had spoilt his character and made him a miser, and the remaining years of his life are a record of ever-increasing avarice and cruelty, which made him detested by his subjects.

Lesgian Campaign, 1741-1742.—There is a Persian proverb which runs, "If any Shah is a fool, let him march against the Lesgians." During the Indian campaign, these savage tribesmen of Daghestan had raided Shirwan and had killed Ibrahim Khan, Nadir's only brother. He was therefore bound in honour to invade their country and punish them severely. At first all went well and certain sections of the tribe, who inhabited the lower hills, submitted. But the main body of the Lesgians retreated into the dense forests until they were able to attack the Persian army and inflict heavy losses. Nadir refused to retreat until supplies failed when he was forced to make for Derbent, where the situation was only saved by the arrival of supplies shipped from Astrakhan. It was this bitter experience which induced Nadir to organise a fleet on the Caspian Sea. For the time being he retired from the scene baffled and sullen.

Like Shah Abbas, Nadir suffered from jealousy of his son, who was a distinguished soldier. He was shot at from an ambush by two Afghans and believed that the assassins were in the pay of his son. However that may be, he ordered him to be blinded and bitterly repented it when too late. Persians remember the remonstrance of the Prince: "It is not my eyes but those of Persia which you have put out."

The success of the Lesgians caused rebellions to break out in various parts of the empire, but they were suppressed with merciless severity. Nadir had unwisely attempted to reunite Islam by abolishing the Shiah sect and by substituting the *Imam* Jafar for Ali, the patron saint of Persia. At the time, there was no open opposition to the change by his subjects, who feared to oppose him, but the following decision was given by the religious leaders of Turkey: "The new sect is contrary to the true belief, and it is permitted to kill the people of Persia." This decision was followed by an enormous Turkish army, which was determined to avenge former defeats, but Nadir was as great a general as ever, and inflicted a crushing defeat, capturing the whole of the artillery and military stores of the enemy. Negotiations for peace followed, in which Nadir agreed to abandon his claims to found a new sect and released his prisoners. This was his last victory.

Assassination of Nadir, 1747.—As the years passed, Nadir put to death so many of his trusted officers that finally, in self-defence, he was attacked at night by his own body-guard and killed, fighting to the bitter end. Thus fell Nadir Shah, who, endowed with superb physique, a voice of thunder, dauntless courage and a genius for war, had hewn his way to the throne. Like Napoleon, with whom he may well be compared, success caused moral deterioration, and when he died, the nation which he had saved from the Afghans, the Turks and the Russians, received the news with intense relief. Had he died after the conquest of Khiva, he would have been the national hero for all time.

The assassination of Nadir Shah gave the signal for the break-up of his composite army. The Afghans under Ahmad Khan alone remained loyal, but being unable to avenge his fallen leader, he marched off to Kandahar and, aided by the capture of a treasure convoy, founded the kingdom of Afghanistan, which included most of the Indian provinces situated on the right bank of the Indus. Throughout, he remained loyal to the family of Nadir and when, after desperate contests for power, the son of ill-fated Riza Kuli was set on the throne of Khorasan and then blinded, Ahmad Shah, as he had proclaimed himself, avenged Shah Rukh and constituted Khorasan a separate kingdom for him under Afghan protection and suzerainty.

Rival Claimants in Persia.—Fath Ali Khan of the Qajar tribe, who was killed by Nadir when he joined Tahmasp, had a son, Mohammed Husayn Khan. After the death of Nadir Shah, he raised a force, with which he successfully opposed Ahmad Shah, and occupied the Caspian provinces. A second claimant was Karim Khan, a member of the Zand tribe of Fars. A man of humble extraction, he raised himself to power by sheer force of character and had a large following in South Persia. Finally there was Azad the Afghan general, who was in charge of Azerbaijan. A curious triangular contest ensued, in which each claimant at one period seemed to have won, but finally Mohammed Husayn was defeated and killed, and Azad surrendered, leaving Karim Khan supreme.

The Zand Dynasty, 1750-1794.—Karim Khan never aspired to the title of Shah, but termed himself *Vakil* or Regent. He made Shiraz his capital and adorned it with many fine buildings. Under his kindly rule, Persia gained a sorely needed rest, and began to recover something of her ancient prosperity. Upon his death, however, there was the usual fight for power among the members of his family. Meanwhile Aga Mohammed Khan, the eunuch chief of the Qajar tribe, collected a force and, winning over to his side Haji Ibrahim, the redoubtable Vizier of the Zand monarch, finally defeated Lutf Ali the heroic representative of the Zand dynasty, who was barbarously done to death by the cruel Qajar.

The Qajar Dynasty, 1794-1925.—Aga Mohammed was a good soldier and, after the final defeat of his rival, decided to attack Heraclius who, upon the death of Nadir Shah, had declared the independence of Georgia, and had annexed provinces up to the River Aras. He had also made a treaty with Russia, by the terms of which he was entitled to receive protection. Heraclius realised that he could not receive immediate help from Russia, yet he foolishly met the overwhelming Persian army in the field and was defeated. Tiflis was taken, the priests and infirm were massacred and the able-bodied of both sexes were enslaved. After Georgia, the Shah turned his attention to Khorasan. The wretched Shah Rukh was unable to offer any resistance, but Aga Mohammed required more than submission. He coveted with passion priceless jewels from Delhi, which he knew were in the possession of the blind monarch, and set his torturers to work. Day by day some valuable gem was produced. Last of all the famous ruby of Aurungzeb was extracted and Shah Rukh, worn out by the tortures, died cursing the Qajar eunuch. Shortly afterwards, the tale of his cruelties was brought to an end by the hands of two of his body-servants whom he had doomed to death, but yet permitted to attend him. Thus, in 1797, after only three years rule over the whole of Persia died the founder of the Qajar dynasty, who was rightly detested by all classes.

Fath Ali Shah.—Under his nephew, Fath Ali, Persia came within the orbit of European politics. The first step was taken by the British rulers in India. In 1798, Lord Wellesley received a letter from the Amir of Kabul in which he stated his intention of making an expedition into India. This would have upset British policy and Wellesley sent a Persian, who was acting Resident at Bushire, to induce the Persian Court to put pressure on the Amir. The task of the envoy was made easy by an Afghan demand for the cession of Khorasan, to which the young Shah replied that he intended to restore the eastern boundaries of Persia, as they were in Safavi days. He followed up this threat by despatching a force to help two Afghan pretenders, with the result that the Amir retired from Lahore to meet the threat in the west. The mission of the British Agent was thus entirely successful and paved the way for an accredited British Envoy, who was about to land on Persian soil.

French Threat to India.—The genius of Napoleon dominated his adversaries to such an extent that even his fantastic schemes caused them great alarm. Among these must be reckoned his plan of using the Shah as an instrument for the invasion of India in co-operation with French and Russian troops. To us, who have studied accurate maps and realise the barren nature of these

countries, the scheme was impracticable but, in 1800, it was seriously considered by Napoleon and Paul of Russia. Indeed, the latter actually ordered the Don Cossacks to march on India. The movement was begun, without supply-columns or maps, but it was stopped at the Volga upon the death of the Tsar, which was fortunate for all concerned. The British, determined to forestall the French, instructed their Agent, Captain John Malcolm to induce the Shah to bring pressure on the Amir of Kabul, to counteract the designs of the French, and to negotiate a political and commercial treaty. Malcolm's success was complete and he speedily gained all his objects. Moreover he established a high regard for British honour in Persia, which still exists.

The British foolishly withdrew Malcolm and left no permanent representative at Tehran. Napoleon took advantage of the favourable position and, in 1802, made definite overtures to Persia. These were followed up, in 1805, by the appearance at Tehran of a French envoy who, in view of the fact that the Emperor had declared war on Russia, offered to restore Georgia to Persia and to subsidise the Shah, who, in return, was to join France in an invasion of India. Fath Ali was most unwilling to become the ally of a nation which had put its monarch to death. However he could obtain no reply to his appeals from the British, who could not make up their minds what to do. Finally, therefore, he agreed to the French proposals. Fortune, however, favoured the British since, by the time that the Persians had agreed to the French proposals, Napoleon had made peace with the Tsar, and Persia lost all hope of recovering Georgia through his aid.

Treaty with Great Britain, 1814.—Outwardly a French Mission held the field and Malcolm, when he again landed in Persia, was affronted. In spite of this the situation was changing, the French Mission was dismissed and Sir Harford Jones representing the Crown, as apart from the Governor-General of Bengal, was given a magnificent reception and a new treaty was negotiated. In 1814, a definite treaty was signed, by the terms of which treaties or military co-operation with nations hostile to Great Britain was barred, Persia further pledging herself to use her influence with the states of Central Asia to adopt a similar policy. In return, Persia was granted a subsidy of £150,000 per annum, which was to be stopped if she engaged in an aggressive war. This treaty dealt with the French peril after it had passed. On the other hand, it was not realised by British statesmen that, so far as Persia was concerned, the annexation of Georgia and Karabagh by Russia had created an entirely new situation, that the treaty had not recognised the fact and was therefore likely to lead to trouble.

Struggle for Georgia.—Persia was bound to fight for Georgia and the campaigns that followed may be considered to fall into two distinct periods. The first ended with the defeat of Persia in 1812, peace being made in the following year by the Treaty of Gulistan. Thirteen years later, Persia again attempted to reconquer Georgia, and her final defeat is recorded in the Treaty of Turkomanchai, which was signed in 1828. The Persian army was commanded by the Heir-Apparent, who invariably lost his head on the battlefield, and rendered the efforts of a handful of British instructors nugatory. The first campaign opened with the siege of Erivan by a Russian force, which was so harassed by its lines of communication being cut, that the operation was abandoned. The campaign was ended, in 1812, by a decisive action fought at Aslanduz. A small Russian column surprised the Persian army in broad daylight. The British officers had drawn up their men when Abbas *Mirza* in a panic, ordered a hasty retreat, with the result that the force was annihilated.

After this disaster, the Shah, who was also panic-stricken, agreed to abandon all claims to Georgia; he also ceded Derbent, Shirwan and Karabagh. Russia, at this very time, was at the crisis of her fate owing to the invasion of Napoleon. Consequently Persia was to be blamed for abandoning her possessions and making no further effort against such a sorely embarrassed enemy. As was to be expected, Persian opinion regarded the Treaty of Gulistan as a national disgrace. It had been vaguely worded, so much so that the possession of three districts remained in dispute. Negotiations were being carried on but, before they were completed, Russia occupied the areas. Persian opinion was deeply stirred, recruits poured in, and the Shah was forced by public opinion to break the treaty. At first the Persians carried all before them, and occupied Shirwan and Talish in less than a month. But the Persians would not face Russian troops.

Defeat of Persian Army.—In an action fought near Ganja, although the Persians were numerically superior, their cavalry fled, demoralised by artillery fire. The Russian infantry then advanced and swept the Persians off the field. Fath Ali was a miser; he refused to pay the troops in the winter, and they perforce were disbanded. Realising the position, a small Russian force marched on Tabriz and captured not only the city but also the entire artillery park of the Persian army. Thus ignominiously hostilities were ended. By the Treaty of Turkomanchai, the Aras became the boundary of Persia. An indemnity was demanded and extra-territorial rights were included as well as a commercial treaty, by the terms of which there was a 5% tax on imports and exports. This treaty inaugurated a new era and became the basis on which other European nations conducted their intercourse with Persia. Great Britain recognised the changed position and, in view of the fact that Persia was the aggressor, declined to pay the subsidy. Persia was, however, in dire straits from lack of money to pay the Russians, and it was arranged that a single payment of £150,000 should be held to cancel all further claims on the subsidy.

Persia and Afghanistan.—Persia realised that her defeat by Russia was final. To salve her wounded pride, she decided to make strenuous efforts to recover Herat and other provinces that now formed the state of Afghanistan. This trend of policy was viewed with apprehension by the British Government, since Persia was under Russian influence and, if she reconquered Herat, Kabul and Kandahar, Russian agents would be established close to the Punjab. Actually her objective during this period was Herat, and Great Britain made strenuous and successful efforts to keep that province outside the influence of both Persia and Russia.

Abbas Mirza was more successful in Eastern Persia than against Russia. He gradually reconquered Khorasan until Sarakhs alone held out, encouraged by the presence of the Khan of Khiva. However the Khan, alarmed by the surrender of Kuchan, retired and Sarakhs was stormed, a feat which restored Persian prestige in Central Asia. Shortly afterwards, Abbas Mirza and then Fath Ali Shah died.

Mohammed Shah was the son of Abbas Mirza and, when he had defeated various pretenders and established himself on the throne, it was clear that he was determined to capture Herat. He had already, during his father's lifetime, commanded a force which was besieging that city, but had hastened to Tehran to secure his nomination as Heir-Apparent, upon hearing the news of his father's death. At this period a second British Military Mission reached Tehran, but it was received with marked coldness by the young Shah and was unable to serve any useful purpose.

Siege of Herat.—It is impossible to give any account of British policy in Afghanistan, and we must confine ourselves to the question of Herat. In 1837, the Shah opened his campaign, and the first prisoner that was captured, was bayoneted in his presence. Yar Mohammed, the able Vizier of the Prince of Herat, had made every preparation for a siege. The fortifications had been repaired and strengthened; supplies in large quantities had been stored, and all villages within twelve miles of the city had been burned. By a singular stroke of good fortune, an English artillery officer, Eldred Pottinger, arrived on the scene, and soon became the life and soul of the defence. In the spring of 1838, the British Envoy reached the Persian camp and nearly persuaded the Shah to break off the siege. However, at this juncture, the Russian Envoy offered the services of a Russian officer. Sir John McNeill was consequently flouted and quitted the Persian camp. Shortly after his departure, the Shah made his final effort. For six days the defences were battered, but the general assault failed. The Shah was utterly dejected and when he received a communication from the British Minister that his Government would view the occupation of Herat as a hostile act, and that the island of Kharak had been seized by British troops, he agreed to their demands and broke up the siege He died in 1848, leaving

Persia on the verge of revolution and bankruptcy.

Nasir-ud-Din began his reign well. He brought with him from Tabriz his adviser, *Mirza* Taki Khan, and appointed him his Vizier. He was the most remarkable Persian of his generation, being not only capable and hard-working, but also incorruptible. He set to work to abolish the sale of appointments and of justice; and the embezzlement of the soldiers' pay, the grant of pensions to favorites and many other abuses were all taken in hand. His reforms raised up a host of enemies, among them the mother of the Shah who persuaded her son that the Vizier was too powerful with the result that he was executed—a terrible blow to Persia. After this the Shah, generally speaking, ruled in the bad old way, although he was a more enlightened ruler than his predecessor, partly owing to his visits to Europe.

Religion of the Bab.—During the early part of Nasir-ud-Din's reign, an inhabitant of Shiraz preached a new religion. He proclaimed himself the *Bab* or "Gate," through which men might attain to knowledge of the Twelfth *Imam*. The *Bab* was the son of a grocer and, when he attempted to convert his fellow-townsmen, he was considered to be a madman and was imprisoned. His followers, however, increased to such an extent that the Shah finally ordered him to be executed at Tabriz. After his death, the doctrine spread far and wide, causing risings and an attempt on the Shah's life, which was met with pitiless persecutions. The religion founded by the *Bab* still exists and counts many followers, not only in Persia but, in the Levant, and in America.

Settlement of Afghan Question.—During the generation that followed her victories over Persia, Russia not only strengthened herself in that country by the creation of a naval base on the Persian island of Ashurada in Astrabad Bay but made great efforts to gain a footing in Central Asia and in Afghanistan. It was probably at her instigation that Nasir-ud-Din determined to win renown by the capture of Herat. Yar Mohammed, the capable Vizier had died, leaving the province to his son, who was mentally deficient, and whose first act was to open up negotiations with Persia. The British Government thereupon imposed a treaty on Persia, by the terms of which that power promised not to send troops into the Herat province, unless it was attacked from outside. The treaty caused intense irritation to Persia and was the main cause of relations being broken off between the two countries. Persia then gained possession of Herat through an Afghan nominee in 1856, and there was intense delight throughout the country. But Great Britain had to be reckoned with. In addition to paying a subsidy to the Amir, she declared war on Persia and landed an expeditionary force at Bushire. Under Outram, a march was made inland and a Persian force was defeated. The troops were then transferred to the mouth of the Karun River, where a second success was gained. Persia had already sued for peace and, by the terms of a treaty signed in Paris, in 1857, the Shah agreed to evacuate Herat and to recognise the independence of Afghanistan. No indemnity or concessions were demanded.

The Awakening of Persia.—Nasir-ud-Din was fated to see the advance of Russia across Central Asia until that Power entirely enveloped his northern frontiers in Asia. The khanates, as they were termed, were annexed one by one, until only the Turkoman was left. In 1881, after more than one failure, Skobeleff stormed the stronghold of the Tekke Turkoman at Geok Teppe, the other tribes gradually submitted and Russia forced Persia to accept a boundary that was most unfavorable to her, and gave her new neighbour a strangle-hold on Khorasan. We must now turn to the advance of the Indian empire. Baluchistan had relapsed into anarchy at the end of the eighteenth century and no immediate attempt would have been made to interfere with this state of affairs, but for the fact that it was decided to construct a telegraph line from England across Persia to India. Negotiations were opened with Persia, with the result that a boundary was finally drawn between Persian and British Baluchistan. This latter province may be said to have been the creation of that great frontier officer, Sir Robert Sandeman, through whose exertions law and order were gradually introduced into a "No Man's Land." From the Persian point of view these boundaries, which included the delimitation of her frontier with Turkey, completed her envelopment.

Constitutional Movement.—The desire for a constitution in Persia is quite recent. Persia was affected by the construction of telegraph lines and so forth, but her national pride in her own perfection was also strong. The Shah as a young man was in favour of progress, but the failure of the attempt at constitutional government in Turkey in 1876 frightened him, and his later policy trended towards keeping Persia free from dangerous new ideas. "I want ministers who do not know whether Brussels is a city or a cabbage," was his frank avowal and, although his point of view was selfish, the event has proved that Persia was not ripe for the new order. Nasir-ud-Din was assassinated in 1896. His successor, Muzaffar-ud-Din was a poor creature, who led Persia down the broad road to bankruptcy by borrowing large sums of money from Russia, which he wasted on his journeys to Europe and on his favorites. During his reign all fear of the Shah passed away, and, with it, the tribes robbed with impunity on the caravan routes, inflicting serious losses on all classes.

The movement in favour of a new order was led by Jamal-ud-Din, an agitator, who gained considerable influence in Turkey and Persia during the last years of Nasir-ud-Din. He was rather a Pan-Islamist than a constitutionalist, who vehemently denounced the corruption of the Persian Vizier. Another moving spirit was Prince Malkom, a clever Armenian with a French education. He was Persian Minister in London and, while holding this post, quarreled with the Vizier over a lottery, which the Shah had sold to him, but which the latter wished to cancel. In a paper which he published, Prince Malkom advocated a Parliament for Persia, while he never ceased to denounce his enemy the Vizier.

The weakening of the power of the Shah encouraged the reformers and, in 1905, a definite movement began in favour of a constitution. It commenced with a protest against the Vizier, who was held to be responsible for the costly journeys of the Shah, for the corrupt government and for the disorder in the country. A number of merchants followed a time-honoured custom and took *bast* or sanctuary at a mosque in the capital, where they were joined by some *mullas*. Driven from the mosque by orders of the Vizier, they proceeded to the shrine of Abdul Azim outside Tehran, where their numbers rapidly increased. In vain the Shah intervened by sending his favourite to induce them to disperse. Finally the Shah was obliged to dismiss the obnoxious Vizier and to promise to convene an *Adalatkhana* or "House of Justice"—it is to be noted that there was no demand for a constitution at this juncture. Upon receiving the royal promise, the *bastis* returned to their homes and the Shah took no steps to convene a House of Justice. In 1906, the Shah had a paralytic stroke and the Vizier decided to take strong measures against the reformers. This led to the Second *Bast*, which ended in the departure of the *Mujtahid* or "Doctors of the Divine Law" to Qum and the threat that they would lay the land under an interdict. Simultaneously thousands of citizens took *bast* at the British Legation and declined to leave it until a National Assembly had been granted by the dying Shah. This was, at length, conceded by Muzaffar-ud-Din, who opened the Assembly in October 1906, and died shortly afterwards.

The Revolution.—Mohammed Ali, who succeeded his father, was an Oriental despot of the worst type. He attempted to blind the reformers by twice pledging himself to adhere to the new constitution. However, he had no intention of keeping his solemn promises, for he resented any infringement of his absolute power to dispose of the revenues of Persia for his own purposes. The able Vizier of Nasir-ud-Din was recalled to office with secret instructions to overthrow the constitution. He set to work to gain the consent of the majority of the *Majlis* for the raising of a loan as the Shah had found the treasury empty, and could not buy partisans without money. It seemed as if the Vizier was achieving his purpose when he was assassinated. This black deed was glorified and the fortieth day after the suicide of the assassin was observed as a national holiday. Public opinion forced the Shah to appoint Nasir-ul-Mulk, who had been educated at Oxford, to be his Vizier. This honest statesman realised that it was essential to restore the finances of Persia but, before he could

carry through any of his reforms, the Shah, who had collected gangs of ruffians, called out his forces with the intention of closing the obnoxious *Majlis* and of arresting its leaders. But he suddenly hesitated and stayed his hand. The *Majlis* thereupon collected armed volunteers and sent telegrams to the provinces asking for support, which evoked a wave of enthusiasm.

The Shah yielded to the popular feeling and sent a Koran to the Assembly sealed with an oath that he would observe the constitution. This is the most solemn form of oath in Persia. Six months later, the Shah bombarded the building, in which the *Majlis* sat, arresting some of the leaders and regaining control of the government for the time being. The answer to this outrage was a rising at Tabriz. In vain the Shah despatched troops to crush the rebellion. They merely blockaded the city and, in the spring of 1909, the Russians broke up the blockade in the interest of their subjects. The defence of Tabriz gave time for national forces to be organised at Resht and Isfahan. These forces combined and entered Tehran, whereupon the Shah who was in camp a few miles from the capital, threw up the sponge and took refuge in the Russian Legation. He was deposed by the victors and left Persia. Thus with little loss of life, the Persian revolution was successfully accomplished.

Anglo-Russian Agreement, 1907.—For a century there had been keen rivalry in Asia between Great Britain and Russia, which, in 1885, had nearly led to war between the two empires owing to the famous Panjdeh incident. The military party in Russia, which desired to approach ever nearer and nearer to India, was averse from any settlement with Great Britain, but the disasters of the war with Japan had a chastening effect and made the Russian military party ready to come to terms. These feelings were warmly reciprocated by the British, and were embodied in an Agreement, which represented a comprehensive effort to settle all questions connected with Tibet, Afghanistan and Persia. Here reference will only be made to the Agreement, so far as it affected Persia. It began with a solemn declaration to respect the "strict independence and integrity of Persia," and then stipulated that each state binds itself to seek no concession of any kind in regions conterminous to the frontier of the other. To avoid misunderstandings, the commercial spheres were then defined. That of Russia included Northern and Central Persia, while Great Britain merely reserved the deserts of South-East Persia. It was a mistake not to have included the whole of South Persia, as there alone would commercial concessions be sought, and leaving it neutral was certain to lead to trouble. This was pointed out at the time, and the subsequent enormous development in oil proved that this view was correct. Persia naturally disliked the Agreement. She had based her policy on the rivalry of her two neighbours, and viewed with dismay the new order, by which, in her opinion, they had agreed to dismember her. British policy was honest and was entirely benevolent, so far as Persia was concerned. On the other hand, Russian officials considered that Northern Persia had been made over to them and, when the World War broke out, they were gradually annexing it. The Agreement has been annulled both by Great Britain and by Russia since the conclusion of the World War. (P. M. S.)

E.—HISTORY OF THE PERIOD, 1909–1929

This period, extending over two decades was destined to prove an epoch-making one in the history and evolution of Persia, and may be said to have commenced with the accession of the boy-King, Sultan Ahmad Shah and the re-establishment of constitutional government.

The first cabinet of the new government naturally included the two patrician heroes of the revolution, the Sipahdar (to be known later as Sipah Salar), as Premier, and the veteran Bakhtiyari chief Sardar Asad, as Minister of the Interior; but they soon found themselves mere figure-heads in the hands of the more extreme elements among the late revolutionaries, whose aim seemed to be to control the government without sharing its responsibilities. In these circumstances it was not long before the two ministers resigned their portfolios and took their seats in the Majlis as ordinary deputies, a new cabinet being formed under the presidency of a well-known figure in Persian politics, Mustaufi-ul-Mamalik, with a sprinkling of the most able of the Young Persian element. Nevertheless the first year of the revived constitution was marked by a continuation of cabinet crises and by the division of the Majlis into a number of conflicting factions.

After the nationalist occupation of Tehran, Yeprem Khan, the military leader of the revolutionaries, had promptly organised a vigorous police administration which gave the city immunity from any of those disorders which are so often experienced in such cases, and the lives and properties of foreigners were in no way molested. Nevertheless, on the plea that special measures were needed for the protection of their nationals, Russian troops were forthwith despatched to Kazvin, and having thus succeeded in effecting a temporary occupation, they altogether refused to withdraw, notwithstanding the earnest remonstrances of Great Britain, who advocated a policy of non-intervention in accordance with the spirit of the 1907 Convention. The lack of administrative experience on the part of the personnel of the new régime, soon made it apparent that the departments of the government could not be effectively reorganised without the assistance of foreign advisers, and when the subject came up for specific discussion Great Britain and Russia not unreasonably required that nationals of one or more of the minor Powers should be engaged, failing which they must press for the appointment of their own nationals.

The deliberations in this connection extended into the new year (1911) and eventually it was decided that Americans should be engaged for the supervision of finances and Swedes for police and gendarmerie. Action was taken accordingly and in due course, in the following May, an American citizen, Mr. Morgan Shuster, was engaged to serve as treasurer general for a period of three years, with a staff of 4 assistants, for the supervision, collection, and disbursement of the revenues of Persia.

Hardly had they got to work, when, on June 17, the recently deposed Mohammed Ali Shah unexpectedly landed at Gumesh Tepe on the Caspian, bent on an attempt to recover the throne; while at the same time his brother, Salar-ed-Dowleh, making a sudden appearance in Kurdistan, there too raised the standard of revolt, ostensibly on his brother's behalf. At first the menace to the capital from these two directions was undeniably serious, but the ex-Shah's effort was conducted with that incapacity and indecision which had distinguished all his activities, and ended in a complete fiasco. The credit for this result was mainly due to the redoubtable Yeprem Khan, and to Shuster's financial reforms which supplied his resources.

Meanwhile Shuster's financial programme had brought him into conflict with Russian interests. Finally the confiscation of the estates of the ex-Shah's brother, Shua-es-Saltaneh (who, it was claimed, was in debt to the Russian Bank) for the part he had played in his brother's abortive exploit, was held to afford sufficient grounds for the presentation of an ultimatum to the Persian Government, in which were included a demand for an indemnity and the dismissal of Mr. Shuster, failing which, it was announced, there would be an advance of Russian troops on Tehran. Great Britain made diplomatic protests at Tehran but they were of no avail and Russia persisted in her demands.

Anti-Russian Feeling.—Anti-Russian feeling now ran high in the capital; Russian goods were boycotted, and the Majlis having refused to sanction compliance with the ultimatum, some 3 to 4 thousand Russian troops were despatched to Kazvin from whence they were expected to march on Tehran at any moment. The position seemed desperate, until finally, on December 24, Nasir-ul-Mulk, who had become Regent on the death of the aged Kajar Azad-ul-Mulk, the year before, took charge of the situation and with the co-operation of the Cabinet and of Yeprem Khan dissolved the Majlis and then signified acceptance of the Russian demands. In pursuance thereof, on December 25, the contracts of Mr. Shuster and his colleagues were terminated and they left the country forthwith. Meanwhile chaos reigned in the provinces, the only bright spot in the picture being the comparatively satisfactory progress of the Swedish military mission in the direction of forming a gendarmerie.

From the time of the dismissal of the Shuster mission the financial administration of the country was carried on as best they could by the staff of the Belgian Customs Administration and with no small measure of success, but in the direction of constructive financial reform, little could be effected in the adverse circumstances then prevailing. During the World War, moreover, Persia, nominally neutral, became a mere field for the rival combatants (*see* PERSIA, CAMPAIGNS IN) On the conclusion of the war Persia was admitted as an original member of the League of Nations.

Post-war Foreign Relations.—In the matter of her foreign relations Persia found herself in a considerably altered position at the end of the war. The cabinet of Vossuq-ed-Dowleh concluded with Britain on Aug. 19, 1919 a Convention on the following basis:

(i) Categorical reiteration of undertaking repeatedly given by Great Britain in the past to respect absolutely the integrity and independence of Persia.

(ii) The lending of expert British advisers as necessary for the various departments of the Persian administration, military and civil.

(iii) The provision of a substantial loan for the purpose of financing the above schemes.

(iv) Co-operation on the part of the British Government in the promotion of Persian enterprises for the improvement of communications.

(v) The appointment by the two Governments of a joint Committee for the revision of the existing customs tariff on lines conducive to the interests and prosperity of the country.

This Convention though it was for a short while put into operation, lapsed on the fall of Vossuq-ed-Dowleh. His successor Sipahdah-i-Azim concluded a treaty with the Soviet providing for:

(i) Renunciation of the old Tsarist policy of force and a guarantee of non-intervention in the affairs of Persia

(ii) Denunciation of treaties concluded in the past between the Tsarist régime and other Powers in regard to Persia (*e g.*, the Anglo-Russian Convention of 1907).

(iii) The writing off of outstanding Russian loans to Persia

(iv) Cancellation of all concessions under which Russia had exercised control over Persian communications—with the clear proviso that they should not be passed on to the nationals of any other Power.

(v) Cancellation of all concessions granted by Persia to Russian subjects.

(vi) Abolition of the clause in the treaty of Turkmanchai under which no ships were allowed on the Caspian save those flying the Russian flag

(vii) The reciprocal right to appoint diplomatic and consular representatives where considered necessary.

(viii) Abolition of the ex-territorial rights of Soviet citizens

But the ink was hardly dry on this document when the capital became the scene of a most dramatic episode, in the form of a *coup d'état* organised by the nationalist newspaper editor, Saiyid Zia-ud-Din This young patriot had secured the co-operation of a native officer of the Cossack division, Sartip Reza Khan, under whose leadership a force of some 3,000 Cossacks from the Kazvin garrison marched on the capital Meeting with no opposition they proceeded to arrest all prominent personages, and the establishment of a government under Saiyid Zia-ud-Din was then announced Very soon after, Saiyid Zia-ud-Din found himself helpless before his colleague Sartip Reza Khan, who now, as minister of War, had sole control of all armed forces and was displaying great jealousy of foreign interference in any direction Feeling that the situation was passing out of his hands Saiyid Zia-ud-Din decided to leave the country and reached Baghdad at the end of May.

From this point the history of Persia is the story of the rising fortune of Reza Khan Pahlavi A native of the Savad Kuh district of Mazanderan, he had entered the Cossack Division as a trooper when about 25 years of age and at the time of his sudden appearance on the stage of Persian politics was a sartip in the division hitherto quite unknown outside it.

On the exit of Saiyid Zia (April 3, 1921) Reza Khan proceeded to set up a government of his own, with himself as minister of War and one of the old régime, Qavam-es-Sultaneh as prime minister. From that moment he practically ruled Persia. Fully alive to the importance of having some reliable troops at his back, attached alike to his person and interests, he set himself at once to reorganise the armed forces of the country and to make effective arrangements to ensure their regular pay. To this end he insisted on certain branches of the ministry of Finance being transferred to the Ministry of War. Having by this means gradually converted the miscellaneous contingents existing into a disciplined force of some 40,000 men, he concentrated his efforts on the subjugation of the distant and semi-dependent tribes, and his phenomenal success in this direction was soon reflected in the increased measure of security prevailing in the provinces.

In the autumn of the same year, as the result of negotiations with the U. S Government, which had been in progress throughout the summer, a strong financial mission arrived from America under the leadership of A. C. Millspaugh, and embarked on the task of reforming Persian finances.

In October 1923 the Shah fled to Europe, Reza Khan appointed himself prime minister and summoned the Majlis

Late in 1924, Reza Khan reduced to submission Shaikh Khazaal Khan, G C I E , K C S I , the semi-independent chief of Mohammerak, who had for years been in close contact with the British. Then on April 19, 1925, the Shaikh was arrested by Persian troops on board his yacht and forthwith removed to Tehran where he has since been detained as a political prisoner

In February 1925 Reza Khan demanded from the Majlis the grant of definite and comprehensive military powers only withdrawable by a vote of that body His request having been acceded to by the Majlis, he now became completely independent of the Shah's authority, and six months later he formally sought elevation to the crown of Persia The change of ruler and dynasty was effected with surprisingly little commotion, the deposition of the absent Sultan Ahmed Shah being executed by a simple declaration of the Majlis on Oct 31, 1925. A Constituent Assembly was then convened, which proceeded to elect "Reza Khan Pahlavi" as Shah of Persia, with right of succession to his heirs.

On December 15 the new Shah took the oath to defend the Constitution, and on the 16th he was publicly proclaimed amidst much popular enthusiasm. A few weeks later his eldest son, Shapur Mohammed Reza, was appointed crown prince On April 25, 1926, his majesty's coronation took place

The contracts of the members of Mr. Millspaugh's financial mission, to which reference has been previously made, having expired in August 1927, were not renewed After a short interregnum, during which the financial administration was carried on by the Belgian customs staff, a German financial expert, Dr Lindenblatt, was appointed (April 1928) to succeed Mr. Millspaugh, but with much reduced powers

Following the example of the rulers of Turkey and Afghanistan, the Shah gave notice to the Powers concerned, in 1927, of his intended denunciation of all treaties in which extra-territorial rights, commonly known as "capitulations," were conferred None of the said Powers having offered serious objections, the abolition was allowed to take effect from May 28, 1928 In the meantime negotiations had been opened for the conclusion of fresh treaties under which Persia's tariff autonomy was to be recognized and the legal position of the nationals of the Power concerned, under the new conditions, duly regulated.

Satisfactory relations have not yet been established between Persia and Iraq, Persia having so far refrained from according formal recognition to the new State. Meanwhile trade between the two countries pursues the even tenor of its ways.

After difficult negotiations extending over some months, an agreement has been reached (November 1928) for the establishment of bases in Persian territory for the air service to India.

At the session of the League of Nations in September 1928 Persia was elected to the Council of the League.

Progress in Persia.—The present position in Persia is dis-

tinctly better than under the Qajar dynasty. Like his great predecessors, Shah Riza realises the supreme importance of security. To ensure it, he has organised a well-trained force of all arms 40,000 strong and, using this instrument with courage and ability, he has disarmed the tribesmen, a feat that was entirely beyond the power of the previous dynasty. More than this, the Kashgais and Bakhtiaris are now ruled by military officers and their chiefs are either in prison or accept subordinate positions. The same policy is being pursued in the case of the smaller tribes and peace is assured. Total disarmament is really the crux of the whole matter as, once the tribesmen are rendered impotent for robbing, security of the roads is established, the sedentary population being most orderly.

Persia is indeed under military Government. For example, the whole of the country south of Isfahan is controlled by the general officer commanding the southern army, whose headquarters are at Shiraz. The *mullas*, like the nomad chiefs, have lost their power for evil and so far have changes gone that civil offices have been opened for marriages. Here, as in many other reforms, the policy of Turkey has been followed.

The Shah, once again like his great predecessors, has realised the importance of communications. Various routes were opened up and improved by the British during the World War, but were not kept up in the years that followed. A new policy has now been adopted, and steady progress is being effected under American engineers. The number of cars that use the routes is increasing at an amazing rate. Indeed, even the poor are beginning to travel, with the result that there is a wider outlook than in olden days. Nor must the marked improvement of the postal services be forgotten, both as regards the transport of mails and passengers. In this connection, in 1927, an agreement was concluded with a German air company for a weekly service between Tehran and Baku, to be followed by a similar service between the capital and the Iraq frontier. Wireless stations have also been established and, to some extent, are available for public use. The construction of a railway line from the Caspian to the Persian gulf is the dearest wish of the progressive Shah, whose enthusiasm has infected the entire nation. American engineers have examined the various routes and, in the autumn of 1927, the Shah cut the first sod of this great undertaking. Thanks to the royalties paid by the Anglo-Persian Oil Company, which constitute the anchor-sheet of Persian finance, and to a special tax on sugar and tea, it is possible that the money may be forthcoming for the construction, but, in view of the barren nature of Persia, the railway can hardly be worked at a profit.

Among the reforms that are being accomplished, is that of the judiciary which is being remodelled on French lines. Capitulary privileges were renounced by the Soviet Government and this probably encouraged the Shah to issue a decree that the capitulations would be abolished in May 1928. It would seem that this action is premature and it is probably a *ballon d'essai*, but it is noteworthy that the French Government has already accepted the position. Possibly the fact that there are practically no French subjects resident in Persia may have influenced this decision. (P. Z. C.; A. T. W.)

PERSIA, CAMPAIGNS IN. For many years before the World War Germany had been making strenuous efforts to increase her influence and interests in Persia. At Tehran a college was opened, staffed by German professors and subsidised by the Persian Government. In the Persian Gulf the firm of Wonckhaus began to deal in mother-of-pearl at Lingeh in 1896; in 1897 a German vice-consulate was opened at Bushire. In 1900 Germany attempted to purchase a site for the terminus of the Baghdad railway at Al Kuwait, but Sheik Mubarak had previously concluded a secret treaty with Great Britain agreeing, in return for protection, not to sell or lease any of his territory without her consent. Other German efforts, made in collusion with Turkey, members of Mubarak's family and the Wahabis, failed; but Turkey established and held posts on Mubarak's territory in Hor 'Abdullah, an inlet running from behind Bubiyan Island to within 30m. of Basra. In 1902 the firm of Wonckhaus attempted to gain control of the pearl fisheries around Hulul, then of the red oxide deposits of Abu Musa and finally of a piece of land along the river bank at Mohammerah. These attempts were foiled by Sir Percy Cox, the British Resident. In 1906 the Hamburg-Amerika Co. started a service to the Persian Gulf. At the outbreak of war Great Britain was engaged in negotiations with Germany which would have given that Power a strong position at Basra, the destined terminus of the Baghdad railway; and had acknowledged Turkey's suzerainty over Al Kuwait.

I. THE MENACE TO INDIA

In July 1914 the regency terminated with the coronation of the young Shah, who had hardly taken up his duties when hostilities commenced. His Majesty summoned the Majlis, and duly proclaimed the neutrality of Persia. The position was, however, a difficult one. The grandees were, in many cases, only anxious to receive money from one or both sides; the masses hated the Russians and mistrusted the British for being the friends of their enemies. There was sympathy in some quarters for the Turks, and "let the Christians devour one another" was frequently heard. But Persia was powerless. Her military forces included the Cossack brigade 8,000 strong, the Swedish gendarmerie 7,000 strong and the useless Persian Army.

German Policy in Persia.—At first sight it would seem unlikely that remote Persia should become a war theatre, but there is no doubt that Germany had prepared her plans for attacking the Indian Empire across Persia, using the Turkish Army as her instrument. Before Turkey declared war, the Government of India took the precaution of despatching a brigade of Indian troops to the Bahrein Islands. After the outbreak of hostilities this force, increased to a division, defeated the Turks at Sahil, and occupied Basra on Nov. 21, thus effectually protecting the oil refineries of the Anglo-Persian Oil Co. To protect the pipeline, 150m. long, running through Ahwaz to the oilfields at Maidān-i-Naftūn, which the tribesmen had breached and fired in several places, operations were undertaken, as a result of which Persian soil was cleared of a Turkish force that threatened Ahwaz; the local tribes then submitted to the Indian troops and the pipeline was repaired.

Germany hoped to embarrass Russia, and still more, Great Britain, by forcing Persia and Afghanistan into the War on her own side and creating disturbances in India and on her frontiers. If Persia would come in, the claim that Islam was on the side of the Central Powers might have brought in Afghanistan Germany was able to divert forces to Persia at a small cost; for India was weakly held, and the "Emden" was causing some uneasiness The chief German agent was Wassmuss, formerly consul at Bushire, who organised an anti-British confederacy at Tangistan, Dashti and Dashtistan, bought over the Swedish officers of the gendarmerie at Shiraz and secured control of their force The British vice-consul was murdered, the consul and entire colony arrested and taken to the coast, Qawam el Mulk, the chief of the Arab tribes, who was acting Governor-General, was driven out, and Wassmuss reigned supreme in Fars. In Kermanshah, Turks and Germans expelled the British in April 1915; at Isfahan the Germans were equally successful, and later at Yezd and Kerman. At the end of 1915 seven out of the 17 branches of the Imperial Bank of Persia (a British company) were in enemy hands, and the British colonies had been expelled from central and southern Persia, except the Gulf ports. In the north the position was different The Russians landed troops at Enzeli, which marched on Tehran. This action drove the enemy ministers to quit the capital.

One of the dangers to be guarded against was that of German missions to Afghanistan and Baluchistan. Efforts were made to intercept such parties, but it took time to make the necessary arrangements, and it was not until 1916 that the Eastern Persian cordon was in working order with the Russians patrolling the frontier as far south as Kain, from which centre the British, with some regular troops and a number of locally raised levies, were responsible to the borders of Baluchistan. Persia being a land of vast distances, it is not surprising that a German mission was able, by means of very long marches, to reach Herat in

safety. It was received with every honour, but displayed extraordinary lack of tact by openly decrying everything of Afghan manufacture, the arms manufactured at the arsenal at the capital, for instance, being criticised contemptuously. At Kabul too, the same behaviour brought the mission into trouble. The Amir, who had received it courteously, played for time by summoning a council representative of all the tribes and by lengthy meetings with the mission and his own advisers. The Germans gradually realised that, without a Turkish force, their efforts were wasted. They were finally dismissed, the Amir pointing out that he could hardly break with the British until a large, well-equipped army reached Kabul from the west. The mission broke up into small parties, most of which successfully evaded the cordon.

In 1916 the ebb and flow of the struggle were very marked. At first the Turks, shortly after the retreat of the British from Ctesiphon, occupied Kermanshah and pushed forward towards Hamadan. The Russians in their turn, advanced and drove the enemy off the plateau, while a second force swept the hostile Bakhtiaris out of Isfahan and brought back the British and Russian communities. The capture of Kut again transformed the military situation and, in the summer, the Turks, 16,000 strong with 54 guns, gradually drove back the Russians who could only oppose them with 12,000 men and 19 guns. Kermanshah was evacuated and then Hamadan, the retreat continuing as far as the Sultan Bulaq range which covered Kazvin and threatened a force marching on Tehran. This situation remained unchanged until December.

The South Persia Rifles.—In 1916 it was decided, in consultation with the Persian Government, to organise a force of Persian troops to restore order in Southern Persia and take the place of the Swedish gendarmerie. This force was to be 11,000 strong, and the Cossack brigade was to be raised to a similar strength. Brig.-Gen. Sir Percy Sykes, who had spent many years in Southern Persia, was appointed to undertake this task, and landed at Bandar Abbas in March, with three other British officers and a few Indian instructors. The state of affairs was most unfavourable as, apart from the defeat of Qawam, the British agent and his escort were assassinated at Lingeh, and two British officers were assassinated in Makran about the same time, and finally this terrible month of April saw the grave disaster of Kut al 'Amara. Many experienced officials expected a wave of fanaticism to sweep across Persia and there was certainly cause for deep anxiety, especially in Makran, but British coolness undoubtedly saved the situation. Recruiting operations at Bandar Abbas were started immediately after landing and, in spite of a strong anti-British party, men were rapidly enlisted, and, before the end of a month, the Persian flag was hoisted with ceremony over a camp. The force, handled with much tact and patience by its British and Indian instructors, never looked back, and was soon able to protect Bandar Abbas and an important section of the caravan route from the raiding tribesmen.

Qawam was aided by the British with money and munitions, and an exaggerated report of the means placed at his disposal led to the rebel Arab headmen kissing his feet. With their aid he defeated the Swedish gendarmerie, and was marching in triumph to Shiraz when he was killed by a fall from his horse. His son, a man of 28, was, however, able to restore Persian authority in Fars. The success of Qawam and the landing of the mission at Bandar Abbas made the position of the German parties at Kerman decidedly insecure. They fled to two parties, and after suffering some losses from attacks on the road, they were all captured by Qawam and imprisoned at Shiraz. The little band consisted of 60 Germans and Austrians, a dozen Turks and a few Afghans.

A small force of Indian troops, consisting of a section of mountain guns, a squadron of cavalry and 500 rifles, was sent to Bandar Abbas, and Sir Percy Sykes marched inland a distance of 280m. to Kerman, where he was received with much cordiality. The various pro-German elements who had created a state of insecurity fled, the bank and telegraph offices were reopened, and the normal state of affairs was quickly re-established. The column then marched to Yezd, where the British colony had just returned. News being received of the Turkish advance and of a probable attack on Isfahan, the column made a forced march to that city where it joined the extreme left of the Russian Army, represented by 600 Cossacks. The Turks, hearing of the arrival of the British at Isfahan, stopped at a village some six miles distant, and then retired. When it became evident that the danger had passed, the column marched south to Shiraz, which it reached in November, thereby completing a march of 1,000m. through the heart of Persia.

At Shiraz the question of the gendarmerie had to be settled. The Persian Government had not actually given its consent to its being incorporated in the South Persia Rifles, but it was unable to pay or equip the force. Spread over the route for a distance of 200m. from the borders of Fars in the north, to Kazerun in the south, and numbering some 3,000 men, the problem which confronted Sir Percy Sykes was one of extreme difficulty. He had no staff to administer or train such large numbers, and he was aware that it was this force which had seized the British consul only a year previously and that many of the officers were pro-German in sentiment. But he also realized that, if the gendarmerie broke up into well-armed bands of robbers and devastated the country, few supplies would reach Shiraz. He consequently decided to take over the entire body, and the force gradually developed and helped to restore order in South Persia. (*See* WORLD WAR; WORLD WAR: BIBLIOGRAPHY.)

II. THE BRITISH IN PERSIA

During the winter, the position in Mesopotamia entirely changed. Instead of weak, ill-equipped columns, severely handicapped by unfavourable climate conditions, failing before Kut al 'Amara, there was the pleasant picture of overwhelming forces under the inspiring leadership of Gen. Sir Stanley Maude recapturing Kut in February 1917 and following this up by the signal success of the capture of Baghdad. The position of the Turks in Persia became more and more difficult as the British advanced. On the day Baghdad was occupied they evacuated Kermanshah and, pursued by the Russians, reached the Persian frontier at Qasr-i-Shirin on March 31, worn out and hungry but not wholly demoralised. But during the succeeding winter, the Russian army disintegrated. Its collapse opened up to the enemy a completed line of northern advance across the Caucasus and the Caspian sea to 'Ashqabad, Merv (the junction for Kushk, within striking distance of Herat), Bokhara, Samarcand and Tashkent, the administrative centre of Rûssian Turkistan. In Sept. 1917 Georgia and Armenia decided to claim their independence, and a third state came into being under the title of the republic of Azerbaijan, with Baku as its capital. In connection with the efforts made to ward off the danger to India involved in the Russian collapse, British troops entered Western Persia.

The Dunsterville Mission.—It was out of the question to despatch large bodies of troops to support the Georgians or Armenians, as Baghdad was 800m. distant from Baku. The authorities therefore, decided to despatch a military mission to reorganise the sound elements of the country into a force that would prevent the Turks and their German masters from reaching Baku. It was hoped that these small States would fight for their homes, but the Armenians failed to do this. Maj.-Gen. L. C. Dunsterville was appointed to command this mission, and, in Feb. 1918, he started off from Baghdad with a party of officers in 40 cars to cross north-west Persia. Enzeli was his objective, and he hoped from that port to be able to proceed to Baku and Tiflis. He reached Enzeli only to find that the port and its shipping were in the hands of hostile Bolsheviks, while the neighbourhood was dominated by Mirza Kuchik Khan, an ambitious brigand who had recruited some 4,000 followers, nicknamed *Jangalis* or "Forest Dwellers," to the cry of "Persia for the Persians," and who robbed his countrymen if they refused to join him. Dunsterville quickly realised the situation, and, before his opponents had concerted their plans and had overcome their fear of the armoured motor-car, the mission had retired to Kazvin and Hamadan which latter city became its headquarters.

During this period, Dunsterville was brought into close

relations with the Russian generals Baratov and Bicherakov. The former had commanded the Russian troops in Northern Persia and was now helplessly watching their disintegration. The latter, on the contrary, had kept his command of 1,200 men practically intact. By March the last of Baratov's men had left, but Dunsterville had been able to keep Bicherakov's command at his side. Without its aid, the Jangalis, elated by the retirement of the mission, which was magnified into a great victory over a British army, would have been able to march on the capital. There they would probably have introduced a reign of anarchy and have forced Persia into the War on the side of the Central Powers, with whom Kuchik Khan had close relations; he also had German, Austrian and Turkish instructors well supplied with machine-guns. When the Jangalis marched on Kazvin, Bicherakov forestalled them, and drove them back to the forests with heavy losses. He then embarked at Enzeli. Dunsterville, who had received reinforcements consisting of a regiment of cavalry, a battery and two regiments of infantry, followed behind Bicherakov and took over the road. The Jangalis, under their European officers, attacked a detachment at Resht, but suffered heavy losses, and Kuchik Khan made terms and became a contractor for supplies. About this time the Bolshevik Government at Baku was overthrown and replaced by the Central-Caspian dictatorship, which asked for British assistance. Dunsterville took his force to Baku, held it for some weeks against overwhelming Turkish numbers, denying the use of the oil wells to the enemy, whom he also kept away from the Caspian Sea, and finally evacuated the town and returned to Enzeli, thus ending a very gallant episode of the War.

Investment of Shiraz by the Kashgais.—In the spring of 1918 the Persian Government, in reply to a British note, denounced the South Persia Rifles as a foreign force and a threat to Persian independence and integrity. It also expressed the hope that the British Government would withdraw its troops and allow Persia to commence her cherished reforms. The cabinet was under the impression that Germany was winning the World War or such a curt note would never have been penned. This reply was published all over Southern Persia; and the results were speedily shown in serious desertions from the South Persia Rifles and culminated in the formation of a confederacy under the Kashgai chief, Solat-u-Daulah, to annihilate the British in Southern Persia. He had at his disposal 4,500 Kashgais and 1,500 Kazerunis and this number was reinforced by contingents from Dashti, Dashtistan and elsewhere, and reached about 8,000 fighting men. The tribesmen were well armed with Mausers, had plenty of ammunition, and fought both bravely and cunningly. The British force at Shiraz was 2,200 strong, one-third being recruits. The South Persia Rifles slightly outnumbered the Indian troops and, owing to propaganda and the proclaimed hostility of the Persian Government, were a danger to the British. The detachments in the outposts mutinied and surrendered or deserted. Qawam had collected in and about Shiraz 2,000 Arabs, who were ready to attack the beaten side. On May 24 the column marched out 1,600 strong and defeated the Kashgais in the hilly country to the west of the city. About 10 days later the enemy returned in still larger numbers, and the Kazerunis occupied the garden quarter, which almost touched the fortified perimeter constructed by the British outside Shiraz. The inhabitants of Shiraz were incited against the British by the mullahs, some of whom preached *jihad* or Holy War.

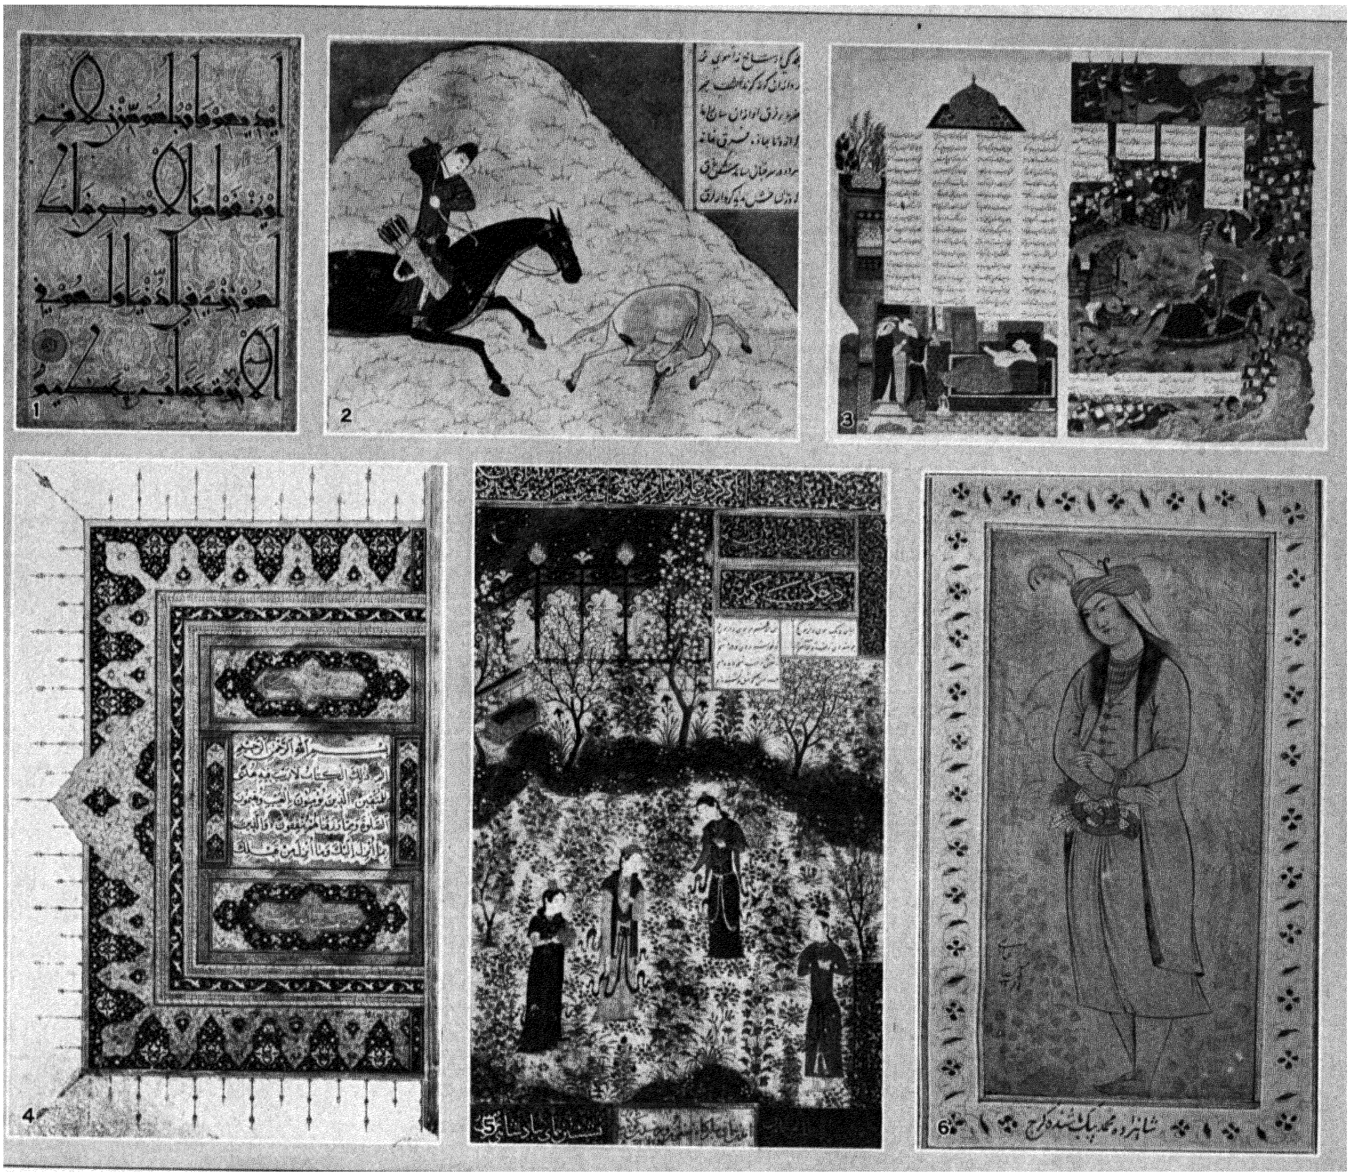
Sir Percy Sykes learned that the Kashgais were preparing to unite with the townspeople in a combined attack on June 17, and he determined to forestall them. Accordingly, on June 16, the column sallied out and again inflicted considerable losses on the enemy. On the following day Shiraz rose, its inhabitants attacking everyone suspected of being friendly to the British. But the Kashgais did not come to the support of the townspeople, who were overawed by the seizure at midnight of various key-positions by the British. The tide then turned. The governor-general appointed a new *Ilkhani* or "paramount chief" in place of Solat, whose followers began to break away, influenced by the heavy losses they had suffered. Qawam declared in favour of the new Ilkhani, and his example was followed by a brother of Solat and by perhaps one-quarter of the tribe. The column marched out again and Solat fled a broken man, pursued by Qawam, the new Ilkhani, and most of the Kashgai tribe. The expedition is described by L. C. Dunsterville, *The Adventures of Dunsterforce*, 1920. (P. M. S.)

PERSIAN ART, PAINTING AND CALLIGRAPHY. The share of Persia in the development of the art of book-production in the Islamic countries dates from even before the beginning of the Abbasid period. Towards the end of the 7th century, in the two oldest centres of culture in Iraq, Basra and Kufa, beautiful Koran mss. executed on broad parchment rolls were common, though at first they had no extraneous decoration, but produced their effect solely by the heavy lapidary style of the archaic character. In the 8th and 9th centuries this the most refined branch of Mohammedan art reached its first period of splendour under the powerful stimulus imparted by the caliphs of Baghdad; and the masters of the Cufic who flourished at that time (*c.* 800) include not only a number of Arabs, but also the Persian Khoshnâm of Basra. More important, however, was the part played by calligraphers of Iranian origin in the development of the various forms of the *naskhi*, the round character, which early began to take a high place beside the vertical script. The inventor of the decorative *thuluth*, which derived from this, is said to have been Ibrahîm Segzi of Sijistan, and his pupil Ustâd Ahwal Segzi has the reputation of having been the first, under the caliph Mamûn, to elaborate and discuss rules of calligraphy. He in turn was the teacher of the celebrated Ibn Moqla, who brought the *naskhi* into general use in place of the Cufic and is regarded as the greatest authority on all the principles of the art. Ibn Moqla's school produced, among other famous pupils Hasan es-Sirâfi (d. 979), who was of Mazdaic origin, and the Buyid prince Fenâ Khosrau (d. 983), a descendant of the Sassanian kings.

In painting the Persian element was stronger. Although no traces of frescoes or illuminations have come down to us from the Sassanian period, we know from other sources that in that great age of Iranian culture painting was another field of endeavour, and Herzfeld has traced to Sassanian models all the motifs (dancing-girls, huntresses, animal figures, floral decoration of various kinds) of the fragments of ornamental wall-paintings which came to light in the caliphs' palace at Samarra in the course of the excavations. At about the same time (9th century) illumination must have come into favour at Baghdad, probably through the Manichees. We have gained some knowledge of this through the discoveries made by the German expeditions to Turfan and by Sir A. Stein. (*See* ILLUMINATED MANUSCRIPT.)

The Baghdad School.—The first extant works of the Baghdad school of painting date from the 12th century, when the Seljuk period had already begun, but in their content and their artistic tendencies they go back unmistakably to older traditions, and continue with little change until the middle of the 13th century. They include scientific treatises translated from the Greek or based on ancient models, with explanatory illustrations; Arabic versions of the Bidpai fables which were imported from India; and the anecdotes of Harîri, then in great favour, in which the bold jests and witty conceits of Abû Saîd of Serrûj were illustrated. These three types of text were all equally well adapted to direct the artist to the study of nature and to emphasize the importance of problems of composition and colour, and the works of this school are veritably astonishing in their wealth of colour-shading and their forcible depiction of their subjects. To what extent Persian masters are represented we do not know; but the circumstance that the "minai" pottery of Raghes (*c.* 1200) borrowed the Baghdad style of painting suggests that the whole tendency had already spread from Mesopotamia to centres in Iran.

As early as about the 10th century, paper had supplanted parchment, not only in secular works but also in copies of the Koran and other religious texts, its manufacture having gradually spread from Samarcand to all the countries of Islam. Various places competed to produce perfect and costly types of paper, and the writing-material was often fetched from a distance, especially when commissioned by royal courts. Ornamental decoration of



PERSIAN MANUSCRIPTS AND MINIATURES

1. Leaf of a Koran in ornamental Kufic, 11th century
2. Bahram Gur hunting. From a Persian anthology made for the Library of Baisonqur, dated 1420
3. Persian miniature
4. Title page of a Koran written in Tabriz, A.D. 1463
5. Humay and Humayan in the Imperial Garden at Peking. Herat school, about 1450
6. Portrait of a young man, by Alî Rizâ Abbâsi, Isfahan

APPLIED ARTS IN PERSIA

1. Persian plate of the second half of the 17th century, showing elements of Chinese influence in the free and lavish floral decoration, combined with purely Persian elements in the border. 2. Blue glass bottle of the 17th or 18th century; one of a class with narrow necks designed for holding perfumes, illustrating Persian skill in handling the material. 3. An early bronze mortar of the 12th or 13th century; a primitive type showing Sassanian and Scythian elements. 4. Amber glass vase of the 17th or 18th century; its shape probably due to the influence of Chinese porcelains. 5. So-called Sultanabad plate, 14th century, illustrating the combination of freedom and balance characteristic of the best Persian design. 6. Pottery vase of the 17th century, with the typical informality and crowded richness of much later Persian ceramic ware. 7. Wall tile of the 13th or 14th century in underglaze blue and yellow lustre. The combination of Arabic letters with architectural motives and interlacing, conventionalized foliage is characteristic. 8. Water pitcher of engraved and inlaid copper, bronze and silver of the 19th century; a comparison with figure 3 shows the refinement of the later Persian work. The shape is probably due to influences from pottery. 9. Persian prayer rug of the 19th century; both border and field decorated with conventionalized floral motives. 10. Fourteenth century Sultanabad jar, like figure 5, characteristic of Persian pottery at its best. 11. Persian rug of the 16th century. *See* also *Rugs and Carpets*, Plates IV., V., VI.

manuscripts, from which for religious reasons figures were excluded, also made continual strides, and we soon find the craft of the illuminators and gilders breaking away from that of the calligraphers and painters and developing on its own lines. Cufic was now no longer used except in chapter-headings and title-pages; elsewhere the script employed was either one of the many variants of *naskhi,* or a decorative script representing a more graceful and stylistic development of the vertical character.

THE MONGOL PERIOD

The Mongol invasion in the 13th century proved unexpectedly fortunate for the art of book production in western Asia. Hulagu and his successors not only took pains to promote it in every possible way, but also brought it into contact with the highly-developed painting of the Far East, and directed it towards new subjects, with the important effect of immensely enlarging the painters' outlook. The main tendency was now to the pictorial representation of historic events and legendary episodes, in world histories conceived on a large scale, and the principal result of acquaintance with the works of the Chinese masters of the Sung period was to enhance the feeling for landscape. In manuscripts of the early 14th century we see the foreign stimuli combining with older traditions, until in course of time there developed a new Perso-Mongol style of painting which reached a high standard in the two capitals of the Ilkhâns, Baghdad and Tabriz. The captions were now no longer in Arabic, but generally in Persian, and the whole art of miniature painting was soon persianized when the great national epic of Firdûsi and other poems, such as those of Nizâmi and Khwadju Kirmâni, became increasingly common in illustrated copies. New and effective uses were here found for devices of composition, and, moreover, the arrangement of the verses in vertical columns, which could be broken up wherever desired, made possible a much more intimate and aesthetically satisfying conjunction of picture and text than had ever till then been known. Heroic scenes from the Shahnamah, sentimental themes from Khosrau and Shirin, Leila and Majnûn, etc., were then for the first time expressed in characteristic forms.

When Timur altered the whole political complexion of western Asia, there arose, beside the two centres already named, a third and highly productive centre—his capital of Samarcand, where, in addition to the miniature book-illustration in body-colour, the separate sheet bearing a light ink sketch, usually picked out in gold, came again into favour through the stimulus of Far Eastern example. Of Arabic texts there were at this period only the cosmography of Qazwîni and a few astrological treatises, which seem to have been produced with loving care in Western Turkestan. To the Baghdad school of calligraphy belongs the credit of having, about 1300, developed the lapidary style of the Cufic Korans into a rounded form, and brought this to the ripest degree of ornamental beauty in the majestic *tumar* variants. In the production of the magnificent Korans of the age of the Ilkhâns, with their large size and their few and incomparably imposing lines of script, Persian masters were certainly concerned; and they carried to Tabriz and Samarcand the new principles they had learnt in this school for the decoration of the holy book, especially the rich arabesque illumination. Timur's chief secretary, Emir Mohammed Bedr ed-Dîn of Tabriz, has an immense reputation as a master of all forms of writing, and two of the great Mongol emperor's grandsons, Ibrahîm Mîrzâ and Baisonqur Mîrzâ, were very famous calligraphers. The latter, who unfortunately met an early death in 1434, also earned much honour by founding the Academy of Artistic Book-Production at Herat in connection with his library; for years it employed 40 calligraphers, besides numerous illuminators and painters. In this academy the Persian texts were no longer written in *naskhi,* but in *nastaliq,* an offshoot of the old cursive character, invented by the celebrated Mir Ali of Tabriz. All the 40 masters of Herat were directly or indirectly his pupils, and towards the end of the century the style of calligraphy invented by him found its most splendid representative in Sultân Alî of Meshed (d. 1513), the protégé of the famous poet and minister Mir Ali Shîr Newâi and friend of the great poet, Jâm'i.

The preference that painters displayed for subjects drawn from the national literature, and the enthusiasm with which they steeped themselves in the magic of their native countryside, give to Persian painting of the Mongol period a romantic note which often chimes with the atmospheres we find in our own contemporary western Gothic. In the East, however, the purely decorative and impersonal character of the pictures continued, whereas in Europe they were gradually diverted from their original purpose by the influence of wall-painting and panel-painting. It was at this time that the harmony between picture and text reached the highest imaginable degree of perfection, and in turning the leaves of the extant manuscripts we are continually astonished at the skill with which the painters fitted their subjects into spaces allotted to them quite arbitrarily by the calligraphers. At the beginning of the 14th century the backgrounds were still carefully coloured red, but subsequently a rich blue became general, and it was not until the end of the period that a gold background came into favour, the other colours were predominantly bright and lively. The incidental landscape is generally of a steppe-like character, jagged rocks, isolated trees, and little brooks rippling among stones and bordered by growing flowers, are the essential features of almost all open-air scenes, and only occasionally is the mysterious atmosphere of the forest or the luxuriance of a flower-garden depicted. The highly effective motif of a tree in blossom, which is often used in smaller pictures, is obviously taken from Chinese models of the Ming period. We know that, particularly under the Timurids, contact with the Far East became increasingly frequent.

Behzâd of Herat.—An undeniable weakness of Perso-Mongol painting lies in the diagrammatical conventionalizing of the figures, the spiritless treatment of the heads, and the absence of expression in the movements. In this respect no progress is to be seen throughout the whole development of the art, which is in other directions so astonishing; and the appearance of a completely revolutionary personality was needed before a change could be brought about and new paths indicated. This personality was found in the genius Behzâd of Herat, who is rightly honoured as the greatest master of Persian painting. Behzâd understood how, even in his most populous compositions, to differentiate every single figure in countenance and bearing; his palette was extraordinarily rich, especially in warm, full tones, and this enabled him to individualize his portraits by the employment of numerous colour-nuances for costumes and even for flesh. He was also a reformer in the treatment of landscape, which appears more realistically in his pages than in those of his forerunners, and in the choice of subject a markedly realistic note is likewise seen. Moreover, it was he who revolted against the dictation of the calligraphers, and admitted no text at all, or only a few lines of verse in one corner, in the pages he illustrated; we have even a number of double-page miniatures by his masterly hand.

Behzâd, who was born before 1450 and died after 1520, represents the zenith of the Mongol and the opening of the Safawid period in Persian painting. He was head of the Herat Academy until 1506, when Shah Ismail took him to Tabriz, made him his chief librarian, and covered him with honours. Only a few extant works are indisputably by his hand. A characteristic early work is the *History of Timur,* illustrated in 1467, which was formerly in the Schulz collection and afterwards went to America; an edition of Saadi's *bustân* in the Cairo library is dated 1487, and the illustrations to Majnûn and Leila at Leningrad are among his last works. Both in Herat and in Tabriz he had many pupils, who carried his style far and wide in Persia, Western Turkestan, and India; and even in the 16th century his name was already so famous that his art was imitated on every side, while later on pages of the most various origins were furnished with his signature to enhance their value.

The Tabriz School.—The next generation of painters in Tabriz is dominated by the highly-gifted Sultân Mohammed, who exercised a commanding influence in the whole field of art at the court of Shah Tahmasp. In collaboration with other masters he illustrated *éditions de luxe* of the Persian epics, several of which have come down to us; but for the most part he preferred *genre* subjects and portraits, which were produced as single

sheets and were designed to be bound up in volumes with specimens of the handwriting of famous calligraphers. He opened new fields of activity to the painters by bringing lacquer bindings into fashion, and also by inducing them to design patterns for stuffs and knotted carpets to be made at the royal factories. Some of the studies for the celebrated hunting and animal tapestries of the 16th century were made in his studio, as were also a few velvets and silk brocades with figure subjects of the delicacy of miniatures.

Since the end of the 15th century an immense impetus had been given to Koran decoration at Tabriz. It was here that the picturesque division of the title-pages into star- or medallion-shaped fields and borders with a reciprocal pattern or a cartouche design was devised, and this, transferred to the knotting technique, brought about a revolution in the style of Persian carpet-making. The ornament grows richer and more complicated; to the arabesque are added slender floral twines in a bewildering profusion of lines, palmettes, rosettes and cloud patterns.

In Behzâd's time Shah Mahmûd of Nishapur came to eminence as a master of the *taliq* script, while later Mîr Alî of Herat, "the royal scribe" (d. 1559), held the foremost place. Sultân Alî el-Kâtib and many other calligraphers and illuminators heard the call of the Ottoman rulers and founded a school of book-decoration at Constantinople, which adhered closely to the tradition of Tabriz.

The Isfahan School.—Late in the 16th century, when all the artistic forces of Persia were once more being concentrated at the new capital, Isfahan, under the powerful impulse communicated by Shah Abbas the Great, there arose also in Isfahan a new and important centre for the art of book-production in all its various forms. Mîr Imâd el-Husni (d. 1618) and Alî Rizâ Abbâsi competed in calligraphy for the royal favour, while others sought to attract attention by animal figures ingeniously constructed out of pious mottos and similar subjects, or by a perfect mastery of the *shikeste,* a complicated script so full of flourishes as to verge on illegibility. In painting there is a link with the schools of Herat and Tabriz in the person of Ustâd Mohammedi, who was undoubtedly the first to put his observations of nature on to paper in the purest ink-wash technique without any reference to a text. His successor as head of the painters' gild at Isfahan was Rizâ Abbâsi, whose signature, genuine or doubtful, is frequently met with; it is still not established beyond dispute whether this artist is identical with the calligrapher mentioned above, and with Agâ Rizâ, who is thought to be of an older generation. Be that as it may, it was he who filled the albums of Persian and Indian collectors with his gay, sure-handed colour sketches and drawings in red chalk on the most every day subjects, and with carefully-executed pages in rich colour; and he ultimately became so much admired as almost to overshadow, for a time, the fame of Behzâd. He likewise gave a new impulse to the illustration of manuscripts, and his elegant, fashionable style gained him a great influence in the other decorative arts also; painted tiles and lacquered doors in the garden-palaces of Isfahan clearly show the mark of his atelier.

Rizâ's best pupil, and his bosom friend, was Muîn, one of whose extant works is a portrait of his master; the style created by the latter was still a living force at the end of the 17th century, in the works of Mohammed Qâsim, Mir Mohammed Ali, Mohammed Yûsuf and numerous others.

Later Persian painting is of little interest to the history of art. In the 18th century European paintings and engravings were slavishly copied, and Nadir Shah's expeditions to India introduced transitory influences of the Mogul school. At the beginning of the 19th century an enormous impetus was given to lacquer-painting, though only as an ordinary bazaar industry, which permeated the entire realm of writing materials and toilet accessories; decoration also took the form of large canvases, such wretched and barbarous productions as to demonstrate that Persian artistic taste, once so cultivated, had now become a thing of the past. Since the end of the 19th century the growing interest displayed by European and American museums and collectors in Persian miniatures has called into existence a considerable number of workshops for the production of fakes, where single pages and even complete manuscripts are concocted in the style of any old master that may be desired. This somewhat questionable development has at least the advantage of preserving skilled craftsmanship from decay and maintaining some contact with the masterpieces of the past.

OTHER FORMS OF PERSIAN ART

A strain of decorative skill dating from the Mohammedan conquest permeates all the expressions of Mohammedan art generally known as Persian, but pre-Mohammedan influences are not absent. Such Sassanian motives as twinned animals facing each other appear constantly.

Architecture.—The progress of architecture from the Seljuk domination continues to a rich climax in the 16th to 17th centuries. The love of barrel-vaulted porches can be traced directly to Sassanian palaces and were the chief motives of the great mosques where they were flanked by twin minarets in the design of which appears that emphasis on height which is universally Persian. A second characteristic was the use of a dome with two shells, the outer onion-shaped and supported on a high drum, and the swelling slight in early examples but more pronounced later. Daring ingenuity of construction prevailed in all of these vaults and domes. The stalactite (*q.v.*) corbels, elaborate intersections of curved surfaces, delicate groined lines and scalloped forms were handled with extraordinary skill and these types differed widely from similar buildings in the rest of the Muslim world.

During the 18th century there developed rich and delicate wooden construction including slim columns, intricate cornices treated with lavish carving and inlays used frequently in the exquisite formal gardens so important to Persian life. The Mohammedan love of surface ornament led to dominance of plane surfaces covered with tiles so that walls, vaults, domes and minarets glowed with blue greens and turquoise, rose and yellow. In no other style has applied color become such an integral part of architectural design. (*See* Mohammedan Architecture; Mosque; Tile.)

Ceramics.—Springing from the most ancient Mesopotamian development of pottery Persian ceramics developed in about the 13th century into one of the most exquisite of all arts. The pottery body was coarse due to the available clay but the glazes were developed to a high degree of perfection and the coloration, more especially the blues ranging from turquoise to cobalt, became world-famous. Sassanian, Parthian and Byzantine influences lent vigour and charm. By the 14th century floral ornament became more important and the designs were freer and less formal. Vases were decorated in low relief and covered with monochrome blue glaze. During the 16th century the Chinese influence made itself felt and became strong in the 17th century not only in design but in methods of manufacture and at the same time Persian influences were felt in China. Tiles were of course an important phase of the ceramic industry. (*See* Pottery and Porcelain: *Near and Far East;* Tile; Mosaic.)

Textiles.—Church treasuries throughout Europe reserve textiles that are obviously of Asiatic origin showing the same Sassanian and Byzantine influences felt in Persian ceramics.

Lions, eagles and imaginary beasts enclosed in geometric patterns form the decoration on a material of woven silk and sometimes gold and silver. Prior to the 13th century these textiles came from different parts of the Mohammedan world but later from Turkey and Persia, the Turkish development appearing in conventionalized ornament and the Persian from the 18th century onward showing greater complexity in formality and realism, and influenced eventually by Chinese elements due to the Mongol domination.

Rugs are the most important of Persian textiles, the best of them, which date from the 16th and 17th centuries, displaying amazing delicacy in technique and great decorative skill in design with rich soft colours marvelously adapted to the texture. (*See* TEXTILES AND EMBROIDERIES; RUGS AND CARPETS; BROCADES.)

Metalwork.—The Persians were aesthetic craftsmen in metal and their delicate inlaying of silver and gold into copper and steel of intricate geometric and naturalistic ornament shows decorative genius and the greatest of technical facility. The motives in this work were similar to those used in ceramics and textiles. A rinceau or branching scroll ornamented with sharp pointed spear-like leaves was widely used. Much of this artistry was employed of course in the decoration of arms and armour and though there is a resemblance between the work of Turkey and Persia, the Persian far surpasses with its richness and delicacy. (*See* SILVERSMITHS' AND GOLDSMITHS' WORK: *Oriental;* DAMASCENING.)

(T. F. H.)

PERSIAN BERRIES are the seed-bearing fruit of species of *Rhamnus* which are, or were, cultivated in France, Spain, Italy, the Levant and Persia. The Persian berry proper is derived from *R. amygdalinus*, *R. saxatilis* and *R. oleoides*. The berry, gathered when unripe, has a greenish-yellow colour, but when older it is black and gives an inferior result in dyeing. Though their use has declined, Persian Berries are still employed by calico printers for the production of "steam" orange, olive and green effects. In dyeing property they closely resemble quercitron bark and contain, as their main constituent, xanthorhamnin, $C_{34}H_{42}O_{20}$, a glucoside of rhamnetin, $C_{16}H_{12}O_7$. (A. G. P.)

PERSIAN GULF. The term Persian Gulf is, strictly speaking, restricted to the landlocked sea which extends in a south-easterly direction from the mouths of the Euphrates and Tigris rivers some 500 miles to the mountain mass of the promontory of Oman, terminating in Ras Musandam; but for the purpose of this article it will be considered to include the Gulf of Oman to which it is joined by the Strait of Ormuz, 29 m. wide in its narrowest part; it thus extends roughly from lat. 22° to 30° N., and from long. 48° to 62° E. The Gulf within the Strait of Ormuz has a maximum width in its southern part of about 200 m. and covers an area of about 97,000 sq.m. Its waters are comparatively shallow: the deepest soundings range from 40–50 fathoms, while in the Strait just off Musandam the depth is about 80 fathoms. The deep soundings lie much nearer the Persian than the Arabian shore, the 20 fathom line lying 100–105 m. off the coast of Bahrein, while it is only 10 m. off Lingeh on the Persian coast. The Gulf is tidal, spring tides rising about 9 ft. The salinity of the water, while somewhat higher than that of the Indian Ocean, is yet low for an inland sea subject to great evaporation. Within the Gulf proper, currents are scarcely observable, but at the Strait of Ormuz there is a distinct inward flow from the Indian Ocean during the south-west monsoon and a slight outward flow during the rest of the year.

By far the most important waters received by the Persian Gulf are those of the Euphrates and Tigris rivers, though until 1766 the Karun had direct access to the sea via Khor Musa, and at a much earlier date the Karkhah (which now disembogues into a marsh) joined the Karun below Ahwaz. The Shatt-el-Arab is now the main channel whereby all these rivers pour their waters into the Gulf and, with the exception of the Jarrahi and Hindiyan rivers to the east, all the other streams are insignificant and their water so salt as to be undrinkable. The Persian Gulf does not lack fine harbours, *e.g.*, Maskat, Elphinstone Inlet, Kuwait, Khor Musa and sheltered anchorages, *e.g.*, Chahbar, Jashk and Gwadur, but those principally used are mostly shallow and exposed.

The Gulf is dotted with numerous islands varying in size from the rocky pinnacles, such as the Quoins, to the extensive Qishm Island (close to the Persian coast and 70 m. in length), and Bahrein Island (off the Arabian shore, 30 m. by 10 m. and covering an area of 210 sq. miles). Some of these islands, *e.g.*, Kharag, Qishm and Shaikh Shu'aib are geologically similar to the main land of which they once formed a part: others, such as the Daiyinah group, Halul, Hormuz and Larak are salt plugs which have been thrust up from below, bringing to the surface boulders of the older rocks, such as may be seen on the shore at Henjam. Two extensive islands at the head of the Gulf, Abadan and Bubiyan Islands, are of deltaic formation.

The Persian Coast.—From the Indian Ocean the outer Gulf, or Gulf of Oman, is entered approximately where Persian territory begins in Makran at the small port of Gwatar, long. 61° 29′ E., whence the coastline, running W. first to the Strait of Ormuz, next along the north shore of the inner Gulf and finally to the mouth of the Shatt-el-Arab (the Perso-Iraq frontier) is nominally under the exclusive control of the Persian Government, falling in large part within the administrative district known as the "Gulf Port" of the province of Fars (*q.v.*). The sections of this coast named in order, from the neighbourhood of Jashk are: Biyaban, Minab, Shamil, Bastak, Lingeh, Shibkuh, Dashti, Tangistan, Dashtistan, Angali, Rud-Hilleh, Hayat Davud and Liravi. Then follows the coast of Khuzistan. The inhabitants of these coastal tracts are either Persians, or Arabs who by domicile and intermarriage with Persians have lost nearly all their racial and most of their social characteristics, but retain a dialect of Arabic as their mother tongue and are for the most part Sunnis and not Shi'ahs. The principal places along the coast are Chahbar, Jashk, Bandar Abbas, Lingeh, Bushire, Bandar Rig and Bandar Dilam.

The Arabian Coast.—The south coast of the Persian Gulf may be regarded as commencing from Ras el Hadd, the most easterly point of Arabia. Extending to Ras Musandam, this coast is part of the sultanate of Oman and is ruled by the sultan of Muscat (*q.v.*), and the principal towns, naming from east to west, are Sur, Muscat, Matra, Khabura and Sohar.

From Musandam, westward of the Muscat boundary at Tibat, the coastal tract now known collectively as the Trucial Oman, but formerly as the "Pirate Coast," is occupied by a number of independent sheikhdoms. The headquarters of the Trucial chiefs run east to west as follows: Ras al Khaima, Umm al Qaiwain, Ajman, Sharja, Dibai and Abu Dhabi. Further west is Qatar, a peninsula consisting of low barren hills projecting some 120 m. into the Gulf. Doha is the principal place and residence of the chief. The political position of Trucial Oman and Qatar is not easy to define briefly, but it is regulated in the main by two agreements signed individually by the five chiefs in 1853 and 1892. The first provided for the suppression of piracy and cessation of hostilities at sea among the signatories, and it imposed on the British Government the duty of enforcing peace; by the second agreement the Trucial chiefs bound themselves to enter into no treaty with a power other than Great Britain and not to cede, sell or mortgage any part of their territories, save to the British Government. Subsequently a treaty was made with the chief of Qatar whereby his position was assimilated to that of the Trucial chiefs; and the British Government undertook, in addition, to afford their good offices to all in the event of unprovoked aggression from within or without.

North-west of Trucial Oman and Qatar lies the extensive maritime tract of Al Hasa and Hofuf, over which, up to 1913, the Turks exercised authority, and claimed it also in Qatar and the

adjacent territory of Kuwait on the North. The emir of Nejd, Abd-ul-Aziz ibn Sa'ud, ejected them from the first-named district, and the World War put an end to Turkish claims elsewhere in the Gulf. Al Hasa is now entirely absorbed in the dominion of Ibn Sa'ud. The chief places on the coast are Uqair and Qatif, and Hofuf in the oasis of the same name.

Lying in a deep bay between Qatar and Al Hasa is Bahrein Island, with the smaller subsidiary island of Muharraq on the north. In 1892 the sheikh entered into an agreement with the British Government not to "cede, sell, or mortgage or otherwise give for occupation any part of his territory save to the British Government." North of Al Hasa, at the head of the Gulf, is situated the independent principality of Kuwait (*q.v.*) which has a low stretch of coastline some 200 m. in length. The chief town is Kuwait on Kuwait Bay. Between Kuwait and Persia is the narrow corridor which gives access to Iraq (*q.v.*).

Climate.—The prevalent winds in the Gulf follow the configuration of the coast, *i.e.*, north-west and south-east, and are known respectively as the *shamal* and the *qaus*. The former, often rising to a gale in a few hours and falling as suddenly, is foretold by no change in the barometer. With the qaus the reverse is the case, and this wind is much dreaded by native mariners, as it strikes nearly all the sheltered anchorages.

Meteorological observations systematically taken over periods ranging from eight to thirty-three years, give the following mean annual rainfalls for places round the Gulf: Basra 6·23 inches, Bushire 11·07, Jashk 4·17, Muscat 3·94 and Bahrein 2·47. Thus the rainfall is considerably greater on the Persian than on the Arabian coast. The influence of the south-west monsoon, though marked at Muscat, is scarcely noticeable in the Gulf proper, but upper-air investigations at Baghdad give some reason to think that the effect of the monsoon can be observed even there.

Mean temperature (Fahr.) varies as follows:—

Basra and Mohammerah	52° in Jan. to	91° in Aug.
Bushire	56° " " "	89° " "
Jashk	67° " " "	89° " "
Muscat	69° " " "	90° " "
Bahrein	61° " " "	91° " "

Absolute shade temperatures are:—

Basra and Mohammerah	24° in Jan. to	120° in Aug.
Bushire	32° " " "	115° " "
Jashk	42° " " "	112° " "
Muscat	58° " " "	114° " "
Bahrein	41° " " "	108° " "

Relative humidity is high throughout the Gulf proper, the maximum being experienced at Bahrein.

The Medical Conditions prevailing in the Gulf are largely determined by the peculiar climatic influences to which the inhabitants are exposed. The hot season is from May to Oct., and the Gulf had in the early part of the last century and during the World War an unenviable reputation, but the experience of the Anglo-Persian Oil Co., Ltd., who employ over a thousand Europeans and 25,000 Persians all the year round, largely in the open air, indicates that with good housing, sanitation and water supply, and under careful medical supervision, it is possible to maintain a higher general standard of health in the Persian Gulf and south-west Persia than in most parts of India and of the Far East. This has also been, in recent years, the experience of the British and Indian navies.

Earthquakes.—The latest movement to which the Gulf has been or is now being subjected is one of gradual elevation, evidences of which are found in recent sea-beaches, some as much as 450 feet above present sea-level, and in the flat ledge which surrounds Muscat harbour. Earthquakes are frequent and sometimes severe in the Persian Gulf proper, especially on Qishm Island and on the neighbouring mainland. In 1865, an earthquake levelled the villages of Darveh Asuh near Mugam in the Shibkuh section of the Persian coast; in 1880 an earthquake caused 120 deaths in Basra; in 1883, severe shocks were felt from Bushire to Tahiri (long. 52° 15′ E.); in 1884 an earthquake caused 132 deaths on Qishm Island, which was deserted for a time in consequence; in 1897 another destroyed Qishm town and caused over 1,000 deaths; further shocks were experienced at Qishm and Bandar Abbas in 1902 and 1905.

GEOLOGY

The Persian Gulf and its continuation, the alluvial plain of Mesopotamia, together form a depressed zone lying between the stable tableland of Arabia and the folded ranges of south-western Persia, the so-called Zagros system. It is a shallow sea, nowhere with depths of more than 60 fathoms, and is in no sense a "rift valley" such as the Red sea. The rocks forming its shores are of recent or young Tertiary age and are mostly sandstones, marls, limestones and gypsum. Locally Eocene and Upper Cretaceous limestones are exposed, and the Hormuz series, in part Cambrian, appears associated with intrusive salt bodies. Relics of raised beaches up to 150 ft. above sea-level are locally preserved.

The strike of the folds throughout the length of the Persian coast is parallel to the shore line. A number of anticlinal structures form prominent ranges, such as Kuh-i-Bang, Kuh-i-Mund, Shahin Kuh, etc. The greatest folding movement is of late Pliocene age. The marked swing of the strike between Lingeh, Bandar Abbas and Jashk shows the influence of Oman which projected as a buttress towards the advancing fold waves of the Zagros system. The headland of Oman, the Ruus el Jebel, consists of massive limestones of Permian to Lower Cretaceous age. These were strongly folded in middle Cretaceous time and the complex played a passive part during the later Pliocene folding of Persia. The inlets in the Ruus el Jebel are drowned valleys indicating a relative depression of the land of about 1,500 ft.

The Arabian coast of the Gulf is mostly very flat and featureless. Between Koweit and Qatif it is composed of an extended sheet of horizontal or very gently folded calcareous sandstones and limestones probably of Pliocene to Pleistocene age. Bahrein island and Qatar peninsula are elongated domes exposing Eocene limestones and marls. The water of the copious springs of Bahrein and of the wells of Qatar is artesian.

The numerous islands of the eastern half of the Gulf are formed of intrusive salt plugs. Salt is only exposed in a few islands, Qishm, Henjam, Hormuz, etc., but its presence under the other islands may be assumed. On the Persian mainland there are a great number of these plugs, which in some cases build great salt mountains rising to nearly 4,000 ft. above the surrounding plain, as at Kuh-i-Namak in Dashtistan. The salt masses are 4 to 6 m. in diameter and appear as intrusions.

Economic Geology.—Red oxide of iron is obtained from Hormuz island and smaller deposits are numerous elsewhere. The oxide is a concentrate from haematite-bearing rocks of the Hormuz series.

Copper.—Old copper workings are known in Oman and in Persia, north-east of Minab. The serpentines of the Hormuz series carry locally traces of copper.

Salt occurs in great quantities but it is only quarried for local markets.

Oil seepages or bitumen occur at Qishm, Khamir, Bahrein, etc. A boring by the Anglo-Persian Oil Co. on Qishm island was unsuccessful and has been abandoned.

BIBLIOGRAPHY.—G. E. Pilgrim, "The Geology of the Persian Gulf," *Mem. Geol. Surv. Ind*, vol. 34. pt. 4 (1908); *ibid*, vol. 48 (1924); G. M. Lees, "Physical Geography of S.E. Arabia," *Geogr. Jour.*, vol. 71 (1928); H. de Böckh and others, *Contribution to Discussion on the Tectonics of Asia*, British Association (1928).

Minerals.—Though very careful search has been made for possible oil fields along the Persian littoral by the Anglo-Persian Oil Co., Ltd., and though seepages of oil, gas and asphalt are not uncommon, no potential field has yet been located near the coast. Experimental borings on Qishm failed to give results. Oil and asphalt shows occur likewise at Kuwait and Bahrein, but the prospects of oil being found in those territories in adequate quantities is slender.

Coal is found 30 m. inland from Sur, but apparently in pockets only, while some seams of good coal occur elsewhere in newer strata. Sulphur occurs in fairly pure state at Khamir and Bustaneh on the coast east of Lingeh, and on Qishm island. Copper, as copper glance and malachite, occurs in the interior of Oman, and ancient copper workings are not infrequently met with on the Persian coast. Some thousands of tons of red ochre have

been mined on Hormuz and occasionally on Abu Musa and other islands. Salt from deposits is obtained in abundance on Qishm and Hormuz, and by evaporation near Khor Musa, Fao and elsewhere on both sides of the Gulf. Iron, as haematite and pyrites, is widely found through the Ormuz series of rocks, but not in commercial quantity.

Agriculture and Livestock.—Fertile patches in the immediate vicinity of the Persian Gulf are exceedingly sparse: the only cultivated tracts of considerable extent are at Minab, east of Bandar Abbas; in the valley of the Mund river in Laristan; in the oasis of Hofuf in Hasa, and along the Batina coastal strip of Oman. Date plantations are extensive in the interior of Muscat at Minab, at Lingeh and along the banks of the Shatt-el-Arab. The Muscat date reaches maturity sooner than the Basra crop and forms a valuable article of export, being supplied chiefly to the United States markets. Camels are numerous on the Arabian side of the Gulf, but are much less common on the Persian coast. Horses are scarce in Oman, Bahrein and Al Hasa, but are in more common use in Qatar and Kuwait. Further details regarding agriculture are to found in the articles describing specific districts of the Gulf.

Sailing Craft.—The Persian Gulf is by tradition a home of sailing craft,—for their skill in handling which the Phoenicians afterwards became famous in the Mediterranean, and the Arabs in Indian waters. There are some 14 types of native craft which are more or less peculiar to the Persian Gulf proper. The same principle of construction applies to nearly all, and as a general rule these vessels are remarkable for the beauty of their lines. They sail well and fast and are weatherly craft. The principal boat-building centres are Kuwait, Sur and Lingeh. The craftsmen of the latter place are especially noted for their skill in building and repairing.

Fisheries.—Few seas are more prolific in fish than the Persian Gulf and the Gulf of Oman; most of the known species are edible, and many have a commercial value for the isinglass or oil extracted from them. Fish are extensively used for manure, especially around Muscat, where they are also fed to cattle with satisfactory results. Sharks are caught in enormous numbers with hook and harpoon: the flesh is regarded by some as having aphrodisiacal properties and is freely exported to the interior in sundried strips; while the dried fins and tails are exported to China, and the oil is used for smearing boats. Turtles are numerous, the carapace being exported as tortoiseshell. The narwhal whale is often seen in the Gulf of Oman and sometimes in the Persian Gulf, and porpoises and swordfishes are common.

Pearling Industry.—The temperature and shallowness of the Persian Gulf and its freedom from silt, except at the northwest end, appear to be favourable in a high degree to the growth of the pearl oyster, and the banks which are known and actually worked occupy a considerable area, chiefly upon the Arabian side. The pearling grounds of Bahrein lie in over six fathoms of water, mostly beyond the three-mile limit. The banks of the Persian side are found chiefly along the coast between Lingeh and Tahiri, and again in the neighbourhood of Kharag island. The largest and most important banks on the Arabian side are fished annually, while those of the Persian coast, poor and small, are worked at infrequent intervals. The total value of pearls exported was declared at £220,000 in 1925 and £192,000 in 1926, but the actual value is probably ten times as great, having regard to the large number of persons employed in and mainly dependent on the industry, not only in Bahrein but all along the Arab coast. The exports from Lingeh for the same years were £9,000 and £5,200. Mother-of-pearl was exported, before the World War, to the value of £20,000; after the war high freights and absence of demand from Hamburg, the principal market, killed the trade for the time being. Some 4,500 boats employing about 75,000 persons are engaged in the industry during the season, of three to four months, its length depending ultimately on the temperature of the water from a diving standpoint.

Commerce.—Commerce between East and West had from early times followed the Persian gulf route in preference to that of the Red sea, and when during the 15th Century Genoa and Venice successively lost their control of Oriental commerce, through the capture of Constantinople by the Turks and by the hostility of the Mamelukes of Egypt respectively, the country which most earnestly sought a new way to India was Portugal. Albuquerque in 1507 seized several towns on the coast of Oman, including Muscat, and soon afterwards established his authority on the island of Hormuz. Towards the end of the 16th century the Dutch made their appearance in Indian waters as rivals of the Portuguese, and in 1616 the first English "factory" of the East India Company was established at Jask. In 1622 the Portuguese were expelled from Hormuz by joint efforts of the British by sea and the Persians by land; in 1650 they were driven out of Muscat. In 1664 the French appeared, but did little trade, though in 1698 they took a share in the policing of the Gulf against pirates. The Dutch who had played no part in expelling the Portuguese, now became increasingly predominant, and the wars waged in Europe between England and Holland had their counterpart in the Gulf. In 1674 hostilities between the two countries ceased, but the position was still unsatisfactory in Indian waters owing to the prevalence of piracy, from which other nations as well as England suffered. About 1700 improved affairs in India began to have good effect on the East India Company's commercial position in the Gulf; by 1765 the Dutch trade there had ceased.

Henceforward the bulk of the trade was in British hands, but piracy was rife, the slave trade flourished, and the coast towns had fallen from their ancient prosperity to a low level. To restore and maintain this prosperity has, for a century past, been the mission of Britain in this region, the British Resident in the Gulf acting as the representative of the Government of India, being the arbiter to whom by long custom all parties on the Arab coast have appealed and who has, under treaty, been entrusted with the duty of preserving peace.

The following summary shows the import, export and total values of trade (in thousands of pounds sterling) in the Persian Gulf (excluding Iraq and Basra, *qq.v.*), in 1926 as compared with the pre-war year 1913–14:—

	1926			1913–14		
	Imports	Exports	Total	Imports	Exports	Total
Arabian side						
Muscat	448	226	674	408	272	680
Bahrein (Manama)	1,622	1,155	2,777	1,878	1,740	3,618
Kuwait	448	247	695	371	114	485
Total	2,518	1,628	4,146	2,657	2,126	4,783
Persian side						
Mohammerah	1,078	338	1,416	Not available		
Abadan	1,101	36*	1,137	Not available		
Bushire	2,099	1,899	3,998	826	602	1,428
Lingeh	170	66	236	180	126	306
Bandar Abbas	1,024	338	1,362	459	267	726
Total	5,472	2,677	8,149	..		..
Grand total	7,990	4,305	12,295	..	..	..

*Not including Anglo-Persian Oil Co.'s shipments of petroleum in 1926 = £11,494,000 (£St. = 47,34 krans).

The total tonnage of shipping passing up the Gulf to the various Persian ports amounted to nearly 8 million tons, in 1925–26, including A.P.O.C. shipping. Of this total about 220,000 tons only represented tonnage by local sailing craft. 95% of the shipping was British, the bulk of the remainder being Persian, German and Japanese. Figures for the Arabian side of the Gulf are not available, but Manama is the principal distributing port on that side.

The percentage of the total trade of each port, as shown in the above table, carried by sailing craft, in 1926, was as follows:—Muscat, 20%, Kuwait, 44%, Mohammerah, 38%, Bushire, 2%, Lingeh, 53%, Bandar Abbas, 7%.

The principal local products exported from the various ports of the Gulf in 1926 were as follows (values within brackets in thousands of pounds):—

From Muscat: Dates (138), Dry and Salted fish (60).
From Bahrein (Manama): Pearls (192), Dates (20), Specie (270), Misc. re-exports (600).
From Kuwait: Pearls (11), Dates (10), Hides, skins and wool (6).
From Mohammerah: Dates (114), Raw wool (104), Tobacco (14).
From Abadan: Petroleum (11,574), Fresh and dried fruits (10).
From Bushire: Opium (1,390); Carpets and rugs (160), Fresh and dried fruits (104), Gum (93), Tobacco (45).
From Bandar Abbas: Carpets (113), Dry and fresh fruits (65), Raw Cotton (63).

The peculiar interests of Great Britain, strategic, political and commercial, in the Persian Gulf have never been denied and they are intimately connected with the welfare of India, the security of its communication with the outside world, and its internal tranquillity. The considered policy of the British Government was embodied in 1903 in Lord Lansdowne's declaration in the House of Lords that "we should regard the establishment of a naval base or of a fortified port in the Persian Gulf by any other Power as a very grave menace to British interests, and we should certainly resist it by all the means at our disposal." This declaration was formally reaffirmed in 1907 by Sir E. Grey, in a despatch to the British ambassador at St. Petersburg, which further stated that "H. M. Government will continue to direct all their efforts to the observance of the *status quo* in the Gulf, and the maintenance of British trade; in doing so they have no desire to exclude the legitimate trade of any other Power." These declarations were never openly challenged, and in 1912–14 the British Government entered into far-reaching negotiations with the Turkish and German Governments with the object of regularizing the position in Mesopotamia. The resulting agreements had not, however, been ratified before the declaration of war, but in the result, the *status quo ante bellum* has been uniformly maintained throughout this region, except in Iraq (*q.v.*) and Nejd (*q.v.*).

Banks and Currency.—The Imperial Bank of Persia, in addition to others in Persia, has branches at Abadan, Bushire, Bandar Abbas and Mohammerah. The Eastern Bank has a branch at Bahrein. Persian currency alone is legal in Persia, but the rupee is current in Persian ports. On the Arabian coast the rupee is legal tender, and is almost exclusively used for commercial transactions, but the Maria Theresa dollar circulates freely and is preferred by the inhabitants of the interior.

Lights and Buoys.—In view of the difficulties attending navigation in the Gulf, and the impossibility of arranging with the various governments of the littoral for the provision of lights and buoys, except on terms which would have greatly hampered shipping; in view also of the great preponderance there of British shipping, the British Government has established since 1912 a very complete system of lights and buoys, at various ports and on certain islands. The cost is met (since Oct. 1925) by a levy on all vessels crossing the bar of the Shatt-el-Arab. There is a powerful lighthouse on one of the Quoins off Musandam and another on Tanb island farther west. There is a small shore light at Muscat harbour, but none on Ras el Hadd. Lightships are moored at Qais island and on the Shatt-el-Arab bar, the channel of which is very adequately buoyed and lighted throughout its length to Fao, where there is a fixed light. There is a beacon light at Ras al Arz (Kuwait bay); two lighted buoys at Manama (Bahrein); lighted buoys and a shore light at Bushire; and a shore light at Jask. The dredging of the bar of the Shatt-el-Arab to a maximum depth of 28 ft. along a channel 12 m. in length, was almost complete in 1928, the object being to maintain a good maritime approach to Iraq.

Mail Communications.—The Persian Gulf was at the end of the 18th century the most rapid route between Europe and India, and it was not until 1833 that the Red Sea route was adopted by the East India Company. From this date, until 1862, the Gulf fell into an extraordinary state of inaccessibility—letters from India being sent to Baghdad and Basra via Damascus, and correspondence from Bushire for Baghdad via Tehran. In 1862, the British India Steam Navigation company undertook their first mail contract for the Persian Gulf, and simultaneously the Euphrates-Tigris Steam Navigation company agreed to run a subsidized line of mail steamers from Basra to Baghdad. Since the World War the only steamship line running regular weekly services to the Gulf ports is still the British India Co. via Bombay and Karachi. Their direct mail steamers call only at Bushire and Mohammerah on their way to Basra, but there is a weekly subsidiary mail service which provides a service in each direction for every port in the Persian Gulf at least once a fortnight. The next line of importance is run by Messrs. F. C. Strick and Co. Ltd., who maintain a direct fortnightly service between the United Kingdom and the Persian Gulf (Basra). These steamers call at Bandar Abbas, Bushire and Mohammerah and, occasion requiring, elsewhere.

When merchandise has arrived at any port, the further transport to the hinterland is mostly effected by pack animal, except at Basra which has railway communication into Iraq, and at Bushire where transport by motor lorry is coming into use. Goods for the interior landed at Mohammerah are transhipped into barges which are taken by river steamers to Ahwaz and after further transhipment on to Shushtar.

Posts.—The reopening in 1862 of direct communications between India and the Persian Gulf gave rise to a demand for properly organized post-offices, and the Indian Postal Department accordingly opened branches in 1864 at Muscat and Bushire and later on at every port of importance. The Indian post-offices on Persian territory ceased to function in 1925 but those on the Arabian side are still maintained by the Government of India.

Telegraphs.—The inception of the Persian Gulf telegraphs, which formed the first links in an inter-continental chain, was dictated not by local interests, but by broad considerations of national advantage. The Crimean war brought home to the Porte the slowness of communication between the Persian Gulf and the outlying provinces of the Turkish Empire, while the Indian Mutiny taught the British Government a similar lesson in regard to India. In 1857, after some unfruitful negotiations, the Turkish Government agreed to the construction, on their behalf, of a telegraph line from Scutari to Baghdad; this was finished in 1861, and extended to Fao in 1864 when it was linked up with the cable from Karachi which had been laid meanwhile. The route of the cables has been several times altered. They now run from Karachi to Jask, whence a cable runs to Muscat; from Jask one cable runs to Hanjam, and thence to Bushire (Rishahr); another cable runs direct to Bushire. A double cable connects Bushire with Fao; and Hanjam is connected with Bandar Abbas. Jask is connected by land line to Karachi. Mohammerah is connected by land line with Abadan, and via Ahwaz with Bushire and with the inland Persian system. Kuwait is connected with Basra. The system is under the control of the Indo-European Telegraph Department, whose director-in-chief is responsible to the secretary of state for India. The Department, which also controls the principal international lines in Persia, is amply self-supporting. Bushire, Hanjam, Bahrein, Abadan, Basra and Jask are provided with wireless stations. Bushire and Bandar Abbas have their own telephone systems; and Abadan is connected by telephone with the Anglo-Persian oil fields at Masjid-i-Sulaiman (150 m.).

The Arms Traffic.—During the third Afghan War, the trade in modern arms and ammunition in the Persian Gulf attracted the attention of the British and Indian Governments for the first time. In 1880, the latter took preliminary steps to stop the traffic within its own borders. In 1881 the importation of arms and ammunition into Persia was made illegal, but with little effect. In 1890 the General Act of the Brussels Conference struck a blow at the trade in Africa, and diverted it to the Persian Gulf, which was not subject to the Act. The stream of arms flowing from Zanzibar continued to increase in volume until, in 1892, no less than 11,500 firearms were landed at Muscat, of which more than half were at once re-exported. The number was doubled by 1895 and trebled in 1897, and, in spite of prohibitions, imports into Persia continued on a large scale. Moved at last by the menace of the great quantity of military material that was being disseminated in the Gulf, the British Government urged the Persian Government to enforce the existing law, and to confiscate the large stores of arms which had accumulated at Bushire. Persia took strong action but with only temporary effect. Somewhat similar action was taken at Bahrein.

From 1898 to 1908 the attitude of the British Government

towards the question was one of constant attention without the power to intervene directly or effectively. In 1900, the consignment of arms and ammunition to the Gulf, through Indian ports, with or without transhipment, was made illegal. This was reinforced by Act of Parliament declaring illegal the export of arms to countries or to places where they might be employed against British troops or subjects. The trade, blocked at Persian and all Gulf ports except Muscat, continued, nevertheless, to flourish, in spite of a naval blockade of the Makran coast by the British in 1910–11. At length, in 1912, the sultan of Muscat issued a proclamation requiring all arms imported into his territory to be placed in an "arms warehouse," where they were registered and from which they could not be removed except on production of an import permit from the competent authority at the place of destination. This killed the trade at Muscat. The French Government who first held that the proclamation was inconsistent with the sultan's treaty engagements with them, accepted the accomplished fact after lengthy diplomatic negotiations. The trade was almost dead by 1913, except at the north end of the Gulf where it still persisted on a small scale. The traffic in arms has from first to last been responsible for much unrest among the tribesmen of the Middle East and indeed of Arabia; but for this phenomenon the European Powers, signatories of the Brussels Act of 1892, are largely to blame, from lack of foresight and to some extent of goodwill. The international conference on arms traffic held in 1925 under the auspices of the League of Nations rejected the Persian claim that the Gulf was "private waters" of Persia, declaring it part of the high seas.

Slave Trade.—On board the fleet which, in 1626, conveyed Sir Dodmore Cotton, British ambassador, with his staff from Surat to Bandar Abbas, there were more than 300 slaves bought by Persians in India, and the only remark which this scandalous circumstance suggested to Sir Thomas Herbert, his chronicler, was that "ships, besides the transporting of riches and rarities from place to place, consociate the most remote Regions of the Earth by participation of commodities and other excellencies to each other." In 1772 it was decided by the English courts that a slave as soon as he set foot on the soil of the British Isles became free; the slave trade, however, continued actively until 1807, when an Act was passed to prevent British subjects from dealing in slaves; in 1833 the status of slavery was abolished throughout the British Dominions. In defiance of her commercial interests and of her popularity with the Muslim population of the Gulf, Great Britain set herself the arduous task of suppressing the traffic in slaves, a task which involved great sacrifice of life and money.

The trade in the early days was carried on mainly at Muscat and Sur, notably the latter, a sheltered port conveniently placed for such a purpose, just north-west of Ras el Hadd. The source of supply was Zanzibar to which market the negroes captured in the interior of Eastern Africa were brought for sale. Other places of export were Kilwa and Juba. The destination of the "harvest" cannot be so clearly defined, but we are told that "we find the slave, after his final sale, as a pearl diver in the shallows of the green waters of Oman, as the familiar dependent and domestic of the Arab gentleman, or as the servant of the Persian merchant." In furtherance of her aims, Britain had to treat successively with several separate and largely independent political entities in the Gulf, and this made progress slow. Her first definite efforts were with the sultan of Muscat with whom, as a first step, a treaty was concluded in 1822, which prohibited the sale of slaves to Christian nations by the sultan's subjects, made the purchase of slaves a punishable offence, and empowered Britain to place an agent in the sultan's dominions of Zanzibar to watch the traffic and seize Omani vessels engaged in it. This agreement was amplified by further treaties in 1838–9 and 1845 and, in 1873, by final treaties with Muscat and Zanzibar separately. Treaties of a similar character were also made with the Trucial Chiefs and with the Sheikh of Bahrein. Persia agreed in 1851 to a Convention prohibiting the importation of negroes into Persia by sea, and this was amplified by a further convention in 1882.

The enforcement of the treaties, however, called for constant vigilance and involved the patrolling of the Gulf and Indian waters. Hundreds of slaves were rescued at sea and thousands otherwise released. By 1920 the last remaining traces of the nefarious traffic by sea had virtually disappeared. Domestic slavery, however, as an institution, continues in Muscat and in Central Arabia: it is important to distinguish between this—an institution recognised by Koranic law, which imposes many obligations and restrictions on the owners of slaves—and the commercialized slavery which disgraced Christendom in the 18th and the first half of the 19th Century, and was exposed with such courage and devotion by David Livingstone.

PERSIAN LAMB, the skin of the young of Persian sheep, known generally as *astrachan*, which produces a valuable fur for commercial purposes. *See* FUR.

PERSIAN LANGUAGE: *see* IRANIAN LANGUAGES AND PERSIAN.

PERSIAN LITERATURE. We possess scarcely any documents on the intermediary stages of the Persian language between middle Persian and modern Persian. More than this, the first specimens of modern Persian are in verse; therefore the beginnings of the Persian language, as known to us, practically coincide with those of Persian literature. The origin of Persian poetry is associated with the rule of the Persian dynasties, which sprang up in the east as soon as the grip of the caliphs became less felt in the outlying parts of their empire. The earliest poets (9th and 10th centuries) were mostly natives of such extreme north-eastern provinces as Merv, Bukhara and Samaruand, but we may simply be less informed of the developments in the west. According to Ṭabari, the amīr of Marāgha (in Azerbaijān) Muḥhammad bin Ba'īth (d. A.D. 850) was the author of some poems in Persian.

Earliest Poets.—The earliest name mentioned by the Persian biographers is that of 'Abbās of Marv, who in A.H. 193 = A.D. 800 composed an ode in honour of Hārūn al-Rashīd's son Ma'mūn, noted for his strong pro-Persian feelings. Specimens of it, as quoted in the anthologies, are now regarded as spurious, but a Persian verse by a certain Abū Taqī al-'Abbās bin Ṭarkhān preserved by the Arabic geographer Ibn Khurdādhbih (towards A.D. 846) has a more genuine appearance; this Abū Taqī al-'Abbās may even be the same person as 'Abbas of Marv.

We know little more than the names of the poets who lived under the Tāhirids (A.D. 821–873) and the Ṣaffārids (A.D. 878–900), but the unification of the eastern provinces under the Sāmānids (A.D. 875–999) was marked by the rise of a great many Persian poets. Some of them were patronised by the princes of other contemporary Persian dynasties: the Buwaihids (932–1055), the Ziyārids (A.D. 928–1042, in Tabaristān and Gurgān) and the Farīghūnids (A.D. 980–1010 in the region west of Balkh). Even the surviving fragments of these poems, some of whose authors wrote also in Arabic, permit us to trace the principal literary forms developed later on,—such as the *qasīda*, or panegyric, the *ghazal*, or ode (love-ditty, wine-song or religious hymn), the *rubā'ī* or quatrain (in a special metre unknown to the Arabs), and the *mathnavī*, or double-rhymed poem (used for epic and didactic poetry). Many of these earliest specimens of Persian verse, first discovered in Europe by Dr. H. Ethé, are real gems of spontaneous poetic feeling not yet fettered by the later conventional forms of rhetoric.

The Sāmānid Times.—The Sāmānid Naṣr II. (913–943) particularly patronized arts and sciences. His court-poet was Rūdagī, the first Persian classic. (*See* RŪDAGĪ.) In 963 Bal'amī, vizīr of Manṣūr I. (961–976), abridged and translated from Arabic into Persian the famous *Annals* of Tabari. The same

Manṣūr employed the most learned theologists of Transoxiana for a translation of Tabari's second great work, the *Tafsir*, or commentary on the Koran, and accepted the dedication of the first Persian book on medicine, a pharmacopoeia by the physician Abū Manṣūr Muvaffaq b. 'Alī of Herat (edited by Seligmann, Vienna 1859) which forms a kind of connecting link between Greek and Indian medicine. Perso-Arabian medical science was soon after developed by the great Abū 'Alī b. Sīnā, or Avicenna (d. A.D. 1037), himself a Persian by birth and author of pretty wine-songs, moral maxims and a manual of philosophy, the *Danish-nāma-i 'Alā'ī*, in his native tongue.

Daqīqī and Firdausi.—Manṣūr's son Nūh II. (976–997), commanded from his court-poet Daqīqī a modern Persian version of the "Book of Kings" (in Middle-Persian *Khvātāy-nāmak*). Daqīqī, who openly professed in his ghazals his Zoroastrian sympathies, began the work but died in the prime of life. The great undertaking was carried on by Firdausi who in 1010 added the final touches to this work. (*See* FIRDAUSI.) The *Shāh-nāma* almost immediately found many imitators who chiefly exploited the minor episodes of the Seistān cycle (legends concerning Rustam's family and not belonging to the original *Khvātāy-nāmak*). 'Alī b. Aḥmed al-Asadī (the younger), author of the oldest Persian glossary *Lughat-i Furs* (ed. by Horn, Berlin 1897), completed in 1066, in upwards of 9,000 distichs, the *Garshāsp-nāma* (ed. by Huart, Paris 1927), a story of warlike feats and love adventures of Garshāsp, one of Rustam's ancestors. Other poets followed with their lengthy *Sām-nāma, Johāngīr-nāma, Farāmurz-nāma, Gushāsp-nāma* (story of Rustam's Amazon daughter) etc.

Later Epics.—Later epic poets turned their attention towards more recent historical events and produced rhymed chronicles interspersed with poetical pictures of battles and conquests. The historian Ḥamdullāh Mustaufi wrote a *Ẓafar-nāma* of 75,000 couplets narrating the events from the birth of the Prophet Mohammed down to the year 1331. Other poets sang the deeds of Tīmūr, of the Ṣafavi kings and of the later sovereigns. In India too this kind of poetry was very popular. One of the last productions in this style is the huge *Jārj-nāma, i.e.,* "George-nāma," which in 44,000 distichs gives a poetical history of India from its discovery by the Portuguese till the conquest of Poona by the British in 1817.

Heroic fiction, pure and simple, drew its inspiration from various sources: the apocryphal exploits of Alexander the Great were sung in numerous *Iskandar-nāmas*, of which the earliest and the most original was completed by Niẓāmī (*q.v.*) about 1202; the subjects of other poems were borrowed from the chivalrous times of the Bedouin Arabs; some were devoted to the heroic exploits of the saints of Islam, especially of the Caliph Ali.

Romantic Fiction.—Romantic fiction too was born in the time of Firdausi. Love episodes in the *Shāhnāma*, like that of Zāl and Rūdāba, are characterized by occasional transitions from the epic to the romantic note. Firdausi's second great mathnavi *Yūsuf-u-Zulaikhā* is entirely romantic. It represents the oldest poetical treatment of the Biblico-Moslem story of Joseph, which later on tempted many Persian poets, such as Jāmī. Some tales of the Sasanian times were likewise popular among the poets: the *Vīs-u-Rāmīn*, composed by Fakhr ad-dīn As'ad Jurjānī about 1048, is noteworthy for its resemblance to the legend of Tristan and Iseult. The highest triumph in Persian romantic poetry was scored by Niẓāmī (1141–1203).

Encomiasts.—Panegyrics, which form an important department of Oriental literatures, are less apt to interest an average reader, but Persian *qasīdas* merit the special attention of all Persian students, owing to a wonderful mastery of language and expression displayed by their best-known authors. This sort of literature could thrive only under the benevolent looks of the patrons (*mamdūh*) and it will suffice to enumerate the courts which chiefly attracted and encouraged the poets.

What was commenced by the poets of Sultan Maḥmūd's "Round table," such as 'Unsuri, Farrukhi, Minūchihri (whose *dīvān* has been edited by Kazimirski, 1886) and others, reached its perfection in the celebrated group of court-poets who gathered in Marv around the throne of the Seljuk Sultan Sanjar (1118–1157), viz., the "King of Poets" Amīr Mu'izzī, killed in 1147 by a stray arrow from his master's bow; Adīb Ṣābir, drowned in the Oxus (in 1151) by the order of the Khārizm-shāh Atsiz, whose designs against Sanjar he had discovered, and Auhad ad-dīn Anvari (d. about 1189), perhaps the most celebrated Persian *qasīda*-writer. Among Anvari's poems, the one entitled by the European translators "the Tears of Khorasan" (Browne, II., p. 386) is especially famous; it is a sort of message to Sanjar, then a captive of the Ghuz Turks, describing the sufferings of the people under the invader's yoke.

Of the poets patronized by Sanjar's rival Atsiz the best-known is Rashīd Vaṭvāṭ (the "Swallow," so nicknamed for his small stature), who died in 1182 and left besides a series of *qasīdas*, a valuable treatise on poetry.

Another group of famous *qasīda*-writers is that of Shīrvān (in Transcaucasia) and Azerbaijān. The most serious of Anvari's rivals was Khāqānī (d. 1199), court-poet to the Shīrvān-shāh. Khāqānī was well versed in many of the contemporary sciences and had a profound knowledge of Persian lexicology, which makes it particularly difficult to comment on his *qasīdas*.

Some other notable poets lived under the aegis of the noble Ṣā'idī family whose members held high offices in Isfahan. To this group belonged Sharaf ad-dīn Shafarva (d. 1204) and Jamāl ad-dīn (d. 1192). The latter's son Kamāl ad-dīn Ismā'īl, who enjoyed a still higher reputation, perished at the hands of the Mongols about 1237.

Satirists.—The first example of a bitter personal satire had been given by Firdausi in his famous invective against Sultan Maḥmūd. Anvari's sarcasms were pungent but not so reviling. A curious figure is that of 'Ubaid of Zākān, who lived under the Mongols and died in 1370. Many of his jokes are ribald and untranslatable, but his *Akhlāq al-ashrāf* or "Ethics of Aristocracy" is a clever social satire opposing the "adopted" morale to the old "abrogated" idea of virtue. Satirists of a special kind are Busḥāq of Shiraz (beginning of the 15th century), a sort of comic Brillat-Savarin singing exclusively of food, and his counterpart Maḥmūd Qārī of Yazd, author of sartorial poems.

Didactic and Mystical Poetry.—In didactic and mystical poetry too very high standards were reached in the 11th and 12th centuries. The origin of the former class can again be traced back to the times of Firdausi, as the *Shāh-nāma* abounds in moral reflections and wise maxims. The first Persian who employed poetry exclusively for the illustration of Ṣūfī doctrines (*see* ṢUFIISM) was Firdausi's contemporary, the renowned Shaikh Abū Sa'īd b. Abu'l-Khair of Maihana, of northern Khurasan (967–1049). (*See* Nicholson, *Studies in Islamic mysticism*, 1921.) Abu Sa'īd initiated the form of quatrains (*rubā'ī*) well adapted to a concise expression of religious and philosophic aphorisms. This literary form was further developed by the great free-thinker 'Omar-Khayyām (*q.v.*), who moulded in it his original sceptical and hedonistic ideas. The first Persian handbook of Ṣūfiism was composed by 'Ali b. 'Uthmān al-Jullābī al-Hujvīrī (d. probably after 1072); this *Kashf-al-maḥjūb* or "Revelation of Hidden Things" treats of various schools of Ṣufis, their teachings and observances (ed. by Zhukovsky, Leningrad, 1926; abridged transl by Nicholson, 1911). A great saint of the same period, Shaikh 'Abdullāh Anṣāri of Herat (1006–1089) further encouraged the mystical movement by his *Munājāt* or "Invocations to God," several prose tracts and an important collection of biographies (*Tabaqāt*) of eminent Ṣufis, based on the Arabic *Tabaqāt* by Sulami (d. 1021), and in its turn serving as ground-work for Jāmī's valuable *Nafahāt-al-uns* (completed in 1478, ed. in Calcutta by Nassau-Lees, 1859). One of the earliest ethical *mathnavis*, with a mystical tinge, is the *Hadīqat-ul-haqīqat* or "Garden of Truth" composed in 1130 by Hakim Sanā'ī of Ghazni to whom all the later Ṣufi poets refer as their master. The greatest heights of the pantheistic teaching of "Union with God" were attained about the time of the Mongol invasion. The author of the *Ṣifat al-ādāb* or "Rules of conduct," Najm ad-dīn Kubrā, was slain in 1221 during the sack of Khārizm (Khiva) by the troops of Jenghiz khan. The great Farīd ad-dīn 'Aṭṭār lost his life in his native Nishapur in A.D. 1230 at the age of 114 lunar years. This

ascetic shaikh composed very numerous Ṣufi works, partly in prose, as the *Tadhkirat ul-awliyā* or "Memoirs of the Saints" (ed. by Nicholson 1905–7), but mostly in verse. Among his *mathnavis* (some 20 in number), the best known are the *Pand-nāma* or "Book of Counsel" (published several times) and the *Mantiq uṭ-ṭair* or "Speech of the Birds" (ed. by Garcin de Tassy, Paris, 1857, 1863). In the latter, an allegoric poem, the final absorption of the Ṣufi in the Deity is illustrated by an ingenious parable. The greatest mystical poet of Persia Jalāl ad-dīn Rūmī (1207–1273) is a direct continuator of 'Aṭṭār. (*See* RUMI.)

Sa'di.—In strong contrast to the poetry of these pantheistic teachers are the works of Shaikh Sa'dī of Shiraz (d. 1292, *see* SA'DI). His *Būstān* and especially *Gulistān,* works of unsurpassed mastery, profess less lofty and more practical morals. Both these masterpieces have found comparatively few imitations (Jami's *Bahāristān* or "Spring-garden," Qā'ānī's *Parīshān*, etc.), whereas an innumerable host of purely sūfī compositions followed in the wake of the works of Sanā'ī, 'Aṭṭār and Jalāl ad-dīn Rūmī; *see* the books of reference mentioned at the end of the present article.

Lyric Poetry.—Lyric poetry has ever constituted one of the most conspicuous elements of Persian literature. One of the fullest anthologies, that compiled by 'Ali Quli Vālih in 1749, contains 2,594 biographical notices of Persian poets, mostly lyric. The first landmark on this field is Rūdagī (*q.v.*) who died in A.D. 900. Later Persian poetry, with all its refinement, never regained the natural tone of the Sāmānid poets. (*See* above.) As a peculiar phenomenon may be mentioned the curious figure of the dialect-poet Bābā Tāhir of Hamadan, who was still alive in A.D. 1055. His quatrains composed in a special metre are captivating by their freshness and sincere tone and still enjoy great popularity among all classes. (*See* Heron Allen, *The Lament of Bābā Tāhir,* 1902.)

Hafiz and his Epigons.—Speaking roughly, the second and highest stage in the Persian lyrics, corresponding with the post-Mongol epoch, is marked by Hāfiz (d. 1389). (*See* HAFIZ.) The influence of this *Lisān al-ghaib,* or the "Tongue of the Invisible," has been enormous. Hardly any Persian poet has escaped the spell of his sweet voice veiled by some placid yearning for things unearthly. But this predominant influence has been fatal for the epigons. As time went on, mannerism and tradition more and more asserted their right in Persian poetry.

More or less contemporary with Hafiz was Salmān of Sāva (1300–1378), the panegyrist of the Jalair Uvays, amusing in his irony, graceful and inventive in his conceits. To a still later Timurid epoch belongs the last Persian classic Jāmī, of Jām in Khurasan (1414–1492). Apart from his seven great *mathnavis* and numerous compositions in prose, he is the author of as many as three *dīvāns.* His lyric poems, though mostly in a mystical vein, are written in a clear and direct style devoid of artificial subtleties, but there is no great personal note in them.

Later Persian Poets.—Curiously enough, under the Ṣafavi dynasty, which gave a powerful impulse to such arts as architecture and painting, one finds in Persia proper very few poets of mark. One of the exceptions is the poet-laureate of 'Abbās II., Ṣā'ib of Tabriz (d. 1677), whose ghazals are full of vivid similes and original maxims. In the 18th century, the scarce poetical productions of Hātif of Isfahan (d. about 1784) are pleasant and fresh: in his celebrated *tarjī'-band* (a strophic poem) he ingeniously conveys the idea that a Unique Truth permeates all the Religions. Under the Qajar dynasty (19th century) lived Qā'āni of Shiraz (d. 1853), perhaps the most brilliant and melodious among the poets that Persia has ever produced, though rather indifferent in the choice of his subjects.

Persian Poets in India.—Persian poets who lived in India need special notice. The highest fame was gained by two poets of Delhi: Amīr Ḥasan (d. 1327) and especially Amīr Khusrau (d. 1325), who lived at the court of the Khilji kings. Amīr Khusrau composed no fewer than five *dīvāns* and nine large *mathnavis,* equally remarkable for the rich imagination and the graphic style of their author. Among the poets of the later Moghul times were Faiḍī (d. 1590); 'Urfī (d. 1590); Nau'i (d. 1610), and many others. Most of the Persian poets of the 16th and 17th centuries spent their lives in India. Thanks chiefly to the Emperor Akbar's (1556–1607) enlightened encouragement, many standard works in Sanskrit, such as the *Rāmāyana* and the *Mahābhārata,* the *Bhagavat-Gitā,* the numerous *Purānas* and *Upanishads* were translated into Persian. Indian folk-lore and fables (*Kalīla-va-Dimna, Sindbād-nāma, Ṭuṭi-nāma* or the "Tales of a parrot") have ever been popular in Persia.

History.—Persian prose literature presents manifold interest. The great importance of Persian historical works is now a recognised fact.

Only a passing mention may be made of the Persians who wrote in Arabic, like ad-Dīnāwari (d. A.D. 895), the famous Abū Ja'far Muhammad Tabari (d. A.D. 923), Hamza Isbāhāni (d. about 961), Abu Manṣūr ath-Tha'ālibi of Nishapur (b. A.D. 961), Abu Nasr 'Utbi, the historian of the years A.D. 975–1011, etc. Among the histories written in Persian are Gardizi's *Zayn al-akhbār* (about A.D. 1050), with some important items on the Turks and India (partly ed. Berlin, 1928); *Tarikhi Baihaqi* by Abū'l-Faḍl Muḥammad Bayhaqi (d. A.D. 1077), a vivid picture of the times of the Ghaznavid Mas'ūd; the anonymous *Mujmal attavārikh* (written A.D. 1126) valuable for the early history of Persia and the Turkish tribes; the *Rāhat as-Ṣudūr* by Muḥammad b. 'Ali ar-Rāvandi written about A.D. 1203, a history of the Seljuks (ed. by the *Gibb Memorial*). A particularly brilliant period of Persian historiography is that of the Mongol domination of Persia: 'Aṭā Malik Juwaini's *Jahān-gushā,* completed A.D. 1260 (ed. by the *Gibb Memorial*), is perfect both in style and in the accuracy of the author, who held a high office under the Mongols; Minhāj-i Sirāj Jūzjānī was also a personal witness of the Mongol invasion, and his *Tabaqāt-i Nāṣiri* is especially interesting for the events which occurred in Afghanistan; the *Tārīkh-i Waṣṣaf* completed in A.D. 1312 by 'Abdullāh of Shīrāz continues the authentic record of an important period but its usefulness is somewhat marred by the tedious redundance of its style. The *Jāmi'-ut-tawārīkh* (published in part by Quatremère, Berezin and Blochet) of the famous Rashīd ad-dīn (d. A.D. 1318), is a vast historical encyclopaedia, such as no single people possessed in the Middle Ages. Rashīd ad-dīn utilized the Mongolian archives and in the composition of special chapters was assisted by a Kashmiri hermit, by two learned Chinese and probably by some European monks. Ḥamdullāh Mustaufi's *Tārīkh-i Guzīda* (ed. *Gibb Memorial*), written in 1330, is a useful compendium, containing many valuable details of contemporary events. Among the historians of the Tīmūrid epoch the best known (though largely dependent on their predecessors Niẓām ad-dīn Shāmī and Ḥāfiz-i Abrū) are Sharaf ad-dīn 'Ali Yazdi, author of the *Ẓafar-nāma* or "Book of victories" (A.D. 1424), and 'Abd al-Razzāq Samarqandi (d. A.D. 1482) whose *Matla' as-sa'dain* is very valuable for the history of Timur's successors and contains interesting episodes, like the author's journey to India. A younger contemporary of 'Abd al-Razzāq was the well-known Mīrkhond (*q.v.*). Khondamīr, Mīrkhond's grandson, abridged his grandfather's history and wrote his own *Habīb as-Siyar,* documentary for the time of Ismā'īl I., the founder of the Ṣafavi dynasty. Among the numerous historians of the latter, Iskandar-munshi enjoys a merited fame; his *'Ālamārā* (history of 'Abbās the Great) is full of authentic data on Persia and her neighbours at that memorable time. There exist special histories of Nādir-shāh, Karīm khan Zand and the Qajars. The Bābī movement and the revolution of 1907 have also had their historians, several of whose works have been published by E. G. Browne. Of great value are special local histories of the provinces of Iran (Seistan, Herat, Tabaristan, Gilan, Kurdistan, Fars, Shushtar, etc.). Unique in their importance are numerous histories of India, most of which have been described and partly translated in the eight volumes of Sir H. M. Elliot's *History of India* (1867–1878).

Geography.—Many of the Arabian geographers of the 9th and 10th centuries were Persians but the oldest geography in Persian seems to be the *Hudūd al-'Ālam* (the so-called "ms. Tumansky"), written by an anonymous author of the court of the Farighūnid, Abu'l Hārith of Jurjan (d. soon after A.D. 998). Nāṣir-i

Khusrau left a curious account (Safar-nāma) of his journey (A.D. 1046–1052) from Merv across Persia, Mesopotamia and Palestine to Egypt and back to Balkh. Of special importance is the geography of the Mongol epoch which forms a part of Hamdullah Mustaufi's cosmographic work called *Nuzhat al-Qulūb* (written in A.D. 1430). Towards A.D. 1420 Hāfiz-i Abrū completed for Shāhrokh his rare geography (nameless) in which the description of some Persian provinces is accompanied by an epitome of their history. Many valuable additions to *Nuzhat al-Qulūb* are found in Amīn Aḥmad Rāzī's important geographico-biographical encyclopaedia *Haft Iqlīm* (A.D. 1594). In the year 1831 Zain al-'Ābidīn Shīrvānī wrote the final draft of his geographical dictionary *Bustān as-siyāḥat* which is based on personal observations. Towards the end of the nineteenth century Muḥammad Hasan khan Ṣanī' ad-daula started the publication of a historico-geographical dictionary *Mir'āt al-buldān* (4 volumes); more independent is the same author's *Matla' ash-shams,* describing, with an archaeological commentary, his journey to Khurasan. Not devoid of importance are the diaries of Nāṣir ad-dīn Shah's journeys, written under his name in a clear and simple style.

Theological.—Very numerous are the religious and philosophical works in prose and verse of the celebrated preacher of the Ismā'īlī (Assassin) doctrines, Nāṣir-i Khusrau (b. 1003, d. after 1065), *q.v.* They were imitated by the representatives of numerous other Persian sects (Ḥurūfi, Ahl-i Haqq, Bābī, etc.). In 1092 Abu'l-Ma'ālī Muḥammad composed the *Bayān al-adyān* in which are explained the tenets of different religions and sects. To the end of the seventeenth century belongs a similar *Dabistān al-madhāhib* (transl. by Shea and Troyer) written in India by Shaikh Muhsin Fānī whose identity is still dubious.

The names of numerous works on theology, astronomy, politics, mathematics, ethics, medicine, lexicography, etc., will be found in the standard catalogues of the great European and Asiatic libraries.

The Drama.—Persian drama is still at the spontaneous and popular stage of semi-religious performances during the month of Muḥarram, in the style of the mediaeval "mysteries," or the present-day Oberammergau Passion-plays. These *ta'ziya* (*see* DRAMA: *Persian*) originated in the public lamentations in memory of the tragic fate of the house of the Caliph 'Alī, such as were introduced in Baghdad as early as A.D. 963 by the Buwaihid Mu'izz ad-Daula. The librettos of the *ta'ziyas* belong to little known playwrights. Since the reign of Nāsir ad-dīn Shah a few plays, mostly comedies, have been translated and written in Persian. Quite popular farces are the so-called *shab-bāzī* or "night plays." The marionette-theatre is also known in Persia under the name of *Kachal-Pahlavān* or "The Bald Hero."

The Persian Press.—A very important rôle in the Persian literary movement has been played by the press. The first Persian paper in Tehran appeared in the reign of Fatḥ 'Ali Shāh. Some organs founded abroad enjoyed real political influence, such as: the *Akhtar* or the "Star," Constantinople 1875–1895; the *Qānūn* or the "Law," started in London in 1890 by a former Persian Minister at the court of St. James, Malcom-khan, who advocated for Persia a constitutional form of government; the *Habl al-Matīn,* which has been published in Calcutta since 1893; and the *Kāva* (in its first phase, 1916–1920) published in Berlin by the deputy of the first Majlis Taqizada. Great impetus was given to the Persian press by the revolution of 1905–08. Speaking from a merely literary point of view, the press has rendered the language more pliant, simple and popular. Daily papers have revealed such talents as 'Alī Akbar Dakhau, good poet and excellent publicist imitating in his satirical feuilletons the humorous bazar-speech; the poet Malik ash-shu 'arā Bahār, and several others. To the class of magazines belong the *Kāva* in its last phase (Berlin 1920–21); the *Irānshahr,* Berlin 1922–25, whose editor was Kāẓim-zāda, and three periodicals published in Tehran after 1918: the *Dānish-kada* or the "Temple of Knowledge" (ed. Malik ash-shu 'arā), the *Armaghān* or the "Gift," the *Āyanda* or the "Future." These last have been the centres round which gathered the young Persian poets and writers, nationalists yet admirers of European culture.

Latest Persian Literature.—The possibility of seeing their work printed without the intervention of a rich patron has been a great encouragement to the Persian authors of recent times. Among the poets of the older generation are: Adīb-i Pīshāvarī (b. 1844), a learned author, who during the war indulged in the composition of a *Qaisar-nāma,* meaning the "Book of the Kaiser," written in the style of Firdausi; Adīb al-Mamālik (d. 1917), a poet of civic tendencies; Īraj-mīrzā (d. 1926), a man of remarkable feeling and talent, who is also known as a champion of the Persian woman's emancipation. To a younger generation belong Malik ash-shu 'arā, already mentioned, and some others whose lyres are tuned on a vast scale, from the romantic admiration of the great past (Pur-i Davud) to the modern revolutionary war-cries (Lāhūtī).

Promising attempts have been made to create the national novel. In 1922 Jamāl-zāda published in Berlin a remarkable volume of realistic tales *Yakī būd, yakī nabūd,* or "Some of it was, some of it was not"; other authors are transplanting on Persian soil the European *genres* of sentimental and didactic novel, as well as of "roman de boulevard."

Several able works have been written by the young Persian economists, literary critics and historians. A very conspicuous figure is that of Muḥammad khan Qazvīni (b. 1877, resident in Europe since 1904), the learned editor of Juvaini's history and of other important works on history and philology.

BIBLIOGRAPHY.—A scientific and systematic study of Persian literature in its general lines was made by Dr. H. Ethé, whose *Neu-persische Literatur* published in Geiger und Kuhn's *Grundriss der Iranischen Philologie* (Strassburg, 1906), II., p. 212–368, enumerates and resumes all the previous works of the same author and gives a complete bibliography of the subject. Of capital importance are also E. G. Browne's *A Literary History of Persia from the Earliest Times until Firdawsi,* first ed. I. (1902); idem, *A Lit. Hist. of Persia from Firdawsi to Sa'di,* first ed. (1906); idem, *A History of Persian Literature under Tartar Dominion* (A.D., 1265–1502) (1920); idem, *A Hist. of Pers. Lit. in modern times* (A.D., 1500–1924) (1924). *See* also J. Darmesteter, *Les origines de la poésie persane* (1887); P. Horn, *Geschichte d. persischen Literatur* (Leipzig, 1901); I. Pizzi, *Litteratura persiana* (Milan, 1887) (208 pages), *Storia della poesia persiana* (Turin, 1894), 2 vol. (350+425 pages) with numerous translations; Krymski, *Istoriya Persii, yeya literatury i dervisheskoi theosofii,* 3 vols., single parts several times re-edited (Moscow, 1906–1917) (detailed bibliography); A. V. W. Jackson, *Early Persian Poetry* (1920); Shibli Nu 'mānī, *Sh'r al-'Ajam,* 5 vols. (Lahore, 1907–1924) (in Urdu) contains an important account of the whole Persian poetry; C. A. Storey, *Persian Literature, a bibliographical survey* (1927) (Section I. Qur'anic literature); *The Encyclopedia of Islam* (published at Leyden from 1908) has special articles on the principal Persian writers. For the recent developments *see* E. G. Browne, *The Press and Poets in Modern Persia* (1914), and K. Chaykin, *A short sketch of the most recent Persian Literature* (in Russian) (Moscow, 1928). As only a few manuscript copies exist even of very important works in Persian, of extreme importance are the detailed descriptions of single collections of mss. A list of such catalogues will be found in C. A. Storey's book (*see* above); the most valuable among them is the *Catalogue of the Persian manuscripts in the British Museum* by Rieu (4 vols., 1879, 1881, 1883, 1895); *see* also *A catalogue of the Persian printed books in the British Museum,* by E. Edwards (1922), where most of the Oriental editions are mentioned. For European critical editions and translations of Persian poets *see* the works of Ethé and Browne.

Many important prose works have appeared in the "E. J. W. Gibb Memorial" series (histories and geographies of Ibn-Balkhi, Ibn Isfandiyār, Rāvandi, Niẓāmī-i 'Arūḍi, Juvaini, Rashīd ad-dīn, Hamdullāh Mustaufi, etc.); in the *Persian Historical Texts,* Leyden: 'Aufi, 'Aṭṭār, Daulat-shāh; in the *Recueil de textes relatifs à l'histoire des Seldjoucides,* Leyden; in the *Publications de l'Ecole Nationale des Langues Orientales,* Paris, and in single publications of the Russian Academy (histories of the Caspian provinces, of the Kurdish dynasties); etc. For Persian Languages *see* IRANIAN LANGUAGES AND PERSIAN. (V. F. M.)

PERSIGNY, JEAN GILBERT VICTOR FIALIN, DUC DE (1808–1872), French statesman, was born at Saint-German Lespinasse (Loire) on Jan. 11, 1808, the son of a receiver of taxes. A strong Bonapartist, he planned the attempt on Strasbourg in 1836 and that on Boulogne in 1840; he took a prominent part in securing the election of Louis Napoleon to the presidency.

Persigny plotted the restoration of the empire, and was a devoted servant of Napoleon III. He succeeded Morny as minister of the interior in January 1852, and later became senator. He resigned office in 1854, being appointed next year to the London

embassy, which he occupied with a short interval (1858–1859) until 1860, when he resumed the portfolio of the interior. The growing influence of Rouher provoked his resignation in 1863, when he received the title of duke. A more dangerous enemy than Rouher was the empress Eugénie, whose marriage he had opposed and whose presence in the council chamber he deprecated in a memorandum which fell into the empress's hands. He sought in vain to see Napoleon before he started to take over the command in 1870, and the breach was further widened when master and servant were in exile. Persigny returned to France in 1871, and died at Nice on Jan. 11, 1872.

See *Mémoires du duc de Persigny* (2nd ed., 1896), edited by H. de Laire d'Espagny, his former secretary; an eulogistic life, *Le Duc de Persigny* (1865), by Delaroa; and Emile Ollivier's *Empire libéral* (1895, etc.).

PERSIMMON, the name given in the United States to the fruit of *Diospyros virginiana.* The tree which bears it belongs to the ebony family, Ebenaceae, and is usually from 30 to 50 ft. in height, with large oval entire leaves and greenish unisexual flowers. The fruit-stalk is very short, bearing a subglobose fruit 1 in. to 2 in. in diameter, of an orange-yellow colour, and with a sweetish astringent pulp and oblong, flattened seeds. The fruit is extensively eaten in the Southern States where several varieties are cultivated. The wood is heavy, strong and very close-grained and used in turnery. The tree is very common in the South Atlantic and Gulf States, and attains its largest size in the basin of the Mississippi. It was brought to England before 1629 and is cultivated, but rarely if ever ripens its fruit. The Chinese and Japanese cultivate another species, *D. Kaki*, which is now grown commercially in southern California. The fruits are larger than those of the native American kind, but have similar qualities; they are used as a sweetmeat when dried. *D. Lotus* is the date-plum.

PERSIS (mod. Fars, *q.v.*), the south-western part of Iran (Persia), named from the inhabitants, the Iranian people of the Pārsa (Fars); their name was pronounced by the Ionians *Persai*, with change from *a* to *e*, and this form has become dominant in Greek and in the modern European languages. The natural features of Persis are described very exactly by Nearchus, the admiral of Alexander the Great (preserved by Arrian *Indic.* 40 and Strabo xv. 727). The country is divided into three parts, of very different character and climate: the coast is sandy and very hot, without much vegetation except date palms; it has no good harbours, and the climate is very unwholesome; the population is scanty. About 50m. from the coast rise the chains of the mountains, through which some steep passes lead into the interior valleys (called κοιλὴ Πέρσις, Strabo xv. 729), which lie about 5,000ft. above the sea. Here the climate is temperate, the country watered by many rivers and lakes, the soil fertile, the vegetation rich, the cattle numerous. These regions, which were thickly populated, form the real Persis of history. "This land Persis," says Darius, in an inscription at Persepolis, "which Ahuramazda has given to me, which is beautiful and rich in horses and men, according to the will of Ahuramazda and myself it trembles before no enemy." The third part is the north, which belongs to the central plateau, still much higher, and therefore rough and very cold in the winter. Towards the north-west it borders on the Median district of Paraetecene (about Isfahan); towards the north and north-east it soon passes into the great desert, of which only the oasis of Yezd (*Isatichai* in Ptolem. vi. 4, 2) is inhabitable. In the east, Persis proper is separated by a desert (Laristan) from the fertile province of Carmania (Kerman), a mountainous region inhabited by a Persian tribe. To Carmania belonged also the coast, with the islands and harbours of Hormuz and Bander Abbasi. In the west Persis borders on the mountains and plains of Elam or Susiana. For the ancient topography *cf.* Tomaschek, "Beiträge zur historischen Topographie von Persien," in *Sitzungsber. der Wiener Akademie, phil. Cl.* cii. cviii. cxxi.

The Persians are not mentioned in history before the time of Cyrus; the attempt to identify them with the Parsua, a district in the Zagros chains south of Lake Urmia, often mentioned by the Assyrians, is not tenable. Herodotus i. 125, gives a list of Persian tribes: the Pasargadae (at Murghab), Maraphii, Maspii, Panthialaei (in western Carmania), Derusiaei, Germanii (*i.e.* the Carmanians) are husbandmen, the Dahae (*i.e.* the "enemies," a general name of the rapacious nomads, used also for the Turanian tribes), Mardi, Dropici, Sagartii (called by Darius *Asagarta,* in the central desert; *cf.* Herod. vii. 85) are nomads. The kings of the Pasargadae, from the clan of the Achaemenidae, had become kings of the. Elamitic district Anshan (probably in 596, *cf.* CYRUS). When, in 553, Cyrus, king of Anshan, rebelled against Astyages, the Maraphians and Maspians joined with the Pasargadae; after his victory over Astyages all the Persian tribes acknowledged him, and he took the title of "king of Persia." But from then only the inhabitants of Persia proper were considered as the rulers of the empire, and remained therefore in the organization of Darius free from taxes (Herod. iii. 97). Carmania, with the Sagartians, the Utians (called by Darius *Yautiya*), and other tribes, formed a satrapy and paid tribute (Herod. iii. 93); the later authors therefore always distinguished between Carmania and Persis. Names of other Persian tribes, partly of very doubtful authority, are given by Strabo xv. 727,[1] and Ptolem. vi. 4 and 8.

The Persians of Cyrus (*see* PERSIA: *Ancient History*) were a vigorous race of husbandmen, living in a healthy climate, accustomed to hardship, brave and upright; many stories in Herodotus (especially ix. 122) point the contrast between their simple life and the effeminate nations of the civilized countries of Asia. They were firmly attached to the pure creed of Zoroaster (*cf.* Herod. i. 131 sqq. and the inscriptions of Darius).

When Darius had killed the usurper Smerdis and gained the crown, a new usurper, Vahyazdata, who likewise pretended to be Smerdis, the son of Cyrus, rose in *Yautiya,* but was defeated in two battles by Darius's generals and put to death (Behistun inscription). Cyrus had built his capital with his palace and tomb, in Pasargadae (*q.v.*). Darius founded a new city about 30m. farther south on the left bank of the Pulwar, near its confluence with the Kur, with a large terrace, on which his magnificent palace and that of his son Xerxes were built. As Pasargadae was named after the tribe in whose district it lay, so the new capital is by the Persians and Greeks simply called "the Persians"; later authors call it Persepolis (*q.v.*), "the Persian city."

Both in Persepolis and Pasargadae large masses of gold and silver from the tribute of the subject nations were treasured, as in Susa and Ecbatana. But Persis lies too far off from the centre of the Asiatic world to be the seat of government. Like Arabia and similar countries, it could exercise a great momentary influence in history and produce a sudden change throughout the world; but afterwards it would sink into local insignificance. So the Persian kings fixed their residence at Susa, which is always considered as the capital of the empire (therefore Aeschylus wrongly considers it as a Persian town and places the tomb of Darius here). After the reign of Xerxes, Persis and Persepolis became utterly neglected in spite of occasional visits, and even the palaces of Persepolis remained in part unfinished. But the national feeling of the Persians remained strong. When Alexander had won the victory of Arbela, and occupied Babylon and Susa, he met (in the spring of 330) with strong resistance in Persia, where the satrap Ariobarzanes tried to stop his progress at the "Persian gates," the pass leading up to Persepolis. Here Alexander set fire to the cedar roof of the palace of Xerxes as a symbol that the Greek war of revenge against the Persians had come to an end. Our best information tells us that he soon had the fire extinguished (Plut. *Alex.* 38); the story of Thais is a pure fiction, and we may well believe that he repented the damage he had done (Arrian. vi. 30, 1).

Alexander had planned to amalgamate the former rulers of the world with his Macedonians; but his death was followed by a Macedonian reaction. Peucestas, the new satrap of Persis, followed the example of Alexander, and thus gained a strong hold on his subjects (Diod. xix. 48); nor did Seleucus, to whom the

[1]To the Pateiskhoreis belongs the lance-bearer of Darius, "Gobryas (Gaubaruva) the Pātishuvari," mentioned in his tomb-inscription; they occur also in an inscription of Esarhaddon as Patushara, eastwards of Media, in Choarene at the Caspian gates; the Kyrtii are the Kurds.

dominion of the east ultimately passed (from 311 onwards), disdain the aid of the Persians; he is the only one among the Diadochi who retained his Persian wife, Apame, daughter of Spitamenes. Seleucus and his son Antiochus I. Soter tried to introduce Hellenism into Persis. Of Greek towns which they founded here we know Alexandria in Carmania (Plin. vi. 107; Ptol. vi. 8, 14; Ammian. Marc. 23, 6, 49), Laodiceia in the east of Persis (Plin. 6, 115), Stasis, "a Persian town on a great rock, which Antiochus, the son of Seleucus, possessed" (Steph. Byz. *s.v.*), Antiochia in Persis, founded apparently by Seleucus I. and peopled by Antiochus I. with immigrants called together from all Greece, as we learn from a *psephisma* passed by "boule and demos" of this town in 206 in honour of Magnesia on the Maeander. But at the same time we find in the centre of Persis in the district of Istakhr (the town which succeeded Persepolis) a local dynasty with Persian names (Bagdat, Vahuburz, Astakhshatr, Vatafradat), and the still unexplained title Fratadara. On their coins in Aramaean Pehlevi which begin about 250 B.C., they have Persian features and wear the headdress of the satraps; on the reverse is the fire-altar with the image of Ahuramazda hovering above it and the standard of the empire. They must have been recognized as vassals by the Seleucids; but a story preserved by Polyaenus (vii. 30) narrates, how one of them, Oborzos (Vahuburz), allured 3,000 settlers (evidently Greek settlers) into a fertile plain and annihilated them at night. Another story (Polyaenus vii. 39) relates, how in the same way a general of Seleucus (evidently Seleucus II. 247–225), destroyed 3,000 Persian rebels with his Macedonian and Thracian troops. Thus the Seleucid supremacy was restored, but the dynasty of the Fratadaras was suffered to continue. When in 221 Molon, the satrap of Media, rebelled against Antiochus III., his brother Alexander, satrap of Persis, joined him, but they were defeated and killed by the king. Persis remained a part of the Seleucid empire down to Antiochus IV. Epiphanes, who at the end of his reign restored once more the authority of the empire in Babylonia, Susiana and Persis; perhaps a battle, in which the satrap Numenius of Mesene (southern Babylonia) defeated the Persians on the shore of Carmania on sea and land (Plin. vi. 152), belongs to this time. But after the death of Antiochus IV. (164) the Seleucid empire began to dissolve. While the central provinces, Media and northern Babylonia, were conquered by the Parthians, Mesene, Elymais and Persis made themselves independent.

Persis never became a part of the empire of the Arsacids, although her kings recognized their supremacy when they were strong (Strabo xv. 728, 736). From the periplus of the Erythraean sea 33–37 we learn that their authority extended over the shores of Carmania and the opposite coasts of Arabia. On their coins they now wear Parthian dress and have the title of King (written *malkâ,* pronounced *shâh*). Among their names we find Darayav (Darius), probably the founder of a town, Darabjird, in eastern Persia, his son Artaxerxes (according to a fragment of Isidore of Charax in Lucian, *Macrob. 15,* murdered by his brother Yosithros at the age of 93 years), Narses, Manocihr and others. From the traditions about Ardashir I. we know that at his time there were different petty kingdoms and usurpers in Persis; the principal dynasty is by Tabari called Bāzrangi. The coins demonstrate that Hellenism had become quite extinct in Persis, while the old historical and mythical traditions and the Zoroastrian religion were supreme. There can be no doubt that at this time the true form of Zoroastrianism and the sacred writings were preserved only in Persis, whereas everywhere else (in Parthia, in the Indo-Scythian kingdoms of the east and in the great propagandist movement in Armenia, Syria and Asia Minor, where it developed into Mithraism) it degenerated and was mixed with other cults and ideas. So the revival of Zoroastrianism came from Persis. When Ardashir I. the son of a king of Istakhr began to subdue the other Persian dynasts and in A.D. 224 defeated and slew the Parthian king, Artabanus, his aim was religious as well as political. The new Sassanid empire which he founded enforced the restored religion of Zoroaster (Zarathustra) on the whole of Iran.

The new capital of Persis was Istakhr on the Pulwar, about 9m. above Persepolis, now Hajjiabād, where already the predecessors of Ardashir I. have resided. It was a great city under the Sassanids, of which some ruins are extant. But it shared the fate of its predecessor; when the empire was founded the Sassanids could no longer remain in Persis but transferred their headquarters to Ctesiphon. (ED. M.)

PERSIUS, in full AULUS PERSIUS FLACCUS (A.D. 34–62), Roman poet and satirist. According to the *Life* contained in the mss., Persius was a native of Volaterrae, of good stock on both parents' side. When six years old he lost his father, and his stepfather died in a few years. At the age of 12 Persius came to Rome, where he was taught by Remmius Palaemon and the rhetor Verginius Flavus. Four years later began a close intimacy with the Stoic Cornutus. In this philosopher's pupil Lucan, Persius found a generous admirer of all he wrote. Still in early youth he became the friend of the lyric poet Caesius Bassus, whilst with Thrasea Paetus (whose wife Arria was a relative) he had a close friendship of ten years' duration and shared some travels. Seneca he met later, and was not attracted by his genius. The perusal of Lucilius revealed to Persius his vocation, and he set to work upon a book of satires. But he wrote seldom and slowly; a premature death (*vitio stomachi*) prevented the completion of his task. He is described as possessed of a gentle disposition and girlish modesty and personal beauty. To his mother and sister he left a considerable fortune. Cornutus suppressed all his work except the book of satires in which he made some slight alterations and then handed it over to Bassus for editing. It proved an immediate success.

The scholia add a few details—on what authority is, as generally with such sources, very doubtful. The *Life* itself, though not free from the suspicion of interpolation and undoubtedly corrupt and disordered in places, is probably trustworthy. The mss. say it came from the commentary of Valerius Probus, a contemporary scholar. The mere fact that the *Life* and the *Satires* agree so closely does not of course prove the authenticity of the former. One of the points of harmony is, however, too subtle for us to believe that a forger evolved it from the works of Persius. It requires indeed a thoughtful reading of the *Life* before we realize how distinct is the impression it gives of a "bookish" youth, who has never strayed far, at least in spirit, from the domestic hearth and his women-folk. And of course this is notoriously the picture drawn by the *Satires.* So much better does Persius know his books than the world that he draws the names of his characters' from Horace.

The chief interest of Persius's work lies in its relation to Roman satire, in its interpretation of Roman Stoicism, and in its use of the Roman tongue. The influence of Horace on Persius can, in spite of the silence of the *Life,* hardly have been less than that of Lucilius. Not only characters, as noted above, but whole phrases, thoughts and situations come direct from him. The resemblance only emphasizes the difference between the caricaturist of Stoicism and its preacher. Persius strikes the highest note that Roman satire reached; in earnestness and moral purpose rising far superior to the political rancour or good natured persiflage of his predecessors and the rhetorical indignation of Juvenal, he seems a forerunner of the great Christian Apologists. Like Seneca, Persius censures the style of the day, and imitates it. Indeed in some of its worst failings, straining of expression, excess of detail, exaggeration, he outbids Seneca, whilst the obscurity, which makes his little book of not 700 lines so difficult to read and is in no way due to great depth of thought, compares very ill with the terse clearness of the *Epistolae morales.*

Persius's satires are composed in hexameters, except for the scazons of the short prologue above referred to, in which he half ironically asserts that he writes to earn his bread, not because he is inspired. The first satire censures the literary tastes of the day as a reflection of the decadence of the national morals. The theme of Seneca's 114th letter is similar. The description of the *recitator* and the literary twaddlers after dinner is vividly natural, but an interesting passage which cites specimens of smooth versification and the languishing style is greatly spoiled by the difficulty of appreciating the points involved and indeed of distributing the dialogue (a not uncommon crux in Persius). The remaining satires

handle in order (2) the question as to what we may justly ask of the gods (*cf.* Plato's second *Alcibiades*), (3) the importance of having a definite aim in life, (4) the necessity of self-knowledge for public men (*cf.* Plato's first *Alcibiades*), (5) the Stoic doctrine of liberty (introduced by generous allusions to Cornutus' teaching), and (6) the proper use of money. The *Life* tells us that the *Satires* were not left complete; some lines were taken (presumably by Cornutus or Bassus) from the end of the work so that it might be *quasi finitus.* This perhaps means that a sentence in which Persius had left a line imperfect, or a paragraph which he had not completed, had to be omitted. The same authority says that Cornutus definitely blacked out an offensive allusion to the emperor's literary taste, and that we owe to him the reading of the mss. in *Sat.* i. 121,—"auriculas asini *quis non* [for *Mida rex*] habet!" Traces of lack of revision are, however, still visible.

AUTHORITIES.—The mss. of Persius fall into two groups, the one represented by two of the best of them, the other by that of Pithoeus, so important for the text of Juvenal. Since the publication of J. Bieger's *de Persii cod. pith. recte aestimando* (Berlin, 1890) the tendency has been to prefer the tradition of the latter.

The important editions are: (1) with explanatory notes: Casaubon (Paris, 1605, enlarged edition by Dübner, Leipzig, 1833); O. Jahn (with the scholia and valuable prolegomena, Leipzig, 1843); Conington (with translation; 3rd ed., Oxford, 1893); B. L. Gildersleeve (New York, 1875); G. Némethy (Buda-Pesth, 1903); (2) with critical notes: Jahn-Bücheler (3rd ed., Berlin, 1893); S. G. Owen (with Juvenal, Oxford, 1902). Translations into English by Dryden (1693); Conington (*loc. cit.*); Hemphill (Dublin, 1901); Ramsay (Loeb, 1918), etc., in Martha, *Les Moralistes sous l'empire romain* (5th ed., Paris, 1886); Nisard, *Poètes latins de la décadence* (Paris, 1834); Hirzel, *Der Dialog* (Leipzig, 1895); Saintsbury, *History of Criticism*, i. 248; Henderson, *Life and Principate of the Emperor Nero* (London, 1903); and the histories of Roman literature (especially Schanz, §§ 382 *sqq.*). *A Bibliography of Persius*, by M. H. Morgan (Cambridge, U.S.A., 1893); Villeneuve, *Essai sur Perse* (Paris, 1918).

PERSON, OFFENCES AGAINST THE. This expression is used in English law to classify crimes involving some form of assault or personal violence or physical injury, *i.e.*, offences affecting the life, liberty or safety of an individual: but it is also extended to certain offences which cannot technically be described as assaults, such as criminal libel. The bulk of the offences thus classified, so far as their definition or punishment depends upon statute law, are included in the Offences Against the Person Act 1861, in the Criminal Law Amendment Acts, and in the Children Act 1908. The classification in these statutes is not scientific. The particular offences dealt with by the acts above named are discussed under their appropriate titles, *e.g.*, abortion, assault, bigamy, homicide, rape, etc. In the Indian penal code most of the offences above referred to fall under the head "offences against the human body." In his *Digest of the Criminal Law* Sir James Stephen includes most of these offences under the title "offences against the person, the conjugal and parental rights and the reputation of individuals."

United States.—In the United States, such crimes as fall under the classification of offences against the person in England, are crimes by common law or statutes in the different States, but sometimes without any such general classification in the statutes.

PERSONAL ACCIDENT INSURANCE: *see* ACCIDENT INSURANCE, PERSONAL.

PERSONALITY. What is new in the philosophical treatment of Personality is the recognition of its supreme place in the interpretation of value. To meet the modern form of the ancient subjective explanations of "good" ("Man is the measure of all things," including good and evil), or the modern theory that the only account to be given of good or value, is that it is what is desired, a new form of idealism arises; viz., personal idealism. If "There's nothing either good or bad but thinking makes it so," what is the nerve or soul of the thinking which penetrates into the essence of life, giving it a character of value or disvalue? The philosophy of personality conceives value as correlative to person, person being something unique in every human being, which he brings with him to experience, and which urges him in all activities to seek value.

In earlier modern discussions, the question of *knowledge* was chiefly investigated. MacTaggart for instance, in his article in *Encyclopaedia of Religion and Ethics,* examines the problem whether the self, which he regards as equivalent to Personality, can be known as an object. He concludes that the self can perceive itself as an object of awareness. He holds also that self-consciousness is not essential to selfhood. With this James Ward (*Realm of Ends*) would clearly agree. For his Pan-psychism or doctrine that the nature of things consists, as in Leibniz's *Monadism,* of psychical units, rather mental than physical in kind, supposes even the unconscious monads, or psychic atoms of nature to be "conative, that is feeling and striving subjects, or persons, in the widest sense." This wide use of the term person is inadmissible, since it is required for a principle which is indispensable for the understanding of human experience in its most individual character. Ward admits the difficulty of conceiving a psychic being without memory. And without a realization of the part played by memory, actively bringing to the events of life the results of all experience of value, it seems impossible to understand the essence of personality, in its incommunicable character. Here Leibniz's theory that the world for each individual is "perspective" or known only from his unique point of view, in its further elaboration by modern thinkers, falls in with the new insight in regard to the creation by the individual mind of all the meaning through which his world is real for him. In Prof. Wildon Carr's *Theory of Monads* the perspective view of knowledge is carried farthest, and the monad appears to do almost all the work of creating its own world.

Some thinkers explain the significance of personality, by giving it the highest place in a philosophy of "emergence," according to which there is a hierarchy of orders, or stages of evolution in the universe, gradually following upon one another. Thus Gen. Smuts (*Holism and Evolution*) conceives Personality as the culmination of a series, and, whilst holding with Bergson that all evolution is "creative," finds in the personality of every human being a "unique creative novelty." Dr. William Brown's view (*Mind and Personality*) that consciousness is creative is based on psychology, especially psycho-analysis, whilst his philosophical standpoint is in harmony with this result. "So far as the mind is a conscious mind," it is always producing something new. The individual has produced in himself a "final differentiation," and "superimposed it on all he has inherited." Such an interpretation seems confirmed, when we turn from the subtle and microscopic analyses of the individual consciousness, and sub-consciousness in which lies the genius of modern psychology, to the large-scale impressions of human nature presented in biography, history and literature. Thucydides' dictum that human nature will remain the same, gives one side of the truth, but the original individuality of each person's struggle to realize his own idea of good, even though it may take a poor form, is the more impressive side. This becomes more intelligible if we conceive the distinctive character of personal mind, as that which cannot survive, but will disappear in sinking to a lower level, unless it finds some minimum of worth in its experience. The conception that value is correlative to personality is presented impressively by Dr Max Scheler ("Formalismus"—"Formalism in Ethics, and a Material Ethic of Value"). Personality he conceives as a new type of being, emerging in humanity, at some stage of its development, together with a new type of values and acts. The philosophy of "Personalism" in its American form emphasizes the creativity of the person in the spheres of knowledge and of value. Borden P. Bowne (*"Personalism, Common-Sense and Philosophy"*) insists on the necessity for the understanding of knowledge, of recognizing that "we are in a personal world from the start."

The greatest problem which arises for this type of philosophy, is whether that principle which is found to be essential to the interpretation not of knowledge alone, but of human activity in all its reality and meaning, can be attributed to the whole of things. Is the Universe personal? That it is, is the conviction of Professor Clement Webb, who argues (*God and Personality*) that "The thought of the Universe as a whole," primarily presents itself as a religious thought, and for the religious emotion, our relation to the universe must be conceived as "essentially of the same nature as our relation to a person" Similarly Bowne (*Theism*)

in view of the fact of the incompleteness of personality in our experiences, finds it necessary to posit a complete personality, which he identifies with the Infinite. And Professor Flewellyn (*Creative Personality*) assumes that the source of personality must be the "Absolute Personality" which is the Whole. MacTaggart's arguments, in the article cited above seem conclusive against the logical validity of this conception. It may be added that the notion that the Whole, within which all spiritual life falls, can be personal, is inconsistent with the idea of personality in the deepest sense. For this involves distinction and relations between persons, possessing each at least some degree of an independent quality to constitute him a term or subject of a spiritual relation. The mystical loss of personality in communion with the Supreme Being implies a distinct personality to be lost and to be found again. Neither the part nor the whole is personal where all is One. This is understood by the Neo-Hegelians, who consistently recognize that in holding nothing to be in the end real, except the Whole, they must give up personality. With other values it suffers a change or is "transcended" in the Absolute. This view, of which Bernard Bosanquet and F. H. Bradley were the most distinguished English exponents, would render unintelligible the profoundest experiences of personality, feeling itself to be in contact with reality. That this feeling corresponds with truth, is a conviction which seems confirmed when the problem is considered in the light not only of theory of knowledge and of logic, but of history and practical experience.

PERSONAL PROPERTY, one branch of the main division of the English law of property, the other being "real property." The division of property into real and personal represents in a great measure the division into immoveable and moveable, incidentally recognized in Roman law and generally adopted since.

Personal estate is divided in English law into *chattels real* and *chattels personal;* the latter are again divided into *choses in possession* and *choses in action* (*see* CHATTEL; CHOSE).

Interest in personal property may be either absolute or qualified.

There are several cases in which, by statute or otherwise, property is taken out of the class of real or personal to which it seems naturally to belong. By the operation of the equitable doctrine of conversion money directed to be employed in the purchase of land, or land directed to be turned into money, is in general regarded as that species of property into which it is directed to be converted. An example of property *prima facie* real which is treated as personal is an estate *pur autre vie,* which, since 14 Geo. II. *c.* 20, s. 9, 1740–41 (now replaced by the Wills Act 1837, s. 6) is distributable as personal property in the absence of a special occupant. Examples of property *prima facie* personal which is treated as real are fixtures, heirlooms, such as deeds and family portraits. (*See* further SUCCESSION.)

The terms *heritable* and *moveable* of Scots law in a general sense correspond with the real and personal of English law. Moveable or personal property is, in Scots law, subdivided into corporeal and incorporeal moveables. Corporeal or physical things, not being land or attached to land, are moveable property. Incorporeal things, or rights, are said to form moveable property when they do not affect land, and are not similar to rights affecting land in having a tract of future time. By the Titles to Land Consolidation (Scotland) Act 1868, s. 117, heritable securities are moveable as far as regards the succession of the creditor, unless executors are expressly excluded. They still, however, remain heritable *quoad fiscum,* as between husband and wife, in computing legitim, and as far as regards the succession of the debtor. Annuities, as having *tractum futuri temporis,* are heritable, and an obligation to pay them falls upon the heir of the deceased. At common law an obligation to pay money was, after the term of payment, considered heritable in the person of the creditor as having a tract of future time. Bonds containing such obligations, except where the creditor's executors are excluded, are now moveables in the creditor's succession. See the Scots Act of 1661 cap. 32 and the Conveyancy (Scotland) Act 1924 s. 22 (1).

The law in the United States agrees in most respects with that of England. Chattels real include all estates in land less than freehold. Legislation in some States has, however, made terms for years and estates *pur autre vie* real property. Title-deeds are generally regarded as personalty inasmuch as their importance is less than in England, due to the Land Registration Acts. Shares in some of the early American corporations were, like New River shares in England, made real estate by statute, as in the case of the Cape Sable Company in Maryland (Schouler, *Law of Personal Property,* i.). Otherwise, shares of stock, like other choses in action, are regarded as personalty.

PERSONATION, in English and American law, a form of fraud consisting in a false representation by one person (by words or conduct) that he is another person living or dead. It is not an offence by the common law unless the representation is made on oath under circumstances constituting the offence of perjury, or unless the representation if not made on oath is made under circumstances amounting to a common law cheat. (*See* also FALSE PRETENCES; ELECTORAL SYSTEMS.)

PERSPECTIVE, deals with the phenomena of appearance; usually applied to the construction of drawings intended to represent objects as seen from some definite point of view. In appearance an object may seem very unlike what it is known to be in reality. A railway track is of the same width throughout its length, yet in appearance the rails seem to approach one another as they recede, Plate I., fig. 2. A cube is known to have 12 edges all equal in length and to have a perfect square for each face, but when viewed the edges do not appear to be equal, nor do the faces appear to be squares, Plate I., fig. 6.

Isometric Drawing.—A method of representing objects is sometimes used in which dimensions in three directions are shown in their true size to the scale of the drawing. A cube constructed by this method is given in fig. 1. Every line in the direction of *ab,* of *ac,* or of *ae,* is drawn at its true scale. Thus all the edges of the cube as shown are of equal length. Such a drawing is known as an *isometric.* It is useful in indicating the size of an object, as three dimensions at right-angles to one another can be shown upon a single plane surface. It is a purely arbitrary method of representation, however, gives a distorted picture of the object, makes no pretence of reproducing its appearance, and should never be confused with true perspective.

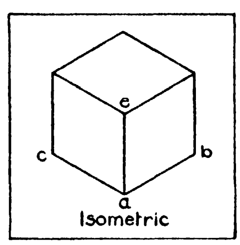

FIG. 1.—AN ISOMETRIC PRESENTATION OF A CUBE. ALL EDGES HAVING SAME DIMENSIONS AS ACTUAL

True Perspective.—In true perspective three lines at right-angles to one another cannot all appear in their true lengths. Lines and forms seem to change in size and shape as they occupy different positions in the picture. Colours and lightings seem to change as well. In the foreground objects appear brilliant with distinct details, clear colours, dark shadows and strong contrasts. As one looks farther into the distance objects seem less brilliant, contrasts less marked, colours gradually lose their clearness and tend to merge into a purplish monotone. This is caused in part by minute specks of dust or moisture held in the atmosphere which reflect a soft hazy light into the picture. These lighting effects are outside the scope of the present article. The apparent changes in form, however, are dealt with as an exact science known as *linear perspective,* by means of which it is possible to construct, from the actual dimensions of an object, its apparent shape and size at any point in space.

The camera is an instrument by means of which perspective views can be produced mechanically. On Plate I., figs. 2 and 6 are so produced. Rays of light reflected from any object, as *ab,* fig. 2, pass through the lens of the camera and fall upon the

sensitive plate forming an image which will represent the appearance of the object to one who views the photograph.

The human eye, fig. 3, is, in effect, a little camera with a lens, *o,* and a sensitive surface, the retina, which receives the image, *fe.* If a transparent plane, *PP,* be placed between the object and the observer's eye, the rays of light coming from the object will pass through the plane and project upon it an image, *cd,* of the object The image on the plane would be a *perspective* of the object and would represent to the observer its appearance

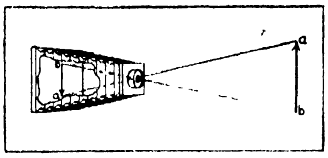

FIG 2 —PERSPECTIVE PROJECTION PRODUCED PHOTOGRAPHICALLY

Wherever one looks he sees a perspective view An expert draftsman before a group of objects might record on paper exactly what he saw. The result would be a perspective drawing reproducing the appearance of the objects and might conceivably be made without any understanding of the laws of perspective Some of the ancient peoples, the Chinese for example, developed an interesting technique in drawing, and their pictures often showed a strong sense of perspective Whether they understood the underlying science or merely copied what they saw is open to argument It was probably not until the early part of the 15th century that the governing principles of the science began to be understood by western civilization The names of Brunelleschi, Alberti, Ucello, Leonardo da Vinci, Piero della Francesca and Albrecht Durer are all connected with its development To Francesca has been attributed the conception of the vanishing point which is the key to modern perspective construction

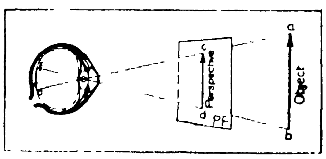

FIG 3 —THE HUMAN EYE AS A CAMERA

FUNDAMENTAL PRINCIPLES

Apparent Diminution in Size.—The complete theory of perspective can be developed from a single basic phenomenon; viz , the apparent decrease in size of an object as it recedes from the eye A railway train moving over a straight track furnishes an example As the train becomes more distant its dimensions apparently become smaller Its speed also seems to diminish, for the space over which it travels in a given time appears to be shorter and shorter as it is taken farther and farther away Plate I , fig 8, is another example, showing posts of equal height and with equidistant spaces between

The reason for the apparent diminution in size is readily understood from fig 4 The size of any object is estimated by comparing it with some standard As the observer looks along the line *ba* at the top of the first post, the top of the second post is invisible It is apparently below the top of No 1, and in order to see it he must lower his direction of sight until he looks along *bd.* He now sees the top of No 2, but No 3 is still invisible and in order to see No 3 he must lower his gaze still further until he looks along *bf* Considering the bottoms of the posts he finds the same apparent shrinkage. Compared with No 1, No 2 seems to have a length only equal to *km,* No 3 only equal to *op,* and so on. The posts thus appear relatively smaller and smaller as they are taken farther and farther from the eye If the line of posts could be extended an infinite distance, the last post would evidently appear incalculably small or of zero length.

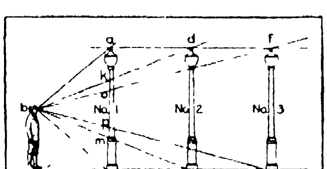

FIG 4 —CAUSE OF APPARENT FORESHORTENING

Similarly the two parallel lines, *adf* and *ceg,* running respectively along the tops and bottoms of the posts must, owing to the apparent decrease in the lengths of the posts, appear to approach one another as they recede Could they be of infinite length they would evidently appear to meet in a point at an infinite distance from the observer This imaginary point which parallel lines seem to approach is called a *vanishing point.* Plate I , fig 3, shows a perspective of the interior of an aqueduct in which the parallel lines of the stone courses can easily be imagined to meet in a vanishing point.

Systems of Lines.—If any object bounded by planes, *e g ,* a cube is examined, its edges can be grouped into several series or systems of parallel lines. Each system will have its particular vanishing point. In fig 5 there are three such series, one apparently converging or *vanishing* toward the right, one toward the left, and a vertical system It is important to be able to locate the imaginary vanishing point of any system of lines This can always be done by looking along one of the lines or *elements* of the system Whatever the position of the observer, every element of a given system appears to converge towards the vanishing point of that system and, if extended indefinitely, to meet the vanishing point Hence if the observer looks along any element, he will be looking directly at the vanishing point of the system The line along which he sights will be seen endwise, as a point, exactly covering the vanishing point toward which all other elements of the system will appear to converge Thus, an observer might sight directly along one of the course lines in Plate I , fig 3, and discover the vanishing point for the other course lines directly in front of his eye

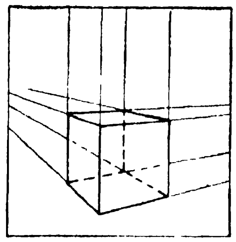

FIG 5 —SYSTEMS OF LINES

This principle is further illustrated by the model shown in Plate I , fig 1, which consists of a series of rods representing straight lines and arranged in a parallel system Let the observer look directly along any one of the rods, as the one at the lower left corner This rod will appear as a dot, and apparently cover the imaginary infinitely distant vanishing point of the system All the other rods or elements will appear to converge toward the vanishing point which the observer has located Again if he sights along the centre rod, Plate I , fig 4, he will see it as a dot covering the imaginary vanishing point towards which the other elements of the system appear to converge Let him choose which rod he will the result will evidently be the same The line along which the observer sights is called the *visual element* of the system Plate I , fig 9, shows the use of this method to locate the vanishing point of the horizontal lines in the view that are parallel to the curbing The observer sights along the fence rail which being parallel to the curb leads his gaze to the desired vanishing point All other horizontal lines in the view belonging to this system seem to converge towards the infinitely distant vanishing point covered by the fence rail

It is evident that the view of the scene as well as the apparent position of any vanishing point must change with every new position of the observer. Therefore a perspective drawing can only attempt to represent the view as it will appear from one point of view This is a limitation inherent in every perspective drawing

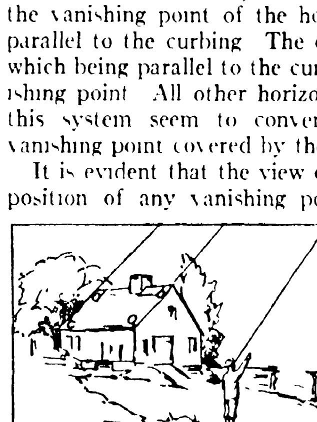

FIG 6 —LOCATING A VANISHING POINT

Instead of sighting along an actual element, the observer can look in a direction parallel to an element The direction in which he looks may be considered as an imaginary element which will lead his eye to the desired vanishing point In fig 6 the observer is looking in a direction parallel to the two edges *ab* and *cd* of the roof plane These two edges appear to him to converge towards a point infinitely distant from him in the direction of his gaze

Rule A.—From the method of locating a vanishing point it follows that if a system is horizontal its vanishing point must appear to be on a level with the eye If a system vanishes upward its vanishing point will be located above the eye; if downward below the eye; if toward the right, to the right of the eye; or if toward the left, to the left of the eye

Theoretically every system of lines has 'two vanishing points, for, if the observer can locate one by looking along an element in one direction, he can also locate a second by looking along the same element in the opposite direction. For any given position of the observer one of these vanishing points will usually lie before and the other behind him. The one lying in the direction of his gaze is the only one considered, except in certain special problems.

Systems of Planes.—Plane surfaces which are parallel appear to approach one another as they recede. This will be evident from fig. 7. Since the horizontal edges of the cube appear to converge, the top and bottom planes must appear nearer together at *cd* and *gh* than at *ab* and *ef,* and must seem to approach one another as they extend into space. Parallel planes extended an infinite distance appear to meet in a straight line known as the *vanishing trace* of the planes. Each system of planes will have its own vanishing trace which can be located by looking along any one of the planes. The plane will appear edgewise, as a line, and cover the vanishing trace which every plane of the system will appear to approach.

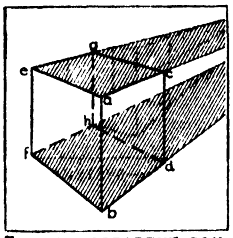

FIG. 7.—APPARENT CONVERGENCE OF PARALLEL PLANES

The method of locating a vanishing trace is illustrated in Plate I., figs. 5 and 7. The plane along which the observer looks is known as the *visual* plane of the system. It appears as a straight line and the other planes of the system seem to approach it. The vanishing trace of the system of horizontal planes will evidently be a horizontal line on a level with the observer's eye. To this vanishing trace is given the special name of *horizon.* The visual plane of a horizontal system is called the *horizon plane.*

If the observer while locating a vanishing trace should slowly turn completely around still looking along the visual plane, at every instant he would see the vanishing trace as a straight line directly in front of him. The vanishing trace therefore may be considered as a circle of infinite radius which is theoretically the same thing as a straight line. In practical work so small a field is usually visible that a vanishing trace is always treated as a straight line.

Axioms.—The foregoing discussion may be summarized in five axioms and one rule.

Axiom 1. Parallel lines appear to converge as they vanish, and to meet at an infinite distance from the observer in an imaginary point called the vanishing point of the system.

Axiom 2. Parallel planes appear to approach one another as they recede from the eye, and to meet at an infinite distance from the observer in an imaginary straight line known as a vanishing trace.

Axiom 3. A line lying in a plane must have its vanishing point in the vanishing trace of the plane. This is evident from the manner of locating the vanishing point of a line and the vanishing trace of a plane.

Axiom 4. The vanishing trace of a plane must contain the vanishing points of all lines which lie in the plane. This is the converse of number 3.

Axiom 5. A line which forms the intersection of two planes, since it lies in both, must have its vanishing point at the intersection of the vanishing traces of the two planes.

Rule B. To locate the vanishing point of a system of lines, look along any real or imaginary line of the system.

APPLICATION TO PERSPECTIVE DRAWING

The Picture Plane.—The five axioms just formulated apply to conditions which are apparent but which do not really exist. In a perspective drawing these apparent conditions in space must be represented by actual conditions on paper. The perspectives of parallel lines are represented by converging lines which actually meet at a point which is the perspective of their vanishing point. Fig. 8 illustrates this. An observer stands before an object. Between him and the object is a plane called the *picture plane.* The object becomes visible to him by rays of light known as *visual rays* reflected into his eye from each point on its surface. Each point is projected upon the picture plane by its visual ray and the result is a perspective view.

Rule C. The perspective of any point is where the visual ray from the point intersects the picture plane.

A perspective is really a *conical projection* of the object on the picture plane, the projecting cone being made up of visual rays. In order to locate the imaginary vanishing point of the roof

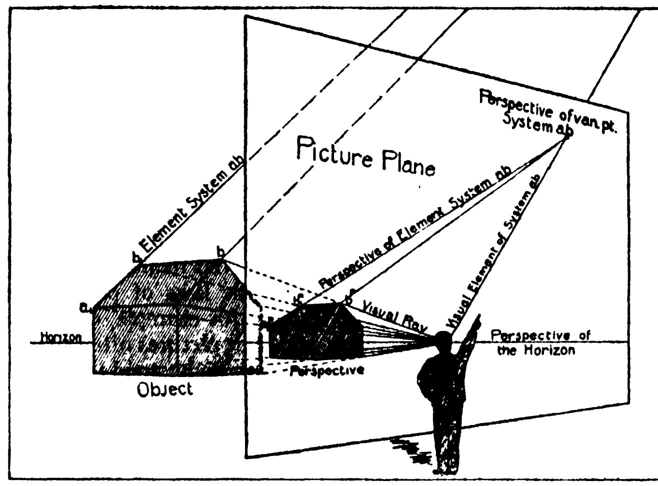

FIG. 8

lines *ab* and a_1 b_1, the observer looks in a direction parallel to *ab* and a_1 b_1 (Rule B). The direction in which he is looking becomes the visual ray passing between the imaginary vanishing point and his eye. The point in which this visual ray intersects the picture plane is the perspective of the vanishing point (Rule C), and to this perspective vanishing point the perspectives of the roof lines *ab* and a_1 b_1 actually converge.

Rule D. To find the perspective of the vanishing point of any system of lines, pass a line parallel to the system through the observer's eye and find where the line pierces the picture plane.

Planes of Projection.—In making a perspective drawing three planes are used: first, a vertical plane, the picture plane, which receives perspective view; second, a horizontal plane, the horizon plane which must always contain the observer's eye; third, a second horizontal plane called the ground plane on which the object always rests, fig. 9. Since the horizon plane always contains the observer's eye, or *station point,* and the object always rests upon the ground plane, the relation between these two planes determines the kind of view to be produced. If the distance between them equals the height of a man (to the scale of the drawing) the view obtained will be as though seen by an observer standing on the ground plane. Increasing this distance is equivalent to raising the observer's eye, and if the distance is great the result is a bird's eye view. The ground plane may be taken above the horizon plane and the resulting view will show the object as though the observer were looking up at it. The picture plane and the horizon plane are known as the *co-ordinate planes of projection* and on them is performed all the work of constructing the perspective view.

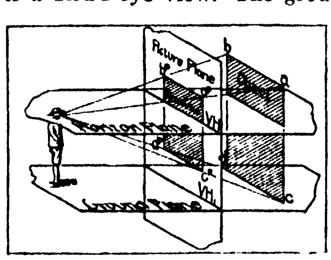

FIG. 9

Orthographic Projection.—As already stated the perspective view is a conical projection on the picture plane. This conical projection is in practice not found from the actual object in space, but from a plan and an elevation of the object. The plan is essentially a top view and the elevation a front view or sometimes a side view.

A plan is constructed by projecting each point in the object to a horizontal reference plane by lines or projectors which are perpendicular to the horizontal plane. An elevation is constructed by projectors perpendicular to the vertical plane. Such views are known as orthographic or right-line projections in contrast to the

conical or perspective projection, and are the ordinary means of representing objects on paper (*see* DRAWING, ENGINEERING). Fig. 10 shows a conical and an orthographic projection. Fig. 11 illustrates the construction of a plan and an elevation. Fig. 12 shows the two views as they are represented on paper. Each point in the object, has two projections, both being necessary to locate accurately the relations of the point to the two planes. Thus the point *a* is above the horizontal reference plane, a distance equal to *am* as indicated in elevation, and in front of the vertical reference plane a distance equal to *an* as shown in plan. The elevation shows vertical distances, the plan shows horizontal distances. The object in space may be above the horizontal plane as in figs. 11 and 12, or it may be below the horizontal plane as in fig. 13. It may be behind or in front of the vertical plane, or it may lie partly behind and partly in front of the vertical plane or partly above and partly below the horizontal plane.

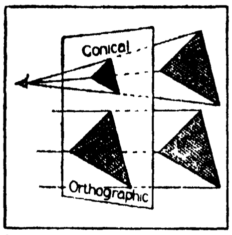

FIG. 10.—COMPARISON OF CONICAL AND ORTHOGRAPHIC PROJECTIONS

Any point in space may have three different but related projections, a plan or horizontal projection, an elevation or vertical projection, and a conical or perspective projection. This is illustrated in fig. 14 where two points in space *a* and *b* are shown, each with its vertical, its horizontal and its conical projection. The horizontal projection is indicated by an index *h*, the vertical projection by an index *v*, and the perspective projection by an index *p*. The point *a* is shown behind the picture plane and above the horizon plane. The point *b* is shown in front of the picture plane and below the horizon plane. The conical projection or perspective is always on the vertical or picture plane.

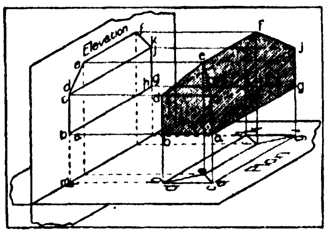

FIG. 11.—CONSTRUCTION OF PLAN AND ELEVATION

Fig. 15 shows the planes of projection with the ground plane indicated by its intersection (VH_1) with the picture plane. The point *a* is shown in space behind the picture plane and below the horizon plane, with its horizontal projection (a^h) and its vertical projection (a^v). The station point is represented by its two orthographic projections just as every point in space. Since it always lies in the horizon plane its horizontal projection, SP^h, must always coincide with the point itself. Its vertical projection will be directly in front of SP^h, on the picture plane as SP^v. SP^v must always lie in the line *VH* which represents the vertical projection of the horizon plane.

Just as a point in space has a horizontal projection and a vertical projection, so the visual ray which passes from the point *a* to the observer's eye has two projections, one on each plane. Its projection is seen on the horizon plane passing through a^h and SP^h. Its vertical projection is seen on the picture plane passing through a^v and SP^v. The visual ray pierces the picture plane at a^p which is the perspective of the point *a* (Rule C).

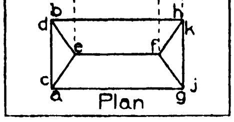

FIG. 12.—PLAN AND ELEVATION, ORTHOGRAPHIC PROJECTIONS

Rule E. The intersection of a visual ray with the picture plane must always lie upon the vertical projection of the visual ray, and must be directly in line with the point where the horizontal projection of the visual ray crosses the horizontal projection (*HPP*) of the picture plane.

In practice both the picture plane and the horizon plane must be represented on one sheet of paper. One can imagine the picture plane to be revolved about its intersection with the horizon plane in the direction indicated by the arrows s_1 and s_2, fig. 15, until the two planes lie coincident as shown in fig. 16. In this position the group of projections on the picture plane will overlap the group on the horizon plane. To avoid the resulting confusion the two planes can be pulled apart as shown in fig. 17. After these movements of the planes the horizon plane will still contain all of the horizontal projections, which will remain undisturbed in all aspects of their relations to one another.

HPP is the horizontal projection of the picture plane and is the reference line for all horizontal projections. Similarly the picture plane will contain all of the vertical projections. *VH* is the vertical projection of the horizon plane, and is the reference line for all vertical projections. VH_1 represents the intersection of the ground plane with the picture plane. The distance between *VH* and VH_1 shows the height of the observer's eye above the plane on which the object rests.

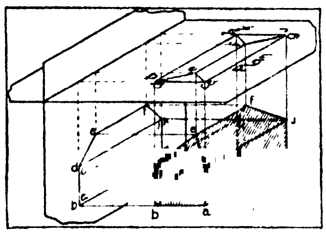

FIG. 13.—CONSTRUCTION OF PLAN AND ELEVATION

The two groups of projections are usually represented as in fig. 18. The only relation between the two groups is that the two corresponding orthographic projections of any point as a^h and a^v, *or* SP^h and SP^v, must always be vertically in line with one another. Horizontal projections show distances back and front. Vertical projections show distances up and down. Distances are never measured between a horizontal and a vertical projection. The relation of a^h to *HPP* shows the point *a* to be behind the picture plane. The relation of a^v to *VH* shows it to be below the plane of the horizon. The two projections of the visual ray through the point *a* are shown (R^h and R^v). By Rule E, the point *p* can be determined.

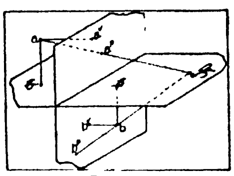

FIG. 14

Measure Lines.—Fig. 19 shows a rectangular block resting upon the ground plane in plan and elevation. The perspective of each point has been found by Rule E. Connecting these points by straight lines, the perspective of the block is determined. Since the object lies some distance behind the picture plane, as seen by comparing the plane with *HPP*, the perspective is smaller than the object. Any line which lies in the picture plane will show its true length in the perspective view, and is called a *measure line*. It can be drawn at once to scale and used to determine the dimensions of other parts of the object which do not lie in the picture plane and consequently appear larger or smaller than their real dimensions, according to whether they are in front of or behind it. Any vertical plane if extended will intersect the picture plane in a vertical line. The intersection will be a measure line on which true vertical dimensions may be scaled. Thus, in fig. 19, the left vertical face of the block can be extended forward until it intersects the picture plane in a measure line on which the distance $a^v m$ will show the true height of the block The right vertical face if

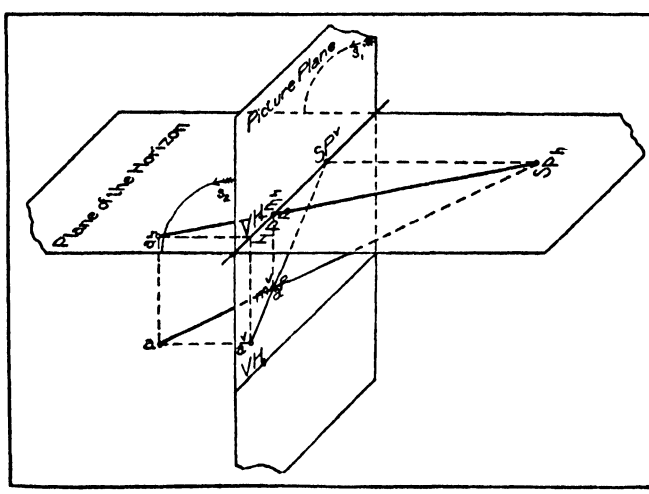

FIG. 15

extended will also give a measure line, on which $b'n$ shows the true height

The Construction of a Perspective Projection.—Fig. 20 illustrates the fundamental method of constructing a perspective from which all other methods are derived A plan and elevation are given on the left, an end view on the right *HPP* determines

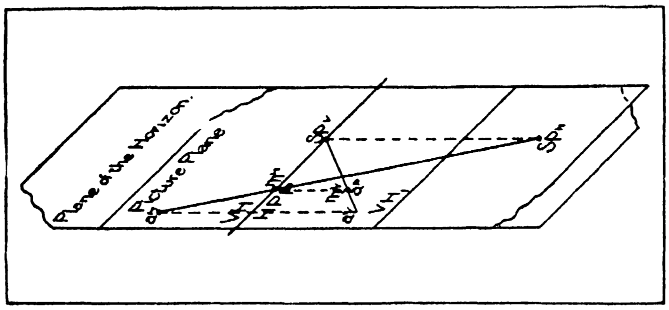

FIG 16

the picture plane in horizontal projection. *VH* determines the plane of the horizon in vertical projection. VH_1 determines the plane of the ground on which the object is to rest The observer's eye, *SP*, is given in vertical and horizontal projections The resulting perspective is to show the house with the vertical corner *ae* lying in the picture plane, and with the face *aefb* making an angle of 45° with it This position is indicated by the

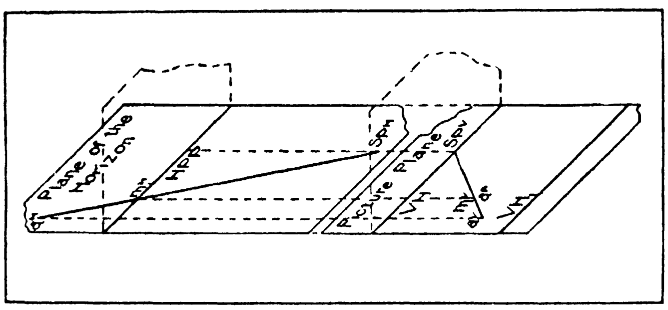

FIG. 17

diagram, which is a plan of the house revolved about a vertical axis until the side *aefb* makes the specified angle of 45° with *HPP*, and placed with the corner *ae* touching *HPP* in accordance with the specification The point *a* will thus lie both in the picture plane and on the plane of the ground Its perspective must be at a^p on VH_1 and directly under the point *a* in the diagram As the front corner lies in the picture plane it will be a measure line and its true height taken from the elevation can be laid off directly from a^p, determining e^p as indicated Next, by Rules D and E establish the vanishing point for the system of lines parallel to *ab*, as follows the horizontal projection of the visual ray will pass through SP^h parallel to *ab* in the diagram, and will cross *HPP* at the point 10 Since *ab* is a horizontal system the vertical projection of the visual ray will pass through SP^v and coincide with *VH* The desired vanishing point must be on *VH* directly below 10, at V^{ab}.

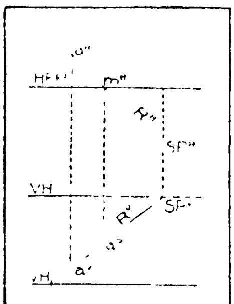

FIG 18 —ELEMENTARY PROBLEM IN PERSPECTIVE

Similarly the vanishing point for the horizontal system parallel to *ad* will be found on *VH* at V^{ad}. The upper and lower edges of the right face run from e^p and a^p respectively and vanish at V^{ab}. The observer sees the rear edge of the right face projected on the picture plane directly below the point where a visual ray from *fb* in the diagram crosses *HPP* As the perspective of a vertical line upon a vertical picture plane is always a vertical line, the rear edge will be found at b^pf^p. In a similar way the upper and lower edges of the left face vanish at V^{ad}, and the rear edge of this face is found at d^ph^p. The rectangular portion of the house is completed by lines running from b^p and f^p vanishing at V^{ad}, and from d^p and h^p vanishing at V^{ab}, establishing by their intersections c^p and g^p.

To find the roof of the main house, extend the ridge (*lk*) in the diagram until it intersects *HPP* in the point 12. Imagine a vertical plane to pass through the ridge It will intersect the picture plane in a vertical line dropped from the point 12. This will be a measure line for the ridge and the true height of the ridge above the ground, 2–1, taken from the elevation, can be laid off on it. A horizontal line through *l* vanishing at V^{ad} must contain the ridge which will be located on this line at k^pl^p directly below the points in which visual rays through the extremities of the ridge in the diagram, intersect *HPP* From k^p, lines to e^p and f^p respectively, and from l^p, lines to h^p and g^p respectively will complete the roof.

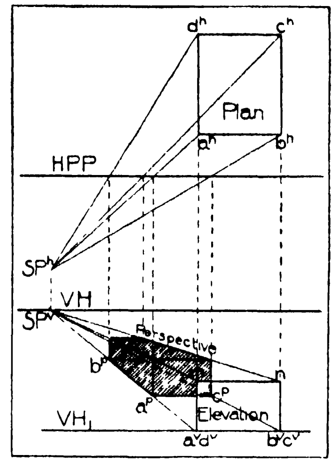

FIG 19 —MEASURE LINES

The chimney can be located in a similar manner Extend the front face through *p* in the diagram until it intersects *HPP* in 13 The plane of this face will intersect the picture plane in the vertical line dropped from 13, which will be a measure line for this face Lay off on this measure line the true height of the top of the chimney 8–7, and the true height of the bottom line of the front face, 8–9. Through 7 and 9 lines vanishing at V^{ad} will contain the top and bottom edges of the front face which will be located vertically below the points where visual rays from the front face of the chimney in the diagram intersect *HPP*. The construction of the rest of the chimney is obvious from the drawing.

A measure line for the right vertical face of the porch is found by extending this face in the diagram until it intersects *HPP* and dropping a vertical 3–4 On this vertical shows the true height front face, 8–9 Through 7 and 9 lines vanishing at V^{ad} will contain the upper and lower edges of the right hand face The points r^p and m^p can be located by visual rays drawn through *r* and *m* on the diagram 5–6 shows the true height of the ridge of the porch laid off on the measure line for the ridge A line through 5 vanishing at V^{ab} will contain the ridge. Points s^p and n^p on this ridge can be located by visual rays through *s* and *n* in the diagram. The construction of the remainder of the porch can be readily understood from the drawing

The heights of the tops and bottoms of the windows can be taken directly from the end view and laid off on a^pe^p which is the measure line for the right hand face of the main house Horizontal lines through these heights will establish the top and bottom lines of the windows The vertical sides can be located vertically below where visual rays from the windows in the diagram cross *HPP*. In this way the entire perspective can be completed

Vanishing Points of Oblique Lines.—The vanishing points for the inclined lines in the roof *ek, kf, lg, lh*, etc, are not absolutely necessary for the construction of the perspective. The method of determining them, however, should be understood as in some problems the vanishing points of oblique lines form an important part of the solution. The construction for their determination is shown on fig 20

First consider *ek* A line drawn through the station point parallel to *ek* will establish the vanishing point by its intersection with the picture plane (Rule D). The horizontal projection of such a line will pass through SP^h parallel to *ek* in diagram, and will cross *HPP* at 14 The vanishing point will be vertically in line with 14 and on the vertical projection of the line through SP^v parallel to *ek* (Rule E). But since the diagram containing *ek* has been revolved from the original position of the given plan, no vertical projection is given which corresponds to the revolved direction of *ek*. The line *ek* must therefore be revolved back into its original direction, *i e*, parallel to e^hk^h in the given plan, in

order that the given vertical projection e^vk^v may be used to establish its vanishing point. As the vanishing point must lie in the vertical through 14, the vanishing point will not be disturbed if the vertical line through 14 is used as the axis about which the revolution takes place. During the revolution, the horizontal projection of any point in the line, as SP^h, will describe a circle with the point 14 as its centre. The vertical projection, SP^v, of the same point in the line, will move in a horizontal path along VH, and at any instant during the revolution will be found directly under SP^h. The revolution will be continued until the horizontal projection of the line is parallel to e^hk^h in the given plane. The line will now be in its original direction, SP^h will have moved to $SP_1{}^h$, SP^v will have moved to $SP_1{}^v$, and the given elevation e^vk^v can be drawn through $SP_1{}^v$, determining by its intersection with the vertical through 14, the desired vanishing point V^{ek}. Since the line *ek* slopes upward as it recedes, V^{ek} is found to be above VH (Rule A).

In a similar manner the vanishing point for *lg* can be found. The line through SP^h parallel to *lg* coincides with the one parallel to *ek*. This is swung back about a vertical axis through 14 until parallel to l^hg^h, in which position it will coincide with the line parallel to e^hk^h, and SP^h will have revolved to $SP_1{}^h$, $SP_1{}^v$ will be on VH directly below $SP_1{}^h$ and a line parallel to the given elevation l^vg^v, drawn through $SP_1{}^v$ will, by its intersection with the vertical through 14, determine V^{lg}. Since the line *lg* slopes downward as it recedes, its vanishing point is found below the horizon (Rule A).

To find the vanishing point for *rs* draw a line parallel to *rs*, in the diagram, through SP^h, crossing HPP at 11. V^{rs} will be found somewhere on a vertical through 11. Swing the line about a vertical axis through 11 until parallel with r^hs^h in the given plan. SP^h will revolve to $SP_2{}^h$ and $SP_2{}^v$ will be found on VH vertically in line Through $SP_2{}^v$ draw a line parallel to r^vs^v in the given elevation which will determine by its intersection with the vertical through 11, the vanishing point *rs*. This will be found above VH as *rs* vanishes upward. A similar series of steps will determine the vanishing point for *st* at V^{st} below the horizon.

Vanishing Traces.—With the vanishing points that have now been determined it is possible to locate a vanishing trace for each plane in the object. The roof planes have been lettered on the diagram. The vanishing trace for the plane *M* will be a line lettered *TM* containing V^{ab} and V^{ek} (Axiom 4). Similarly *TO*, the vanishing trace of the roof plane O, must contain V^{ab} and V^{lg}. *TN* must contain V^{ad} and V^{lg}, *TP* must contain V^{ad} and V^{ek}, *TS* will pass through V^{ab} and V^{rs}, and *TR* will pass through V^{ab} and V^{st}. The vanishing trace of a vertical plane must always be a vertical line and can therefore be determined by a single vanishing point. *TW* will be a vertical line through V^{ab} and *TV* a vertical line through V^{ad}. A vanishing trace is thus found for each plane in the object and, by virtue of Axiom 5, the vanishing points for the remaining oblique systems can now be located. Thus *mn* being the intersection of the planes *S* and *P* will have its vanishing point, V^{mn}, at the intersection of *TS* and *TP*. Similarly *pk*, the intersection of the right hand face of the chimney with the roof plane *P* will have its vanishing point at the intersection of *TW* and *TP*.

V^{no} must be situated at the intersection of *TP* and *TR*, but these two vanishing traces do not intersect within the limits of the paper. A line may be drawn through n^v to meet *TP* and *TR* at their intersection in the following manner. Draw any triangle as n^vvw with its apex at n^v and its base, *vw*, stretching between *TR* and *TP*. Draw any other triangles as *xyz* with its sides respectively parallel to n^vvw and its base *vz* stretching between *TR* and *TP*. A line from n^v through *x* will meet *TR* and *TP* at their intersection.

Lines Parallel to the Picture Plane.—It has been stated that the perspectives of vertical lines on a vertical plane are always vertical and not convergent. The reason for this follows directly from Rule D. If a vertical line is drawn through the observer's eye it cannot pierce a vertical picture plane within finite limits. The perspective of the vanishing point of such a system will theoretically be vertically over SP^v at an infinite distance. As the perspectives of all vertical lines must meet at the perspective of their vanishing point they cannot meet within a finite distance and must be drawn parallel and vertical. The parallel vertical lines drawn in perspective are themselves, however, subject to the laws of appearance, as are all lines in space, and, though actually drawn vertical, will appear to the observer to converge in just the right degree as they recede in the picture from his eye. This is true not only of vertical lines but of all lines which are parallel to the picture plane; *i.e.*, all lines whose projections in the diagram are parallel to *HPP*. From this truth three additional and very useful axioms may be deduced.

Axiom 6. Lines in space which are parallel to the picture plane will have their perspectives drawn parallel to one another and not convergent.

Axiom 7. Any line parallel to the picture plane must have its perspective drawn parallel to the vanishing trace of every plane in which it lies.

Axiom 8. If the line in which two planes intersect is parallel to the picture plane, the vanishing traces of the two planes must be parallel to one another.

These axioms are exemplified in the vertical lines in the drawing and also in the lines *kf* and *lh* whose projections in the diagram show them to be parallel to the picture plane. *kf* being the intersection of *M* and *N*, *TM* and *TN* should be parallel to

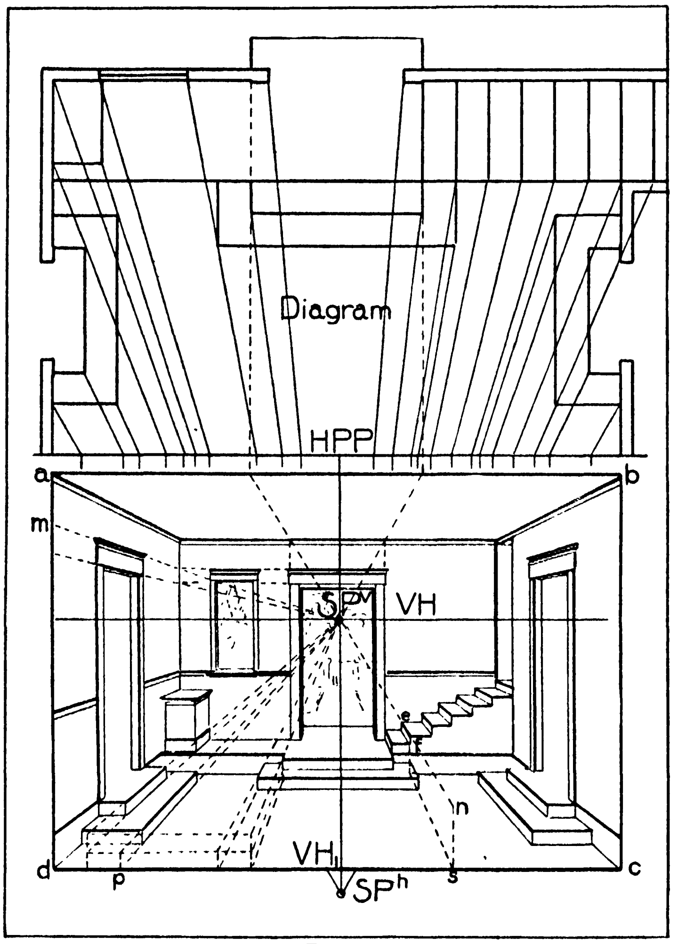

FIG. 21

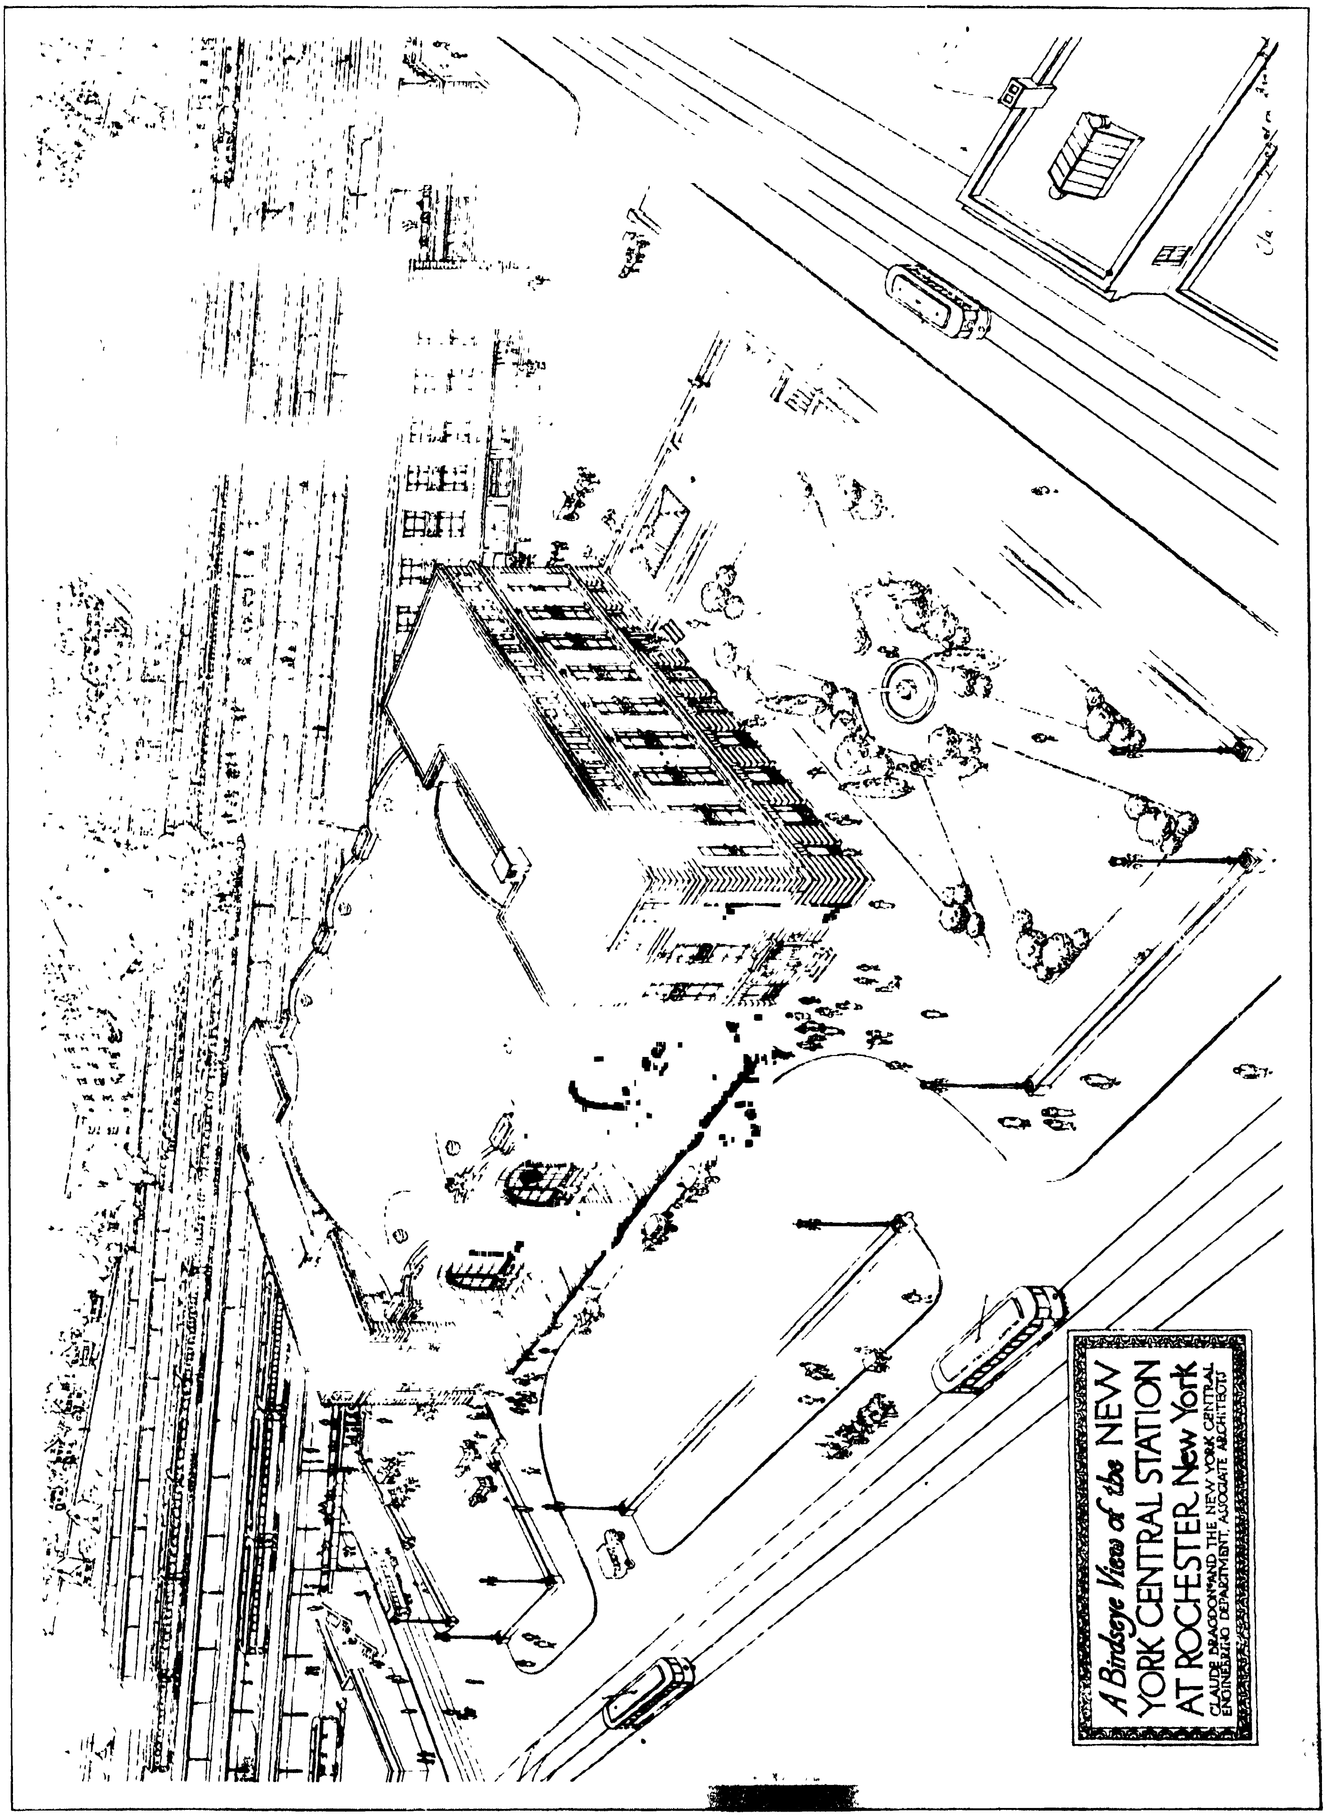
one another (Axiom 8) as they are found to be, and *kf* should be drawn parallel to *TM* and *TN* (Axiom 7). Similarly *lh* is drawn parallel to *TO* and *TP*, and these two vanishing traces are parallel to one another.

Vanishing Point Diagram.—The more or less geometrical figure composed of the vanishing traces of the planes, the vanishing points of the lines, *VH*, *HPP*, and the projections of the station point form the vanishing point diagram. This vanishing point diagram is quite independent of the particular location of the revolved plan, provided the directions of the lines in the



AN ARCHITECTURAL DRAWING IN AERIAL PERSPECTIVE

A rendering by Claude Bragdon showing an interesting use of aerial perspective

volved plan are not changed. It would serve to determine the ›rspective of the house were it placed to the right or the left its present position, or it might be brought forward or moved ıckward in relation to the picture plane. It might also rest on ground plane higher or lower than the one used, provided always at the lines in the object do not change their direction. The ınishing point diagram would therefore serve for a number of nilar objects placed at different positions but always having the me angular relation to the co-ordinate planes. As an illustration this a second perspective projection has been drawn in Plate III. ı a ground plane represented by VH_2 some distance below VH_1. he same vanishing point diagram serves for both perspectives. ıould, however, the angular relation between the diagram and e picture plane be changed it would be necessary to construct new vanishing point diagram.

Parallel Perspective.—Sometimes instead of the diagram ›ing turned with its principal horizontal lines oblique to the cture, it is placed with one of its principal systems of horizontal ıes parallel and the other perpendicular to the picture plane, in fig. 21. The result is often referred to as a *parallel* perspec- ve and is frequently used in showing interior views. The picture ane may be taken coincident with the nearest wall of the room. he horizontal system perpendicular to the picture plane will ıve its vanishing point coincident with SP^v (Rule D). The hori- ɪntal system parallel to the picture plane will, in perspective, ıow as true horizontal lines (Axioms 6 and 7). This is simply special case under the general method already explained, and volves no new principles. The vertical and horizontal edges of ıe room, *ab*, *bc*, *cd* and *da* being lines in the picture plane will › measure lines and true lengths can be laid off on them directly, *dm* the height of the door and *dp* the projection of the lower ep from the wall; or any line as *ef* can be extended forward to the picture plane where it will show its true height *sn,* above ıe ground plane.

CURVES

As must be evident from the foregoing discussion, linear per- ›ective is essentially a science of straight lines. When curves ›pear in the plan or elevation their perspectives are usually con- ructed by reference to straight lines. If the curve is of regular ›rm it can be enclosed in a polygon, usually a rectangle, the per- ›ective of the rectangle found and the ırve then constructed within the perspec- ve rectangle. Fig. 22 shows a curve so ıclosed, the perspective of which has ›en found. The diagonals of the perspec- ve rectangle locate its centre. Lines ·awn through the centre respectively par- lel to the adjacent sides give by their tersections with the sides, points at hich the curve is tangent. The sides of the rectangle give the rections of the curve at the points of tangency. Fig. 23 is an- .her illustration of curves of regular form constructed in per- ›ective. If the curve is not regular in form the enclosing rec- ngle can be subdivided into smaller rectangles, as shown in fig. ı, as a further aid to locating the curve.

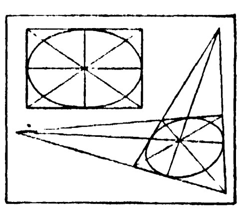


FIG. 22

Although methods can be devised for constructing the exact per- ›ective of any curved object, they are complex and seldom used ı practice. A few important points are usually located and the ıtline sketched in freehand, if in a position corresponding to ıat in the picture.

Apparent Distortion.—It is evident from the statement in ›nnection with Plate I., fig. 3 that an object in space is exactly ›presented by its perspective prospective projection, or in other ords, no distortion or exaggeration can exist in correctly con- .ructed perspective projection. Notwithstanding this fact, very isagreeable effects and very apparent distortions are often noticed ı perspective projections, the accuracy of which cannot be ques- oned. A few examples will suffice to show what is meant. Plate I., fig. 1, is a true perspective. It is supposed to represent a umber of perfect spheres of equal size. The view as seen does ›t convey this impression. A sphere in space always appears as perfect circle and never as the oval-shaped areas seen near the edges of the photograph. Again, Plate II., fig. 2, is a correct per- spective of five circular cylinders all having the same diameter. The ones farthest to the right or left should appear smaller than the nearest one at the centre. In the photograph just the opposite is true and the farther from the eye the larger they appear. The explanation of these seeming anomalies is as follows: Before any perspective projection is constructed the position of the ob- server's eye is definitely fixed, and, in order that the perspective shall represent the view in space, the observer must close one eye and place the other exactly in the predetermined position. It is seldom that an observer looks at a drawing with one eye only, or places either eye even approxi- mately in the correct relation to the drawing. This limitation of a perspective view and the failure to understand it is the cause of all apparent distortion. In Plate II., figs. 1 and 2, the station point has purposely been chosen so close to the paper that it is impossible for the observer to see the view from the correct position. Should either of these views be enlarged so that the distance from the paper to the station point became considerably greater, and should the observer examine the enlarged view with one eye only, placed exactly at the station point, the elliptical projections of the outside spheres would be foreshortened by the obliquity of his line of vision and would appear as perfect circles, representing to him perfect spheres. The cylinders would also appear in their proper relations.

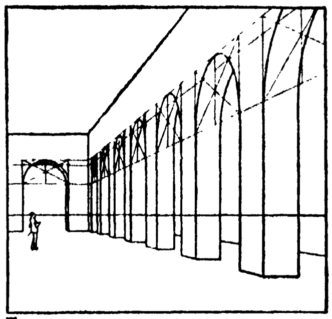

FIG. 23.—SEMI-CIRCLES ENCLOSED IN RECTANGLES

When the eye is not in its proper position all parts of the draw- ing show more or less distortion. This is most noticeable in reg- ular curved forms or in the human figure, especially when these are located near the edges of the drawing. The disagreeable effects are much more pronounced when the station point is taken too near the picture plane. Thus the apparent distortion seen in a cor- rectly constructed perspective is due, not to inaccuracies in the perspective theory, but to an unwise choice in the station point, a faulty arrangement of the view, and the failure of the observer to recognize the limitations of a perspective projection. In making a perspective, the station point should always be chosen in such a position that the observer will naturally place his eyes approxi- mately at the chosen point when viewing the drawing. An arbi- trary rule sometimes given is to assume the station point directly in front of the centre of the drawing, at the apex of an equilateral triangle the base of which just covers the width of the view. The station point may be chosen farther away than this without much danger but not nearer, and never nearer than eight or ten inches. Curved forms of regular shape and human figures or animals should be kept as near the centre of the drawing as possible. Plate II., fig. 3, shows a view of the same cylin- ders and spheres seen in the two previous figures but with the station point much far- ther from the picture plane. The result is a vast improvement in the view obtained, though the spheres on the outskirts of the picture still appear slightly elliptical. After all precautions have been taken, if disa- greeable effects still persist in the drawing it is customary to introduce certain so-called corrections such as making the perspective of the spheres in Plate II., fig. 1, all perfect circles. These are really not corrections but actual transgressions of the rules of perspective which alter the view so that it will not be exactly correct at any point, yet it may not be noticeably dis- agreeable from any position likely to be taken by the observer.

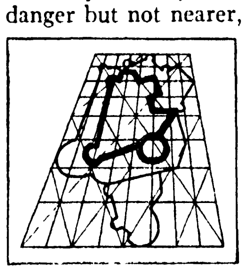

FIG. 24.—IRREGULAR CURVES REFERRED TO RECTANGLES

BINOCULAR PERSPECTIVE

Finally, mention should be made of the most perfect form of perspective representation, the binocular. When a single per- spective drawing is viewed with both eyes the image on the retina

of each eye is practically the same When, however, an object in space is viewed with both eyes two slightly different images are received, one by the right and one by the left eye It is the fusion of these different views which gives to the observer the impression of relief or solidity

In binocular perspective two slightly different views are made of the same scene from two slightly different points of view some 2¾ in apart, to correspond with the views seen by the two eyes This is most easily done with a camera having two lenses, known as a stereoscopic camera The two views are then presented to the observer in such a way that the right eye sees only the view taken by the right-hand lens and the left eye only the view taken by the left-hand lens An instrument designed for showing these double pictures is called a stereoscope (*see* BINOCULAR INSTRUMENT, *Stereoscope*), and gives a result that is startling in its realistic reproduction of distance and relief (*See* ART; ARCHITECTURE; DRAWING, ENGINEERING)

Ware, *Modern Perspective* (1894); V T Wilson, *Freehand Perspective* (1900), W P P Longfellow, *Applied Perspective for Architects and Painters* (1901), W H Lawrence, *Principles of Architectural Perspective* (3rd ed, 1908), D M Norton, *Freehand Perspective* (1924), W W Sturtevant, *Mechanical Pictorial Drawing* (1927) (W H LA)

PERSPIRATION, the excretion of sweat from the sweat-glands of the skin Sweat is a clear colourless neutral or slightly alkaline fluid containing 2% of solids Under pathological conditions, sugar, urea and other substances are found The secretion of sweat is constantly going on, the activity of the sweat-glands being under control of the central nervous system The only function of sweat is the regulation of the heat discharge from the body The chief morbid conditions of the sweat-glands are excessive sweating (*Hyperidrosis*) and foetid sweating (*Bromidrosis*) Excessive sweating is a symptom observed in various diseases, such as tuberculosis and rheumatic fever, but it may exist apart from such conditions, and either be general, affecting the whole body, or confined to a part, such as the axillae, head, hands, feet, or, as in some rare instances, the one half of the body Excessive perspiration may often be prevented by the cold bath, and by tonics, such as iron, quinine, strychnia, etc Locally, the use of astringent lotions of vinegar or a weak solution of lead or atropin will also be of service Foetid sweating most frequently affects the feet, and is apparently due to rapid bacterial decomposition in the perspiration which has saturated the stockings, these should be frequently changed and the feet washed several times a day, dried carefully, and dusted with some antiseptic powder

PERTAB (or PARTAB) **SINGH,** Sir, Maharaja of Idar (1844–1922), native Indian soldier and statesman, belonging to the Rahtor Rajputs of the Jodha class, was born in 1844, being the son of Maharaja Takht Singh, ruler of Marwar (or Jodhpur) In 1878 and again in 1879 he was chief minister of Jodhpur In the following year he accompanied the British mission to Afghanistan, and on his return he carried out many judicious reforms and administered Jodhpur with remarkable success He visited England to take part in the celebration of the 1887 Jubilee of Queen Victoria's reign He served on the staffs of Sir William Lockhart and General Elles in the Tirah and Mohmand expeditions in 1897–98, was slightly wounded, was mentioned in despatches, and promoted to the rank of full colonel He won the reputation of being one of the keenest sportsmen and the best riders that even Rajputana has produced When it was decided to send a force from India to China in 1900 to relieve the foreign embassies besieged in Peking, Sir Pertab Singh at once offered the services of the Jodhpur Lancers, and himself accompanied them His father rendered good services to the British Government in the Mutiny, and Pertab Singh always cherished the memory of the protection given to Jodhpur by the East India Company in 1818 His services to the empire in India were universally recognized. From Queen Victoria he received the honour of knighthood and the Bath and the Star of India; from King Edward VII the distinction of "aide-de-camp"; and the University of Cambridge gave him the degree of LL D From his own State of Jodhpur he obtained the title of Maharaja-Dhiraj In 1901 he succeeded to the rulership of the state of Idar

He relinquished his position as Maharaja of Idar in 1911 in favour of his adopted son Daolat Singh, in order to resume the regency of Jodhpur which he had previously held on the death of his brother in 1895, but this time for his grand-nephew Summair Singh, then 13 years of age When the World War broke out Sir Pertab, in the words of Lord Hardinge the Viceroy, "would not be denied his right to serve the King-Emperor in spite of his 70 years " He came to France for service in the field with his young ward, then only 16, and commanded the Jodhpur Lancers In the later stages of the war he served with them in Egypt and Palestine Sir Summair Singh died in 1918, two years after receiving ruling powers, and Sir Pertab again became regent, assisted by a council. He died on Sept 4, 1922

PERTH, EARLS AND DUKES OF. The Scottish title of earl of Perth was bestowed upon James, 4th Lord Drummond (d 1611) in 1605 His ancestor Sir John Drummond (d 1519) had been created Lord Drummond in 1488

JAMES, 4th earl and 1st duke of Perth (1648–1716), opposed Lauderdale, and after his retirement in 1680 he was one of the committee of seven which managed Scottish affairs He was made justice-general and extraordinary lord of session in 1682, and was lord chancellor of Scotland from 1684 to 1688 As a convert to Roman Catholicism after the death of Charles II, he stood high in the favour of James II Perth, who is credited with the introduction of the thumbscrew, was very unpopular with the Scottish people, and during the Revolution of 1688 he was imprisoned at Stirling Released from captivity in 1693 he joined James II at St Germain, and was made duke of Perth, a titular dignity only after the exiled king's death in 1701 His son JAMES (*c* 1675–1720) and his grandson JAMES (1713–1746) fought for the Stuarts at Sheriffmuir and at Culloden respectively The titular dukedom became extinct at the death of the 6th holder in 1760

The 1st duke's brother, JOHN (*c* 1650–1715), earl of Melfort, rose to favour under Charles II about the same time as his brother, like him, too, he became a Roman Catholic in 1686 In 1684 he was made secretary of State for Scotland, in 1686 he was created earl of Melfort by James II, and during his reign he took a leading part in Scottish affairs He died in Paris on Jan 25, 1715 In 1853 George (1807–1902), nominally 6th duke of Melfort, obtained a reversal of the various attainders, and his own recognition as earl of Perth and Melfort The succeeding earl (the 15th) was his kinsman, William Huntly Drummond, Viscount Strathallan (1871–)

See Sir R Douglas, *The Peerage of Scotland;* and *Histories of Noble British Families*, vol. ii, ed H Drummond (1846)

PERTH, the capital of Western Australia, is situated in the south-west of the State (lat 31° 57′ S; long 115° 50′ E) on ground rising from the Swan river (alt 200 ft) about 12 miles from its mouth where lies its port Fremantle (*v inf*) Established in 1829 and for a long time slow of growth, Perth was constituted a city in 1856 and the metropolitan area now extends over 20 miles east and west along the northern side of the river, though the southern side also (South Perth and Victoria Park) is being increasingly occupied The climate is of "Mediterranean" type, warm to hot and sunny, with occasional hot winds from inland, and winter rains (Av ann temps 73·1°–55·3° F, with occasional days over 100° F; 2,783 hours sunshine; av ann rainfall 34·3 in falling during 120 days, mainly May–Oct inclusive) Fortunate in its site and in its river, which, exhibiting throughout its lower course alternating features of both subsidence and recent elevation, broadens in front of it into a large lake (Perth Water), Perth has during recent years been largely rebuilt, and its environs, including the lower course of the Swan river, improved, in keeping with the State's rapid growth During the last 10 to 15 years nearly £5,000,000 have been devoted to this end and land values have approximately doubled Thus though many of the streets are still narrow, the old, and very plain, city is disappearing and Perth counts amongst its attractions some of the finest terraces, avenues and buildings in Australia (*e.g.*, St. George's Terrace and Forrest Place) A good supply of water is derived from the Darling "Ranges," from some 13 artesian bores (450–2,000 ft) and this is now (1929) being augmented by the enlargement

of the Mundaring Weir to permit of a daily supply of 10,000,000 gallons. The gas and electric tram and lighting and public services generally are upon up-to-date and efficient lines and the city owns some 5,700 ac. of public lands devoted partly to parks, recreation grounds, etc., and including the fine King's Park (1,018 ac.) overlooking the Swan river west of the city. The public buildings include Government House, Houses of Parliament, two Cathedrals, besides numerous fine business and educational buildings (such as the University). The population of Perth and suburbs (including Fremantle) is *c.* 185,000, 48·64% of the total population of the State. Besides being the political and administrative centre, Perth, with Fremantle, is by far the most important centre for trade, commerce, banking, etc., in the State, the natural terminus and departure port for the principal railway routes of a wide hinterland which stretches far inland to the eastern goldfields.

Fremantle is the leading seaport of Western Australia, the first normal port-of-call for liners from Europe, and the terminus of the transcontinental railway. Its position relative to the State's chief wheat and wool producing areas, and to Indian Ocean, South African and European trade routes, lends added significance. Two moles prolonging the course of the Swan river seawards provide a safe approach 5,000 ft. long and 450 ft. wide and lead in to a harbour having over 10,000 ft quay space, 36 ft. depth (low-water), accommodation for large modern vessels and excellent cargo facilities. It is thus one of the most convenient ports in Australia but its rapid growth has outdistanced improvements and large-scale developments upstream and in Freshwater Bay are possible and are contemplated. Fremantle is one of the oldest settlements in Australia (founded 1825). Its population (1928. 32,600) is rapidly growing and the town, which is to attain the dignity of a city in June 1929, is extending along both banks of the river. Activity centres mainly on shipping and railway transportation but a varied industrial activity is also developing. Fremantle with a total trade valued (1927–28) at £30,628,000 conducts 65–70% of the total trade of the State and is visited by shipping of 3,300,000–3,500,000 tonnage annually Its exports in 1927–28, including 55,341,000 lb. of wool, were valued at £13,624,000.

PERTH, city, royal, municipal and police burgh, and county town of Perthshire, Scotland, 32 m N. by W of Edinburgh by the L M S., and 47¾ m. by the L N.E railway, via the Forth bridge and Kinross junction, the two companies using one station. Pop (1921) 33,208 It is situated on the right bank of the Tay, between the meadows of the North Inch and those of the South Inch, both laid out as public parks. The river is crossed by St. John's bridge of nine arches; by Victoria bridge, connecting South street with Dundee road; and farther south (at the end of Tay street) by a footway alongside the viaduct belonging to the railway. On the left bank of the river lie the suburb of Bridgend and Kinnoull hill (729 ft.). To the south are the wooded heights of Moncrieffe hill, Magdalenes hill, Kirkton hill and Craigie wood In the river are Friarton or Moncrieffe islands and the Stanners.

Notwithstanding the importance of Perth in former times, almost the sole relic of the past is the church of St. John the Baptist. The original building is believed to have been erected in the time of Columba, but the transept and nave of the existing structure date from the early part of the 13th century, the choir from the 15th. It was previously divided into three churches, but was in process of complete restoration in 1927. In May 1559 John Knox preached in St John's his famous sermon in denunciation of idolatry. The Dominican, Carthusian, Franciscan and Carmelite monasteries, the castle, palace and fortress, have all disappeared. The tombstone of James I. and his queen, who were buried in the Charterhouse, was afterwards removed to St. John's East church. During the period between the beginning of the 12th century and the assassination of James I. in 1437, many of the Scottish parliaments were held in Perth. The building in which they met stood off High street and was only cleared away in 1818, its site being occupied by the Freemasons' hall. The house of Catherine Glover, the "Fair Maid of Perth," still stands in Curfew Row. James VI.'s hospital, founded in 1569, which occupies the site of the Carthusian monastery, has been converted into workmen's dwellings. A replica of the old market cross (removed in 1765) has been erected opposite the new City Hall (1911). Among modern public buildings the principal are St. Ninian's Episcopal cathedral (1890); the municipal buildings (1881); the Marshall Memorial hall, housing the public library and the museum; the Perthshire natural history museum; the Sandeman public library, founded by a bequest of Professor Sandeman of Owens college, Manchester. The general prison for Scotland, south of South Inch, was originally erected in 1812 as a dépôt for French prisoners. North-west of the city are the military barracks built in 1793–94. The Burgh Grammar school, supposed to date from the 12th century, has been amalgamated with the Perth academy (1807), and Sharp's institute (1860).

The city has long been famous for its dyeing. Perth is under the jurisdiction of a town council, with a lord provost and bailies.

History.—During the time that it was occupied by the Romans, a period estimated at 320 years, the city was called Victoria; its present name probably derives from the Celtic Abertha ("at the mouth of the Tay") On the conversion of the original Pictish inhabitants and the dedication of the first church to St. John the Baptist, the town was designated St. Johnstoun, and it continued to be known indifferently by this name and that of Perth down to the 17th century. Perth is stated to have been a burgh in 1106 and was made a royal burgh by William the Lion in 1210. During the Scottish wars of Independence its fortifications were strengthened by Edward I. (1298). Robert Bruce several times ineffectually attempted to seize it, but in 1311 he succeeded in scaling the walls during a night attack This was the fourth and most brilliant of the seven sieges which the city has sustained. Taken by Edward III. in 1335, it was recaptured in 1339. In 1396 the combat between the Clan Chattan and the Clan Quhele, described in Scott's *Fair Maid of Perth*, took place on the North Inch in presence of Robert III and his queen, Annabella Drummond. The Blackfriars' monastery was the scene of the murder of James I. by Walter, earl of Atholl, in 1437. In consequence Perth lost its status as capital, in which it had succeeded to Scone, and the Parliament Courts were transferred to Edinburgh in 1482 Gowrie palace was the scene of the mysterious "Gowrie" conspiracy against James VI. in 1600. The town was taken by Montrose in 1644, by Cromwell in 1651, and was occupied by Viscount Dundee in 1689. In 1715 the Old Pretender was proclaimed king at the Mercat cross, and the chevalier himself appeared in the city in the following January, only to leave it precipitately on the approach of the earl of Argyll.

PERTH AMBOY, a city of Middlesex county, New Jersey, U.S A., at the mouth of the Raritan river, on Raritan bay and Staten Island sound. It is served by the Baltimore and Ohio, the Central of New Jersey, the Lehigh Valley and the Pennsylvania railways and by boats to New York; and is connected with Tottenville, at the southern end of Staten island, by the Outerbridge Crossing, a highway bridge built by the Port of New York Authority (opened 1928), and with South Amboy, across the Raritan, by the Victory bridge (opened 1926), a State memorial to the men of the World War. Pop. (1920) 41,707 (36% foreign-born white); 1928 estimate 50,100. Perth Amboy has a good harbour, with ship-yards and dry docks, and is a port of entry. Its manufacturing industries are varied and important, with an output in 1925 valued at $232,061,673. Chief among them are huge copper and silver refineries, which produce 37,000,000 oz. of silver annually and 28% of the world's output of copper. The assessed valuation of property for 1927 was $47,494,300. There are many old buildings of historic interest still standing in and near the city, including the Government house, built by the colonial proprietors in 1760; Franklin palace (1764–74), the home of William Franklin, a natural son of Benjamin Franklin and the last royal governor of New Jersey; the Barracks (1759); the Parker house (1729), a Loyalist centre during the Revolution; and Kearney cottage (1730), the home of "Madam Scriblerus." Perth Amboy was founded in 1683 and incorporated as a city in 1718. At first it was called by the Indian name Amboy, but the proprietors named it Perth, after one of their number, the Earl of Perth, and later the two names were combined. From

1686 until the end of the proprietary government in 1702 it was the capital of East Jersey and under the royal government it alternated with Burlington as the seat of government.

PERTHES, JOHANN GEORG JUSTUS (1749–1816), German publisher, was born at Rudolstadt on Sept. 11, 1749. In 1785 he founded at Gotha the business which bears his name (Justus Perthes). In this he was joined in 1814 by his son Wilhelm (1793–1853). On the death of Justus at Gotha on May 2, 1816, Wilhelm took entire control of the firm He laid the foundation of the geographical branch of the business by publishing the *Hand-atlas* (1817–23) of Adolf Stieler. The business passed to his son Bernard Wilhelm Perthes (1821–57), who was then associated with August Petermann and Bruno Hassenstein (1839–1902); and subsequently to his son Bernard (1857–1919). In 1863 the firm first issued the *Almanach de Gotha,* a statistical, historical and genealogical annual (in French) of the various countries of the world; and in 1866 the elaborate *Geographisches Jahrbuch* was produced under the editorship of Ernst Behm (1830–84), on whose death it was continued under that of Prof. Hermann Wagner. A new edition of Stieler's atlas (ed. H. Haack) was published in 1925.

PERTHSHIRE, inland county, Scotland, bounded north by the shires of Inverness and Aberdeen; east by Angus; south-east by the Firth of Tay and the counties of Fife and Kinross; south by the shires of Clackmannan and Stirling; south-west by the counties of Stirling and Dumbarton; west by Argyllshire and north-west by Inverness-shire. It is the fourth largest county in Scotland, having an area of 1,595,802 ac. (excluding water). By far the greater part is mountainous belonging to the highland area of Dalradian schists and metamorphosed rocks, with granite masses and numerous volcanic dikes. Including the hills on the confines of Inverness-shire and Argyllshire, there are at least 50 mountains exceeding 3,000 ft. in height. Of these the most familiar are Ben Lawers (3,984 ft.) near Loch Tay, Ben More (3,843) east of Crianlarich, Ben Lui (3,708) on the Argyllshire border, Schiehallion (3,547) south of Loch Rannoch, Ben Vannoch (3,125) west of Loch Lyon, and Ben Chonzie (3,048) near the head of Glen Almond. Of the immense number of hills of lesser altitude there may be mentioned four made famous through the *Lady of the Lake*—Ben Ledi (2,875) and Uam Var (2,179) near Callander, and Ben Venue (2,393) and Ben A'an (1,750), guardians of the Trossachs. The rocks of most of the remainder of the county are of Old Red Sandstone age, this formation being cut off from the Dalradian schists by the great fault which crosses the, county north of Aberfoyle and Crieff. The Ochils divide Perthshire from the shires of Clackmannan, Kinross and Fife

The chief river is the Tay, which rises on the Argyllshire frontier and discharges into the North sea off Buddon Ness, after a course of 117 m , being thus the longest river in Scotland. Its head-waters are the Fillan and Dochart, and among its affluents are, on the right, the Bran, Almond and Earn and, on the left, the Lyon, Tummel, rising in Argyllshire and receiving the Garry on its left, and Isla. The Earn flows out of Loch Earn and enters the Firth of Tay 6½ m. below Perth. The Forth, the principal natural boundary of the shire on the south, properly belongs to Stirlingshire, in which it rises, but its leading left-hand affluents are Perthshire rivers, namely, the Teith, the Goodie, issuing from the lake of Menteith, and the Allan, rising in the Ochils near Sheriffmuir.

All the lakes are narrow, scarcely one exceeding a mile in width. Loch Ericht, belonging partly to Inverness-shire, is 14½ m. long. Loch Tay (14½ m. long), situated about the centre, is the largest lake in the county. In the south are the series of lakes which the *Lady of the Lake* has rendered famous—Loch Vennachar (4½ m. long), Loch Achray (1¼ m. long), Loch Katrine (about 8 m. long); to the west of Aberfoyle is Loch Ard (3 m. long) and to the east Lake Menteith (1½ m. long). Nearly all the glens possess striking natural features, among them, from south to north, being Glens Artney, Almond, Dochart, Ogle, Lochay, Lyon, Garry, Shee, Bruar and Tilt; while the Trossachs, Killiecrankie, Birnam and Leny are the loveliest passes in the Highlands. The low-lying country is represented mainly by Strathmore, Strath Gartney, Strathallan, noted for its annual "gathering" or games, Strathearn, Strath Bran, Strath Tay and Strath Fillan, but more particularly by the fertile alluvial belts of the Carse of Gowrie, a raised marine platform on the northern shore of the Firth of Tay and the Carse of Stirling.

Agriculture and Industries.—The arable land is chiefly in the drier regions of the east and south-east, the soil for the most part being fertile. Light soils prevail in the lower undulating districts; clay and alluvial land occur in the Carse of Gowrie, the Carse of Stirling and the lower reach of Strathearn below and above Bridge of Earn. The best heavy carse land is very rich and productive, but requires to be thoroughly worked, limed and manured, being well adapted for wheat. The number of holdings is slightly in excess of 4,000 and of these over one-third are under 50 ac. each. Perthshire, with Argyllshire, carries the heaviest flocks of sheep in Scotland. Blackfaced is the principal breed in the Grampians, but there is also a large number of Cheviots and South Downs. In Breadalbane and Menteith there are remains of the ancient Caledonian forest, but little of the county is under wood, though considerable afforestation was carried out during the 19th century by large landowners. The lochs and rivers abound with salmon and trout, while hardly any of the streams have suffered pollution from industries or manufactures. The deer forests, of which the four largest cover some 90,000 ac , are frequented by red deer and roe deer, and on the extensive moors and in the woods are found grouse, pheasants, partridge, capercailzie, woodcock, ptarmigan and hares.

The shire is famous for its dyeing and bleaching works, which are situated in Perth and its vicinity; but, apart from these, there are flax and jute mills at Rattray and Blairgowrie, and cotton mills at Stanley, Deanston and Crieff; woollens, linen, jute and tartans are woven at Dunblane, Alyth, Coupar-Angus, Auchterarder and Crieff.

The L M S railway main line to Aberdeen enters the county near Dunblane and runs in a north-easterly direction via Perth. At Crieff junction it sends off a branch to Crieff and at Perth branches to Dundee and Lochearnhead. The Stirling to Oban line of the same company crosses the shire from Dunblane to Tyndrum. The main line to Inverness runs northwards from Perth, and has a branch at Ballinluig to Aberfeldy. Branches of the L N E railway reach Perth from Mawcarse in Kinross-shire and Ladybank in Fifeshire, and Aberfoyle from Buchlyvie, part of the branch from Buchlyvie on the Forth and Clyde line runs to Aberfoyle. The West Highland branch skirts the west of the shire.

In 1921 the population was 125,503; 16 persons spoke Gaelic only. The chief towns are Perth (pop. 33,208), Crieff (5,877), Blairgowrie (3,072), Dunblane (2,931), Auchterarder (2,263), Coupar-Angus (1,976), Rattray (1,740), Callander (1,874). Among lesser centres may be mentioned Aberfeldy (1,569), a favourite resort on the Tay, well known for the falls of Moness, mentioned in Robert Burns's song "The Birks of Aberfeldy"; Abernethy, the seat of an early bishopric, retaining one of the three ancient round towers in Scotland; Alyth (1,710), Comrie, a holiday resort on the Earn, and Pitlochry. Of old the county was divided into hereditary jurisdictions, which were abolished in 1748. The county forms a sheriffdom with a sheriff-substitute at Perth. For parliamentary purposes it is divided into an eastern and western division (the latter including Kinross). The shire is under school-board jurisdiction, and there are secondary schools at Perth and Crieff, and Trinity college in Glen Almond is a well-known public school on the English model.

History.—In 83 Agricola explored the lands beyond the Forth and in the following year penetrated to the Grampians, defeating the Caledonians under Galgacus with great slaughter. The site of this battle is disputed. The Romans did not pursue their victory, and the Picts were left undisturbed for a considerable period. At this time, according to Ptolemy, the territory now known as Perthshire was occupied by three tribes—the Damnonii, the Venicones and the Vacomagi. The growing lawlessness of the southern Picts and their frequent raids in the more settled country in the south at last compelled the attention of the emperor Severus. He arrived in Britain in 208, but though he led

a strong army to the shores of the Moray firth, he was unable effectually to subdue the tribesmen. The road he constructed ran from Stirling to Ardoch (where there are notable remains) and thence by Strageath, near Muthill, where it branched north-westwards to Dalginross and Buchanty, and north-eastwards to Perth and so to the Grampians.

When the Romans finally withdrew from Britain, the Picts established their capital first at Abernethy and then at Forteviot. Abernethy was the centre of the Celtic church after the conversion of the natives by Ninian, Palladius and other missionaries in the 5th and 6th centuries. On the burning of Forteviot by the Norsemen in the 8th century, the seat of Pictish government was removed to Scone. In the latter half of the 9th century Dunkeld—to which Kenneth Macalpine had brought some of the relics of Columba from Iona—became the scene of monastic activity, the abbot succeeding to the position of the abbot of Iona, and exercising great influence for nearly 100 years. The Danes periodically harried the land, but a crushing defeat at Luncarty in 961 put an end to their inroads in this quarter. In 1054 Macbeth was defeated at Dunsinane by Siward, earl of Northumberland, who had invaded Scotland in the interest of his kinsman, Duncan's son, who, on the death of the usurper three years later, ascended the throne as Malcolm III., called Canmore.

With Malcolm's accession the Celtic rule of the monarchy of Scone came to an end. Perth became the capital at the beginning of the 12th century; from that time the history of the shire is merged in that of the county town, with the exception of such isolated incidents as the removal of the Coronation Stone from Scone to Westminster in 1296, the defeat of Robert Bruce at Methven in 1306, the battle of Dupplin in 1332, the victory of Dundee at Killiecrankie in 1689 and the indecisive contest at Sheriffmuir in 1715. Among archaeological remains may be mentioned the hill-fort on Dunsinane; the ship-barrow of the vikings at Rattray, weems (or earth-houses) in the parishes of Monzie, Alyth and Bendochy; standing stones near Pitlochry, and an extraordinary assemblage of sculptured stones at Meigle.

PERTINAX, PUBLIUS HELVIUS (A.D. 126–193), Roman emperor, the son of a charcoal-burner, was born at Alba Pompeia in Liguria. From being a teacher of grammar he rose through many important offices, both civil and military, to the consulate, which he held twice. Chosen, at an advanced age and against his will, on Jan. 1, 193, to succeed Commodus, he was himself assassinated in a mutiny of the soldiers, on March 28, 193.

PERTZ, GEORG HEINRICH (1795–1876), German historian, was born at Hanover on March 28, 1795, and studied at Göttingen. Baron Stein engaged him in 1820 to edit the Carolingian chroniclers for the newly-founded Historical Society of Germany. After a prolonged tour through Germany and Italy in search of material Pertz was placed (1823) in charge of the publication of *Monumenta Germaniae historica*, texts of all the more important historical writers on German affairs down to the year 1500, as well as of laws, imperial and regal archives, and other valuable documents, such as letters, falling within this period. In 1823 he had been made secretary of the archives, and in 1827 principal keeper of the royal library at Hanover; from 1832 to 1837 he edited the *Hannoverische Zeitung*, and more than once sat as a representative in the Hanoverian second chamber. In 1842 he was called as chief librarian to Berlin, where he shortly afterwards was made a privy councillor and a member of the Academy of Sciences. He resigned all his appointments in 1874, and on Oct. 7, 1876, died at Munich.

The *Monumenta* began to appear in 1826, and at the date of his resignation 24 volumes folio (*Scriptores, Leges, Diplomata*) had appeared. This work for the first time made possible the existence of the modern school of scientific historians of mediaeval Germany. In connection with the *Monumenta* Pertz also began the publication of a selection of sources in octavo form, the *Scriptores rerum germanicarum in usum scholarum;* among his other works are an edition of Leibnitz, and a life of Stein (*Leben des Ministers Freiherrn vom Stein* (6 vols., 1849–1855); also, in an abridged form, *Aus Steins Leben* (2 vols., 1856).

PERU, a republic on the Pacific coast of South America. It extends in a general south-easterly direction from 3° 16′ S. to 18° S., with a sea-coast of more than 1,400 miles. Its area is estimated at 522,689 sq.m., an approximate figure, however, since much disputed territory is occupied by neighbouring States, with boundaries as yet undetermined.

Boundaries.—Beginning at the Estero de Machala on the Pacific (3° 16′ S.), the boundary with Ecuador runs south to the Chira river, then east to the confluence of the Canchis and Chinchipe. So much is agreed upon. From the Chinchipe, pending settlement of the dispute with Ecuador, Peru still claims all the territory east of the cordillera as far north as the boundary which has now been established between Peru and Colombia. In a treaty of 1922, ratified by Colombia in 1925, and by Peru in 1927, those countries came to an agreement. Their common boundary now runs from the confluence of the Cuembi with the Putumayo down the Putumayo to the mouth of the Yahuas; thence by a straight line to the mouth of the Atacuari in the Amazon; and from there down the main channel of the Amazon to the Brazilian boundary. By this treaty, the Apaporis-Tabatinga line, defined by treaty in 1851 as the boundary between Brazil and Peru, is now part of Colombia's boundary with Brazil. Furthermore, Colombia is given a corridor to the Amazon (the area between the Yahuas-Atacuari and the Apaporis-Tabatinga line) and has been guaranteed freedom of navigation in perpetuity on that river. The Peruvian frontier from Tabatinga on the Amazon is fixed. It ascends the Yavarí to its source, running south along the divide between tributaries of the Ucayali and those of the Yuruá to 9° 24′ 36″ S., where it crosses the Yuruá, thence to the Purús, which it crosses at the mouth of the Santa Rosa, running south, then east, to the source of the Acre and following it to the Yaverija. Boundaries between Brazil, Peru and Bolivia were defined in this region by the treaty of Sept. 8, 1909. From the junction of Acre and Yaverija the boundary runs south-east to the junction of the Heath with the Madre de Dios. It ascends the Heath in a southerly direction to its source, continuing by an irregular line to the shore line of Lake Titicaca, crossing the lake in a south-easterly direction to the Desaguadero. From this point south to the Chilean frontier the boundary between Peru and Bolivia is undemarcated. The *de facto* boundary with Chile is the Sama river in the department of Tacna. (*See* TACNA-ARICA.)

GENERAL VIEW SHOWING A STREET IN THE BUSINESS DISTRICT OF LIMA

Description.—Peru is traversed throughout its length by the Cordillera de los Andes, which runs roughly north-north-west and south-south-east, dividing the country longitudinally into three sharply contrasted regions: (1) coastal zone, 50–100 m. wide by over 1,400 m. long; (2) mountainous areas (*sierra*) consisting of stupendous chains commonly called cordilleras, high plateaux and deep, narrow valleys; (3) and beyond the *sierra*, heavily forested slopes which lead to the vast, low-lying Amazonian plains (*montaña*). The coastal zone of hills and plains is crossed by about 50 intermittent streams. South of Punta Pariñas it is a desert, except for irrigated valleys. Imperceptibly this zone merges with the foot-hills and spurs of the cordillera. A transition zone, without clearly defined boundaries, is called Las Cabezas de los

Valles (valley-heads), where, in steep-sided, dry, stony *quebradas* (gorges), the stream-beds narrow as they steepen. Most of the streams shrivel as they approach the coast, because of evaporation and loss of water by irrigation.

The *sierra* extends from the lower limit of summer rains on the west to the upper limit of tropical forest on the east. It is approximately 200 m. wide at the south, and less than half that at the north. On the east is the Cordillera Oriental, on the west the Cordillera Occidental, the continental divide. No other mountains are continuously so lofty (some over 20,000 ft.) near a coast which drops off to such abyssal depths (20,000 ft.). The highest peaks are covered with perpetual snow. Wide undulating plateaux with a mean altitude of about 12,000 ft. between eastern and western cordilleras are called *puna* in the south, and *jalca* north of 8° S. Longitudinal valleys with their tributaries make a labyrinth of ramifying wild gorges on an immense scale.

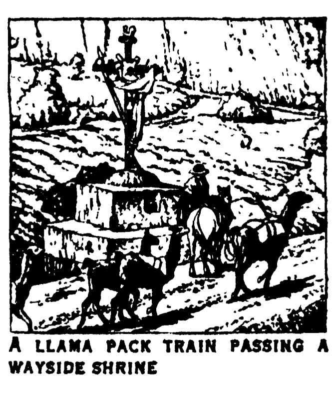
Between *sierra* and *montaña* lies a second transitional zone, *ceja de la montaña* (eye-brow of the *montaña*). The contrast between *sierra* and *montaña* on the east, in rock structure, topography, climate and vegetation is one of the most abrupt and spectacular on earth. The *sierra* is dry and cold. The *montaña* is covered with tropical forest, impenetrable except for rivers and a few short trails to gold or rubber camps.

Geology.—The conception of the structural geology of the Andes has been revolutionized during the past few years. Instead of the notion of three separate, structurally unlike chains, Oriental, Central and Occidental, of which the eastern was the oldest, the Andes of Peru are now considered a single broad plateau, a peneplain uplifted to 13,000–15,000 ft., whose original character has been largely destroyed by erosion. Deep canyons cut by streams tributary to the Amazon divide the plateau in a general way into three longitudinal strips, designated in the past as Eastern, Central and Western Cordilleras, and still popularly so-called. Crest-lines and major valleys trend with the axes of the mountain folds, showing that the streams follow broader structural depressions and that residual mountain masses survived because of greater resistance. Isolated volcanic peaks in southern Peru are not survivals, but are superimposed on the plateau surface. Erosion of these peaks has played an important part in levelling mountain basins, many of which are the result of drop-faulting accompanying the general elevation. The Cordillera Oriental has a central core of granite and gneiss, flanked by shales, slates and schists, with infolded limestones and sandstones. The surface of the plateau, where not covered by volcanic extrusives or alluvium, is sedimentary, largely limestone and sandstone deposits dipping west. The same formations in the Cordillera Occidental have been so deformed and metamorphosed by igneous intrusions, andesite, porphyry and diorite, as to be almost unrecognizable. In places they are covered by volcanic lavas and ash, and are much dissected by entrenched streams. The coast area consists of sedimentaries and late volcanic products; most traces of sub-strata are obscured except in river valleys. The maturely dissected coast range between 14° and 16° S. is composed of granitic rock of uncertain age. Other outcrops exist at frequent intervals along the coast. As the zone has been recently uplifted, the sea-cliffs are largely composed of stratified conglomerate, sands and clays, with broken shells and detrital material from igneous rocks interbedded with sand. The eastern lowlands do not resemble the structure of adjacent mountains, being unlike the western lowlands in this respect. The foot-hills are composed of upturned beds of sandstone rising above the level of the plain. Surface conglomerates are somewhat dissected and covered by present river gravels (*see* ANDES).

Coast Zone.—The coast zone varies in width and topography. At the north it is a plain more than 100 m. wide, gently sloping toward the sea, where it terminates in a bluff. At the south it is a more elevated plain, separated from the coast by a range of low hills, differing in topography and climate from the rest of the coast. Here fog prevails much of the year, causing intermittent vegetation, enough at times for pasture. Though excellent crops, such as olives and grapes, are raised in the deeply entrenched valleys, comparatively little is exported, as there are few ports. Mollendo, the largest, serves only the *sierra*. Valleys north of Lima are given over to industrial crops, mostly sugar and cotton. They monopolize the water, have eliminated food crops and restricted pasture. Dispossessed Indians take refuge in the valley-heads. Valleys near Lima are intensively cultivated in order to supply the capital with food; its white towers are surrounded by market-gardens and plains of alfalfa with grazing cattle. The coastline is remarkably straight, usually steep, with occasional stretches of beach and but few real harbours; those which are most sheltered are too shallow or too far from productive areas. A thick mantle of wind-blown sand covers the desert surface, forming in some localities crescent-shaped sand-dunes (*médanos*). The islets are barren and rocky. From north to south the more important are Lobos de Tierra and Lobos de Afuera; San Lorenzo (1,050 ft. high, 1 by 4½ m. in extent), which protects the harbour of Callao, and near Pisco bay rugged San Gallán and the three Chincha islands, famous for their guano.

Sierra.—The southern Cordillera Oriental, a grandiose wilderness of craggy peaks and ridges, mostly snow-covered, loses its high-mountain character north of Cerro de Pasco; the extensive *puna* has no parallel in the north, and the volcanic cones of the Cordillera Occidental, so marked a topographical feature in the south, are entirely absent north of Lima.

Sections of the *sierra* may be briefly summarized as follows: In southern Peru the *puna*, or *altiplano*, is overshadowed on the east by the Cordillera Oriental (Real) and on the west by the Cordillera Occidental. It is a vast intermontane basin, roughly 500 by 100 m., sloping gently to the south, very high, cold and dry. Upon it, ranges of low hills alternate with alluvial tracts, salt swamps and many lakes, the largest of which is Titicaca. At an altitude of 12,466 ft., Lake Titicaca is 130 by 41 m., with an average depth of 100 ft. (maximum about 1,000 ft.). Well defined on the east, the bordering scarps of this great tectonic depression are concealed on the west by thick lava-flows. Near the lake, crops of barley, *quinoa* and potatoes are grown, while the western part of the plain is pastoral, covered with grass and occasional stretches of bushy growth. Puno is the only large town. Seen from the western slopes of the Cordillera Occidental, the even sky line of the lava plateau is broken by a series of volcanic peaks, some eroded, some symmetrical. They are isolated, snow-capped, dormant or extinct, 19,000 to 20,000 ft. in height (Coropuna, 21,703 ft.). Earthquakes are frequent throughout this area. The bordering scarps of the *altiplano* converge on the north at the Nudo de Vilcanota (14° 26′ S.). In the valley of the Huatanay, 11,000 ft. high, is the ancient city of Cuzco. In this beautiful, luxuriant valley enclosed by mountains the Incas founded their great empire. Between 12° and 14° S. the heart of the *sierra* is a wilderness of gorges with cliffed sides, some over 6,000 ft. deep. Into these it is usually impossible to descend. The valley of the Apurimac is spectacular, its highly-coloured walls with tufts of cactus reaching from fever-ridden floor to snowy peaks. Between 10° and 12° S. the *puna* is called the Pampa of Junín. It has many lakes, the largest of which is Lake Junín (Chinchaicocha), 20 by 7 m., altitude 13,415 ft. From it the Mantaro flows south across the plain—a deep, silent, swift-flowing stream. The chief activities in Junín are mining and pastoral, the only crops, potatoes and *quinoa*. North of the Pampa of Junín is the Cordillera de Huayhuash as the Nudo de Cerro de Pasco is now called, a desolate mining region. North of this, the western chain is divided in two Cordillera Negra, toward the west, and Cordillera Blanca, so called because of its snow-caps. The latter (8° 43′ and 9° 53′ S.) is about 70 m. long, its average height 15,000 ft., and its highest peak, Huascarán (22,180 ft.), a laccolith of granodiorite. Inhabitants are few, Indians living on slopes and valley moraines in



A LLAMA PACK TRAIN PASSING A WAYSIDE SHRINE

small groups of huts like animal burrows. The Cordillera Negra (8° 43′ S. and 10° 11′ S.) is about 100 m. long and about 14,000 ft. high (maximum 16,000 ft.). The bare, dark-grey rocks and even skyline contrast with the sharp peaks of the Cordillera Blanca. It is an unbroken wall without practicable passes. Between the two ranges lies the fertile valley of the Huaráz, averaging 25 m. in width, one of the most thickly settled parts of the *sierra*. The river flows north through a series of basins each with its town—Recuay, Huaráz, Yungay, Caráz, Huaylas, strung like beads upon a thread, responding to the presence of good soil, water and favourable climate. Temperate zone crops are raised in upper reaches of the valley and tropical in the lower, known as the Callejón de Huaylas. At 8° 40′ S., the Huaráz, now called Santa, cuts the Cordillera Negra at right angles and crosses the desert to the Pacific. Two great rivers. Marañón and Huallaga, rise on the northern slopes of the Cordillera de Huayhuash. The valley of the Marañón, 500 m long, (4° 30′–10° 20′ S.) and for most of that distance more than a mile deep, is east of the Cordillera Blanca and parallel to it. In the rainy season the Marañón is impassable. It cuts the Cordillera Oriental at the Pongo de Manseriche (4° 25′ S.) and flows toward the Atlantic. The valley of the Huallaga, farther east than the Marañón, is more open and populated Huánuco, in the upper valley, communicates by a good road with Cerro de Pasco. The Huallaga cuts the eastern chain at the Pongo de Aguirre (6° 30′ S.). North of 8° S the cordilleras gradually subside. There are no more snowy peaks The *jalca*, 7,000 to 9,000 ft. high, is covered by dense steppe vegetation with little seasonal variation, and much dissected by youthful valleys, some being canyons with vertical walls and narrow floors The ancient town of Cajamarca is the agricultural centre of the northern *sierra*

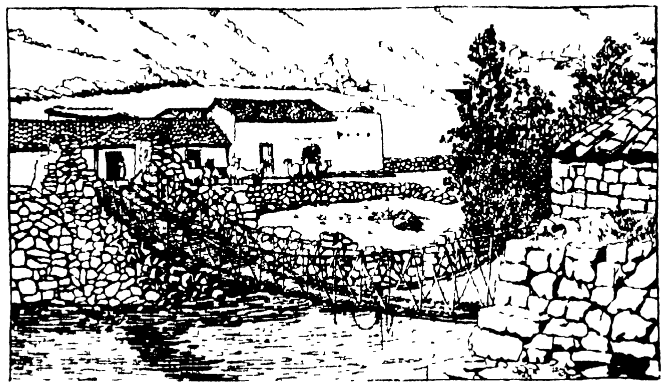
Throughout the length of the Peruvian Andes there are 27 practicable passes, most of which are over 12,000 ft high The highest in use, between Antabamba and Cotahuasi, is 17,400 ft., the lowest in the far north at Huarmaca (Piura), 7,085 ft. high

Montaña.—The heavy precipitation on the eastern slopes of the eastern cordillera results in some of the profoundest erosion in progress to-day The soil on the valley bottoms is a rich, alluvial fill, adapted to tropical crops Sides of lower valleys, as well as slopes of mountains and foot-hills, are covered with impenetrable forest shrouded in mist

The steaming equatorial basin below is an endless blue-green lowland with ranges of low hills, and here and there a glimpse of the windings of shining rivers which disappear in the mists of the horizon These plains at the foot of the Cordillera Oriental are less than 1,000 ft. above the sea, usually much less Topographically Amazonia is monotonous but botanically it is most diversified.

Climate.—Though there are three major climatic controls in Peru, latitude, ocean and the Cordillera de los Andes, the last is by far the most important. Change of climate is sought not by travelling north and south, but up and down, from west to east A frigid zone can be reached in a few hours of ascent from tropical lowlands. Rainfall, which is heavy on the east, increases up to a certain height, decreasing from east to west across the *sierra*. The south-east trades sweep across the warm lowlands of Amazonia, filled with moisture. Confronted by the Andes, they are forced to rise, are chilled and heavy rains result The annual rainfall on the lower eastern slopes of the Peruvian Andes is 150 in or more Swollen streams give rise to the world's greatest river-system The trades cross the mountains and in descending do not again reach sea-level until 50 to 100 m off shore. The Humboldt or Peruvian current, a mass of cold water about 150 m. wide, sweeping up from the south along the coast brings cool, moist south and south-west winds, which, meeting the warm air over the land, cause fogs (*garúas*) along the southern coast. They are about 1,500 ft. thick and extend about 5 to 15 m. inland. North of 8° S. there are none whatever, but a summer rainfall of a few inches occurs every few years, as in 1925. There are no electrical storms on the coast.

Climatic provinces are distinguished chiefly by variations in rainfall. From east to west, *montaña* and *ceja de la montaña* have precipitation throughout the year, heaviest in summer. *Sierra* rainfall, confined to summer, diminishes both in quantity and in length of season toward the south. The rainfall of the higher western slopes resembles that of the *sierra*, the amount of precipitation diminishing with altitude, disappearing entirely at altitudes which vary with latitude and exposure. (1) The immedi-



ANCIENT SUSPENSION BRIDGE OF NATIVE CONSTRUCTION IN CENTRAL PERU. A HERD OF LLAMAS IS STANDING ON THE FARTHER SIDE

ate coast zone, though desert, has a cool, damp climate with small annual and diurnal variability Mean annual temperatures at the north average about 10° F warmer than those at the south (Paita 75° F, Mollendo 65° F). The western slopes below 4 to 6,000 ft, though averaging about the same, have greater diurnal ranges of temperature This uniformity, interrupted by no storms and no sudden changes of temperature, is very monotonous, especially since the skies, as far north as 8° S, are covered with clouds during more than half the year, though the total annual rainfall is under 2 inches. (2) The summer-rain zone is an extremely complex province. It includes, besides the western slopes above the rainless zone already described, the summit region above 15,000 ft., desolate, high plateaux, intermont basins and deep canyons, whose climates range from equatorial to frigid Climates in Peru depend primarily on altitude, deep valleys are tropical to semi-tropical, depending on depth, valley-trend, slope and exposure Mean annual *puna* temperature averages about 50° F, with greater diurnal than annual range With an average relative humidity of 50%, the mean annual rainfall is 25 in at the south, where it is confined to summer, reaching 40 in in the north, where precipitation occurs in spring, summer and autumn, overlapping the equatorial rainfall type Snowfall occurs south of about 7° S above 12,000 to 13,000 feet. Because of aridity the snow-line is very high. Heat in deep *sierra* valleys is so great and rainfall so slight, that often the narrow floors are semi-desert; while 4,000 to 6,000 ft above those same floors rainfall may exceed 80 inches Similarly, high-level basin stations have less rainfall than surrounding mountains, and irrigation is often necessary. (3) Maximum rainfall is on the eastern slopes between 4,000 and 8,000 ft elevation. Rainfall may be different on opposite sides of a single valley, so that the eastern walls may be grassy, the western forest-covered It probably averages 150 in or more, except where the slopes are protected by foot-hills The mean annual temperature is about 72° to 75° F, with a negligible range (4) Constant evaporation takes place above the great Amazonian wilderness (the area of which equals half that of Europe) and this moisture is again precipitated, to be once more vaporized and condensed With two permanent lows, one near the mouth of the Amazon, into which both north-east and south-east trades flow, and one near the boundary between Bolivia and Argentina, excessively high relative humidity is maintained throughout the year. It is so great that salt dissolves and matches will not ignite unless kept in air-tight boxes Rainfall averages well over 100 in. with winter minimum. The mean annual temperature probably averages 78° F, with a range of 3° F

Hydrography.—The Cordillera supplies three systems of drainage. The first flows toward the Pacific, the largest of these streams (Santa) is the only one to cross the Cordillera Occidental

The second flows toward the Atlantic, including such vast tributaries of the Amazon as Marañón, Huallaga, Mantaro and Apurimac. These clear, quick-flowing streams pass through narrow *pongos* (gateways) and then join the sluggish jungle streams of Amazonia, whose branches spread out over half a continent before reaching the Atlantic, nearly 3,000 miles away. The third is that of Lake Titicaca, an inland system, complete in itself, fed by perpetual snow. *Via* the Desaguadero river, a shallow stream, it empties into Lake Aullagas (Poopó), thence into a series of *salars* (salt swamps) to the south, where its waters eventually evaporate.

Flora and Fauna.—The coast desert seems to be without vegetation except cacti, *Furcraea* and occasional clumps of gnarled *algarroba* trees (*Prosopis juliflora*), the sweet pods of which are used for cattle food. South of 8° S., however, *garúas* are followed by a sparse, fugitive plant cover upon the hills. It springs up as if by magic, growing more luxuriant up to about 3,000 ft., following the mists so closely that it indicates the limit of their distribution. On the other hand, all streams are lined with vegetation—acacia, willow, pacay, pepper-trees, thorny Leguminosae, bushes and tall reeds. Where irrigation is possible there are crops and orchards including such delicious native fruits as *chirimoya* (*Anona cherimolia*), and *palta* (*Persea gratissima*).

The fauna of the coast zone is poor, consisting of rodents, armadillos, bats, scorpions, lizards and poisonous vipers in the sugar fields. There are owls, vultures and birds of prey. Otters live in some of the streams. In contrast is the teeming ocean which abounds in fish and bird life.

In the valleys of the western slopes, xerophytic vegetation may reach as high as 10,000 ft. with geranium, heliotrope, floripondio, fruit trees and temperate zone crops, where irrigated. The zone of seasonal grass-steppe and small perennial plants begins at about 8,000 feet. Above 12,000 ft., the treeless *puna* has hard grasses, mostly *ichu* (*Stipa jarava*). Clumps of *yareta* (*Bolax globaria*) are used as fuel. On low-lying damp lands, distichia moors form a continuous carpet. Lichens and mosses and some Compositae climb to 16,000 feet. Near Lake Titicaca grows the *totora* (*Scirpus riparius*), reeds which in bundles serve to make boats for the Indians. This bleak height is the original home of the potato, *oca* (*Oxalis tuberosa*), *ulluco* (*Ullucus tuberosus*), and *quinoa* (*Chenopodium quinoa*), a grain peculiar to Peru, which heads at high altitudes, and is a staple Indian diet. Barley is the only other cereal which will head at these altitudes. In valleys there is elder, alder and *Cantua buxifolia*, the *cantu* shrub of the Incas, with leathery leaves and large red flowers. There are great stands of *queñuar* (*Polylepis racemosa*), gnarled old evergreen trees 15 to 20 ft. high, and *quisuar* (*Buddleia incana*) on the valley walls, together with a fibrous plant 12 to 18 ft. high, (*Pourretia gigantea*), of which the prickly leaves and thorns are the bane of shepherds. If deep enough, the valley floors have xerophytic vegetation like that of coast valleys (Marañon). Tropical crops are grown in lower valleys, sugar up to about 6,000 feet.

The Camelidae are the most important animals of the *sierra*, llamas, alpacas, huanacos and vicuñas. Two rodents, viscacha and chinchilla live among the rocks. There are quantities of water and game-birds on the clear lakes and several species of fish. The condor (*Sarcoramphus gryphus*) is seen in the loneliest places.

The tropical rain-forest of the *montaña* extends up the eastern slopes to 8,000 ft. or more, even crossing the divide north of 8° S. It is a dense mass of vegetation, with occasional openings of soft, short grass which increase in extent above 6,000 feet. Nowhere is nature more prodigal. Cabinetwoods, dyes, aromatic plants and spices, rubber, vegetable-ivory—the list of beneficent plants is inexhaustible. Animal life is identical with that of Brazilian Amazonia. (*See* AMAZON: *Flora and Fauna.*)

Population.—Though the exact population of Peru is unknown, it is estimated at 5,000,000. More than half are *sierra* Indians, and of the rest, the majority are half-breeds (*mestizos*), the others, whites, negroes and Asiatics. The original Spanish stock numbers less than 500,000, mostly members of the governing and professional classes. There are three types of Indians, *Quechua*, (the majority), *Colla* or *Aymará* (in the Titicaca basin), and *Chuncho*. The *sierra* Indian is very strong, silent and apathetic and stolidly endures hardship. He resists cold and is able to carry great weights for long distances. His homespun clothing has altered little since the conquest. His house is a thatched stone hut with a door for its only opening. His food is dried mutton, salt beef or llama meat, maize, *oca*, frozen potatoes and cakes of *quinoa*. The universal beverage is maize *chicha*. His implements are few and simple. Only *coca* and alcohol induce him to toil for more than bare necessities. His occupations are live stock raising, primitive agriculture, mining and driving pack-trains. He travels day and night, if necessary, following his flock of llamas with hoarse cries, throwing his sling, climbing rocks, fording streams, crossing the puna, sleeping anywhere at night in spite of snow and hail-storms. The life of an Indian consists of two parts, drudgery and orgies on feast days. Indians of the *montaña* (*Chunchos*), divided into scores of tribes speaking as many languages, differ greatly in habits and customs. These tribes, isolated and independent, are all in a low state of culture (*see* BRAZIL). Coast Indians, mostly half-breeds, have special terms for all degrees of colour and race. Negroes, introduced as agricultural slaves shortly after the conquest, live only on the coast. They were emancipated in 1855. The first Chinese coolies were brought under contract for the extraction of guano in 1849. Most of them went to the Chincha islands, and after the guano boom subsided, became agricultural labourers, or artisans and small shopkeepers. In Lima there is also a Japanese colony; about 2,000 arrived in 1926–27. Foreign population is chiefly concentrated in Lima and Callao. Several hundred eligible colonists arrived in the eastern valleys in 1926–27, mostly Poles. Spanish is the official language of Peru.

SIERRA INDIAN BEFORE THE DOOR OF HIS THATCHED STONE HUT

Public Health.—Common diseases are malaria, tuberculosis and bubonic plague. Permanent commissions for the study of malaria and tuberculosis were appointed by the Government in 1926. Yellow fever, which used to sweep the coast, has been stamped out, largely by the efforts of the International Health Board of the Rockefeller Foundation. The source of *verruga peruana* (Carrion's disease), peculiar to Peru on the upper, western slopes of the cordillera, has been traced. Hospitals can accommodate only a fraction of the ill. The Government is constructing hospitals, prisons, markets and other public buildings. A most comprehensive undertaking is that of city sanitation. Thirty-two cities are being supplied with water and sewage systems.

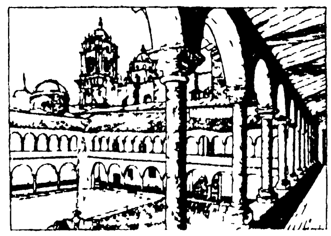
Education.—A new education law was put into effect in 1921. Primary instruction, which is free and compulsory between the ages of 6 and 14, covers 5 years. Vocational training is given in both common and special schools. In 1926, 262,267 pupils were enrolled in 3,330 public primary schools, with 5,487 teachers. Secondary schools (*colegios nacionales*) have an attendance of about 5,326. Convent instruction is traditional for girls. In spite of an excellent system, there is still much illiteracy.

There are four universities, of which the largest and most famous is the Universidad Mayor de San Marcos in Lima. It was founded by a grant from Charles V. in 1551, and is the oldest university in the New World. The University of Cuzco was founded in 1598, Arequipa in 1821 and Trujillo in 1824. There are about 2,000 university students.

A School of Civil and Mining Engineering was established at Lima in 1876. There are in addition, military, naval, agricultural and commercial schools and several agricultural experimental stations. The Government maintains academies of medicine, music and the fine arts, a national museum, national archives, meteorological and magnetic observatories and many learned scientific bodies. The national library, founded in 1821, was pillaged

by Chileans during the War of the Pacific. After the evacuation of Lima by Chile, Ricardo Palma devoted his life to the recovery of the scattered books and manuscripts. The Geographical Society of Lima (1888), is the chief centre of scientific study, while the Historical Institute of Peru (1905) and the Athenaeum (1877) are also important organizations (*see* LIMA).

Science and Literature.—Peruvian literature does not antedate the Spanish conquest. The Quechua drama, *Ollanta,* which purports to be pre-Spanish, was really written about 1770. The earliest accounts of Peru and its inhabitants were chronicles written by eye-witnesses. Chief among them are the *Comentarios reales* by Garcilaso de la Vega (1539–1616), whose mother was of the Inca blood-royal, *Crónica del Perú* by P. de Cieza de León (1553) and *Historia natural y moral de las Indias* (1590), by José de Acosta Several chronicles, including the *Royal Commentaries,* have been translated into English by Sir Clements R. Markham, and published by the Hakluyt Society of London The bulk of 17th and 18th century literature is history, accounts of exploration or raids of British pirates Many scientific investigations during the last half of the 18th century are embodied in *El Mercurio Peruano,* a periodical founded by Hipólito Unánue in 1791 Dr Unánue wrote a book on the climate of Lima, founded the *Anfiteatro Anatómico* in 1792, and the Colegio de Medicina de San Fernando in 1811 The most prolific writer of the colonial period was Pedro de Peralta Barnuevo (1663–1743), who was not only poet-laureate of the viceroy, but wrote more than 60 astronomical and mathematical works. In the late 18th century there were many scribblers of light, humorous verse and pleasant romances; devotional writings in both verse and prose and dramas for instructional purposes Mariano Melgar (1791–1815) wrote plaintive love-songs and patriotic odes After Peruvian independence (1821), both science and literature gained new life Mariano Eduardo Rivero with J J. von Tschudi published *Antiguedades Peruanas* in 1851, one of the earliest scientific studies of pre-hispanic culture in Peru. *Geografía del Perú* by Mateo Paz Soldán appeared in 1862; his *Diccionario estadístico y geográfico del Perú* in 1877. The most important works during this period were those of the Italian savant, Antonio Raimondi (1825–90), embodied in *El Perú: estudios mineralógicos,* etc., Lima (1874–1902) and of Manuel de Mendiburu (1805–1885), *Diccionario histórico-biográfico del Perú* (1890)



COURTYARD OF THE UNIVERSITY AT CUZCO, AN INSTITUTION OF LEARNING FOUNDED IN 1598

Political satire in verse and prose, eulogies of liberty and odes to civilization characterized the literature of the revolution. About 1830 this artificiality gave way to romanticism. Felipe Pardo y Aliaga (1806–68) and Manuel Ascensio Segura (1805–71), who wrote comedies about the established order, are the founders of the national theatre. Among writers since their day three are pre-eminent. Ricardo Palma (1833–1919) recreated anecdotes of the colonial period in six volumes of *Tradiciones Peruanas,* a treasure house of Peruvian history and culture. Manuel Gonzáles Prada (1848–1918) was a poet, radical philosopher and essayist. José Santos Chocano (1875–), the poet, belongs to a new literary school. His inspiration is the geography, history, flora, fauna, legends and mythology of Peru. Literature since the declaration of the republic has been studied by José de la Riva Agüero in *Carácter de la literatura del Perú independiente* (1904) and by Ventura García Calderón in his anthology, *Del Romanticismo al Modernismo* (1910). Francisco García Calderón is internationally known for essays on contemporary history, philosophy and literature (*Le Pérou contemporain,* 1907, and *Démocraties latines de l'Amérique,* 1912). There is (1928) a host of younger writers in Peru, some of whom, like Luis Alberto Sánchez (1901–), have already attained fame. Among contemporary men of learning may be mentioned Julio C. Tello and Luis E. Valcarcel (archaeology); H. H. Urteaga and Carlos Wiesse (history); Victor M. Maúrtua (jurisprudence); Federico Villarreal (mathematics); and Oscar Miró Quesada (philosophy). A recently developed type of architecture (neo-Peruvian) combines Inca and Spanish colonial characteristics. There are several artists of international reputation, such as Carlos Bacaflor. Among composers, J. Valle-Riestra has written several operas, the most famous of which, *Ollantá,* was inspired by the Indian music of the *sierra.*

Religion.—The Roman Catholic Church is protected by the Government. There are ten dioceses: Lima, (an archbishopric), Arequipa, Puno, Cuzco, Ayacucho, Huánuco, Huaraz, Trujillo, Cajamarca and Chachapoyas Each diocese has its seminary for the education of the priesthood, that of Arequipa being renowned for its influence in church affairs The church owns 3,552 monasteries, churches, and other buildings. There is a Catholic university in Lima The city of Lima has produced two saints, St. Toribio, archbishop from 1578 to 1606, and Santa Rosa, patron of Lima (1586–1616) Nine strictly religious festivals are public holidays. There are Anglican Churches in Lima and other cities.

Political Divisions.—Under the Spaniards the country was divided into *intendencias,* renamed "departments" by the republic (1821). Departments are sub-divided into provinces, and provinces into districts. There are at present 20 departments (including Tacna Libre), two littoral provinces and the constitutional province of Callao. The departments, with their areas, capitals and estimated populations are as follows.—

Departments	Area square miles	Population estimated	Capitals
Amazonas	13,947	70,876	Chachapoyas
Ancachs	14,705	386,463	Huaráz
Apurimac	8,189	177,387	Abancay
Arequipa	21,052	229,007	Arequipa
Ayacucho	18,190	302 469	Ayacucho
Cajamarca	12,541	442,412	Cajamarca
Callao (province)	14	53,258	Callao
Cuzco	55,731	438,646	Cuzco
Huancavelica	8,300	223,796	Huancavelica
Huánuco	15,430	145,309	Huánuco
Ica	9,799	90,962	Ica
Junín	22,820	394,303	Cerro de Pasco
Lambayeque	4,615	124,091	Chiclayo
Libertad	10,209	250,931	Trujillo
Lima	15,052	423,729	Lima
Loreto	163,283	100,506	Iquitos
Madre de Dios	58,842	16,000	Maldonado
Moquegua (province)	5,550	42,604	Moquegua
Piura	15,239	213,909	Piura
Puno	26,140	537,345	Puno
San Martín	17,450	70,361	Moyobamba
Tacna Libre	3,100	15,700	
Tumbez (province)	1,501	8,602	Tumbez

Cities.—There are but five cities with over 15,000 inhabitants: Lima, Callao, Arequipa, Cuzco and Cerro de Pasco. On the coast, the largest settlements are not ports, but towns in the fertile valleys a few miles inland. Ports usually consist of offices and warehouses near the landing-stage on an open roadstead and a cluster of adobe houses. Towns in the *sierra* coincide with agriculturally productive areas, intermont basins (Cajamarca, Cuzco), or rich valleys (Huaráz, Huancavelica), except for mining communities In the *montaña* there are river ports, but only one town of importance (Iquitos). Towns are all built on the same plan—a quadrangular plaza surrounded by public buildings. The church is often a fine example of Spanish colonial architecture The condition of the plaza is an index of the prosperity of the community. Streets, crossed by others at right angles, extend from it in parallel lines. The houses, usually of adobe, are built around courts, and are one or two storeys high, the second with a balcony encircling the patio Windows overlooking the street are covered with iron grilles Flat roofs characteristic of the coast are replaced in the *sierra* by high-pitched tile roofs.

Communications.—At the fall of the Inca dynasty there were two longitudinal highways from Cuzco to Quito, each about 2,000 m. long, one in the *sierra,* one along the coast, and many cross-roads. But as these were destroyed or allowed to fall into decay

by the Spaniards, Peru has been for the last 400 years practically without roads. The programme of construction authorized by Congress in March 1920 is of first importance in a country where the natural resources of adjacent regions are so unlike that they are mutually dependent. This plan included the construction of two longitudinal trunk-lines, one in the *sierra*, one along the coast, and a series of cross-roads, thus reverting to the plan of the Incas. More than £P400,000 was voted for road construction in 1926, and £P700,000 in 1927. Every citizen must give direct or indirect road service. In 1926 there were 6,600 m. in use, and 5,398 m. under construction. The coast road from Zarumilla to Mollendo is actually in use throughout a distance of 1,500 m., including the environs of Lima, where more than 100 m. of modern asphalt and concrete paving has already been laid. The *sierra* road is much less advanced. Finished sections include those in the Huaráz valley, Huánuco to Huancayo and Pampas, and Cuzco to Desaguadero, more than 400 m. in all. Transverse roads ascending the rocky *quebradas* from the coast end either at *sierra* towns or cross to river ports of the *montaña*. Of the latter, the most important unites the port of Paita with Yurimaguas on the Huallaga, which is in constant communication with Iquitos and the Atlantic.

The first South American railway, between Lima and Callao, was opened in 1851, the first line of penetration, between Mollendo and Arequipa, in 1869. The next few years were the golden age of construction. The War of the Pacific put an end to this activity in 1879. In 1926, there were 2,523 m. of railways of various gauges, 80% of which were under the management of the Peruvian Corporation, Limited. The two most important systems are the Central (259 m.) and Southern (569 m.). The Central Railway runs from Callao to Oroya, thence south to Huancayo and Huancavelica. Between Lima and Oroya, there are 65 tunnels and 67 bridges and the divide is crossed at 15,665 feet. It is the highest standard-gauge railway in the world; its construction, begun by Meiggs, was a famous engineering feat. (*See* CERRO DE PASCO.) The Southern railway runs from Mollendo to Lake Titicaca, 326 m., and connects with steamers to Bolivia. The highest point is Crucero Alto (14,666 ft.). A branch from Juliaca runs to Cuzco (210 m.). The Peruvian Corporation operates several lines from seaports to towns a few miles inland. £P633,070 were spent on construction in 1926 as against £P484,900 in 1925. Power for electric traction and light for Lima is supplied by the Rimac.

The most important means of communication in the *montaña* is river transportation. There are 3,000 to 4,000 m. of navigable tributaries to the Amazon. The chief port is Iquitos on the Marañón, 2,653 m. from the Atlantic. Two British lines of steamers, the Booth and Red Cross lines, ply between Iquitos, England and New York. On the Huallaga is Yurimaguas, about 500 m. upstream from Iquitos, connected with it by a regular line of steamers. A railway from Yurimaguas to the Pacific coast is under contract. On Lake Titicaca steamers ply regularly between Puno and the Bolivian port of Huaqui, a distance of about 50 miles. This line is one of the highest in the world.

The Marconi Wireless Telegraph company administers (1928) the postal and telegraph services. The telegraph dates from 1864 and there are 10,557 m. of lines; but the cost of construction in the *sierra* is so great that the Government is substituting wireless telegraphy. First established in 1908, there are now about 15 stations. A national telephone company operates the system of Lima and surrounding districts, with about 8,000 telephones and about 11,000 m. of lines. There is an army air service and naval aviation service. Two submarine cables connect with London and New York. The Compañía Peruana de Vapores is the only national steamship line operating on the coast. The Peruvian merchant marine consisted in 1925 of 23,000 tons. There are ten first class ports: Talara, Lobitos, Paita, Pacasmayo, Pimentel, Salaverry, Callao, Pisco, Mollendo and Iquitos. Most importing is done through Callao (*q.v.*); but the petroleum port of Talara nearly equals it in exports. Several foreign steamship lines carry coastwise traffic. There are (1927) 21 lighthouses on the coast, five of which have a visibility of more than 20 m.

Commerce.—During the colonial period foreign trade was confined to Spain; export was mainly silver. After independence (1821), export of guano and nitrate became the chief source of revenue; from 1851–72, guano worth more than £75,000,000 was exported. The War of the Pacific took the nitrate provinces from Peru in 1879 and trade was paralysed. Until 1914 it recovered slowly. European demand for Peruvian products as a result of the World War brought a period of fresh prosperity. Large North American investments and Peru's need for manufactured products have increased trade with the United States. Countries whose trade with Peru amounted in 1926 to over £P1,000,000 are as follows:—

	Imports	Per cent of total imports	Exports	Per cent of total exports
	£P.		£P.	
United States	9,037,094	46·2	8,258,009	34·5
United Kingdom	3,052,752	15·6	6,841,246	28·5
Argentina	95,761	·5	2,641,401	11·0
Canada	212,570	1·1	1,375,029	5·7
Chile	427,466	2·2	1,992,206	8·3
Germany	1,927,319	9·9	384,707	1·6

While the total foreign trade in 1913 was £P6,088,777 (imports) and £P9,137,181 (exports); in 1927 it was £P18,735,421 (imports) and £P28,931,507 (exports). The chief exports of Peru are petroleum, cotton, sugar, copper, mineral concentrates, wool, silver, gold, hides and skins. Wild rubber, until recent years a large item of export, is now unimportant. The chief articles of export in 1926 were as follows: Petroleum and derivatives, 1,198,756 tons (£P7,421,128); cotton, 50,234 tons (£P4,593,939); copper, 44,805 tons (£P4,247,986); sugar, 329,779 tons (£P3,604,995). Imports are mostly machinery and manufactured goods from the United States and the United Kingdom, in 1926 those from the United States being nearly three times those from the United Kingdom, its nearest competitor. In 1926 the chief imports were cotton textiles, manufactured metal articles, wheat, lumber, agricultural and mining machinery and woollen textiles.

INDIAN OF SOUTH-CENTRAL PERU GUARDING A FRAME ON WHICH BALATA (CHICKLE GUM) IS DRYING

Agriculture.—Under the Inca empire agriculture achieved a perfection never equalled since. During this period the potato was developed from the wild, bitter tuber, and other plants as well. Total lands cultivated at present are estimated at about 4,000,000 acres. The chief vegetable products are cotton and sugar. Cotton is indigenous and has been cultivated since pre-Columbian times. Most of the crop is grown in northern irrigated coast valleys: Peruvian cotton (*Gossypium Peruvianum*), full rough and semi-rough, grown in Peru only, chiefly in Piura; Egyptian (*Gossypium herbaceum*), the "upland cotton" of the United States; *mitafifi*, a variety of *Gossypium barbadense; tangüis*, a native blend of rough and smooth, which although of recent origin, now constitutes four-fifths of the entire crop. Production is steadily increasing, export having reached 8,000 tons in 1900 and 50,234 in 1926. Sugar-cane has been cultivated in Peru since 1545, total production, 375,963 tons in 1926. The principal centres of production are the valleys of Libertad and Lambayeque. About 50,000 tons of sugar and 6,000,000 litres of pure alcohol are consumed annually in Peru. Wheat has been grown in the *sierra* since the conquest; annual production averages 80,000 tons, about one-half national requirements. Rice was introduced in the colonial period and about 35,000 tons are produced annually. Maize is the staple food everywhere. There are many fruits, but beyond local market demands, their commercial production is limited to grapes and olives from southern coast valleys. Wheat, barley, oats, *quinoa*, alfalfa, maize, *oca* and potatoes are the principal *sierra* products. Potatoes and *quinoa* are the only crops above 13,000 feet. Cattle

have been raised ever since Spanish occupation. They are commonly small and hardy. Sheep are bred chiefly for their wool, and goats are raised for their skins and fat. Swine-breeding for lard is important in some coast valleys. Horses are bred on a small scale, also mules for mountain travel. The llama is used as a pack animal, and the alpaca for wool, hides and meat. Wild vicuña wool is highly prized and its export prohibited. The llama was the only beast of burden before the conquest and it is still indispensable on difficult trails. Most of the world supply of alpaca wool comes from Peru. The export of wool in 1926 was 4,161 tons, valued at £P518,192. *Montaña* and *ceja de la montaña* crops include sugar, tobacco, sweet potatoes, cacao, vanilla, coffee, bananas and yucca. The export of Peruvian bark (*Cinchona officinalis*) is no longer important. The Peruvian supply is practically exhausted by destructive methods employed in collecting the bark. Quinine, extracted from it, is now imported in manufactured form. Coca (*Erythroxylon coca*) is a product peculiar to the eastern slopes of Bolivia and Peru; it is a medium of exchange in the *sierra*, the Indian's cure-all. By masticating the leaves he is able to perform incredible tasks with little food. Guano exerted a profound influence on the economic and political life of Peru during the past century. Though used by pre-historic peoples, it was not exploited until 1841–79, when it became the chief source of revenue. The birds which deposit it are so numberless that they cover the islands with a living carpet and fill the air with clouds that obscure the sun. Among them are cormorants, pelicans, gannets, penguins, gulls and terns. The actual deposits are now protected by law, since "mineral" deposits, over 3,000 ft. thick, were largely exhausted during the boom. About nine-tenths of the total output is now used for domestic agriculture. In 1926–27, 98,196 tons were extracted. The prime requisite of agriculture on the Peruvian coast and in parts of the *sierra* is irrigation. Pre-Hispanic Indians built aqueducts, some of which are still in use. The Government has returned to vigorous support of irrigation projects. About 640,000 ac., an area which yields almost half the agricultural produce of the country, are at present irrigated. The most important project under construction is that of diverting the Huancabamba river to the Pampa of Olmos. It includes drilling 18 m. of tunnels through the continental divide and constructing two hydro-electric dams 150 ft. high.

Mining.—Peru is the classic land of gold and silver. Its yield has been so great that it smacks of legend. The conquerors enslaved the Indians and by forced work in the mines filled the coffers of the Spanish kings. This was responsible for wholesale destruction of the Indian population. Up to 1603, the "King's Fifth" from the mines had amounted to £60,000,000, largely silver. With the republic, mining declined, chiefly because guano could be easily exploited. But after the establishment of the National School of Mines (1876) the industry revived. Large North American investments have resulted in an increase in export value from £P610,000 (1896) to over £P12,000,000 (1926). Petroleum, copper and silver constitute 80% of mineral output. Gold, silver, copper, mercury, lead, zinc, nickel, iron, manganese, tungsten, vanadium, antimony, bismuth, molybdenum, mica and coal are found in the *sierra*. On or near the coast are coal, salt, sulphur, borax, nitrates and petroleum. The total value of mineral production in 1926 was £P22,453,627 as against £P4,495,753 in 1913, most of which, except coal for smelting, was sent to the United States. First in importance is petroleum. The producing area lies between 3° 40′ S. and 5° S. near the coast, and has been worked at intervals since 1880. There are now 1,384 producing wells with an average annual output of 1,500,000 tons, most of which is exported (*see* PIURA). Second in mineral export value is copper. In the Andes silver, argentiferous lead and copper are the most numerous metalliferous deposits and are found and mined together, though primitive silver mines are scattered throughout the *sierra*. Total production was 668,734 kilos in 1926. Copper has become more important than silver, its production steadily increasing (13,474 tons in 1902, to 46,958 in 1927) (*see* CERRO DE PASCO). Gold is found throughout Peru in lodes and alluvial deposits. Sandía and Carabaya (Puno) are the most important centres of production and may have been the source from which the Incas derived most of their store. Total production in 1926 was 2,910 kilos. Vanadium, mined in Junín, is 90% of the world's requirements; 11,927 tons of zinc were produced in 1926. The present coal industry is merely subsidiary, about 150,000 tons annually (*see* CERRO DE PASCO). Mercury is obtained in Huancavelica (*q.v.*). There are numerous unexploited iron deposits. Sulphur is mined in Piura and borax at Salinas (Arequipa). Salt, in all of its forms, is a State monopoly (29,121 tons in 1926).

Manufacture.—In spite of many new enterprises, the country as a whole can hardly as yet be said to have reached the industrial stage of development. The largest plants are copper smelters, oil refineries, cotton and sugar mills. Besides cotton-seed crushing mills and oil refineries, 11 cotton textile mills manufacture the cheaper grades of cloth (about 33,000,000 yd. annually). The output of woollen goods is much less. Eighteen tanneries export about 3,000 tons of hides. Eight shoe factories manufacture 200,000 to 250,000 pairs annually. About 20,000 gal. of castor oil are produced annually, and about 50,000 gal. of olive oil. In Huánuco and Trujillo are cocaine factories. Since 1909 tobacco has been a Government monopoly (over 2,000,000 lb. of cigars and cigarettes produced annually). A Swedish company has a monopoly on the sale of matches. There are chocolate factories and flour mills. The rubber industry, dependent on the exploitation of wild rubber in the *montaña*, is fast disappearing because of unsupervised and primitive methods. About 5,000 doz. straw hats ("Panama") woven of palm leaves (*Carludovica palmata*) are exported annually. It is an historic industry. (*See* LIMA; CALLAO; AREQUIPA.)

Government.—The supreme law is the Constitution of Jan. 18, 1920. Every male citizen over 21, or under, if married, who can read and write, is entitled to vote. There is no woman suffrage. Laws protect and bind everyone equally. Legislation is by a national Congress, a senate of 35 senators and a chamber of 110 deputies; both are elected for five years by direct, popular vote and may be re-elected. They must be native-born Peruvians in full enjoyment of civil rights. The government of departments, provinces and districts is by prefects, sub-prefects and governors; the first two are appointed by the executive, the governors by the prefects. There are three regional legislatures, in the north, centre and south of the republic, with deputies elected by the provinces

THE RUINS OF AN INCA FORTRESS IN THE ANDES
Some of the stones weigh 800 tons and all were put in place without the use of any known machinery

at the same time as national representatives. These legislatures sit annually for a period of 30 days.

The chief executive is the president of the republic. He is elected by direct, popular vote for a period of five years and may be re-elected. He must be 35 years of age, a Peruvian by birth, and ten years a resident of the republic. He names a council of ministers, whose number is designated by law. If he dies or resigns, Congress chooses a new president within 30 days, the council of ministers governing in the meantime. There is also a council of State composed of seven members, appointed by the council of ministers, with approval of the senate. It acts in an advisory

capacity. The ministries are as follows: Interior and Police; Foreign Affairs; Justice, Worship and Education; Finance and Commerce; War; Navy; Public Works. Peru is a member of the League of Nations.

The judiciary is composed of a supreme court in Lima, superior and first instance courts in departments and provinces, respectively, and justices of the peace. Justices and State's attorneys of the supreme court are selected by Congress from ten names submitted by the executive. Justices of the superior court are appointed by the president from a list submitted by the supreme court, and justices of first instance from one made by the respective superior courts. The supreme court has authority over all other courts. No member of the judiciary may hold political office, but justices of the supreme court may be ministers of State.

Army.—The strength of the regular army is 1,006 officers and 6,416 men, that of the national police, 420 officers and 6,380 men. There are no other armed forces. It is estimated that about one-half of the strength of the national police would be available in emergency, to serve as a body. The regular army is organized into four skeleton divisions and a garrison for the *montaña*. Each division has two regiments of infantry, one regiment of cavalry, one regiment of field artillery. For administration and mobilization the republic is divided into five areas. Four of these are divisional regions, with headquarters in Piura, Lima, Arequipa and Cuzco, the fifth is the region of the *montaña*, with headquarters at Iquitos. Military affairs are directed by a general staff. Service is compulsory, but not universally enforced, for all males between 19 and 50. There is a military high school, a staff school and engineering, agricultural and military aviation schools.

Navy.—The navy, practically annihilated in the war with Chile, has cruisers (two light, one auxiliary), a destroyer, six submarines and four gun-boats on the Amazon. In 1920 an American naval mission began reorganization. In 1927 there were 200 officers and 2,000 men. The Naval academy is at La Punta (Callao) and a school of hydro-aviation is at Las Palmas near Lima. Naval aviation has air-mail and passenger services between Iquitos and San Ramón. It comprised 20 officers and 110 men (1927). There is a submarine base at San Lorenzo island (Callao).

Finance.—The present budget system dates from 1922. While revenues in 1896 were only £P1,128,714, they had risen to £P10,219,547 in 1926, when expenditures were £P10,518,689. Although actual expenditures exceeded actual collections by approximately 3% in 1926, in both years revenues actually exceeded the original estimates. Budgetary estimates of receipts and expenditures for the year 1928 are £P11,113,650. Internal taxes are collected by a Tax Collecting company which makes payments to the Caja de Depósitos y Consignaciones, so long as any bonds of the Peruvian National Loan (1926) are outstanding. Fiscal agents of the New York banking house which floated the loan are represented on the board of directors.

The foreign debt began with a small loan of £1,200,000 in London in 1822. Lavish expenditures in spite of ample (guano) revenue had raised the total to £49,000,000 in 1872, on which the annual interest amounted to about £2,500,000, a sum wholly beyond the resources of the treasury. Then came the War of the Pacific (1879–83). By 1889 the total foreign debt, including arrears of interest, was nearly £56,000,000. On Jan. 11, 1890, a contract was made whereby the Peruvian Corporation, Ltd. was formed and the entire external indebtedness of the republic was cancelled in return for certain concessions. Among these were operation for 66 years of State railways, free use of certain ports, right of navigation on Lake Titicaca, exploitation of the remaining guano deposits up to 3,000,000 tons and 33 annual payments of £80,000 each. This contract in modified form is still in force.

On June 30, 1927, the total national debt of Peru amounted to £P20,856,522 of which £P16,030,864 was external, loans chiefly in the United States and United Kingdom. Proceeds of recent loans are applied to railway construction, irrigation and sewage systems and the refunding of loans bearing higher service charges. In 1922 the Banco de Reserva del Perú was established; in addition to its rediscounting functions it regulates the currency. It alone issues notes, secured by a gold reserve. On Oct. 31, 1927, the ratio of gold to paper currency in circulation was over 83%. In Jan. 1928, the Mortgage Bank of Peru and its subsidiary, the Agricultural Intermediate Credit Bank, were established. The capital of the former is £P1,500,000, of the latter £P500,000, held entirely by the parent organization. They facilitate both the placing of mortgages and the extending of agricultural credit.

Currency.—The single gold standard was established in 1897, silver and copper being used for subsidiary coinage. The monetary unit is the Peruvian pound (*libra*, abbr. £P) uniform in weight and fineness with the British pound sterling. Half and fifth pounds are also coined. There are gold notes beginning with ½ *libra*. Silver coinage consists of *sol* (100 *centavos*), half *sol* (50 *centavos*), silver and nickel pieces of 20 (*peseta*), 10 and 5 *centavos* and copper coinage of one and two *centavos*. The change from the double standard was effected without any noticeable disturbance in commercial affairs, but this was in part due to the precaution of making the British pound sterling legal tender in the republic and establishing the legal equivalent between gold and silver at 10 *soles* to the pound. Intrinsically they are still equivalent. Since 1919, however, no gold has been available in payment of notes and none is in circulation, so the currency depreciated in 1928 but recovered early in 1929.

Weights and Measures.—The legal standard is the French metric system. It is in use in the custom-houses and in foreign trade, but the old units are still commonly used among the people. These are the ounce (1·014 oz., avoirdupois); Spanish *libra* (1·014 lb. avoirdupois); Spanish *quintal* (101·43 lb. avoirdupois); *arroba* (25·36 lb. avoirdupois); wine *arroba* (6·70 imperial gallons); *galón* (·74 of an imperial gallon); *vara* (32·91 in.) and the square *vara* (·835 sq.yd.).

History.—Ruins of vast edifices at Tiahuanaco just south of Lake Titicaca, at Cuzco and at Ollantaitambo appear to have been erected by sovereigns with unlimited command of labour. Of their origin nothing is known, for they are entirely unlike the later Inca structures. Settlement of the Cuzco valley by the Incas or "people of the sun" probably took place in the 13th century. They already possessed a considerable civilization. The Peruvian empire dated from the victories of Pachacutec Inca about a century before Huayna Capac, the Great Inca, who died in 1526, one year before Pizarro first appeared. The consolidated empire extended from the river Ancasmayo north of Quito to the Maule in Chile. (*See* INCAS.)

In March 1526, a contract for the conquest of Peru was signed by Francisco Pizarro, Diego de Almagro and Hernando de Luque. In 1527 Pizarro landed at Tumbez. The next year he went to Spain, and in 1531, with his brothers returned to Tumbez. The civil war between Huascar and Atahualpa, sons of Huayna Capac, had been fought out in the meanwhile, and the victorious Atahualpa was at Cajamarca, whither Pizarro with 183 men made his way. On Nov. 15, 1532, after a friendly welcome from the Inca, Pizarro treacherously seized him. In Feb. 1533 Almagro arrived with reinforcements. In spite of fulfilling an agreement to provide a vast ransom in gold and silver, the Inca Atahualpa was murdered on Aug. 29, 1533; in November, Pizarro entered Cuzco. He allowed Manco, the legitimate son of Huayna Capac, to be solemnly crowned. Almagro then undertook an expedition to Chile, and Pizarro founded the City of Kings (Lima), on Jan. 18, 1535. A dispute arose between Francisco, Juan and Gonzalo Pizarro and Almagro as to the limits of their respective jurisdictions; Almagro was defeated near Cuzco in 1538 and executed. His adherents recognized his young half-caste son, a gallant youth generally known as Almagro the Lad, as his successor. Bitterly discontented, they conspired at Lima and assassinated Francisco Pizarro on June 26, 1541. Meanwhile Vaca de Castro had been sent out as governor by Charles V. On Sept. 16, 1542, he defeated Almagro the Lad and beheaded him at Cuzco.

Civil Wars.—The "New Laws" code was enacted in 1542 whereby grants of estates (*encomiendas*) on which the inhabitants were bound to pay tribute and give personal service, reverted to the Crown on the death of the holder. Blasco Nuñez de Vela was sent out in 1544 as first viceroy of Peru to enforce the "New

Laws." Their promulgation aroused a storm among the conquerors. Gonzalo Pizarro rebelled and entered Lima on Oct. 28, 1544. The viceroy fled to Quito, but was followed and killed in Jan. 1546. The "New Laws" were revoked. Pedro de la Gasca, first president of the court of justice of Peru, arrived in 1547, and in April 1548 defeated and executed Gonzalo Pizarro near Cuzco. La Gasca made a redistribution of *encomiendas* to the loyal conquerors, which caused great discontent, and left Peru before his scheme was made public in Jan. 1550 Don Andrés Hurtado de Mendoza, marquis of Cañete, entered Lima as viceroy on July 6, 1555, and ruled with an iron hand for six years. All leaders in former disturbances were sent to Spain. Magistrates were ordered to execute all turbulent individuals. Unemployed persons were sent on distant expeditions. The viceroy came to an agreement with Sayri Tupac, son and successor of the Inca Manco, and granted him a pension. Schools and towns were founded, wheat, vines, olives and European domestic animals introduced. From this time there was a succession of viceroys until 1824 The splendour of their entourage was unexcelled. Meanwhile, in the *sierra,* Indians were being exterminated in an extravaganza of destruction.

Viceroyalty.—Don Francisco de Toledo (viceroy 1569–81), fearing that the little court of the Inca Tupac Amaru might prove rebellious, beheaded the last of the Incas at Cuzco in the year 1571. Toledo's *Libro de Tasas* fixed taxes on the Indians, exempting all under 18 and over 50 In addition to the tribute, there was the *mita,* or forced labour in mines and farms; he enacted that one-seventh of the male village population was subject to paid conscription for this service, but they were not to be taken beyond a specified distance from their homes. This system has become so ingrained that even now, though the Indian is theoretically free, he is incapable of grasping the fact and continues to regard the patron as lord of the land The Spanish authorities, although desiring to protect the people, were unable to restrain distant officials and the country was depopulated by the illegal methods of enforcing the *mita* Moreover, the colonies suffered from strict trade monopoly of Spain, and from arbitrary proceedings of the Inquisition Between 1581 and 1776, 59 heretics were burned at Lima, and there were 29 *autos da fe.* A descendant of the Incas, who assumed the name Tupac Amaru, rose in rebellion in 1780. The insurrection lasted until July 1783; wholesale slaughter followed his defeat

Peru Independent.—Meanwhile the Creoles (American-born Spaniards) had long been shut out from all important official positions Peru was still the centre of Spanish power in South America, though New Granada (Colombia) in 1740 and Río de la Plata (Argentina) in 1776 had been created independent viceroyalties. As military strength was concentrated at Lima, the more distant provinces, Chile and Buenos Aires, were first to declare themselves independent, in 1816 and 1817 But destruction of the viceroy's power at Lima was essential to their continued independent existence A fleet fitted out at Valparaiso, officered by English, convoyed the Argentine and Chilean army under command of the Argentine general, San Martín, to the coast of Peru in Sept 1820 San Martín was enthusiastically received, and after the viceroy had withdrawn, the independence of Peru was proclaimed at Lima (July 28, 1821). On Sept 20, 1822, San Martín resigned his protectorate, and on that day the first Congress of Peru became the sovereign power. It elected Don José de la Riva Agüero first president, in Feb. 1823 He was energetic but unsuccessful; the aid of the Colombians under Simón Bolívar was sought, and Agüero deposed

Bolívar arrived at Lima in Sept. 1823, and organized an army to attack the Spanish viceroy and his forces in the interior. On Aug. 6, 1824, the cavalry battle of Junín was fought near Chinchaicocha. It was decided by a gallant Peruvian charge under Capt. Suárez. Soon afterwards Bolívar left the army and the final battle of Ayacucho (Dec. 9, 1824) was won by his aide, Gen. Sucre Spanish power in Peru was at an end. Gen Bolívar then ruled Peru with dictatorial powers. Upper Peru was given the name of Bolivia and declared an independent republic in 1825 Bolívar left Peru in Sept 1826

Early Presidents.—Gen. José de La Mar, who commanded the Peruvians at Ayacucho, was elected president in Aug. 1827, but was deposed and Gen. Agustín Gamarra, chief of staff in the patriot army at Ayacucho, was elected third president in Aug. 1829. From 1829 to 1844, Peru painfully experimented with independence. The officers who fought at Ayacucho were all-powerful and settled political differences by the sword. Three men during that period are conspicuous: Generals Agustín Gamarra, Felipe Santiago Salaverry and Andrés Santa Cruz. Gamarra never accommodated himself to constitutional usages, but attached to himself many loyal and devoted friends. Born at Lima of pure Basque descent, Salaverry joined the patriot army before he was 15 and displayed audacious valour in many a hard-fought battle. Feeling the guilt of civil dissension, he wrote poems which became very popular. Andrés Santa Cruz was an Indian, his mother a lady of high rank, and he was very proud of his descent. Unsuccessful as a general in the field, he nevertheless possessed remarkable administrative ability and for nearly three years (1836–39) realized his dream of a Peru-Bolivian confederation. But the strong-handed intervention of Chile on the ground of assistance rendered to rebels, ended in the defeat and overthrow of Santa Cruz After this, except for administrations of Gen Ramón Castilla (1845–51 and 1855–62), revolution succeeded revolution for the spoils of office. In 1849 regular payment of interest on the public debt was begun, steam-lines established along the Pacific coast and a railway built from Lima to Callao. Income from guano and nitrate was amounting to several million pounds a year. In 1868 Col. José Balta became president With the vast sums of money at his disposal, he began the construction of public works, principally railways, on a gigantic scale—an orgy of expenditure. He was succeeded in 1872 by Don Manuel Pardo, an honest and enlightened statesman, who tried to compensate for the reckless policy of his predecessor He promoted education, encouraged literature and regulated Chinese immigration to the coast valleys, which from 1860 to 1872 had amounted to more than 50,000. But in general, conditions went from bad to worse. In 1876 Gen Mariano Ignacio Prado was elected president

War of the Pacific.—Peru and Bolivia, alarmed at continued Chilean encroachments in the desert of Atacama, signed on Feb. 6, 1873, a treaty of defensive alliance. On Feb. 14, 1879, Chile, in the course of a dispute over Bolivia's right under treaty to levy an export tax on nitrates, occupied the Bolivian port of Antofagasta, and on April 5 declared war on Peru (*see* CHILE-PERUVIAN WAR) President Prado having left the country to obtain aid, Nicolás de Piérola assumed a dictatorship, and was elected president in Dec 1879 The United States made several efforts to mediate, first in Oct 1880, without success. Chile refused to deal with President Piérola A provisional government under Francisco García Calderón was set up with Chile's approval in 1881, but when that, too, failed to meet their demands, they removed him to Chile; Lima was occupied by Chilean troops, and a reign of terror followed The university was looted and the national library destroyed Occupation continued for over two years. With Chilean support, Gen. Iglesias was elected president in 1883 and on Oct. 20, 1883, a treaty of peace was signed at Ancón Though the invading army left shortly after, Chile maintained a strong force in Lima until July 1884, when the treaty was ratified. The chief conditions imposed by Chile were: Cession in perpetuity and unconditionally of Peru's nitrate province of Tarapacá; possession for a period of ten years of the provinces of Tacna and Arica, at the expiration of which time a plebiscite should decide whether the territory was to remain under the dominion of Chile or continue to form part of Peruvian territory. There was violent dissatisfaction in Peru with the terms of the treaty and President Iglesias was forced to abdicate in 1885; Gen. Cácares succeeded him. The country was in a desperate plight, politically and financially. Not only had many of the ablest leaders been killed, but there was no money for war debts. Morales Bermúdez, elected president in 1890, died in 1894, just before the expiration of his term of office. Disputes as to his successor culminated in a year's fighting. In 1895 Nicolás Piérola became president. He initiated several unpopular reforms and in

Sept. 1899, abdicated in favour of Eduardo de Romaña, the people's choice. The chief problem was still that of Tacna and Arica. Though 15 years had passed, the Chileans still continued in possession. Following the term of Dr. José Pardo (1904–08), Don Augusto B. Leguía was elected president (1908–12); attempted reforms were ineffectual because of shortage of funds. Dr. Pardo entered upon a second term in July, 1915. The World War created a demand for sugar, cotton and copper and Peruvian industry had the greatest boom (1916–18) in the history of the country. (Diplomatic relations with Germany had been severed in 1917.) National finances, however, did not sufficiently profit by the boom. Leguía again became president on July 4, 1919. On July 10 a Constituent Assembly was authorized to alter the Constitution of 1860. The new one, promulgated on Jan. 18, 1920, affects almost every phase of government. From that time to the present (1929)—for President Leguía was re-elected in 1924 for another term, now of five years—there has been steady progress. Efforts of the United States to mediate in the Tacna-Arica dispute are dealt with in another article (*see* TACNA-ARICA).

PERU, a city of La Salle county, Illinois, U.S.A., on the north bank of the Illinois river, immediately west of La Salle and 100 m. S.W. of Chicago. It is on Federal highway 51 and is served by the Burlington Route, the Illinois Traction (electric), and the Rock Island railways. Pop. 8,869 in 1920 (20% foreign-born white); estimated locally at 10,000 in 1928. There are coal mines within the city limits, and the manufacturing industries include the largest alarm-clock factory in the world and large zinc works. The city was founded in 1830 and incorporated in 1845.

PERU, a city of Indiana, U.S.A., 75 m. N. of Indianapolis, on the Wabash river; county seat of Miami county. It is on Federal highways 24 and 31, and is served by the Chesapeake and Ohio, the Nickel Plate, the Wabash, and other railways. Pop. (1920) 12,410 (95% native white), estimated locally at 15,000 in 1928. Peru is headquarters of three large circuses, and during the winter is the home of more wild animals than any other city in the world. Peru was founded about 1834 and was incorporated as a city in 1867.

PERUGIA (anc. *Perusia*), a city and archiepiscopal see of Italy, the capital of the province of Perugia in Umbria situated 1,444 ft. above sea-level. Pop. (1921) 37,701 (town); 72,971 (commune). The town is finely situated upon a group of hills nearly 1,000 ft. above the valley of the Tiber. Its outline is very irregular; from the centre of the town, at the junction of several ridges, parts of it extend for a considerable distance along their summits, being divided from one another by deep valleys. This is the extent enclosed by the mediaeval walls; within them are considerable remains of the lofty terrace walls of the Etruscan period. The so-called Arco di Augusto is a town gate with a Decorated superstructure of the Etruscan period, bearing the later inscription *Augusta Perusia;* above this again is a Renaissance loggia. Five other gates of the Etruscan period can still be traced.

The citadel was erected by Pope Paul III. in 1540–46, after the plans of Antonio da Sangallo the younger, and demolished in 1860. On one side of the Piazza del Duomo stands the cathedral of San Lorenzo, a Gothic structure of the 14th and 15th centuries, in the plan of a Latin cross; on the other the Palazzo Comunale with two fine Gothic façades (1297, completed in 1429–43), with the figures of the Perugian griffin and the Guelph lion above the outside stair; and in the centre the marble fountain constructed in 1277–80 by Arnolfo di Cambio, and adorned with statues and statuettes by Niccolo and Giovanni Pisano. In the Palazzo Comunale is the Pinacoteca Vannucci, with an important collection of Umbrian pictures, of ceramics, and illuminated mss. On the decoration of the Sala del Cambio, close by, Perugino put forth the full force of his genius. San Domenico, a Gothic edifice originally designed by Giovanni Pisano but rebuilt in 1614, contains the monument of Pope Benedict XI., and in its east front a large Gothic window with 15th century stained glass. San Pietro de' Cassinensi (outside the Porta Romana) is a basilica with nave and aisles, founded at the end of the 10th century, remarkable for its conspicuous campanile, its ancient granite and marble columns, its walnut stall-work of 1535 by Stefano de' Zambelli da Bergamo and its numerous pictures (by Perugino, etc.). The oratory of S. Bernardino has an early Renaissance polychrome façade, richly sculptured, of 1457–61, by Agostino d'Antonio di Duccio of Florence. S. Severo contains Raphael's first independent fresco (1505). The circular church of S. Angelo, with antique columns in the interior, probably dates from the 5th century. The university dates from 1307, and has faculties of law, science and medicine; it had 346 students in 1925–26. It contains an important museum of Etruscan and Roman antiquities. Three miles to the S.S.E., lay the Etruscan necropolis. The large tomb of the Volumni (2nd century B.C.) hewn in the rock, with its carved cinerary urns, is interesting. (*See* E. Galli, *Il Museo Funerario del Palazzone all' Ipogeo dei Volunni,* 1921.)

The ancient Perusia first appears in history as one of the 12 confederate cities of Etruria. It took an important part in the rebellion of 295 B.C. and was reduced, with Vulsinii and Arretium, to seek for peace in 294. In 216 and 205 it assisted Rome in the Hannibalic war; in 41–40 B.C., L. Antonius took refuge there, and it was reduced by Octavian after a long siege. A number of lead bullets used by slingers have been found in and around the city. The city was burnt, we are told, with the exception of the temples of Vulcan and Juno—the massive Etruscan terrace-walls, naturally, can hardly have suffered at all. It must have been rebuilt almost at once, but is hardly mentioned except by the geographers until the middle of the 6th century.

In the 9th century, Perugia passed under the popes; but for many centuries the city continued to maintain an independent life, warring against many of the neighbouring lands and cities. It remained true for the most part to the Guelphs. On various occasions the popes found asylum within its walls, and it was the meeting-place of the conclaves which elected Honorius II. (1124), Honorius IV. (1285), Celestine V. (1294), and Clement V. (1305); but when papal legates sought to coerce it by foreign soldiers, or to exact contributions, they met with vigorous resist-

ance. In the 15th century power was at last concentrated in the Baglioni family. Gian Paolo Baglioni was lured to Rome in 1520 and beheaded by Leo X.; and in 1534 Rodolfo, who had slain a papal legate, was defeated by Pier Luigi Farnese, and the city, captured and plundered by his soldiery, was deprived of its privileges. The citadel was begun six years later "ad coercendam Perusinorum audaciam." In 1797 Perugia was occupied by the French; in 1832, 1838 and 1854 it was visited by earthquakes; in May 1849 it was seized by the Austrians; and, after a futile insurrection in 1859, it was finally united, along with the rest of Umbria, to Piedmont, in 1860

PERUGINO, PIETRO (*c.* 1450–1524), whose family name was VANNUCCI, Italian painter, was born at Città della Pieve in Umbria, and belongs to the Umbrian school of painting. The name of Perugino came to him from Perugia, the chief city of the neighbourhood. Pietro was one of several children born to Cristoforo Vannucci, a member of a respectable family settled at Città della Pieve. Before he had completed his ninth year the boy was articled to a master, a painter at Perugia Who this may have been is very uncertain; the painter is spoken of as mediocre, but sympathetic for the great things in his art Fiorenzo di Lorenzo may possibly have been the man. Pietro painted a little at Arezzo, where he may have worked under Piero della Francesca; thence he went to the headquarters of art, Florence It appears to be sufficiently established that he studied in the atelier of Andrea del Verrocchio, where Leonardo da Vinci was also a pupil. The date of this first Florentine sojourn is not settled. In 1475 he was back at Perugia and employed on work in the town hall, which is no longer extant. One of his earlier works now in existence is the fresco, dated 1478, in the church of Castel Cerqueto, near Perugia. Though much ruined it displays a beautifully modelled figure of St. Sebastian. Another early work is the small panel with the "Annunciation" of Conte Ranieri in Perugia, where the influence of Fiorenzo di Lorenzo is apparent. Soon afterwards Perugino proceeded to Rome. His fresco of the Virgin in the apse of St. Peter's was destroyed at the rebuilding of the church. From 1480–82 he worked in the Sixtine chapel. The painting of that part of the chapel which is now immortalized by Michelangelo's "Last Judgment" was assigned to him by the pope; he covered it with frescoes of the "Assumption," the "Nativity," and "Moses in the Bulrushes." These works were ruthlessly destroyed to make space for his successor's more colossal genius, but other works by Perugino still remain in the Sixtine chapel: the "Baptism of Christ" and "Christ giving the Keys to Peter." Pinturicchio accompanied Perugino to Rome, and executed the greater part of the "Baptism of Christ." "Christ giving the Keys to Peter" is the first great work of the master that has survived, and it shows him as a mature artist who had assimilated the Florentine traditions, while keeping the character of the native Umbrian school.

Perugino must have left Rome after the completion of the Sixtine paintings. He visited Perugia and in 1486 was in Florence Here he figures by no means advantageously in a criminal court In July 1487 he and another Perugian painter named Aulista di Angelo were convicted, on their own confession, of having in December waylaid with staves someone (the name does not appear) in the street near S. Pietro Maggiore. Perugino was fined ten gold florins.

Between 1486 and 1499 Perugino resided chiefly in Florence, making one journey to Rome and several to Perugia In 1490 he completed the altarpiece for Cardinal Guiliano della Rovere, now in the Villa Albani. This is one of his most charming creations. Other notable works of this period are the half-figure of "the Madonna" in the National Gallery (*c.* 1480); the tondo of "the Madonna with Saints and Angels" in the Louvre (*c.* 1490); and the "Crucifixion," now in the Uffizi (*c.* 1490). One of his most celebrated pictures, the "Pietà" in the Pitti gallery, belongs to the year 1495. From 1496 to 1498 he was employed on the great altarpiece for S. Pietro of Perugia, consisting of 15 panels. The greater part of these were taken by the French in 1797 and are now at Lyons, Nantes, Rouen, and in St. Gervais, Paris. Others are in the Vatican gallery Only five small panels have remained at Perugia. In 1499 the gild of the cambio (money-changers or bankers) of Perugia asked him to undertake the decoration of their audience-hall. This extensive scheme of work, which may have been finished within the year 1500, comprised the painting of the vault with the seven planets and the signs of the zodiac (Perugino doing the designs and his pupils most probably the executive work) and the representation on the walls of two sacred subjects—the "Nativity" and "Transfiguration"—the Eternal Father, the four virtues of Justice, Prudence, Temperance and Fortitude, Cato as the emblem of wisdom, and (in life size) numerous figures of classic worthies, prophets and sibyls. On the mid-pilaster of the hall Perugino placed his own portrait in bust-form. In Sept. 1493, Perugino married Chiara, the daughter of Luca Fancelli, architect and engineer. He was made one of the priors of Perugia in 1501. About 1500 he produced the *chef-d'oeuvre* of the "Madonna and Saints" for the Certosa of Pavia The six constituent parts of this noble work have now been sundered. The only portion which remains in the Certosa is a figure of God the Father with cherubim. Three compartments—the Virgin adoring the infant Christ, St. Michael, and St. Raphael with Tobias—are among the choicer treasures of the National Gallery, London. Two portions representing the Annunciation have disappeared.

Pope Julius II. had summoned Perugino to paint the Stanza in the Vatican, now called that of the Incendio del Borgo; but he soon preferred a younger competitor, that very Raphael who had been trained by the aged master of Perugia; and Perugino, after painting the ceiling with figures of God the Father in different glories, in five medallion-subjects, retired from Rome, and was once more in Perugia from 1512. Among his last works one of the best is the extensive altar-piece (painted between 1512 and 1517) of S. Agostino in Perugia

Perugino's last frescoes were painted for the churches S. Maggiore at Spello, S. Maria della Lagrime at Trevi; and S Agnese at Perugia; and in 1523 for the church of Castello di Fontignano hard by. This, his last work, representing "The Adoration of the Shepherds," is now in the National Gallery, London. He was still at Fontignano when the plague broke out and he died in February or March 1524. He was buried in unconsecrated ground in a field, for, on the sudden outbreak of the plague, the panic-stricken local authorities ordained that all victims should be at once interred without waiting for any religious rites. Perugino left three sons With him the ideal and mystic tendency of the Umbrian tradition prevailed. Perugino is, however, open to the charge of mannerism. He employed many assistants and frequently repeated the same motive in his works. Among his pupils were Raphael, Giovanni lo Spagna and Mannia. He was, after Raphael, the greatest representative of the Umbrian school His fame spread, and he received commissions from princes and churches all over Italy. His figures are graceful, gentle and pure; his landscapes bathed in glowing evening lights, and he excelled in compositions with graceful flowing lines.

Among the very numerous works of Perugino a few not already named require mention Towards 1496 he painted the "Crucifixion" in S. Maria Maddalena dei Pazzi, Florence. "The Marriage of Joseph and the Virgin Mary" (the "Sposalizio"), now in the museum of Caen, was painted about 1503 and served indisputably as the original, to a great extent, of the still more famous "Sposalizio" which was painted by Raphael in 1504, and is now in the Brera gallery in Milan. In the chapel of the Disciplinati of Città della Pieve is an "Adoration of the Magi," a square of 21 ft. containing about 30 life-sized figures; this was executed in 1504; about this time he finished, after much persuasion from Isabella d'Este, a panel for her study representing the struggle between chastity and sensuality, now in the Louvre In 1507, when the master's work had for years been in a course of decline, he produced, nevertheless, one of his best pictures—the "Virgin between St Jerome and St. Francis," now in the National Gallery

London. In S. Onofrio of Florence is a much-lauded and much-debated fresco of the "Last Supper," a careful and blandly correct but not inspired work painted before 1500. Perugino painted a few portraits. The most noted is that of Francesco dell' Opera (1494) in the Uffizi. It is painted with great minuteness and recalls the Flemish portraiture. The sitter holds a scroll in his hand with the inscription *Timete Deum.*

See Crowe and Cavalcaselle, *History of Painting in Italy* (edit. Tancred Borenius, 1914); G. C. Williamson, *Perugino* (1903); Walter Bombe, *Geschichte des Peruginen Malerei* (1912); *Perugino* (Klassiker der Kunst, 1914).

PERUZZI, BALDASSARE (1481–1536), Italian architect and painter of the Roman school, was born at Ancajano, near Volterra, on March 7, 1481, and passed his early life at Siena. Peruzzi went to Rome about 1503, under the patronage of the Sienese banker, Agostino Chigi, and there studied architecture and painting. The choir frescoes in Sant' Onofrio, on the Janiculan hill, show the influence of Pinturicchio. However, he soon fell under the influence of Raphael, and he learnt much from the study of the antique. The first work which brought renown to the young architect was the villa on a bank of the Tiber, now known as the Farnesina, built for Agostino Chigi. This villa is best known for the frescoes painted there by Raphael and his pupils. One of the loggie has frescoes by Peruzzi's own hand—the story of Medusa. In 1516 he painted the frescoes in the Capella Pozzetti at S. Maria della Pace. On account of his success, Peruzzi was appointed by Leo X., in 1520, architect to St. Peter's at a salary of 250 scudi; his design for its completion was not, however, carried out. In 1522 he was invited to Bologna to design a façade for the church of S. Petronio. In 1525 he built the Ossoli palace in Rome. During the sack of Rome in 1527 Peruzzi escaped with his life to Siena, where he was made city architect, and designed fortifications for its defence. A little court of the oratory of S. Caterina, the frescoes in Castel Belcaro and in the church of Fonte Giusta, date from this time. In 1529 he was made *capo maestro* of the cathedral. Here he designed a magnificent wooden-organ case, the high altar, and the Cappella del Battista. He then returned to Rome and in 1535 began the famous Palazzo Massimi. He died on Jan. 6, 1536, and was buried by the side of Raphael, in the Pantheon.

Peruzzi was an eager student of mathematics and was also a fair classical scholar, a most able architect, a fair painter, and a scientific engineer. The National Gallery has an interesting drawing of the "Adoration of the Magi." The Uffizi and the library at Siena contain a number of Peruzzi's designs and drawings, many of which show ancient buildings which have been destroyed since the 16th century.

Bibliography.—Vasari, *Vita di Baldassare Peruzzi* (Milanesi's ed., 1882), iv. 489; Milizia, *Memorie degli architetti* (1781, i. 210–215); Della Valle, *Lettere senesi* (1782–86); G. Frizzoni, *Arte Italiana del Rinascimento* (Milan, 1891).

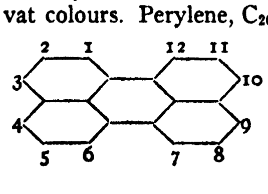
PERVIGILIUM VENERIS, the vigil or nocturnal festival of Venus, a short Latin poem. The occasion, author, date and place of composition are unknown. The poem probably belongs to the 2nd or 3rd century A.D. It describes in admirable if slightly florid poetry, the spring-time awakening of the world through the goddess. It consists of 93 trochaic septenarii, divided into groups of unequal length by the refrain:

Cras amet qui nunquam amavit, quique amavit cras amet.

A famous imaginative reconstruction of the manner of its writing can be found in Pater's *Marius the Epicurean.*

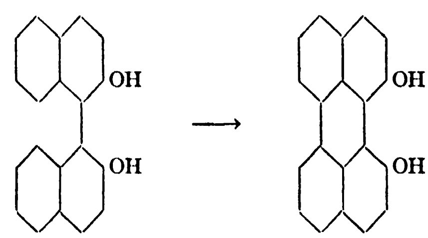
Bibliography.—Editio princeps (1577); many modern editions, either alone (as G. Bücheler, J. W. Mackail, C. Clementi, R. W. Postgate) or with Catullus; also in the *Anthologia Latina* (*see* Anthology).

PERYLENE, a hydrocarbon whose preparation was described in 1910, since when the subject has become of importance in view of its application to vat colours. Perylene, $C_{20}H_{12}$,



does not appear to have been detected in coal tar. The hydrocarbon itself was first obtained by the union of two naphthalene nuclei, but it is more conveniently prepared by heating β-dinaphthol with a mixture of condensing and reducing agents. It is also formed on distilling dihydroxyperylene over zinc dust in hydrogen, or by dry distillation of calcium perylenetetracarboxylate. In organic solvents perylene exhibits a blue fluorescence, whilst in sulphuric acid a rich violet develops. On crystallization of the crude product, glistening bronze plates melting at 264–265° C are obtained, but when purified through its picrate, perylene melts at 273°–274° C.

Nitration of perylene yields mono- to tetra-nitro-derivatives: these compounds form vat dyes on treatment with aluminium chloride. The most important halogen derivatives are those in which positions 3:9- or 3:10- are occupied by chlorine or bromine. Higher halogenated compounds are also known. Perylene derivatives have also been obtained by the condensation of substituted 1:1′-dinaphthyls, such as 4:4′-diamino-, 4:4′-dicyano-, 4:4′- and 2:2′-dihydroxy-dinaphthyl, by means of aluminium chloride:—

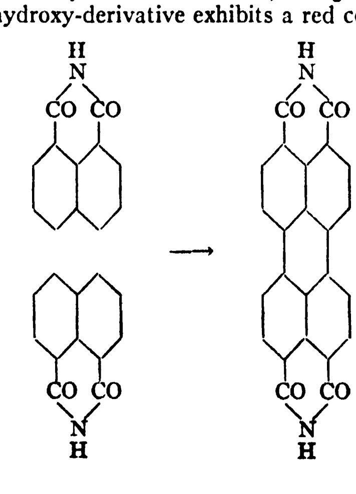


The dihydroxy-derivatives of perylene are specially important. Of the 21 theoretically possible, 12 should be capable of forming quinones; three of the latter have been isolated.

1:12-Dihydroxyperylene, prepared from β-dinaphthol, has been isolated as yellow leaflets. On passing air through an alkaline solution of dihydroxyperylene the crude quinone separates. The latter on treatment with lead peroxide and benzene crystallizes in reddish-brown needles, melting at 287° C, dissolving to a brown solution in sulphuric acid. The vat is yellow with green fluorescence and dyes cotton in yellow to brown shades.

3:9-Dihydroxyperylene, obtained by oxidation of 3:9-dichloroperylene by concentrated sulphuric acid and reduction of the product, crystallizes as yellow-orange needles. The corresponding quinone could not be isolated, but instead a compound, $(C_{20}H_{10}O_2)_2,H_2O$, was obtained. The sulphuric acid colour is red, becoming green on addition of water. The vat is orange-red with a yellow-green fluorescence, dyeing cotton orange-red which in air changes through brown to olive green.

3:10-Perylene quinone can be obtained by direct oxidation of perylene by aqueous chromic acid, by oxidation of 3:10-diaminoperylene or 3:10-dichloroperylene or *via* the dihydroxy-compound, by the action of aluminium chloride on α-dinaphthol. It crystallizes in bright yellow needles, melting above 350° C, and giving in sulphuric acid a blue-red colour and intense fluorescence. The cherry-red vat dyes cotton carmine, changing to light yellow in air. The dihydroxy-derivative exhibits a red colour in sulphuric



acid; the dibenzoate melts at 295–6°. Nitro-, amino-, and halogen derivatives of this quinone have been prepared.

A new class of vat dyestuff, containing the perylene nucleus and two carboxylic imide groups, has appeared in patent literature. The simplest dyestuff is formed on fusing naphthalimide or acenaphthenequinoneoxime with caustic alkali. *See* p. 636.

Hydrolysis of this product by concentrated sulphuric acid yields the parent tetracarboxylic anhydride which, on treatment with aliphatic or aromatic primary amines, forms *N*-substituted imide dyestuffs; the same products may be obtained by alkali fusion of *N*-substituted naphthalimides. These substances are remarkable for the colours and fluorescences they exhibit in solution. The anhydride dissolves in alkali forming a yellow solution which shows a brilliant green fluorescence on dilution: in sulphuric acid the colour is bright pink with yellow-red fluorescence. The parent dyestuff, the di-imide, dissolves to a reddish purple with scarlet fluorescence, whilst the *N*-phenyl derivatives show a purple colour with less fluorescence. The dyestuffs form cherry-red vats and dye cotton violet changing to red in air: as the molecular weight of the substituent increases, the colour tends to blue. Nitro- and chlorinated derivatives of these dyestuffs have been prepared.

Corresponding dyestuffs, also containing the perylene nucleus, have been prepared by alkali fusion of imides of anthracene 1:9-dicarboxylic anhydride; these dye cotton in green shades. The perylene nucleus is also present in violanthrone, isoviolanthrone and many other products derived from benzanthrone, dibenzanthrone and similar substances, by alkali fusion.

See A. E. Everest, *The Higher Coal Tar Hydrocarbons* (1927).

(J. G. M.)

PESARO, a city and seaport of the Marches, Italy (anc. *Pisaurum*), the capital of the province of Pesaro and Urbino, situated on the coast of the Adriatic 37 m. N.W. of Ancona by rail, on the right bank of the Foglia, the ancient Pisaurus. The ground on which it is built is only from 10 to 40 ft. above the sea, but it is surrounded by hills. Upon the Coles S. Bartolo stands the Villa Imperiale, the foundation stone of which was laid by the emperor Frederick III., built by the Sforza, and decorated with fine stucco ceilings and wall paintings and pavements of majolica plaques. A new palace was begun in 1530 by the Genga for Eleonora Gonzaga, but never finished. (*See* B. Patzak, *Villa Imperiale in Pesaro,* 1908.) The city walls were in 1830 transformed into a public promenade. The cathedral of the Annunciation has a 4th century mosaic pavement under the present one. There are a number of smaller churches with Gothic portals. The most conspicuous buildings are the prefecture (a palace originally erected in 1455–1465 for the Sforza, and restored by Francesco Maria della Rovere in the 16th century, which contains various antiquities, a picture gallery and a fine collection of majolica [the best in Italy] from the old Urbino and other manufactories) the fortress of Rocca Costanza (built by Costanzo Sforza in 1474, Laurana being the architect) and the large lunatic asylum. The composer Gioacchino Rossini, who was a native of Pesaro, left all his fortune to found a musical school in the city. The Museo Mosca, left by its owner to the town, contains collections of faience, furniture, etc. Pesaro is the centre of a rich agricultural district and is also a sea bathing resort. Pop. (1921), 22,663 (town); 29,899 (commune).

Destroyed by Vitiges the Goth, the town was restored and strengthened by Belisarius, and afterwards along with Ancona, Fano, Senigallia and Rimini formed the Pentapolis Maritima. In the course of the 13th century Pesaro was sometimes under the government of the popes, sometimes under that of the emperors; but the Malatesta family, which first took root in the city about 1285, gradually became the real masters of the place. In 1445 they sold their rights to Francesco Sforza; and in 1512, through the influence of Julius II., the Sforza were supplanted by his nephew Francesco Maria, duke of Urbino. Pesaro became the residence of the dukes of Urbino till the death of Francesco Maria II. in 1631, when it reverted to the States of the Church.

PESCADORES (*i.e.,* fishers), a group of islands (called by the Japanese *Hōkō tō* or *Hōko Guntō*) lying 30 m. west of Formosa, from which they are separated by the Pescadores Channel, about the tropic of Cancer. The islands number 48 (21 inhabited), have a coast-line of 98·67 miles, a total area of 85·50 sq.m., and a population of about 70,000, principally Chinese. Meteorological observations taken by the Japanese during a period of three years show that the annual average number of stormy days is 237. The anchorage is at Mako (Makyū or Makun) on the principal island of Penghu. The chief industry is fishing.

PESCARA, FERNANDO FRANCESCO DAVALOS, Marquis of (1489–1525), Italian *condottiere,* was born at Naples, of Spanish origin. At the age of six the boy was betrothed to Vittoria Colonna (*q.v.*), and the marriage was celebrated in 1509. In 1512 he commanded a body of light cavalry on the Spanish side at Ravenna. When Francis I. invaded Italy in 1524 Pescara was appointed as lieutenant of the emperor to repel the invasion. There was much discontent in the ill-paid army, but the tenacity, patience and tact of Pescara triumphed over all obstacles. On Feb. 24, 1525 he defeated and took prisoner Francis I. by a brilliant attack. He destroyed the superior French heavy cavalry by assailing them in flank with a mixed force of harquebusiers and light horse. He died at Milan on Nov. 4, 1525.

Bibliography.—The life of Pescara was written in Latin by Paolo Giovio, and is included in the *Vitae illustrium virorum,* printed at Basle (1578). Giovio's Latin *Life* was translated by L. Domenichi (1551). *See* also Mignet, *Rivalité de François Ier et de Charles Quint* (1875), which gives references to all authorities.

PESCARA, a river and town of Italy. The river is formed by the confluence of the Gizio and Aterno, flowing into the Adriatic at the town of Pescara (pop. [1921] 5,543), the capital of the province of that name. This town occupies the site of the ancient Aternum, the terminus of the Via Claudia Valeria. The railway from Sulmona follows the Pescara valley and joins the coast line to Brindisi at Pescara. In this valley, 22 m. from the sea, was the site of the ancient Interpromium, a town belonging probably to the Paeligni; and not far off is the very fine Cistercian abbey church of S. Clemente di Casauria, founded by the emperor Louis II. in 871. The present building belongs to the 12th century. The sculptures of the portals, the pulpit, the Paschal candelabrum, etc., and the bronze doors of this period are important.

PESCHIERA SUL GARDA, a fortress of Venetia, Italy, in the province of Verona, on an island in the Mincio, 77 m. by rail E. of Milan. It occupies the site of the ancient Arilica, a village of boatmen and fishermen. It was one of the famous fortresses of the Quadrilateral, the chief bulwark of the Austrian rule in Italy until 1866 (Mantua, Legnago and Verona being the other three) and has played a prominent part in all campaigns conducted in north Italy, more especially during the Napoleonic wars, but now has no military value. It was taken by the Piedmontese from the Austrians, in 1848.

PESELLINO, IL (1422–1457), name given to Francesco di Stefano Giuochi, a Florentine painter of the early Renaissance. He was brought up by his grandfather, the painter Giuliano il Pesello (1367–1446) and worked as his assistant until his death, when he became associated with Fra Filippo Lippi, and in 1453 with Piero di Lorenzo di Pratese, a little known painter. During this partnership he began, for the church of S. Trinità at Pistoja, the altarpiece of the Trinity now in the National Gallery, London. It was left unfinished at his death on July 29, 1457.

He excelled in the execution of paintings on a small scale, and is famous for his "cassone pictures," intended for the decoration of marriage chests in which he illustrated, in charming tapestry-like designs, some old legend or tale. Two such cassone pictures representing the story of David and Goliath are in the collection of Lady Wantage. The Museum of Bergamo has the "Story of Griselda" and a "Judgment Scene."

Two predella pieces, now in the Louvre, and three, now in the Florence academy, once formed together the predella which Pesellino painted for an altarpiece of Fra Fillippo in the church of S. Croce, Florence. Other works are an "Annunciation," in the Uffizi, Florence, and a "Madonna Enthroned with Angels and Saints," in the museum at Empoli. His works are exceedingly rare and precious; the miniature altarpiece of "The Madonna and Six Saints" was sold at the Holford sale in 1927 to Messrs. Knoedler

for 16,000 guineas. Drawings by the master are in the Louvre and the Uffizi.

PESETA. The monetary unit of Spain. It is divided into 100 centimos. It is a coin of 5 grammes of silver ·835 fine, and is thus equivalent at par to the franc.

The history of the peseta since 1914 is in many ways a curious one. During the war, Spain escaped the huge losses incurred by the Allies, but was involved in the general economic dislocation. Nevertheless, she preserved her currency and exchange system intact. At the beginning of 1919, the pound was quoted at Ptas. 23·67, and a year later at Ptas. 19·72. At this latter date, the Peseta was at a premium of 33 per cent, or was alternatively worth 12·2 pence against its par value of 9·5 pence.

Internally, the note-issue had expanded from Ptas. 1,931 millions in 1913 to Ptas. 4,326 in early 1921, but the Bank of Spain's "cover," or reserves, had risen from Ptas. 1,390 millions to Ptas. 3,031 millions, of which Ptas. 2,456 millions were gold.

The weak spots were the budget, the foreign trade balance, the American exchange and the internal price-level. For 1920–21 the budget had a deficit of Ptas. 633·5 millions. In 1920 the adverse trade balance was Ptas. 406 millions, which was not abnormal in relation to 1913 and the intervening rise in prices. But for 1921, it rose to Ptas. 1,252 millions, and remained there or above until 1924. In New York, the peseta fell from its parity of cts. 19·295 to cts. 13·53 for 1921, while between 1920 and 1921, internal wholesale prices only fell by 14 per cent., whereas in America they fell by 35 per cent, and in England by 36 per cent.

The fact is that, whereas in 1921 England, Sweden, Holland and the United States were well embarked on the path of deflation and reconstruction, Spain was delayed by her war in Morocco, and by wasteful and inefficient Government administration at home. After the revolution of 1923 matters began to improve. The budget deficit was gradually reduced, until, in 1927, a small surplus was actually realized. The adverse trade balance was similarly contracted and the ratio of legal cover to notes was maintained at the pre-war figure.

The result was a steady improvement in the peseta, so much so that during 1927 there were constant rumours of its impending stabilization at Ptas. 25·22 to the pound. The Spanish Government, however, made it clear that stabilization would not be hurried. Subsequent events were to reveal the wisdom of this decision since, as with other countries, successful stabilization depended upon internal economic and political stability. In early 1929 political events in Spain caused a fall in the peseta exchange serious enough to undo the improvement of many previous months. Its subsequent fluctuations at rates running over 30 to the pound showed that the restoration of political stability must precede currency stabilization.

PESHAWAR, a city of British India, the capital of the North-West Frontier Province, giving its name to a district. The city is situated near the left bank of the river Bara, 11 m. from Jamrud at the entrance of the Khyber Pass, the railway station being 1,588 m. north-west of Calcutta; pop. (1921), 104,452. Two miles west of the city are the cantonments, forming the principal military station of the North-West Frontier Province. To Peshawar for many centuries the *Povindahs,* or Afghan travelling merchants, have brought their caravans from Kabul, Bokhara and Samarkand every autumn. They bring horses, wool, woollen stuffs, silks, dyes, gold-thread, fruits, precious stones, carpets and poshtins (sheepskin clothing), fighting and buying their way to the British border where, leaving their arms, they are free to wander at will to Delhi, Agra and Calcutta.

The District of Peshawar has an area of 2,607 sq.m.; pop. (1921), 622,349. Except on the south-east, where the Indus flows, it is encircled by mountains which are inhabited by the Mohmand, Utman Khel and Afridi tribes. The inhabitants are Pathans.

In early times the district of Peshawar seems to have had an essentially Indian population, for it was not till the 15th century that its present Pathan inhabitants occupied it. Under the name of Gandhara it was a centre of Buddhism, and especially Graeco-Buddhism. Rock-edicts of Asoka still exist at two places; and a *stupa* excavated in 1909 was found to contain an inscription of Kanishka, as well as relics believed to be those of Buddha himself. The Mogul emperors always found difficulty in maintaining their authority over the Afghan border tribes. Peshawar was a favourite residence of the Afghan dynasty founded by Ahmed Shah Durrani, and here Mountstuart Elphinstone came as ambassador to Shah Shujah in 1809. A few years later Ranjit Singh crossed the Indus, and after much hard fighting Sikh authority was firmly established under General Avitabile in 1834. In 1848 Peshawar passed to the British. During the Mutiny, after the sepoy regiments had been disarmed, Peshawar was a source of strength rather than of danger, though Sir John Lawrence did at one time contemplate the necessity of surrendering it to the Afghans, in order to preserve the rest of Northern India.

PESHITTA or **PESHITA** (*i.e.,* "simple"), the Syriac version of the Bible. Long supposed to be the original Syriac version, it is now generally recognized as a revision made by Rabbula, bishop of Edessa, early in the 5th century, to standardize the Syriac text much as Jerome had done for the Latin in his Vulgate. (*See* Bible: *Old Testament, Texts and Versions.*)

PESHWA, the title of the head of the Mahratta confederacy in India. The word is Persian for "leader." Originally the peshwa was only prime minister, but afterwards he supplanted his master, founding an hereditary dynasty, with the capital at Poona. The last peshwa, Baji Rao, came into collision with the British, and was dethroned in 1818. His adopted son, Nana Sahib, took a leading part in the Mutiny of 1857.

PESO. The monetary unit of certain Central and South American countries; divided into 100 centavos. Its value varies between country and country, as shown below:—

Argentina: 100 pesos paper = 44 pesos gold	= $42.45.
Chile: 1 peso	= 12·166 cents.
Colombia: 1 peso gold	= 97·331 cents.
Guatemala: 1 peso	= 1·666 cents.
Mexico: 1 peso or dollar	= 49·85 cents.
Uruguay: 1 peso	= 103·425 cents.

The most important of these six pesos is that of Argentina.

PESSIMISM, a word of modern coinage, denoting an attitude of hopelessness towards life, a vague general opinion that pain and evil predominate in human affairs (from Lat. *pessimus,* worst). It is the antithesis of "optimism," which denotes the view that on the whole there is a balance of good and pleasure, or at least that in the long run good will triumph. Between optimism and pessimism is the theory of "meliorism," according to which the world on the whole makes progress in goodness. The average man is pessimist or optimist not on theoretical grounds, but owing to the circumstances of his life, his material prosperity, his bodily health, his general temperament. Perhaps the most characteristic example of unsystematic pessimism is the language of Ecclesiastes, who concludes that "all is vanity."

Pessimism and optimism have, however, been expressed in systematic philosophical forms, a brief summary only of which need here be given. Such systems have been elaborated chiefly by modern thinkers, but the germs of the ideas are found widely spread in the older Oriental philosophies and in pre-Christian European thought.

Oriental pessimism, at least as understood by Europeans, is best exemplified in Buddhism, which finds in human life sorrow and pain. But all pain and sorrow are incidental to the human being in his individual capacity. Let who will cast aside the "Bonds," the "Intoxications," the "Hindrances," and tread the Noble Eightfold Path (*see* Buddhism) which leads to Nirvana, and attain the ideal, the "Fruit of Arahatship," which is described in terms of glowing praise in the Pali hymns. This, the original doctrine of the Buddha, though not adopted in the full sense by all his followers, is in fact at least as optimistic as any optimism of the West. To call it "pessimism" is merely to apply to it a characteristically Western principle according to which happiness is impossible without personality. The true Buddhist on the contrary looks forward with enthusiasm to this absorption into eternal bliss. However, Western Christian mysticism has never been a stranger to this concept.

Passing over the Italian Leopardi we may notice two leading

modern pessimists, Schopenhauer and von Hartmann. Schopenhauer emphasizes the pessimistic side of Hegel's thought. The universe is merely blind Will, not thought; this Will is irrational, purposeless and therefore unhappy. The world being a picture of the Will is therefore similarly unhappy. Desire is a state of unhappiness, and the satisfaction of desire is therefore merely the removal of pain. Von Hartmann's doctrine of the Unconscious is in many respects similar to Schopenhauer's doctrine of the Will. The pessimism of Schopenhauer and Hartmann does not, however, exclude a certain ultimate mysticism, which bears some analogy to that of Buddhism.

PESSINUS (Πεσσινοῦς, Πεσινοῦς), an ancient city of Galatia in Asia Minor, situated on the lowest southern slope of Mt. Dindymus. The ruins, discovered by Texier, lie round the village of Bala-Hissar, 8 or 9 miles S.E. of Sivri-Hissar. Originally a Phrygian city, it became the capital of the Gallic tribe Tolistobogii and the chief commercial city of the district. It contained the most famous sanctuary of the mother of the gods (Cybele), who here went by the name of Agdistis, and was associated with the god Attis, as elsewhere with Sabazius, etc. Her priests were also princes, who bore rule not only in the city (the coinage of which, beginning about 100 B.C., was for long issued by them) but also in the country round, deriving a large revenue from the temple estates; but in the time of Strabo (A.D. 19–20) their privileges were much diminished. Some time before the year 164 B.C. Pessinus fell into the power of the Gauls, and the membership of the priestly college was then equally divided between the Gauls and the old priestly families Like Ancyra and Tavium, Pessinus was Romanized first and Hellenized afterwards. Only about A.D. 165 did Hellenic ways and modes of thought begin to be assumed; before that we find a deep substratum of Celtic feeling and ways, on which Roman elements had been superimposed without filtering through a Hellenic medium Christianity was introduced late; it cannot be traced before the 4th century. When Galatia was divided into two provinces (A D 386–395) Pessinus was made the capital of Galatia Secunda or Salutaris, and it became a metropolitan bishopric. After the 16th century it disappears from history.

PESTALOZZI, JOHANN HEINRICH (1746–1827), Swiss educational reformer, was born at Zürich on Jan. 12, 1746. His father died when he was young, and he was brought up by his mother At the university of Zürich he was associated with Lavater and the party of reform. His earliest years were spent in schemes for improving the condition of the people. The death of his friend Bluntschli turned him however from politics, and induced him to devote himself to education. He married at twenty-three and bought a piece of waste land at Neuhof in Aargau, where he attempted the cultivation of madder. Pestalozzi knew nothing of business, and the plan failed. Before this he had opened his farm-house as a school; but in 1780 he had to give this up also. His first book published at this time was *The Evening Hours of a Hermit* (1780), a series of aphorisms and reflections. This was followed by his masterpiece, *Leonard and Gertrude* (1781), an account of the gradual reformation, first of a household, and then of a whole village, by the efforts of a good and devoted woman. The French invasion of Switzerland in 1798 brought into relief his heroic character. A number of children were left in Canton Unterwalden on the shores of the Lake of Lucerne, without parents, home, food or shelter. Pestalozzi collected a number of them into a deserted convent, and spent his energies in reclaiming them. During the winter he cared for them personally, but in June 1799 the building was required by the French for a hospital, and his charges were dispersed. In 1801 Pestalozzi gave an exposition of his ideas on education in the book *How Gertrude teaches her Children.* His method is to begin with observation, to pass from observation to consciousness, from consciousness to speech. Then come measuring, drawing, writing, numbers, and so reckoning. In 1799 he had been enabled to establish a school at Burgdorf, where he remained till 1804. In the year 1805 he removed to Yverdon on the Lake of Neuchâtel, and for twenty years worked steadily at his task. He was visited by all who took interest in education—Talleyrand, Capo d'Istria, and Mme. de Stael. He was praised by Wilhelm von Humboldt and by Fichte. His pupils included Ramsauer, Delbrück, Blochmann, Carl Ritter, Froebel and Zeller. About 1815 dissensions broke out among the teachers of the school, and Pestalozzi's last ten years were chequered by weariness and sorrow. In 1825 he retired to Neuhof, the home of his youth; and after writing the adventures of his life, and his last work, the *Swan's Song,* he died at Brugg on Feb. 17, 1827. For his far-reaching influence on educational methods *see* EDUCATION.

Pestalozzi's complete works were published at Stuttgart in 1819–26, and an edition by Seyffarth appeared at Berlin in 1881. Volumes on his life and teaching have been written by De Guimps (1889), Barnard (1862) Krüsi (1875) and Pinloche (1901) *See* also J. A Green, *Life and Works of Pestalozzi* (1913); P. Matorp, *Der Idealismus Pestalozzis: eine Neuuntersuchung der philosophischen Grundlagen Seiner Erziehunglehre* (Leipzig, 1919), W. O. Nicolay, *Pestalozzis Stellung zu Religion und Religionsunterricht* (Langensalza, 1920).

PESTS: *see* ENTOMOLOGY.

PÉTAIN, HENRI PHILIPPE BENONI OMER JOSEPH (1856–), French soldier, was born on May 24, 1856 at Cauchy la Tour (Pas de Calais). He was commissioned from St. Cyr 1878, passed in due course through the École de Guerre, filled various staff appointments, including that of instructor at the École de Guerre, and was promoted colonel in 1910 At the outbreak of the World War he was commanding an infantry regiment, but he was immediately given a brigade and then a division, and acquitted himself so well during the opening weeks of the struggle that he was advanced to the command of the XXXIII. Army Corps in Artois on Oct. 25, 1914 He greatly distinguished himself on the occasion of the French offensive near Arras in May 1915, where his corps completely broke through the German position, though exploitation proved to be impossible for want of reserves On June 21, 1915 he was given command of the II. Army, which under his orders carried out on Sept. 25, 1915 the great attack in Champagne. After this action Gen. Pétain wrote a remarkable *Rapport sur les opérations de la IIe. armée en Champagne et enseignements à en tirer.* This contained the principles of a new tactical doctrine, and was published in the *Archives de la Grande Guerre,* No. 10, pp 5–30

After the battle of Champagne, the staff of the II. Army was withdrawn from the front, and was thus available at the moment when the Germans were attacking Verdun on Feb. 21, 1916. It was then that the task of stopping the advance of the German crown prince was entrusted to Pétain.

His first task was to organize the battle zone. He fixed a line of defence from Bras to Douaumont: this line had to be held at all costs, and under cover of it he divided up the ground to be held in sections which were duly laid out and equipped. It was largely owing to the system and energy of Pétain that Verdun was saved (*see* VERDUN, BATTLES OF). On May 1, 1916 he was given the command of the centre army group, of which the IV. Army, on the left, took part in the great offensive of April 16, 1917 On April 28 he was appointed chief of the general staff at the Ministry of War in Paris; and on May 15 he replaced General Nivelle as Commander-in-Chief of the armies in the field.

The French army at that time was faced with a grave crisis, not excluding mutinies. Pétain did his utmost to remove the special causes of discontent, such as the irregularity of leave, and the inequality between units in their tours of duty in the trenches. He also saw to it that soldiers on leave were not exposed to dangerous influences or neglect, and he renewed the confidence between the combatants and their leaders. By means of reforms

rather than measures of repression, he succeeded from the month of June onwards in having the army completely in hand. In *directive* No. 1 he informed the army group and army commanders that they must limit themselves provisionally to preparing attacks with only limited objectives with the object of wearing out the enemy reserves. In *directive* No. 2, which was issued in the second fortnight of June, he reconstructed the training of the troops. In *directive* No. 3, at the beginning of July, he laid down the method of distribution in depth. The key-note of the limited operations outlined by his *directive* No. 1 was to be thoroughness of organization and high proportion of fire-power, so as to give the maximum result with the minimum risk. Such were the characteristics of the action of the I. Army in Flanders, July 15–31; the II. Army before Verdun, Aug. 13–25 (*see* VERDUN, BATTLES OF) and of the VI. Army at Malmaison, Oct. 17–26.

Late in 1917 it became apparent that owing to the defection of Russia a formidable German offensive would be launched in the spring of 1918 on the western front. With this in view, Pétain studied the possibilities of surprise by placing reserves within reach of the threatened points. On Feb. 22, 1918 he and Sir Douglas Haig agreed to give each other mutual assistance.

On March 21 when the Germans had just attacked General Gough's Army with great violence, Pétain hurried forward the V. Corps which was in reserve behind his left wing. On the 22nd Haig having requested the intervention of the French army, Pétain pushed forward the extreme left or 125th Division of the VI. Army towards the field of battle, where it arrived during the night March 22-3. Other French units were speedily added in order to assist the British, and these formed successively the III. Army and then the I.

Meanwhile, on March 26 at Doullens, General Foch had been entrusted with the mission of co-ordinating the efforts of the Allied armies. Pétain therefore had only to carry out on the lines of the *directives* issued by Foch those operations which had been assigned to the French armies. He withstood the German attacks of May 27, June 9 and July 15, and as a tactical counter to the enemy's offensives, he planned in a note of June 24 new tactics of elastic defence under which the second line trench system became the main position of resistance.

It was now the moment to pass to the counter-offensive. On June 27 Foch had asked Pétain to draw up a *directive* for an offensive. This was the *directive* No. 5, July 1. The operation itself as originally planned was to consist of a move by General Mangin's army on Soissons. On June 14 Foch had ordered preparations to be made for an offensive against this town. On June 16 Pétain issued the same order to General Fayolle, the commander of the army group. On June 20 Mangin, who was entrusted with its execution, drew up the plan of action, which consisted of preliminary operations which were to be followed by the occupation of the heights in front of the town. This plan was approved on June 27 and the first phase was carried out between June 28 and July 3. The preliminary successes led Mangin to think that the action could be further developed. On July 7 Pétain and Foch discussed this point; and next day Pétain sent Fayolle a letter in which he expressed approval of Mangin's plans. But on July 9 Foch conceived the idea of an action on a larger scale in which two other armies should take part. With this end in view Pétain on July 12 issued to the army group commanders instructions which were approved by Foch on July 13. On July 14 Foch went to see Pétain, and an agreement was reached between them as to the time when the offensive should be launched. This was planned for the 18th.

Pétain, under similar conditions, prepared the great offensives of Aug. 8 and Sept. 25, 1918 and he was also responsible for pushing the Germans back to the Ardennes. On Nov. 21 Pétain received at the hands of the president of the republic at Metz the baton of *Maréchal de France;* he was also the recipient of many high honours from the Allied Governments. He subsequently held the position of vice-president of the *Conseil Supérieur de la Guerre;* and it was in this capacity that he went to Morocco in the summer of 1925 to supervise the arrival and employment of the reinforcements which were sent out to carry on the campaign against Abdel Krim.

PETALITE, a mineral species consisting of lithium aluminium silicate $LiAl(Si_2O_5)_2$. The monoclinic crystals approach spodumene (*q.v.*) in form, which is also a lithium aluminium silicate with the formula $LiAl(SiO_3)_2$. There is a perfect cleavage parallel to the basal plane, and the mineral usually occurs in platy cleavage masses; on this account it was named, from Gr. πέταλον (a leaf). The hardness is 6½ and the specific gravity 2·4 (that of spodumene being 3·16). The mineral is colourless or occasionally reddish, varies from transparent to translucent, and has a vitreous lustre. It was discovered in 1800 as cleavage masses in an iron mine on the island of Utö near Stockholm, where it is associated with lepidolite, tourmaline and spodumene.

PETALUMA, a city of Sonoma county, California, U.S.A., at the head of navigation on the Petaluma river, 35 m. N.N.W. of San Francisco. It is served by the North-western Pacific and electric railways, and (for freight) by boats and barges to points on San Francisco bay. Pop. (1920) 6,226 (80% native white); 1928 estimate, 8,250. It is famous for its poultry industry, which occupies 3,000 families and sent 42,480,000 dozen eggs to market in 1927. Dairying is also important, and the city has numerous manufacturing industries, including incubator factories and the first silkthread mill established west of the Rockies. The town was plotted in 1852, incorporated in 1858, and chartered as a city in 1911. The poultry industry was introduced by Lyman C. Byce, a young Canadian, in 1878.

PETCHENEGS or **PATZINAKS** [Latin *Bisseni*], a nation which played a considerable part in the mediaeval history of Eastern Europe. The Petchenegs were a Turkish race, akin to the Cumans (*q.v.*), whose language, according to Anna Comnena, they spoke. They were probably a federation formed of the earlier Bukuk and Kangaris. In the 9th century A.D. they were living between the Volga and the Urals, having as their neighbours the Burtas on the west, the Khasars south-west, and the Ghuz south-east. About 860 the Khasars and Ghuz combined and drove them west, a remnant only remaining in their old territory, which was now occupied by the Ghuz. The remainder drove the Magyars, who were the western neighbours of the Khasars, over the Dnieper, themselves settling near the Don. In the year 889 they again drove the Magyars westward into Moldavia, arriving on the Dnieper 895. In this or the following year they allied themselves with Khan Symeon of the Bulgars, inflicted a third and crushing defeat on the Magyars, and drove them into their present homes in Hungary. The Petchenegs made their own headquarters on the two banks of the Dnieper, where for a century they harassed Kiev and the trade route between that state and Constantinople, lurking near the rapids at which convoys disembarked, then charging them on horseback and raining arrows on them. In addition, they ravaged Wallachia, Bulgaria, and the lands of the eastern Roman empire, perhaps the most formidable of their many incursions being that of 934, when, allied with the Magyars, they destroyed Varander. In 972 they had slain Sviatoslav of Kiev; but in 1036 Prince Yaroslav defeated them so heavily that they ceased to trouble Russian territory. Their incursions westward grew correspondingly more severe. Between 1020–1030 they invaded Bulgaria almost every year, and from 1048–1056 were at war with Byzantium without intermission. At the close of this campaign the Emperor granted them lands for settlement in north-east Bulgaria, but their depredations continued. The great westward raid of the Ghuz in 1064 passed clean through their territory, and many Petchenegs were probably then slain or absorbed by the Ghuz. Others fled into Hungary, where King Ladislaus defeated them in 1067. Colonies of the survivors were settled as guards on Hungary's western frontiers. In 1080 the emperor Alexius again defeated them, and their power was finally

broken in 1091 by the crushing defeat which they suffered at Lebunien. Remnants of them, however, still lurked about the Balkans, and one band, imitating their old tactics on the Dnieper, attacked Peter the Hermit's party of Crusaders north of Belgrade in 1096. After this they fade out of history; but the "Sops" in the plain of Sofia to-day are believed to be their descendants.

The Petchenegs were ruled by a Khan and organised in 8 hordes and 40 minor units, each under its khan of lower degree. They were purely nomadic; on their raids they took their women and children with them, forming their camps out of rings of wagons. They wore long beards and moustachios, and were dressed in long kaftans. The food of the wealthy was blood and mares' milk; of the poor, millet and mead. They were originally "magicians," *i e*, fire-worshippers; but a form of Islam early became current among them and the nation was temporarily converted to Christianity in 1007–1008. They were the most dreaded and detested of all the nomads; Matthew of Edessa calls them "the carrion-eaters, the godless, unclean folk, the wicked, blood-drinking beasts." Other anecdotes are current of their shamelessness, and many of their cruelty; they invariably slew all male prisoners who fell into their hands The modern Sops are despised by the other inhabitants of Bulgaria for their bestiality and stupidity but dreaded for their savagery. They are a singularly repellent race, short-legged, yellow-skinned, with slanting eyes and projecting cheek-bones. Their villages are generally filthy, but the women's costumes show a barbaric profusion of gold lace.

PETER, ST., the Apostle who is referred to in the New Testament by several names. Most commonly he is called Peter, but we also find Simon, Simon Peter, Cephas, and once Symeon We may infer that the Apostle's name was the common Hebrew "Symeon" (שִׁמְעוֹן) which was generally rendered by the Greek "Simon" (Σίμων); he also received the title "Cephas" (כֵּיפָא) which was Graecized according to the sense of "stone" or "rock" into "Peter" (Πέτρος). There is no certain evidence that either "Cephas" or "Peter" was already in use as a proper name. The bestowal of the name Cephas is mentioned by Mark in connection with the sending forth of the twelve (iii. 16), by Matthew in connection with Peter's confession at Caesarea Philippi (xvi. 18), and in the fourth gospel in connection with the first call of Simon near the scene of John's baptizing (i 42)

Prominence of St. Peter.—The gospels agree in representing St. Peter as the most prominent of the disciples during the ministry of Jesus He is mentioned by Mark 23 times, by Matthew 24 times, by Luke 27 times, by John 39 times, and 182 times in the whole of the New Testament. Together with the sons of Zebedee, he formed an inner circle among the disciples, and was constantly in the company of the Master. Thus he is mentioned as present on several notable occasions such as the raising of Jairus' daughter (Mark v. 22 *sqq.* and parallels), the Transfiguration (Mark ix. 2 *sqq.* and parallels), and in the Garden of Gethsemane (March xiv. 32 and parallels). Early tradition (Papias) makes Peter the ultimate source of the Marcan narrative, to which Matthew and Luke were indebted. If so, the frequency of Peter's appearances may be partly explained; but it is Matthew rather than Mark who exalts Peter, and there is no reason to doubt that he was indeed the leader of the Twelve.

Early History.—Of his earlier history nothing is known. In Matthew xvi. 17 he is called "Simon Barjona" (*i.e.*, Simon Son of Jonas), whereas in John i. 42 and xxi. 15 he is referred to as "Simon son of John." Jonas and John are quite distinct names, but among Greek-speaking Christians the confusion would not be difficult. He was married and lived in a house at Capernaum with his brother Andrew and his mother-in-law (Mark i. 29). His occupation was that of a fisherman, and Luke says he was in partnership with James and John.

Call of St. Peter.—The synoptic gospels describe the call of Peter to discipleship as taking place by the Lake of Galilee (Mark i. 16 *sqq.*, Matt. iv. 18 *sqq.*, Lk. v. 1. *sqq.*). No explanation is given of the suddenness of the call or of the ready response which it evoked. But the fourth gospel represents the earliest disciples of Jesus as previously disciples of John the Baptist and as leaving John to follow Jesus. One of these disciples was Andrew, who brought his brother Simon to Jesus with the announcement, "We have found the Messiah," and Jesus received him with the words "Thou shalt be called Cephas," which is by interpretation Peter. It is difficult to accept this account wholly as it stands, for the synoptic gospels make it plain that the disciples did not at first regard their Master as the promised Messiah; but it may embody a genuine tradition that the disciples had been connected with John's work, and thus explain why on a later occasion Peter was so ready to obey the call of Jesus. On the other hand it is possible that the account of the fourth gospel is coloured by a desire to minimize the importance of the Baptist save as a forerunner of the Christ. It is not improbable that a rival sect of the Baptist persisted to the end of the first century (Acts xviii. 25), and it was for that reason that the author of the fourth gospel omitted to mention John's independent work, and represented him as surrendering his disciples to Jesus.

Mark and Matthew agree closely in their accounts of the call of Simon and Andrew, and both quote the saying, "I will make you fishers of men" Luke has a good deal of non-Marcan material, and his account differs considerably. He places the visit to Capernaum and the healing of Simon's mother-in-law before the call to Simon, and he connects the call with the story of the miraculous draught of fishes which appears in the fourth gospel after the resurrection (John xxi) If the story of the miraculous draught arose from the prophecy that Peter should catch men, Luke's arrangement is in a sense justified. According to John the catch numbered 153—probably men of every race whom Peter was to attract by his teaching.

Confession of St. Peter.—Of the incidents during the ministry in which Peter played a prominent part it is only possible here to deal with one in detail Critics attach considerable importance to the account of Peter's confession at Caesarea Philippi (Mark viii. 27 *sqq*, Matt. xvi. 13 *sqq*, Luke ix 18 *sqq*). According to all three synoptic gospels, at a comparatively late date in the history of the ministry Peter, in answer to a question of Jesus, acknowledged him to be the Messiah Jesus then spoke of his coming passion, and Mark and Matthew add that Peter brought upon himself a severe rebuke by protesting against such an unwelcome development. The gospels make it clear that this was a turning-point in the history of the ministry and in the education of the Twelve Matthew emphasizes the importance of the occasion by the insertion of a remarkable paragraph concerning Peter. "And Jesus answered him, Blessed art thou Simon Barjona, because flesh and blood did not reveal it to thee, but my Father in Heaven. And I say to thee that thou art Peter and upon this rock I will build my church, and gates of Hades will not prevail against it. I will give thee the keys of the kingdom of the heavens, and whatsoever thou shalt bind on earth shall be bound in the heavens, and whatsoever thou shalt loose on earth shall be loosed in the heavens." Here difficulties multiply, but two points seem clear. (1) Peter is to have unique importance in the future corresponding to the unique insight which he has displayed; he is the rock on which a new *ecclesia* will be founded to triumph over death. (2) Peter will have unique authority to admit to the new *ecclesia* and to legislate for its members We must consider these points in greater detail. (1) Peter has received a definite revelation from Heaven, and his confession does not reflect the opinion of men (*cf* Gal. i 16). In virtue of this insight he is to become the foundation of "my church," that is, of an *ecclesia* comparable with the old Israel which is frequently referred to in the Old Testament as "the congregation" (Heb. קָהָל LXX. ἐκκλησία).

C. Taylor (*Sayings of the Jewish Fathers*) quotes a remarkable rabbinic parallel. When the Holy One wanted to create the world, he passed over the generations of Enoch and of the flood as unsound; but when he saw Abraham who was going to arise he said, Lo I have discovered a rock (petra) to build and to found the world upon. Therefore he called Abraham "rock" (צוּר), as it is said, "Look unto the rock whence ye are hewn." In what sense Peter is to be the foundation of the new *ecclesia* is perhaps

explained in the following words: "Peter will bear witness to the resurrection, and against the Church thus encouraged to face death the gates of Hades (Death, not Hell) will not prevail."

(2) Peter will receive the keys of the kingdom and will have unquestioned authority to bind and to loose, that is to legislate for the community. As to the keys, Is. xxii. 20–23 should be studied, and, for a Christian parallel, Rev. iii. 7. Two ideas seem to be combined: a chief steward bears the keys of a house as the sign of his authority, and a teacher of truth has the means of admission to the kingdom of Heaven (*cf.* Luke xi. 52 where the lawyers are blamed for taking away the key of knowledge). St. Peter will have authority in the new church such as Eliakim had in the old; and, as the ideal Scribe, St. Peter will admit many to the kingdom by his teaching. It is remarkable that in Matt. xviii. 18 a similar power of binding and loosing is bestowed upon all the disciples. (B. T. D. Smith, *St. Matthew*, pp. 151, *sqq.*)

Opinions differ as to the authenticity of this saying addressed to Peter. The use of *ecclesia* for the Christian Church as a whole seems to reflect later usage (*cf.* Matt. xviii. 17 where the word means a local congregation); and the whole passage implies a reverence for St. Peter such as might be felt by the second generation of Christians, especially by some community (? the Church of Antioch) which regarded him as its founder. John vi. 68 records another confession of Peter which is perhaps the Johannine equivalent of the synoptic "Thou art the Christ."

St. Peter and the Resurrection.—The New Testament implies that St. Peter was specially famous in the early church as a witness to the resurrection of Jesus. St. Paul (I. Cor. xv. 5) mentions an appearance to Cephas first among the evidences of the resurrection. The "young man" of Mark xvi. thus instructs the women at the tomb, "Go tell his disciples *and Peter* that he goeth before you into Galilee and there ye shall see him"; from which we may infer that Mark intended to relate an appearance in Galilee at which Peter was specially prominent. Luke testifies to a belief in an early appearance to Simon (xxiv. 34), although he does not describe it and it does not fit easily into his scheme. It is very strange that the description of this appearance has dropped out of the synoptic tradition, for it seems to have belonged to a very early stratum. The omission may be variously explained. The original ending of Mark is almost certainly lost. Luke and John adopted the belief that the disciples stayed in Jerusalem after the crucifixion, and both were therefore bound to omit a story of an early appearance in Galilee. Matthew seems to have deliberately preferred an account of an appearance to all the disciples on a mountain, perhaps because he thought it evidentially superior. But it is very probable that the appendix to St. John (ch. xxi.) reproduces a late version of the half-forgotten story; and, so far as we can judge, the apocryphal gospel of Peter ended with a similar account. In the Johannine narrative Jesus appears to seven disciples, and Peter is prominent. The apocryphal account begins, "And I Simon Peter. . . ." It has been suggested that the story of Jesus' walking on the water (Mark vi. 48 and parls.) is another version of the same incident, for Matthew represents Peter as acting in a similar way on that occasion, jumping out of the boat to meet Jesus. (Matt. xiv. 29, *cf.* Joh. xxi. 7.)

Later History and Death.—The last chapter of the fourth gospel is important as containing what is certainly the earliest reference to the death of St. Peter. Three times Jesus tests his love which three times he had denied, and three times entrusts to him the pastoral duty to "feed my sheep." The sheep (or lambs, *v.* 15) are doubtless members of the early Church dependent upon Peter's teaching for their spiritual food. So we have a further testimony to the Apostle's great reputation as a teacher, and a suggestion that his life was devoted to pastoral rather than to missionary work. The reference to his death is to us obscure, though probably it was clear enough to the original readers of the gospel. "Verily verily I say unto thee, when thou wast young thou didst gird thyself and walkedst whither thou wouldest; but when thou shalt be old thou shalt stretch forth thy hands and another shall gird thee, and bear thee whither thou wouldest not. Now this he spake signifying by what manner of death he should glorify God." The inference seems to be that the life of St. Peter was prolonged to an age at which he was unable any longer to attend to himself, that he lived under some kind of restraint, and that his death was somehow connected with these circumstances. To the Church it was a martyrdom by which he glorified God, but the words do not necessarily imply more than that Peter died of old age, bearing bravely its infirmities and indignities. Clement of Rome (*Ep.* 5 Πέτρος μαρτυρήσας) perhaps implies more than this, but the tradition that Peter was crucified rests upon a misunderstanding of the words "thou shalt stretch forth thy hands" (*i.e.*, to allow another to gird thee), and has nothing but a respectable antiquity (Tertullian and Origen) to commend it.

The first part of the Acts is largely a record of Peter's doings, and from these chapters it appears that for some time after the Ascension he was the acknowledged head of the Jerusalem church. His prominence brought him into collision with the Jewish authorities, and twice he was arrested by the priests (iv. 3, v. 18, possibly a doublet). Accompanied by John he made a journey to Samaria to see the results of Philip's preaching, and thus he was concerned in the earliest expansion of the Church (viii. 14 *ff.*). At a later date he travelled further afield, visiting Lydda, Joppa and Caesarea. At Caesarea he baptized Cornelius, and thus it was Peter who admitted the first Gentile to the Church, though Cornelius was no heathen (x. 1 *ff.*). Returning to Jerusalem Peter met criticisms of his policy by relating his experiences, and he was successful in convincing his critics; but it must not be assumed that either St. Peter or the other authorities had as yet any idea of dispensing with circumcision as generally necessary to salvation. There followed (at what interval we do not know) a persecution by Herod in which Peter was arrested, and a famine in which the Jerusalem church, weakened economically by socialistic experiments, suffered severely.

The famine probably continued after Herod's death, and Peter may have been present throughout, for "another place" to which he departed (xii. 17) may mean no more than another house. If he was present during the famine he must have met Saul and Barnabas when they brought relief from Antioch (xi. 30), and this may be the meeting described in Gal. ii. 1 *ff.* at which an agreement was reached between Paul and the senior Apostles on the question of preaching to the Gentiles. This is the view of Sir William Ramsay, and it has the great advantage that it acquits St. Paul of the charge that in writing to the Galatians he omitted to mention one of his visits to Jerusalem.

Peter's last appearance in Acts is in connection with the Council of Jerusalem where he stands up to champion a liberal policy towards the Gentiles. The veracity of the author of Acts has been questioned here, for in Gal. ii. 11 St. Paul discloses the fact that even after the agreement reached at Jerusalem Peter vacillated in his policy towards the Gentiles. If the encounter at Antioch took place after the Council at Jerusalem of Acts xv. then Peter's weakness is as hard to understand as is the obstinacy of the Jewish party. But if Ramsay's view be accepted it is much easier to reconstruct the history of events. At an informal conference in Jerusalem Peter and other leaders were persuaded to sanction an approach to the Gentiles, but not all the Jerusalem party consented nor indeed had they been consulted. The exact terms on which Gentiles might be admitted were not decided. Later, at Antioch, Peter encountered strong conservative opposition and began to waver, but at the subsequent council at Jerusalem he recovered courage enough to state his own convictions, the Jewish party were compelled to bow to the logic of facts, and the whole question was settled. Such a course of events is not inconsistent with what we know of St. Peter's character.

There are one or two hints in the New Testament as to St. Peter's later history. I. Cor. i. 12 mentions a party of Cephas at Corinth, and some have supposed that this implies a residence of St. Peter at Corinth as a consequence of which a party of his admirers was formed. But this is by no means certain, and the evidence of Dionysius of Corinth (*c.* 170) is too late to give substantial support to the belief.

If the first Epistle of Peter be genuine—and to some extent even if it be not—it furnishes some information about the Apostle's subsequent activities. It may suggest a ministry in Asia

Minor (i. 1), and it implies a residence in "Babylon." Babylon has been very commonly taken to mean Rome (Rev. xvi. 19, xvii. 5, etc.), and, if so, we have very early evidence of St. Peter's residence in the capital of the Empire. The belief that Peter lived in Rome goes back to Irenaeus (3 I. i.), Clement of Alexandria (*Comment. on I. Peter*), and Tertullian (*Scorp.* 15). Some hold that it is implied by Clement of Rome who couples the names of Peter and Paul as "champions nearest to us" (I. Ep. v.), and by Ignatius who says to the Romans, "I do not command you as Peter and Paul" (*ad. Rom.* iv). Irenaeus states that Mark acted as Peter's assistant in Rome, and this tradition receives support from I. Pet. v. 14 and from Papias (Euseb. *H.E.* iii. 39, 15). Thus the evidence that St. Peter was at Rome is strong though not conclusive; that he actually founded the Church of Rome is virtually disproved by the silence of Acts and of St. Paul.

Early tradition (Origen, Clementines, Eusebius, Apostolic Constitutions and Jerome) also connects Peter with Antioch of which church he was said to have been the first bishop. Whether this belief was more than an inference from Gal. ii. 11 we do not know.

Nothing definite is known about the Apostle's death. Tertullian states that he was crucified under Nero, and Origen adds that at his own request he was crucified head downwards. But this testimony is late, and we have seen that Joh. xxi. suggests rather that Peter's sufferings were those of old age and restraint upon his liberty. Clement's reference to Peter's fate is very vague. If the Apostle was the author of I. Peter it is almost certain that he lived to a later date than the reign of Nero (*see* PETER, FIRST EPISTLE OF). Early in the third century the grave of Peter and Paul was shown in the Vatican (Euseb. *H.E.* 2. 25, *Acta Petri* 84), and the relics were moved to the catacombs in A.D. 258. Whether or not they were genuine we have no means of judging.

(P. G.-S.)

PETER I., called "the Great" (1672–1725), emperor of Russia, son of the tsar Alexius Mikhailovich and Natalia Naruishkina, was born at Moscow on May 30, 1672. His earliest teacher (omitting the legendary Scotsman Menzies) was the *dyak,* or clerk of the council, Nikita Zotov, subsequently the court fool, who taught his pupil to spell out the liturgical and devotional books on which the children of the tsar were generally brought up. After Zotov's departure on a diplomatic mission, in 1680, the lad had no regular tutor. From his third to his tenth year Peter shared the miseries and perils of his family. His very election (1682) was the signal for a rebellion. He saw one of his uncles dragged from the palace and butchered by a savage mob. He saw his mother's beloved mentor, and his own best friend, Artamon Matvyeev, torn, bruised and bleeding, from his retaining grasp and hacked to pieces. The haunting memories of these horrors played havoc with the nerves of a supersensitive child. The convulsions from which he suffered so much in later years must be partly attributed to this violent shock.

During the regency of his half-sister Sophia (1682–1689) he occupied the subordinate position of junior tsar, and after the revolution of 1689 Peter was still left pretty much to himself. So long as he could indulge freely in his favourite pastimes—shipbuilding, ship-sailing, drilling and sham fights—he was quite content that others should rule in his name. He now found a new friend in the Swiss adventurer, François Lefort, a shrewd and jovial rascal, who not only initiated him into all the mysteries of profligacy (at the large house built at Peter's expense in the German settlement), but taught him his true business as a ruler. His mother's attempt to wean her son from his dangerous pastimes, by forcing him to marry the beautiful but stupid Eudoxia Lopukhina (Jan. 27, 1689), was a disastrous failure. Peter practically deserted his consort about a year after their union.

The death of his mother (Jan. 25, 1694) left the young tsar free to follow his inclinations. Tiring of the great lake at Pereyaslavl (he had seen the sea for the first time at Archangel in July 1683) he returned to Archangel on May 1, 1694, to launch a ship built by himself the year before. Shortly afterwards he nearly perished in a storm in an adventurous voyage to the Solovetsky Islands in the White Sea. From the first the lad had taken an extraordinary interest in the technical and mechanical arts, and their application to military and naval science. He was taught the use of the astrolabe (which Prince Yakov Dolgoruki, with intent to please, had brought him from Paris) by a Dutchman, Franz Timmerman, who also instructed him in the rudiments of geometry and fortifications.

Peter had begun to build his own boats at a very early age, and the ultimate result of these pastimes was the creation of the Russian navy. He had already surrounded himself with that characteristically Petrine institution "the jolly company," or "the company," consisting of his personal friends and acquaintances. "The company" was graduated into a sort of mock hierarchy, political and ecclesiastical, and shared the orgies and the labours of the tsar. Merit was the sole qualification for promotion, and Peter himself set the example to the other learners by gradually rising from the ranks. In 1695 he had only advanced to the post of "skipper" in his own navy and of "bombardier" in his own army. The disreputable Lefort, for the sake of his own interests, diverted the young tsar from mere pleasure to serious enterprises, by persuading him first to undertake the Azov expedition, and then to go abroad to complete his education.

Creator of the Russian Navy.—By this time the White Sea had become too narrow for Peter, and he was looking about him for more hospitable waters. The Baltic was a closed door to Muscovy, and the key to it was held by Sweden. The Caspian remained; it had for long been a common saying with foreign merchants that the best way of tapping the riches of the Orient was to secure possession of this vast inland lake. But so long as the Turks and Tatars made the surrounding steppes uninhabitable the Caspian was a possession of but doubtful value. The first step making for security was to build a fleet strong enough to provide against the anarchical condition of those parts; but this implied a direct attack not only upon the Crimean khan, who was mainly responsible for the conduct of the Volgan hordes, but upon the khan's suzerain, the Turkish sultan. Nevertheless Peter did not hesitate. War against Turkey was resolved upon, and Azov, the chief Turkish fortress in those regions, which could be approached by water from Moscow, was attacked from July 8 to Sept. 22. On Nov. 22, Peter re-entered Moscow. His first military expedition had ended in unmitigated disaster.

Immediately after his return he sent to Austria and Prussia for as many sappers, miners, engineers and carpenters as money could procure. He meant to build a fleet strong enough to prevent the Turkish fleet from relieving Azov. The guards and all the workmen procurable were driven, forthwith, in bands, to fell timber in the forests of the Don, and the shipwrights worked day and night, turning out scores of vessels of all kinds. Peter himself lived among his workmen, himself the most strenuous of them all, in a small two-roomed wooden hut at Voronezh. By the middle of April two warships, twenty-three galleys, four fireships and numerous smaller craft were safely launched. On May 3, "the sea caravan" sailed from Voronezh, "Captain Peter Aleksyeevich" commanding the galley-flotilla from the galley "Principium," built by his own hand. The new Russian fleet prevented the Turks from relieving Azov by sea; and on July 18 the fortress surrendered. Peter thereupon established a new naval station, named Taganrog, at the head of the Sea of Azov.

Turkey was too formidable to be fought single-handed, and it was therefore determined to send a grand embassy to the principal western powers to solicit their co-operation against the Porte. On March 10, 1697 this embassy, under the leadership of Lefort, set out on its travels. Peter attached himself to it as a volunteer sailorman, "Peter Mikhailov," so as to have greater facility for learning ship-building and other technical sciences. As a political mission it failed utterly, the great powers being at that period far more interested in western than in eastern affairs. But personally Peter learnt nearly all that he wanted to know—gunnery at Königsberg, shipbuilding at Saardam and Deptford, anatomy at Leyden, engraving at Amsterdam—and was proceeding to Venice

to complete his knowledge of navigation when the revolt of the *stryeltsy*, or musketeers (June 1698), recalled him to Moscow. This revolt has been greatly exaggerated. It was suppressed in an hour's time by the tsar's troops, of whom only one man was mortally wounded; and the horrible vengeance (September-October 1698) which Peter on his return to Russia wreaked upon the captive musketeers was due not to any actual fear of these antiquated warriors, but to his consciousness that behind them stood the reactionary majority of the nation who secretly sympathized with, though they durst not assist, the rebels.

Peter's foreign tour had more than ever convinced him of the inherent superiority of the foreigner. Imitation had necessarily to begin with externals, and Peter at once fell foul of the long beards and Oriental costumes which symbolized the arch-conservatism of old Russia. On the 26th of April 1698 the chief men of the tsardom were assembled round his wooden hut at Preobrazhenskoye, and Peter with his own hand deliberately clipped off the beards and moustaches of his chief boyars. The *ukaz* of the 1st of September 1698 allowed as a compromise that beards should be worn, but a graduated tax was imposed upon their wearers. The wearing of the ancient costumes was forbidden by the *ukaz* of the 4th of January 1700; thenceforth Saxon or Magyar jackets and French or German hose were prescribed. That the people themselves did not regard the reform as a trifle is plain from the numerous rebellions against it. By the *ukaz* of the 20th of December 1699 it was next commanded that henceforth the new year should not be reckoned, as heretofore, from the 1st of September, supposed to be the date of the creation, but from the first day of January, *anno domini*.

The Great Northern War.—The year 1700 is memorable in Russian history as the starting-point of Peter's long and desperate struggle for the hegemony of the north. He had concluded peace with the Porte (June 13, 1700) on very advantageous terms, in order to devote himself wholly to a war with Sweden to secure for Russia her proper place on the Baltic. The possession of an ice-free seaboard was essential to her natural development; the creation of a fleet would follow inevitably upon the acquisition of such a seaboard; and she could not hope to obtain her due share of the trade and commerce of the world till she possessed both. All the conjunctures seemed favourable to Peter. The Swedish government was in the hands of an untried lad of sixteen; and the fine fleets of Denmark, and the veteran soldiers of Saxony, were on the same side as the myriads of Muscovy. It seemed an easy task for such a coalition to wrest the coveted spoil from the young Charles XII.; yet Peter was the only one of the three conspirators who survived the Twenty-one Years' War in which they so confidently embarked during the summer of 1701. He was also the only one of them who got anything by it. Charles's "immersion in the Polish bog" (1702–1707), as Peter phrased it, enabled the tsar, not without considerable expense and trouble, to conquer Ingria and lay the foundations of St. Petersburg (Leningrad).

In these early days Peter would very willingly have made peace with his formidable rival if he had been allowed to retain these comparatively modest conquests. From 1707 to 1709 the war on his part was purely defensive; Charles would not hear of peace till full restitution had been made and a war indemnity paid, while Peter was fully resolved to perish rather than surrender his "paradise," Petersburg. After Pultava (June 26, 1709), Peter, hitherto commendably cautious even to cowardice, but now puffed up with pride, rashly plunged into as foolhardy an enterprise as ever his rival engaged in. The campaign of the Pruth (March to July 1711) must have been fatal to the tsar but for the incalculable behaviour of the omnipotent grand vizier, who let the Russian army go at the very instant when it lay helpless in the hollow of his hand. Even so, Peter, by the peace of the Pruth, had to sacrifice all that he had gained by the Azov expedition fifteen years previously. On receiving the tidings of the conclusion of the peace of Nystad (August 30, 1721), Peter declared, with perfect justice, that it was the most profitable peace Russia had ever concluded. The gain to Russia was, indeed, much more than territorial. In surrendering the pick of her Baltic provinces, Sweden had surrendered with them the hegemony of the north, and her pretensions to be considered a great power.

Reforms.—The Great Northern War was primarily a training school for a backward young nation, and in the second place a means of multiplying the material resources of a nation as poor as she was backward. During the whole course of it the process of internal domestic reformation had been slowly but unceasingly proceeding. Brand-new institutions on Western models were gradually growing up among the cumbrous, antiquated, worn-out machinery of old Muscovy; and new men, like Menshikov, Goloykin, Apraksin, Osterman, Kurakin, Tolstoy, Shafirov, Prokopovich, Yaguszhinsky, Yavorsky, all capable, audacious, and brimful of new ideas, were being trained under the eye of the great regenerator to help him to carry on his herculean task. At first the external form of the administration remained much the same as before. The old dignities disappeared of their own accord with the deaths of their holders, for the new men, those nearest to Peter, did not require them. "The Administrative Senate" was not introduced till 1711, and only then because the interminable war, which required Peter's prolonged absence from Russia, made it impossible for him to attend to the details of the domestic administration. Still later came the "Spiritual Department," or "Holy Synod" (January 1721), which superseded the ancient patriarchate. It was established, we are told, "because simple folks cannot distinguish the spiritual power from the sovereign power, and suppose that a supreme spiritual pastor is a second sovereign, the spiritual authority being regarded as higher and better than the temporal."

The official birthday of the Russian empire was Oct. 22, 1721, when, after a solemn thanksgiving service in the Troitsa Cathedral for the peace of Nystad, the tsar proceeded to the senate and was there acclaimed: "Father of the Fatherland, Peter the Great, and Emperor of All Russia." Some Russians would have preferred to proclaim Peter as emperor of the East; but Peter himself adopted the more patriotic title.

Towards the end of the reign the question of the succession to the throne caused the emperor some anxiety. The rightful heir, in the natural order of primogeniture, was the little grand duke Peter, son of the Tsarevich Alexius, a child of six; but Peter decided to pass him over in favour of his own beloved consort Catherine. The *ustav*, or ordinance of 1722, heralded this unheard-of innovation. Time-honoured custom had hitherto reckoned primogeniture in the male line as the best title to the Russian crown; in the *ustav* of 1722 Peter denounced primogeniture in general as a stupid, dangerous, and even unscriptural practice of dubious origin. The *ustav* was but a preliminary step to a still more sensational novelty. Peter had resolved to crown his consort empress, and on Nov. 15, 1723 he issued a second manifesto explaining at some length why he was taking such an unusual step. The whole nation listened aghast to the manifesto. The coronation of a woman was in the eyes of the Russian people a scandalous innovation, and the proposed coronation was doubly scandalous in view of the base origin of Catherine herself. (*See* CATHERINE I.) The ceremony took place at Moscow on May 7, 1724.

During the last four years of his reign Peter's policy was predominantly Oriental. He had got all he wanted in Europe, but the anarchical state of Persia at the beginning of 1722 opened up fresh vistas of conquest. The war which lasted from May 1722 to September 1723 resulted in the acquisition of the towns of Baku and Derbent and the Caspian provinces of Gilan, Mazandaran and Astarabad. The Persian campaigns wore out Peter's health. A long and fatiguing tour of inspection over the latest of his great public works, the Ladoga Canal, during the autumn of 1724, brought back another attack of his paroxysms, and he died after terrible suffering, on Jan. 28, 1725.

Character.—Peter's claim to greatness rests mainly on his recognition of the requirements of the Russian nation and his own obligations as its ruler. It would have materially lightened his task had he placed intelligent foreigners at the head of every department of state, allowing them gradually to train up a native bureaucracy. But he was determined that, at whatever cost,

hardship and inconvenience, Russia should be ruled by Russians, not by foreigners; and before his death every important place in his empire was in the hands of capable Russians of his own training. Even in his most sweeping reforms he never lost sight of the idiosyncrasies of the people. He never destroyed anything which he was not able to replace by something better. He possessed, too, something of the heroic nature of the old Russian *bogatuirs*, or demigods, as we see them in the *skazki* and the *builinui*. His expansive nature loved width and space.

No doubt this last of the *bogatuirs* possessed the violent passions as well as the wide views of his prototypes. All his qualities, indeed, were on a colossal scale. His rage was cyclonic: his hatred rarely stopped short of extermination His banquets were orgies, his pastimes convulsions. He lived and he loved like one of the giants of old. There are deeds of his which make humanity shudder, and no man equally great has ever descended to such depths of cruelty and treachery. Yet it may generally be allowed that a strain of nobility, of which we occasionally catch illuminating glimpses, extorts from time to time an all-forgiving admiration. Strange, too, as it may sound, Peter the Great was at heart profoundly religious. Few men have ever had a more intimate persuasion that they were but instruments for good in the hands of God.

PETER II. (1715–1730), emperor of Russia, only son of the Tsarevich Alexius, was born on Oct 18, 1715 From his childhood the orphan grand duke was kept in the strictest seclusion. On May 18, 1727 Peter II., according to the terms of the supposed last will of Catherine I, was proclaimed sovereign autocrat. The education of the young prince was entrusted to the vice-chancellor Osterman. Menshikov, who lodged Peter II. in his own palace on the Vasily island, had intended to marry him to his daughter Maria; the scheme was frustrated by his fall (Sept 21, 1727). Peter fell into the hands of the equally unscrupulous Dolgoruki, who carried him away from Petersburg to Moscow, where he was crowned on Feb 25, 1728. He was betrothed to Catherine, second daughter of Alexis Dolgoruki, but on the day fixed for the wedding (Jan 30, 1730) the emperor died of small-pox

PETER III. (1728–1762), emperor of Russia, only son of Charles Frederick, duke of Holstein-Gottorp, and of Anne, eldest surviving daughter of Peter the Great, was born at Kiel on Feb. 21, 1728. In December 1741 he was adopted by his aunt, Elizabeth Petrovna, as soon as she was safely established on the Russian throne, and on Nov 18, 1742 was received into the Orthodox Church, exchanging his original name of Karl Peter Ulrich for that of Peter Fedorovich. On Aug. 21, 1745, by the command of his aunt, he married the princess Sophia Augusta Frederica of Anhalt-Zerbst (Catherine Aleksyeevna) The union between a prince who physically was something less than a man and mentally little more than a child, and a princess of prodigious intellect and an insatiable love of enjoyment, was bound to end in catastrophe. But there is no foundation for the stories of Peter's neglect and brutality. Even when Peter III. succeeded Elizabeth on Jan. 5, 1762, he paid off Catherine's debts, without inquiring their origin. He gave her a magnificent establishment and great domains. His infidelities Catherine took as a matter of course, provided her own love affairs were not interfered with.

Peter's foreign policy reversed that of Elizabeth He had not been on the throne for two months when he made pacific overtures to the king of Prussia, whom he habitually alluded to as "the king my master." Peter's worship of Frederick resulted in a peace (May 5) and then (June 19) in an offensive and defensive alliance between Russia and Prussia, whereby Peter restored to Prussia all the territory won from her by Russia during the last five years, and engaged to defend Frederick against all his enemies. This was followed up by a whole series of menacing rescripts addressed by Peter to the court of Vienna, in which war was threatened unless Austria instantly complied with all the demands of the king of Prussia Finally he quarrelled with Denmark, and the Russian army received orders to invade Denmark by way of Mecklenburg But before the actual collision took place news came of the coup d'état at St. Petersburg, by which Catherine (*see* CATHERINE II.) succeeded to the throne of Russia. From July 9 to July 18 Peter was in custody at the castle of Ropsha His end is uncertain, but the evidence points to his murder (July 18, 1762) by Alexius Orlov, Theodore Baryatinski, and several other persons still unknown.

PETER (PEDRO), the name of several Spanish kings.

PETER I, king of Aragon (d. 1104), son of Sancho Ramirez, recovered Huesca from the Mohammedans in 1096.

PETER II, king of Aragon (1174–1213), son of Alphonso II, and Sancia, daughter of Alphonso VIII of Castile, had a very marked and curious personal character. As a Spanish prince he was a crusader, and took a distinguished part in the victory over the Almohades at the Navas de Tolosa in 1212. His lands to the north of the Pyrenees brought him in touch with the Albigenses and in 1213 he fought against Simon de Montfort's crusaders, moved not by sympathy with the Albigenses, but by hostility to the conquering intervention of the north under pretence of religious zeal A favourer of the troubadours, he combined great personal valour with the most lax morality He was killed at the battle of Muret (Sept. 12, 1213).

See J Forster, *Chronicle of James I of Aragon* (Trans London, 1883); F. Darwin Swift, *Life and Times of James the First the Conqueror* (Oxford, 1894).

PETER III, king of Aragon (1236–1286), son of James the Conqueror and Yolande, daughter of Andrew II of Hungary. Through his marriage with Constance, daughter of Manfred of Beneventum, he claimed Naples and Sicily from Charles, duke of Anjou, thus beginning the strife of the Angevin and Aragonese in southern Italy His conquest of Sicily earned him the surname of "the Great" He repelled an invasion of Catalonia by the French king and died Nov 8, 1286

See Ramon de Muntanez, *Chronica . . .* ed R Lanz (Stuttgart, 1844, Fr trans by Buchon, Paris, 1824–28 Coll des chroniques nationales); O. Cartellieri, *Peter von Aragon u die Sizilianische Vesper* (Heidelberg, 1904).

PETER IV, king of Aragon (d 1387), son of Alphonso IV. and Teresa d'Entença, known as "The Ceremonious" by the rigid etiquette he enforced, and as "he of the dagger" because he wounded himself in cutting to pieces the so-called "charter of the Union" which authorized the rebellions of his nobles. His life was spent in warfare. He routed his nobles at Epila (1348), re-annexed the Balearic islands, was engaged in conflict with Peter the Cruel of Castile until the accession of Henry of Trastamara (1369), conquered Sicily in 1377 and ceded it to his son Martin (d. 1410). He was three times married. to Mary, daughter of the king of Navarre; to Eleanor, daughter of Alphonso IV. of Portugal; to Eleanor, daughter of Peter II. of Sicily, by whom he had a daughter, Eleanor, whose marriage with John I. of Castile carried the crown of Aragon to the Castilian line.

See Zurita *Anales de Aragon* (Saragossa, 1610).

PETER, "the Cruel," king of Castile (1333–1369), son of Alphonso XI. and Maria, daughter of Alphonso IV. of Portugal, began to reign at the age of 16. Controlled at first by his mother, he emancipated himself with the encouragement of the minister Albuquerque, against whom he turned under the influence of his

mistress, Maria de Padilla, the one woman of his harem of whom he never became tired. In 1354 he was coerced into marrying Blanche of Bourbon, and deserted her at once. Imprisoned in the period of turmoil that ensued, he escaped from Toro to Segovia, and from 1356–66 he was master, and was engaged in continual wars with Aragon. It was at this time that he perpetrated the series of murders which made him odious, earning the reputation of monstrous cruelty indicated by his title. In 1366, attacked by Henry of Trastamara, he fled and took refuge with the Black Prince, who reinstated him. When the Black Prince left Spain, disgusted by his ally's ferocity, Peter was overthrown by Henry, with the aid of du Guesclin, in whose tent he was murdered March 23, 1369.

See P. Lopez de Avala, *Crónicas de los reyes de Castilla* . . . (Madrid, 1779–80, 2 vols); P. Merimee, *Histoire de Don Pèdre I., roi de Castille* (Paris, 1848; Eng. trans., 1849).

PETER I. (1844–1921), first King of the Serbs, Croats and Slovenes, was the eldest son of Alexander Karagjorgjević, who had been elected as Prince of Serbia on the expulsion of the Obrenović dynasty in 1842, and was therefore grandson of Kara George, the first leader of Serbian independence. His father lost his throne in 1858, and withdrew to Austria, where Peter grew to manhood. Accused of conspiring against Prince Michael Obrenović (1868), Prince Alexander transferred himself to Switzerland, and Peter made Geneva his headquarters for many years.

In 1870 he joined the French Army as a volunteer, and served with distinction in the campaign against Germany. In 1876 he joined the Bosnian insurgents against Turkey and fought under the assumed name of Peter Mrkonjić, leaving behind him a legend which had its influence on the young revolutionaries of a later generation. In 1882 he, the exiled Pretender, and not the newly proclaimed King of Serbia, was invited to attend the coronation of Tsar Alexander III., who resented Milan's dependence upon Vienna; and it was very largely due to the Tsar's personal influence that in 1883 Peter married Zorka, daughter of Prince Nicholas of Montenegro. For a time he lived at Cetinje, but after his wife's death in 1890 he again lived in Geneva.

In 1903 shortly after the murder of King Alexander and Queen Draga by a military gang, Peter was unanimously elected King of Serbia and though he was gravely embarrassed at home by the political interference of the regicides, and abroad by the odious circumstances to which he owed his accession, he set himself steadily to work for constitutional government, his tact, self-effacement and liberal outlook forming a marked contrast to the attitude of Serbia's previous rulers and contributing to the rapid political consolidation which followed the upheaval of 1903. In June 1914 ill-health forced him to entrust Crown Prince Alexander with the regency, and condemned him to a passive rôle during the World War. But the simplicity of his life, his stirring proclamations to his soldiers and the visits which he paid to the trenches in a half crippled condition, did much to encourage Serbian resistance; and he shared the privations of the great retreat across Albania, lying in a litter. After the war and his election as "king of the Serbs, Croats and Slovenes," he lived mainly in retirement at Topola and died on Aug 16, 1921 (R. W. S.-W)

PETER, FIRST EPISTLE OF. The Epistle is addressed to the elect who are sojourners of the dispersion (*diaspora*) in Pontus, Galatia, Cappadocia, Asia and Bithynia. The term "dispersion" suggests scattered Jews, but references in the epistle to their previous benighted state (i 14, ii. 9–10, iv 3) seem rather to imply that the recipients were Gentiles, and if so, the word "dispersion" is used metaphorically for Christians scattered among the heathen. The primary purpose of the writer seems to have been to strengthen the courage of these Asian Christians who were faced with persecution, and to enjoin on them such conduct as would remove all excuse for the common confusion between Christianity and crime.

The questions of date and authorship are closely connected, for many critics have maintained that the contents of the epistle imply a date subsequent to the death of St. Peter. (a) References to persecution occur in i. 6, ii. 12, iv. 12–19, v. 9; the recipients are undergoing a "fiery trial"; they have to bear reproaches, and to endure an evil reputation; they may "suffer" as do thieves and murderers, although it is not clear that death is the inevitable penalty; so severe is the trial that it must mark the beginning of the end; persecution is general, and not confined to the provinces addressed. These are very similar conditions to those implied in Pliny's letter to Trajan, and therefore it is argued that I. Peter belongs to the same period and was written long after the Apostle's death.

It is true that if we accept the tradition of Peter's death under Nero it is very difficult to suppose that these conditions existed during his lifetime. There was certainly no general persecution before Nero, and our only real authority (Tacitus) gives no hint that the Neronian persecution extended beyond the city of Rome where it was due to local causes. Systematic religious persecution was so strange to the easy tolerance of Rome that most scholars think that a considerable time must be allowed for the policy to have developed. Ramsay thinks that the Flavian emperors began systematic persecution after the Jewish war; others believe that there was nothing serious in the provinces before the reign of Domitian (81–96), and Professor Merrill (*Essays in Early Christian History*) is sceptical even about that. But the evidence of the Apocalypse seems decisive that Rome persecuted systematically in the time of Domitian, at least in Asia. I Peter appears to have been written at a time when the conditions reflected in Pliny's letter were just coming into being; the imperial authorities were manifesting hostility due to a lack of understanding, but there had been few if any martyrdoms, and the author betrays none of the ferocious resentment against Rome which characterizes the Apocalypse, indeed he still entertains a respect for the authorities not unlike that of St. Paul (I. Pet. iii 13). There is no allusion to the Emperor-worship which caused trouble in Domitian's time. On these grounds it seems possible to date the epistle roughly. The *terminus ad quem* is fixed by the full development of the Domitian policy. If Ramsay is right in connecting persecution with the Jewish war, 70 is the *terminus a quo*; if not, 85–90 is the most probable date, but the epistle must be considerably earlier than the Domitian portions of the Apocalypse. (b) It is generally agreed that the epistle has close affinities with some other early Christian works, notably the Epistle to the Romans (*q.v.*), the Epistle to the Ephesians (*q.v.*), the Epistle of James (*q.v.*), and the Epistle of Polycarp. Unfortunately the dates of some of these works are uncertain, and it is not agreed on which side is the dependence. The majority of scholars allow that in the case of Romans the dependence is on the side of Peter, and the balance of opinion favours the priority of Ephesians, though not of James. If so, the author of I. Peter wrote at a time when Romans and Ephesians were well known at least in his neighbourhood. If the Pauline authorship of Ephesians is rejected the inference must be that I. Peter was written at a time when a pseudo-Pauline epistle had had time to gain currency, and that could hardly be earlier than the second century But, as we have seen, there are difficulties in dating I. Peter after the Apocalypse. If Ephesians be a genuine work of St. Paul then I. Peter may have been written at any time after St. Paul's imprisonment. If James is dependent on I. Peter then we have an additional argument for the early date of I. Peter. The objection that Peter would not be likely to quote Paul is only forcible on the old Tubingen theory of a life-long feud between them. (c) The theology of I. Peter is simple and bears marked resemblances to that which finds expression in the early speeches in Acts. Its "Paulinism" has been much exaggerated. Jesus is the promised Messiah, and "the Spirit of Christ" is the spirit which was in the prophets. His suffering for sin had rescued the elect, and his endurance was an example for Christians faced with persecution. After death Jesus preached to "the spirits in prison." The source of Christian life is to be found in belief in God and in baptism. Christians are a royal priesthood, a holy nation, destined at the end of the world, which is close at hand, to inherit the promises. Church organization as it appears in this epistle is very simple and primitive; there are elders who shepherd the flock, but there is no trace of a developed organization. There is nothing in these facts to preclude a belief in the Petrine author-

ship of the epistle. If, in spite of tradition to the contrary, St. Peter survived the days of Nero and lived subsequently in Rome, he may well have been acquainted with some of St. Paul's letters, particularly with one written to the Romans and with another written during the Apostle's imprisonment in the city. He may have lived to see the beginnings of that persecuting policy which wrought such havoc in the time of Domitian and which we find fully established in the days of Pliny. Nor is the language difficulty serious. St. Peter had lived for many years among Greek-speaking communities, and he would doubtless employ an amanuensis. I. Peter was the first of the Catholic epistles to secure a place in the canon of Scripture, and it seems to have been widely accepted by the end of the second century. It is, however, omitted from the Muratorian canon which probably represents the opinion of Rome about A.D. 200. The omission may have been accidental, and Zahn would emend the text.

PETER, SECOND EPISTLE OF. This epistle claims to have been written by "Simon (or Symeon) Peter, a servant and Apostle of Jesus Christ." The author, after a preliminary exhortation, declares his desire to testify again to the power of Jesus. He bases his testimony partly on his own experience "in the holy mount," and partly "on the word of prophecy." The mention of prophecy leads him to deal with the question of false prophets who are accused of false doctrine and immoral practices. In this section (ii. 1–22) is included almost the whole of the epistle of Jude (*q.v.*). The author then deals with the expectation of the *Parousia* which some were beginning to doubt. This is the main object of the letter, to attack the false prophets and to defend the certainty of the *Parousia* of the Lord.

As I. Peter was the first of the Catholic Epistles to be admitted into the canon, so II. Peter was the last. It was accepted at Alexandria in the third century, thence it passed into the canon of the church of Constantinople; but not until the fourth century was it accepted at Rome, and the Syrian church admitted it in the sixth century.

The cumulative weight of the following objections to its authenticity is generally held to disprove its claim to Petrine authorship:— (a) Origen, the first to mention it as Petrine, admits that its authorship was disputed. (b) The style, language and thought not only differ from I. Peter but from the rest of the New Testament. (c) References to immorality associated with false teaching seem to belong to a date much later than that of the Apostle Peter. (d) The incorporation of Jude makes Petrine authorship improbable. (e) The attribution of scriptural authority to the Pauline epistles (iii. 16) points to a date not earlier than the second century.

It is impossible to say when or where the epistle originated. For the date, a *terminus a quo* must be fixed by (1) the prevalence of an immoral gnosticism; (2) the attainment by the Pauline epistles of a quasi-scriptural authority; (3) the use made of the epistle of Jude, and perhaps of the Apocalypse of Peter. The *terminus ad quem* is the use of the epistle by Origen. We may say that the most probable date for its composition is the middle of the second century.

It may have been written in Egypt, where it first appears; or, as Deissmann thinks, it may have originated in Asia Minor.

The theology of II. Peter is suggestive of a late date. Christ is referred to as "our God and Saviour," and the fatherhood of God seems to be understood only in reference to the Son. The work of Christ was the redemption of the elect, and this redemption awaits its consummation in the *Parousia.* The present world will be destroyed by fire, and the wicked, whether angels or men, will be finally condemned; then will begin a new era of happiness for the elect.

BIBLIOGRAPHY.—*See* the bibliographies to PETER, FIRST EPISTLE OF, JUDE, EPISTLE OF. (P. G.-S.)

PETERBOROUGH, a city and port of entry of Ontario, Canada, and capital of Peterborough county, situated 70 m. N.E. of Toronto, on the Otonabee river and the Canadian National and Canadian Pacific railways. Pop. (1921) 20,994. The five falls of the Otonabee at this point, with a total descent of 50 ft., furnish power for a large and increasing number of manufacturing establishments, whilst its canalization as part of the Trent canal gives communication with Lake Ontario and Georgian bay. Peterborough has an electric railway, and contains important manufactories of electrical machinery and supplies, iron and steel bridges, farm implements, saw, flour and woollen mills.

PETERBOROUGH, a city and municipal borough of Northamptonshire, England, 76 m. N. from London by the L.N.E. railway; served also by the L.M.S. railway. Pop. (1921) 35,532. It is situated on the river Nene, on the western border of the Fen country.

Peterborough (*Burgh, Burgus sancti Petri*), in early days named Medehamstede, was a Saxon village before 655 when Saxulf, a monk, founded the monastery on land granted to him for that purpose by Penda, king of Mercia. Its name was altered to Burgh between 992 and 1005 after Abbot Kenulf had made a wall round the minster, but the town was not a borough until the 12th century. The burgesses received their first charter from "Abbot Robert," probably Robert of Sutton (1262–73). Until the 19th century the dean and chapter, who succeeded the abbot as lords of the manor, appointed a high baliff, and the constables and other borough officers were elected at their court leet, but the borough was incorporated in 1874. Among the privileges claimed by the abbot as early as the 13th century was that of having a prison for felons taken in the soke and borough. In 1576 Bishop Scamble sold the lordship of the hundred of Nassaburgh, coextensive with the soke, to Queen Elizabeth, who gave it to Lord Burghley, and from that time until the 19th century he and his descendants, marquesses of Exeter, had a separate gaol in Peterborough. Weaving and woolcombing were carried on in Peterborough in the 14th century. The city sent two members to parliament for the first time in 1547, but the number was reduced to one in 1885, and in 1918 the representation of the town was merged with that of the county.

The cathedral of St. Peter is the third church that has occupied the site; the first, founded under Penda, king of the Mercians, about 656, was destroyed by the Danes in 870, and the second, founded in King Edgar's reign, was accidentally burnt in 1116. The present building, founded in the following year, was consecrated on Oct. 4, 1237. It embraces eight periods of construction, and in no other building can the transition be better studied through the various grades of Norman to Early English, while the later addition is Perpendicular.

The erection proceeded as usual from east to west, and, while an increase in elaboration is observable in the later parts, the character of the earlier buildings was kept so that no sense of incongruity is produced. A series of uniform Decorated windows were added in the 14th century. The early Norman choir, terminating in an apse, was founded in 1117 or 1118 by John de Sais or Sez, and dedicated in 1140 or 1143; the aisles of both transepts and the whole of the south transept were built by Martin of Bec, 1140–55; the remaining portions of the transepts and the central tower, of three stories, were completed by William de Waterville, 1155–75; the nave, late Norman, was completed by Abbot Benedict, 1177–93, who added a painted roof of wood; the western transepts, transitional Norman, were the work of Abbot Andrew, 1193–1200; the western front, actually a portico of three arches, was probably built between 1200 and 1250. The lady chapel, built parallel with the choir, was consecrated in 1290; the bell-tower was erected between 1260 and 1274; the south-west spire, the pinnacles of the flanking tower of the west portal, and the enlargement of the windows of the nave and aisles in the beginning of the 14th century; the "new building" or eastern chapel in the Perpendicular style, begun in 1438, was not completed till 1528. In 1541 the church was converted into a cathedral, the abbot being made the first bishop. In 1643 the building was defaced by the soldiers of Cromwell. To obtain materials for repairs

the lady chapel was taken down. In the latter part of the 18th century the church was repaved and in 1831 further restoration took place. On account of the insecure state of the central tower in 1883 it was taken down, and reconstructed as it stood except for the four corner turrets added early in the 19th century.

In 1895 the restoration of the west front and other parts was begun; during this restoration the site of the cruciform Saxon church, enclosed within a crypt under the south transept, was discovered. Catherine of Aragon was interred in the cathedral in 1536, and Mary Queen of Scots in 1587, but the body of the Scottish queen was removed to Westminster Abbey in 1612. The cathedral is approached by a Norman gateway, above which is the chapel of St. Nicholas, built by Abbot Benedict, and on the left the chapel of St. Thomas à Becket, built by Abbot Ashton in the 15th century as it stands, but originally Norman. The gateway to the bishop's palace, formerly the abbot's house, was built in 1319, and the deanery gate about 1520. One of the canonry houses is formed partly from a hall of the 13th century.

Peterborough is included for civil purposes in the parish of St. John the Baptist, but for ecclesiastical purposes it is divided into four, the additional parishes being St. Mary's Boongate (1857), St. Mark's (1858) and St. Paul's (1869). The old parish church of St. John originally stood to the east of the cathedral, but was rebuilt on its present site in the centre of the city (1401–07) in Perpendicular style. The educational establishments include the Henry VIII. grammar or chapter school, which used the chapel of St. Thomas à Becket until 1885; and Deacon's and Ireland's charity school, established in 1721 for the clothing and educating of 20 poor boys. The principal public building is the market house (1671), used as a town-hall. The modern prosperity and rapid growth of the town are chiefly due to the trade caused by the junction of so many railway lines. Adjoining the town are extensive railway works. The principal manufactures are of agricultural implements, bricks and tiles. There is trade in agricultural produce. The municipal borough was incorporated in 1874. The soke or liberty of Peterborough, with a population (1921) of 53,464, constitutes a separate administrative county (1888). The diocese of Peterborough includes the whole of Rutland, nearly all Leicestershire and Northamptonshire, and small portions of Derbyshire and Huntingdonshire.

PETERBOROUGH AND MONMOUTH, CHARLES MORDAUNT, 3RD EARL OF (*c.* 1658–1735), English soldier and statesman, son of John Mordaunt, created Viscount Mordaunt of Avalon and Baron Mordaunt of Reigate, in 1659, and Elizabeth Carey. He served in the Navy and then became a Whig and keen opponent of James II. In Holland in 1686 he proposed to William of Orange the invasion of England; and, later, when William was king, Mordaunt was made a privy councillor, first lord of the treasury, and earl of Monmouth. Against the king's wishes, he introduced a bill for triennial parliaments in 1693, and in 1697 he was sent to the Tower on the ground of complicity in Sir John Fenwick's conspiracy. Soon after, on the death of his uncle, Henry Mordaunt, he became earl of Peterborough.

In the reign of Anne he drew down on himself in 1702 the censure of the Commons for his action in trying to secure the return of his nominee at Malmesbury, and was sent off in 1705 to command an expedition in Spain. He besieged Barcelona and in 1706 entered Valencia in triumph. It is difficult to understand the action of Peterborough during this campaign, unless on the supposition that he was out of sympathy with the movement for placing the Austrian prince Archduke Charles on the throne of Spain. He was recalled to England to explain his conduct and joined the Tories in 1707. The differences between the three peers, Peterborough, Galway and Tyrawley, who had served in Spain, caused angry debates in the Lords, but the majority declared for Peterborough, and votes of thanks were passed to him in 1708. He next went to Vienna, where he engaged the ministry in pledges of which they disapproved. Nevertheless, he was made a Knight of the Garter. With the accession of George I. Lord Peterborough's influence was gone, and he died at Lisbon on Oct. 25, 1735.

Short in stature and spare in habit, he was of fierce and turbulent disposition. He is said to have seen more kings than any man in Europe, and the point of Swift's lines on "Mordanto" consists in a description of the speed with which he hastened from capital to capital. He was eloquent in debate and intrepid in war, but his influence was ruined by inconsistency and his want of union with his colleagues. His first wife, Carey, daughter of Sir Alexander Fraser of Dores, Kincardineshire, died in 1709. In 1722 he secretly married Anastasia Robinson, a famous singer of great beauty and sweetness; but she lived apart from him (regarded as his mistress), and it was only shortly before his death that she was acknowledged as the countess of Peterborough.

BIBLIOGRAPHY.—*See* the life by William Stebbing (1890), and the *War of the Succession in Spain,* by Colonel the Hon. Arthur Parnell (1905). The earlier lives are founded on the memoir of Captain George Carleton (1728), which was dismissed as a fictitious narrative inspired by Swift, in the *Eng. Hist. Rev.* (1891), vi. 97–151.

PETER DES ROCHES (d. 1238), bishop of Winchester under John and Henry III., was a Poitevin by extraction. He received the office of chamberlain towards the close of Richard's reign, and under Richard's successor became an influential counsellor. In 1205 he became bishop of Winchester, and though his election was disputed, it was confirmed by Pope Innocent III., who honoured Peter by consecrating him in person. None the less, the bishop stood by his royal patron during the period of the interdict and during the struggle with the barons. In 1213 he was made justiciar in succession to Geoffrey Fitz Peter. At the battle of Lincoln (1217) Peter led a division of the royal army and earned some distinction by his valour; but he played a secondary part in the government so long as William Marshal held the regency. After Marshal's death (1219) Peter led the baronial opposition to Hubert de Burgh, with varying success. At first the justiciar was successful. In 1221 Peter meditated going on crusade; 1223–1224 saw his party broken up by Hubert's energetic measures; in 1227 was himself dismissed from his office and left England to join the crusade of the emperor Frederick II. He was absent from England until 1231; but in the meantime enhanced his reputation both as a soldier and diplomatist. After the fall of De Burgh he kept in the background, but offices and honours were heaped on his dependants. This foreign party triumphed over the revolt which was headed by Richard Marshal in 1233. But the primate, Edmund Rich, denounced Peter as a mischief maker, and demanded his dismissal. Peter was permitted to leave the country with a pardon (1235); he conciliated Gregory IX. by rendering efficient aid in a war with the citizens of Rome (1235); and in the next year returned without molestation to his see. Peter died in 1238, and was buried at Winchester.

PETERHEAD, a burgh and seaport of Aberdeenshire, the most easterly town in Scotland. Pop. (1921) 13,126. It is situated about 33 m. by road E.N.E. of Aberdeen and 44¼ m. by rail, on the L.N.E.R. The town is built of locally quarried red granite. A statue to Field Marshal Keith (born at Inverugie Castle, 2 m. N.W. in 1696), was presented to the burgh in 1868 by William I. of Prussia, afterwards German emperor. Peterhead formerly had an extensive foreign trade, and seal and whale fisheries, now practically extinct. It is, however, an important station of the herring fisheries and head of a fishery district, with a large herring fleet and a busy local trade. The north and south harbours lie between the town and Keith Inch—a suburb—and the isthmus dividing them is pierced by a canal. In the north harbour are two graving docks (21 acres). In addition to granite quarrying and polishing, the leading industries are ship-building and fish-curing. A mile south is the convict prison for Scotland. A large harbour, for which the breakwater extends from Boddam point north across the bay, was built by convict labour.

The town and lands belonged of old to the Abbey of Deer, built in the 13th century by William Comyn, earl of Buchan; but when the abbey was erected into a temporal lordship in the family of Keith the superiority of the town passed to the earl marischal, with whom it continued till the forfeiture of the earldom in 1716. The town and lands were purchased in 1720

by a fishing company in England and, on their failure, by the Merchant Maidens' Hospital of Edinburgh for £3,000, who are still the overlords. Peterhead, made a burgh of barony in 1593 by George Keith, fifth earl marischal, was the scene of the landing of the Pretender on Christmas Day 1715.

PETERHOF, a town of Russia in the Leningrad province, in 59° 52′ N., 29° 53′ E., on the south coast of the Gulf of Finland. It was founded in 1711, and grew, as a summer residence of the court, round the palace built by Peter the Great in 1720. Its palaces and gardens illustrate two centuries of imperial architectural taste; the numerous fountains are famous. Pop. (1926) 8,925. The ancient gem-cutting industry still flourishes.

See *Guide to the Soviet Union* (Moscow, 1925, in English).

PETER LOMBARD (*c.* 1100–*c.* 1160), bishop of Paris, better known as *Magister sententiarum,* the son of obscure parents, was born about the beginning of the 12th century, at Novara (then reckoned as belonging to Lombardy). After receiving his education at Bologna, he removed to France, bearing a recommendation to Bernard of Clairvaux, who first placed him under Lotolf at Reims, and afterwards sent him to Paris with letters to Gilduin, the abbot of St. Victor. He obtained a theological chair in the cathedral school. His famous textbook, the *Sententiae,* was written between 1145 and 1150. In 1159 he became bishop of Paris. According to one account he died on June 20, 1160.

His famous theological handbook, *Sententiarum libri quatuor,* is, as the title implies, primarily a collection of opinions of the fathers, "sententiae patrum." These are arranged into four books, of which the first treats of God, the second of the creature, the third of the incarnation, the work of redemption, and the virtues, and the fourth of the seven sacraments and eschatology. The most important thing in the book was its crystallization of the doctrine concerning the sacramental system, by the definite assertion of the doctrine of the seven sacraments, and the acceptance of a definition of sacrament, not merely as "a sign of a sacred thing," but as itself "capable of conveying the grace of which it is the sign." The sentences soon attained immense popularity, ultimately becoming the textbook in almost every theological school, and giving rise to endless commentaries, over 180 of these being written in England. In 1300 the theological professors of Paris agreed in the rejection of 16 propositions taken from Lombard, but their decision did not obtain universal currency.

Besides the *Sententiae,* Lombard wrote numerous commentaries (*e.g.,* on the Psalms, Canticles, Job, the Gospel Harmony, and the Pauline Epistles), sermons and letters, which still exist in ms. The *Glossae seu commentarius in psalmos Davidis,* were first published at Paris in 1533.

Lombard's collected works have been published in J. P. Migne's *Patrologie latine,* Tomes 191 and 192. *See* also Denifle and Chatelain, *Chartularium universitatis parisiensis,* Tome i. (Paris, 1889); Protois, *Pierre Lombard, son époque, sa vie, ses écrits, son influence* (Paris, 1881); Kögel, *Petrus Lombard in seiner Stellung zur Philosophie des Mittelalters* (Leipzig, 1897); A. Harnack, *Dogmengeschichte,* Bd. iii. (1890; Eng. trans. 1894–1899); and the article in Herzog-Hauck's *Realencyklopädie,* Bd. xi. (Leipzig, 1902).

PETERLOO, or the Manchester Massacre, a name given to a meeting held on Aug. 16, 1819, in St. Peter's Fields, Manchester. Its object was to demand the reform of parliament and it was attended by about 60,000 persons, including an unusually large proportion of women and children. None were armed and their behaviour was admittedly wholly peaceable, but the magistrates, who were in a nervous condition, ordered the Manchester yeomanry to seize the speakers immediately after the meeting had begun. The yeomanry, who were untrained Manchester business men, did not confine themselves to arresting the leaders, but made a general attack upon the audience, crying "Have at their flags," and cutting them down with the edge as well as the flat of their sabres. The chairman of the bench of magistrates thereupon ordered the 15th Hussars and the Cheshire yeomanry also to charge the crowd, and in ten minutes the place was cleared except for bodies, "some still groaning, others with staring eyes, gasping for breath; others will never breathe more; all silent save for those low sounds and the occasional snorting and pawing of steeds." The numbers of killed and wounded were disputed; 600 authenticated cases are known. The indignation caused by the behaviour of the yeomanry and its endorsement by the government contributed largely to the ultimate success of the reform movement. A Peterloo medal, now rare, was struck, bearing the legend "The wicked have drawn out the sword, they have cut down the poor and needy and such as be of upright conversation" (Ps. xxvii., 14).

See *Memoirs of H. Hunt, Esq.* (1820–22); S. Bamford, *Passages in the Life of a Radical* (1893); F. A. Bruton, *Story of Peterloo* (1919); and *Three Accounts of Peterloo* (1921). (R. W. P.)

PETER OF BLOIS [Petrus Blesensis] (*c.* 1135–*c.* 1205), French writer, the son of noble Breton parents, was born at Blois. In 1167 he went to Sicily, where he became tutor to the young king William II., and keeper of the royal seal. He made many enemies and soon asked permission to leave the country, returning to France about 1170. Peter entered the employ of Henry II. of England about 1173. He became archdeacon of Bath and soon afterwards chancellor, or secretary, to Richard, archbishop of Canterbury, and to Richard's successor, Baldwin, being sent on two occasions to Italy to plead the cause of these prelates before the pope. After the death of Henry II. in 1189, he was for a time secretary to his widow, Eleanor, in Normandy; he obtained the posts of dean of Wolverhampton and archdeacon of London. He died some time after March 1204.

Peter's writings fall into four classes, letters, treatises, sermons and poems. His *Epistolae,* collected at the request of Henry II., are an important source for the history of the time; they are addressed to Henry II., and to various prelates and scholars, including Thomas Becket and John of Salisbury. His treatises include *De Ierosolymitana peregrinatione acceleranda,* an exhortation to take part in the third crusade, and *Dialogus inter regem Henricum II. et abbatem Bonaevallensem;* his extant sermons number 65 and his poems are unimportant. Peter's works have been printed in several collections, including the *Patrologia* of J. P. Migne and the *Historiae francorum scriptores* of A. Duchesne. Of separate editions the best are those by Pierre de Goussainville (Paris, 1667) and J. A. Giles (Oxford, 1846–1847).

See the *Histoire littéraire de la France,* Tome xv.; W. Stubbs, *Lectures on Mediaeval and Modern History* (Oxford, 1886); Sir T. D. Hardy, *Descriptive Catalogue of Materials relating to the History of Great Britain* (1862–1867), and C. L. Kingsford in vol. xlv. of the *Dict. Nat. Biog.*

PETER OF COURTENAY (d. 1219), emperor of Romania (or Constantinople), was a son of Peter of Courtenay (d. 1183), and a grandson of the French king, Louis VI. Having, by a first marriage, obtained the counties of Nevers and Auxerre, he took for his second wife, Yolande (d. 1219), a sister of Baldwin and Henry of Flanders, who were afterwards the first and second emperors of the Latin Empire of Constantinople. Peter accompanied his cousin, King Philip Augustus, on the crusade of 1190, fought against the Albigenses, and was present at the battle of Bouvines in 1214. When his brother-in-law, the emperor Henry, died without sons in 1216, Peter was chosen as his successor. Consecrated emperor at Rome, in a church outside the walls, by Pope Honorius III. on April 9, 1217, he borrowed some ships from the Venetians, promising in return to conquer Durazzo for them; but he failed in this enterprise, and sought to make his way to Constantinople by land. On the journey he was seized by the despot of Epirus, Theodore Angelus, and, after an imprisonment of two years, died, probably by foul means.

See Gibbon, *Decline and Fall of the Roman Empire* (ed. Bury. London, 1912), Vol. 5., p. 448–449. E. Gerland, *Geschichte des lateinischen Kaiserreiches von Constantinopel,* Vol. i. (1905).

PETER OF SAVOY (*c.* 1203–1268), earl of Richmond, younger son of Thomas I. (Tommaso), count of Savoy, was born at Susa. After spending some years as an ecclesiastic, he resigned his preferments, and in 1234 married his cousin Agnes, daughter and heiress of Aymon II., lord of Faucigny. On the invitation of the English king, Henry III., who had married his niece, Eleanor of Provence, Peter came to England in 1240, and was created earl of Richmond, receiving also large estates and being appointed to several important offices. During several visits to the continent of Europe Peter increased his possessions in the Vaud district, and returning to England in 1252 he became associated with Simon de Montfort, retaining at the same time the king's friendship. He was employed by Henry to negotiate with the pope and

Louis IX. of France, but supported Earl Simon in his efforts to impose restrictions upon the royal power. He went over to Henry's side in 1260, and was consequently removed from the council. In 1263 he left England, and when his nephew, Boniface, count of Savoy, died in the same year he assumed the title of count of Savoy. This was also claimed by another nephew, Thomas; but Peter compelled the inhabitants of Turin to submit to him and secured possession of the county. He died on May 16, or 17, 1268, leaving an only child, Beatrice (d. 1310). Peter gave his name to the Savoy palace in London.

See L. Wurstemberger, *Peter der Zweite, Graf von Savoyen* (Zürich, 1858); F. Mugnier, *Les Savoyards en Angleterre* (Chambéry, 1890); and C. Bémont, *Simon de Montfort* (Paris, 1884).

PETERS or **PETER, HUGH** (1598–1660), English Independent divine, was educated at Trinity college, Cambridge, where he graduated M.A. in 1622. He took Anglican orders, and was appointed lecturer at St. Sepulchre's, but his unorthodox opinions drove him to the Continent, where he remained till 1635. In this year he sailed for America, where he already had connections, and he became minister at Salem, Massachusetts. He played a leading part in the affairs of the colony and in the founding of Connecticut. Returning to England as agent for the new colony in 1641, he became involved in political matters. He was chaplain to the force of adventurers in Ireland, served in Lord Forbe's expedition, and in the campaigns of 1645 and 1646, and by his eloquence is said to have materially assisted the parliamentary cause. Although an influential leader of the Independents, Peters was disliked by the Presbyterians. He supported the army in its quarrel with parliament, and in 1649 he accompanied Cromwell to Ireland and was present at the fall of Wexford; also the battle of Worcester. Appointed chaplain to the Council of State (1650), he preached at Whitehall continually during the protectorate, and gained much influence. In 1652–53 he protested against the Dutch war, and was severely reprimanded. Soon after he retired from public life. At the Restoration, however, he was specially exempted from the Act of Indemnity, and being tried for abetting the execution of Charles I., he was found guilty and executed at Charing Cross on Oct. 16, 1660.

Peters was the author of several tracts, and his accounts of battles and sieges are valuable.

PETERS, KARL (1856–1918), German explorer, one of the founders of German East Africa, was born at Neuhaus on the Elbe on Sept. 27, 1856, the son of a Lutheran clergyman. He studied at Göttingen, Tübingen and Berlin. After visiting London to study English principles of colonization, he returned to Berlin and promoted the German Colonization Society (*Deutsche Kolonialverein*). In the autumn of 1884 he proceeded with two companions to East Africa, and concluded in the name of his society treaties with the chiefs of Useguha, Nguru, Usagara and Ukami. Returning to Europe early in 1885, he formed the German East Africa Company, which obtained an imperial charter. In 1888 Peters undertook an expedition from the east coast of Africa, avowedly for the relief of Emin Pasha. This expedition was not sanctioned by the German government and was regarded by the British authorities as a filibustering exploit. One of its objects was to extend the sphere of German influence, and, reaching Uganda early in 1890, Peters concluded a treaty with the king of that country in favour of Germany. He left Uganda hastily on the approach of a representative of the British East Africa Company, and on reaching Zanzibar learned that his treaty was useless, as an agreement had been come to between Germany and Great Britain whereby Uganda was left in the British sphere. On his return to Germany Peters was received with great honours, and in 1891 published an account of his expedition entitled *Die deutsche Emin Pasha Expedition* (Eng. trans. *New Light on Dark Africa* 1891). In 1891 he went out again to East Africa as imperial high commissioner for the Kilimanjaro district, and in 1892 was one of the commissioners for delimiting the Anglo-German boundary in that region. In June 1892 accusations were brought against him of excesses in his treatment of the natives, and after three investigations had been held he was, in 1897, deprived of his commission for "misuse of official power." (He was regranted his title of imperial commissioner in 1906.) During 1893–1895 Peters was employed in the colonial office at Berlin. In 1896 he removed to London, where he occupied himself in schemes for exploiting parts of Rhodesia and Portuguese East Africa. In the interests of a company he formed, Peters explored the Fura district and Macombe's country on the Zambezi, where in 1899 he discovered ruins of ancient cities and deserted gold mines. He returned in 1901 and gave an account of his explorations in *Im Goldland des Albertums* (1902), Eng. trans. *The Eldorado of the Ancients* (1902). In 1905 he again visited the Zambezi and Sabi rivers. He died on Sept. 9, 1918.

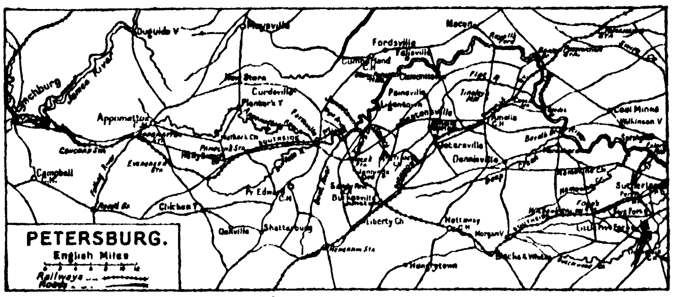
See his disquisition on early gold production entitled *Das goldene Ophir Salomo's* (1895), Eng. trans. *King Solomon's Golden Ophir* (1899); and his autobiography, *Lebenserinnerungen* (1918). *See* also H. T. Schorn, *Dr. Carl Peters* (1920).

PETERSBURG, a city and a port of entry of Virginia, U.S.A., at the head of navigation on the Appomattox river, 10 m. from the James, and 22 m. S. of Richmond; in Dinwiddie county, but administratively independent. It is on Federal highways 1 and 17-1, and is served by the Atlantic Coast Line, the Norfolk and Western and the Seaboard Air Line railways, and river steamers. Pop. 31,012 in 1920 (44% negroes); estimated at 37,800 in 1928. Petersburg is a city of much historic and scenic interest, and also a progressive modern community, with a commission-manager form of government, an active public-health centre, hydro-electric power, banks with resources of over $22,000,000, wholesale houses doing an annual business approximating $20,000,000, a factory output in 1925 valued at $17,342,476 and an assessed valuation for 1927 of $29,495,141. It is a shipping point for tobacco, peanuts and lumber; is one of the principal trunk-manufacturing centres of the country; makes more than 4,000,000,000 cigarettes annually and 6,000,000 lb. of plug and twist tobacco for export; and cures, steams and orders about 4,000,000 lb. of cigar tobacco. On Center Hill is a fine old mansion (1825) which was the headquarters of Gen. Hartsuff in 1865. From its lawn can be seen the several houses which served as headquarters for Cornwallis, Lafayette and Lee. Many monuments and tablets mark historic sites and commemorate historic events. In the suburb of Blandford (once the most fashionable residential section) is the Bristol Parish church, built in 1736, abandoned in 1800 and restored since 1901 as a memorial to the Southern soldiers buried around it. Veterans of four wars rest in the churchyard, and the oldest stone bears the date 1702. Adjoining it is the Confederate cemetery, with 30,000 graves. Two national cemeteries (at Poplar Grove, 4 m. S., and at City Point, 9 m. E.) contain about 12,000 graves. At Ettrick, across the river from Petersburg, is the Virginia Normal and Industrial institute for negroes (1883) and a mile west is the State hospital for the coloured insane. Petersburg is the seat also of the Bishop Payne Divinity school (Protestant Episcopal) for negroes and charitable institutions for white and for coloured.

In 1645 Ft. Henry was built at the falls of the Appomattox, within the present boundaries of Petersburg. A trading post was established in 1733 by Maj. Peter Jones (a companion of Col. William Byrd), after whom it was called Peter's Point, and later Petersburg. It was incorporated as a town in 1748 and as a city in 1850. On April 25, 1781, the British occupied Petersburg, but they were dislodged by Lafayette in the following month. At the opening of the Civil War the city had a population of 18,266. Both armies considered it a strategic point, and important operations took place in the vicinity in 1864–5. (*See* below.) Many of the fortifications still remain. During the World War, Camp Lee, 3 m. E. of the city, was one of the largest training camps, and at Hopewell there were munitions plants employing 30,000 persons.

PETERSBURG CAMPAIGN (1864–65). The name of Petersburg is associated with operations in the American Civil War, which formed the sequel of the Wilderness Campaign (*q.v.*) and the last act in the struggle between the armies of Grant and *Lee* for supremacy. Petersburg and Richmond, Virginia, connected by rail and covered north, east and south by 40m. of entrenchments, formed the salients of a vast fortress, into which reinforcements and supplies could be poured from the rear by means of the James canal, the Virginia Central, the Lynchburg, the Dan-

ville and the Weldon railroads—the latter bringing up to Petersburg from Wilmington (225m. distant) the cargoes of blockade runners. Petersburg became a strategic point as soon as Grant determined to carry the army of the Potomac—defeated at Cold Harbor on the Chickahominy (*see* WILDERNESS CAMPAIGN)—south of Richmond, and, being joined by Butler's Army of the James (momentarily checked in the Bermuda Hundred peninsula



LEE'S RETREAT

by a small army under *Beauregard*), to operate from the east, depending on the James river as his line of supply. The policy of the Confederate president was to employ *Robert E. Lee's* army to protect his capital. Petersburg was nearer than Richmond to the navigable part of the James river—City Point is only 10m. distant—and the capture of Petersburg would involve the fall of Richmond and the capitulation or flight of *Lee's* army.

As early as June 9, 1864, while the main armies were still north of the James and Petersburg was garrisoned by a brigade under Gen. *Wise*, a Federal expedition from the Army of the James approached the city. The column on the City Point road discovered strong earthworks, and that on the Jerusalem Plank road experienced a repulse: the total force of the Federals was 4,500, and *Wise's* brigade (2,400) had been quickly reinforced from *Beauregard's* central position at Bermuda Hundred. A week later a more serious attempt was made to break through the defences, while Gen. *Lee's* main army was detained north of Richmond. Grant detached the II. and XVIII. Corps under Generals Smith and Hancock, who were to unite and operate along the City Point railroad and capture the outer line of works about 2m. from Petersburg while a demonstration was made along the Norfolk railroad by cavalry under Kautz. On June 15 Smith attacked and captured five redans before Hancock came up, and when next day Burnside's corps (IX.) arrived and Gen. Meade assumed control of the three corps, he attacked again at 6 P.M. On June 17 Warren's (V.) corps arrived, and Meade made a third assault with two corps (V., IX.). On June 18 the attack was renewed with three corps (II., V., IX.) late in the afternoon, and the results of the four days' fighting were so far satisfactory that ground was won which could be entrenched and held against any sortie of the Petersburg garrison. Probably on June 18 the town of Petersburg might have been captured by Meade, for at this crisis *Lee* was in temporary eclipse.

It was late on June 17 when *Beauregard*, who had for three days valiantly held his main lines south of Richmond with some 14,000 infantry against three Federal corps, succeeded in convincing *Lee* that the main army was in the wrong place. But when at last the Confederate leader was aroused to a sense of his danger he soon filled every road with divisions marching to save Petersburg: they marched all night; they slept in the trenches on arrival, and on June 19 these reinforcements convinced Meade that his main attack between the Appomattox river and the Jerusalem Plank road was delivered a day too late. At a cost of 10,000 casualties Meade had gained half a mile of ground, but the Confederates in falling back had concentrated, and now that the new plan of operations was exposed and the main bodies were again face to face the power of defensive tactics reasserted itself.

Yet June was not to close without adding some 8,000 men to the Federal casualties, for in addition to daily losses by sharpshooting along the front, over 5,000 men fell or were captured in operations directed against the southern railroads. Grant had resolved to deprive his enemy of these lines of supply: his plan was to prolong his line of investment westward and construct redoubts (such as Fort Davis, Fort Stedman and Fort Sedgwick) as a continual menace to the Confederate garrison and a defence against sorties, while his cavalry and portions of five corps (II., V., VI., IX. and XVIII.) engaged in enterprises which it was hoped would tempt *Lee* to fight outside his works. A decisive victory in the field, a successful assault on the defences between Richmond and Petersburg, or the complete destruction of the railroads, would precipitate disaster to the South, and of these three methods the last would be the surest in its effects. But such a method was necessarily slow. Wilson's cavalry (5,500) destroyed 30m. of the Lynchburg or South Side railroad, and 30m. of the Danville railroad, together with Burkesville junction and Ream's station on the Weldon railroad; but Wilson was caught by the Confederate cavalry 100m. from Petersburg and escaped only by destroying his wagons and limbers and abandoning 12 guns. Even the Virginia Central railroad could not be held by the Federals after Sheridan with the main body of the cavalry had been called back to White House on the Pamunkey to escort a great convoy.

By the end of June the whole of the rival forces were concentrated about the Richmond-Petersburg defences, and Gen. *A. P. Hill* had already sallied out on June 21 to drive the II. Corps from the Weldon railroad. Federal policy and Federal strategy, surmounting the crisis of Cold Harbor, were, however, at last in unison. Grant had a free hand in respect both of his dispositions and his resources in men and money, and had resolved to use unsparingly the resources placed at his disposal.

On July 25 Grant resolved to weaken the enemy on his front by a demonstration north of the James, and accordingly moved a corps (II.) and two cavalry divisions across the river to Malvern hill under cover of Foster's corps (X.). But *Lee* possessed the inner line, and the Federal detachment found two cavalry divisions in its front, and the Richmond defences had been

strengthened by three divisions of infantry. The expedition then returned to take part in a fresh enterprise, which ended disastrously to the Federals. A Confederate redan faced Burnside's IX. corps 100yds. distant, and this strong work was to be destroyed by mining operations. The mine was fired and produced a crater 150ft. long, 60ft. wide and 25ft. deep, into which the Federals poured (*see* FORTIFICATION AND SIEGECRAFT). But the troops could be got no farther before the Confederate counterattack was upon them, and Burnside's corps lost 4,300 men.

In Aug. Sheridan was detached to operate against *Early* in the

Shenandoah valley, and in order to prevent *Lee* reinforcing *Early* another demonstration against Richmond was planned. But *Lee* again strengthened his left and the result of the fighting was a loss to the Federals of nearly 3,000 men. Meanwhile another attack on the Weldon railroad by Warren's corps was met by *A. P. Hill* on Aug. 20, and the possession of the railroad cost the Federals 3,000 men. A further attempt on this railroad by Hancock's II. Corps and Gregg's cavalry division at a point 3m. south of Ream's Station was foiled by *A. P. Hill*, now aided by *Hampton's* two cavalry divisions, and the Federals here lost 2,372 men and nine guns. The Confederates, therefore, still retained possession of the railroad to a point within one day's hauling by wagon to Petersburg. During Sept. another Federal enterprise north of the James with two corps (X. and XVIII.) resulted in the capture of Fort Harrison near Chaffin's Bluff, and when *Lee* reinforced his left and counter-attacked his troops were repulsed with heavy loss. The Federals lost over 2,000 men and failed in the attempt to take Fort Gilmer, Confederate gunboats below Richmond aiding in the defence. While this operation was in progress on the Confederate left under Grant's personal supervision *Lee* was apprised of attacks on his extreme right at Peebles farm by four divisions, which captured a Confederate redoubt covering the junction of two routes to the south-west. *A. P. Hill* prevented a further advance of the enemy by a vigorous counter-attack which caused Warren and Parke (IX.) a loss of 2,000 men, of whom nearly three-fourths allowed themselves to be captured; for the ranks, since the losses of the May battles, had been swamped with drafted and substitute recruits of poor quality and almost insignificant training. The Federals had, however, by these operations pushed their entrenchments beyond the Weldon railroad westward and established new works within a mile of the Confederate right. At the end of Oct. Grant resolved to make a serious effort to bring the South Side railroad within his lines and deprive the enemy of this important line of supply. Parke (IX.), Warren (V.) and Hancock (II.) took each some 11,000 infantry with four days' rations on pack animals. Gregg's cavalry (3,000) were attached for the operation, and both Grant and Meade accompanied the troops. *A. P. Hill* encountered this force with three divisions (14,000) and Hampton's cavalry (5,500), and he contrived to hold two corps with one division and attack Hancock (II.) with his main body. The Federals were stopped when 6m. from the railway.

Lee meanwhile had been called to Chaffin's Bluff, where again Butler was demonstrating with the Army of the James on the approaches to Richmond. But *Longstreet* signalized his return to duty with the Army of Northern Virginia by driving Butler off (Oct. 27). In Dec., however, Warren contrived to evade *A. P. Hill* and destroy the Weldon railroad at a point on the Meherrin river 40m. from Petersburg.

There seemed now little to tie *Lee* to the lines he had so painfully constructed, for his army was without coffee, tea or sugar, and though of foreign meat they had 3½ million rations and of bread 2½ million rations in reserve, the troops lived chiefly on cornbread. *A. P. Hill* on the right held on from Hatcher's Run to Fort Gregg, whence *Gordon* and *Anderson* prolonged to the left as far as the Appomattox river, and *Longstreet* continued the line northwards along the Bermuda front across the James as far as White Oak swamp (37m. in all). The winter was very severe, and the continual trench-work and outpost duty overtaxed the patriotism of *Lee's* 50,000 infantry and stimulated desertion. Supplies were brought in by wagons, as the rolling stock on the railways was worn, and on Feb. 5, 1865, Gen. Gregg moved out to the Boydton Plank road to intercept the Confederate convoys. Gregg failed to locate the wagons, and *Lee*, hearing of the expedition, sent out a force which drove him back. Sheridan, after driving *Early* from the Valley in Oct., destroyed the railways about Staunton, Charlottesville, Gordonsville and Lynchburg, and even rendered the James canal useless as a line of supply.

Grant recalled Sheridan to the main army in March, and at the end of the month prepared for a turning movement westward with the object of drawing *Lee* out of his lines. *Lee* had anticipated such an attempt, and had resolved to abandon his lines and unite with Johnston in North Carolina, but the roads were not yet in a state for the movement of artillery and wagons, and it was to gain time that he now ventured upon a bold offensive stroke—a night attack upon a strong point in the Federal right called Fort Stedman—the success of which might cause Grant to call in the detachments on his left and so facilitate the proposed movement of the Confederates towards Danville. Gen. *Gordon* was selected to conduct the operation and his corps was strongly reinforced for the occasion. The opposing lines east of Petersburg were only 150yds., and the sentries of each side 50yds. apart. *Gordon's* men dashed across the intervening space at 4:30 A.M. on March 25, surprised the garrison and occupied Fort Stedman, but when daylight broke and the Federal guns could be brought to bear the fort was found to be untenable. Parke's corps (IX.) recaptured the work at a cost of 1,000 men, and *Gordon* fell back, leaving nearly 2,000 men in the hands of the Federals.

At this time Sherman visited Grant at City Point and proposed to move at the end of ten days on Burkesville junction and so cut off *Lee* from Danville and Lynchburg; it was while Sherman was preparing for this operation that Grant finished the campaign. Secure behind his formidable entrenchments, Grant had no fear for his base on the James river, and transferred large bodies of troops to his left without *Lee's* knowledge. Sheridan was instructed on March 29 to gain the enemy's right and rear, moving by Dinwiddie Court-House and across Hatcher's Run. But the Confederates were on the alert and quick to extend their right. Sheridan got into a flat country of dense forest, tangled undergrowth, streams and swamps, and the soil of clay and sand was impassable for wagons and guns until he had corduroyed the route. On March 29 *Lee* perceived that the object of Grant was to seize the routes south of the Appomattox river, by which a movement south-west could be made to unite with Johnston's army, and he endeavoured to cover these roads, including the South Side railway, without losing his hold upon his works about Richmond and Petersburg, but in such a contest it was evident that numbers must prevail.

Sheridan's cavalry had reached Five Forks on the White Oak road on March 31, and on his right Humphreys and Warren (II. and V.) held the Confederates to their works along Hatcher's Run astride the Boydton Plank road; yet *Lee* was able to concentrate his three cavalry divisions, and supported them by *Pickett's* five infantry brigades. Sheridan was attacked and driven south as far as Dinwiddie Court-House; but Humphreys and Warren held their ground (action of White Oak ridge) at a cost of 2,000 men. *Pickett* and the cavalry fell back to Five Forks during the night and hastily entrenched, for he had been ordered to defend this position; since the Boydton Plank road could no longer be held, the possession of White Oak road and the South Side railway became necessary for the flank movement which *Lee* had resolved to attempt. Grant meanwhile had ordered Warren to support Sheridan in an attack on *Pickett* at daybreak. Sheridan advanced on April 1 and at 3 P.M. issued his orders for attack, explaining verbally a diagram he had prepared for the use of divisional commanders. *Pickett* held a front of 2m. with a division of cavalry on either flank and *Rosser's* cavalry guarding the baggage behind Hatcher's Run, and when attacked at 4 P.M. he was with *Rosser* 1½m. in rear. Before *Pickett* was made aware of a battle being in progress his left was destroyed. *Lee* seems to have made no arrangements to support him in this direction. *Pickett's* position on the right was finally carried by Sheridan's cavalry dismounting and storming the entrenchments frontally. *Pickett's* routed brigades were rallied at the South Side railroad but the Confederates had lost White Oak road, and unless *Lee* was capable of a vigorous counterstroke on his extreme right it was evident he must also lose the South Side railroad.

But a crisis was approaching. Sheridan's success at Five Forks induced Grant to deliver a general assault on April 2. The Confederate lines were bombarded all night, and on April 2 with Wright's corps (VI.), Grant attacked the weakest part of *Lee's* line and broke through, losing 1,100 men in 15 minutes. *A. P. Hill* was killed and his corps broke and was cut off from Peters-

burg. At the same time Parke's corps (IX.), on the right of the VI., attacked the eastern front near Fort Stedman but was repulsed; then Humphreys' corps (II.) on the left attacked a Confederate division and forced it to retreat to the South Side railroad, where at Sutherland station a final attack dispersed it. Wright, supported by Gen. Ord (commanding the Army of the James), afterwards won the strong redoubts called Fort Whitworth and Fort Gregg, and thus in a day the Confederate right had been destroyed from Five Forks to a point some two or three miles west of the Weldon railroad; 10m. of works had been abandoned, and if Grant had been able to press his advantage at once the campaign must have ended. But Grant was not aware of the enemy's plight, and so resolved to wait until the morrow before completing his victory.

Meanwhile *Lee* perceived that the hour had come at last when Richmond must fall, and at 3 P.M. he had issued orders for the march of the remains of his army to Lynchburg via Amelia Court-House, a march which evidently must partake of the character of a forlorn hope, hastily planned, ill prepared, and undertaken by troops whom the disasters and hardships of the past six months had weakened physically and morally. Yet if *Lee* had negotiated a peace on April 2 military history would have lost one of the finest examples of the strategic pursuit. *Lee's* proposed movement involved the transfer of the army and its baggage 100m. on bad roads across the front of an enemy, and nothing but mischance could prevent the Federals intercepting *Lee's* columns by a shorter route and seizing the South Side railroad, on which supplies were to be forwarded from Lynchburg to meet the retreating army at Appomattox station, Pamplin's station or Farmville station. The Appomattox river must be crossed two or three times at its bends. Various creeks and swamps must be bridged, and the bridges destroyed after crossing. The wagons must move on separate roads so as to be covered by the columns during marches and combats and the infantry were to follow the artillery on the roads. *Longstreet, Gordon* and *Mahone's* division from Richmond all crossed the Appomattox at Goode's bridge. *Ewell* from Richmond crossed the Appomattox by the Danville railroad bridge north of Goode's bridge. *Anderson* commanded the flank guard which moved south of the Appomattox with *Fitzhugh Lee's* cavalry. *Lee* gained a day's start by moving at 8 P.M., for Grant was making preparations to attack the entrenchments next day (April 3), but the start was lost in waiting for President *Davis* and the Government to escape from Richmond. Sheridan's cavalry got in touch with *Lee's* flank-guard early on April 3 near Namozine creek, and at nightfall the Federal advance-guard was at Deep creek. On April 4 Sheridan reached the Danville railroad at Jetersville, and on April 5, when *Lee* had halted at Amelia Court-House on the railroad to get supplies, the Federals had three corps (II., V., VI.) in support of Sheridan 8m. nearer than *Lee* to Sailor's creek, the point where he must again cross the Appomattox.

Interception was now a *fait accompli,* though neither side suspected it. *Lee* was unaware of the enemy's proximity, and Grant believed that *Lee* would remain at Amelia Court-House, but *Lee* moved west, crossing Flat creek at sunset on April 5, to the Lynchburg railroad (*Longstreet,* marching all night, reached Rice's station at sunrise on April 6), while the Federals moved northward on the same day to attack *Lee* at Amelia Court-House, and on discovering *Lee's* evasion the three Federal corps effected a wheel to the left and advanced on Deatonsville after bridging Flat creek. Meanwhile the Federal cavalry had located and destroyed a convoy at Painesville, but had in turn been attacked by *Fitzhugh Lee's* cavalry and driven back on the main body at Flat creek. The rearguard of *Lee's* army was *Gordon's* command, which was at Amelia springs at 8 A.M. on the 6th of April. *Lee's* army stretched out for 15m., and when its advance-guard was at Rice's station its rearguard was still at Amelia Court-House. Rice's station is 62m. from Lynchburg. Here *Longstreet* waited all day for *Anderson, Ewell* and *Gordon* to close up, and then at night he moved 8m. to Farmville station (68m. south-west of Richmond), where 80,000 rations had been railed from Lynchburg; then *Longstreet* crossed the Appomattox, and on April 7 moved forward towards Lynchburg, covered by *Fitzhugh Lee's* cavalry. Meanwhile the remainder of *Lee's* army had been practically destroyed within a few miles of the point where *Longstreet* had halted. Sheridan's cavalry and two corps (II., VI.) had caught it entangled with the trains of the army attempting the passage of Sailor's creek; and Ord would even have attacked *Longstreet* (whom he had located late at night) had his march been delayed.

Complete disorganization and demoralization seem to have taken hold of the Confederates on this fatal day, and *Lee* was once more in eclipse. The Federal cavalry headed the column, the infantry attacked it, and *Ewell* became the victim of tactical envelopment after *Anderson* had been defeated and *Gordon* had failed to save the trains of the army. Surrender or massacre being the alternatives, *Ewell* surrendered, and here in fact the career of the army of Northern Virginia ended, as Grant plainly saw, for at 5:30 P.M. he addressed a demand to *Lee* for his capitulation. But *Lee* clung to his diminished forces for another 48 hours. *Longstreet* in crossing at Farmville had burnt the bridges and thus delayed the pursuit; but *Gordon* and *Mahone,* who had crossed at High bridge (the railroad bridge), failed to check Humphreys' corps (II.), and so were compelled to take up a position of defence on the north bank until darkness enabled them to slip away. *Lee* was with this remnant of the army. Meanwhile Sheridan with the cavalry and two corps (V., XXIV.) had hastened along the South Side railroad, seizing the supplies waiting for *Lee* at Pamplin's Station, and then moving on another 12m. to Appomattox station. At nightfall he found that he was astride the enemy's line of operation, which was also his line of supply, and so *Lee* would be compelled to give battle or capitulate on the morrow.

Lee, quitting Farmville heights on the night of April 7 changed the order of march during the next day, so that *Gordon* (8,000) was in the van and *Longstreet* (15,000) furnished the rear-guard. *Ewell's* corps was now represented by 300 effectives. The cavalry still numbered some 1,600 sabres. *Lee's* column was pursued along the Lynchburg road by two Federal Corps (II., VI.), which marched 26m. in 18½ hours, and at midnight halted within 3m. of *Longstreet,* who had entrenched near Appomattox Court-House, facing east and covering the road on which *Gordon's* corps and the cavalry was to press forward to Lynchburg at daylight. But *Gordon* on the morning of April 9 found Sheridan's cavalry in his front, and in accordance with plans made overnight he commenced an attack, driving the Federals back until he encountered at 10 A.M. two corps of infantry (V., XXIV.) under Ord, who had marched 29m. in order to support Sheridan at the crisis; and when at the same moment *Longstreet* was threatened by Humphreys and Wright (II., VI.) the situation had arisen which *Lee* considered would justify surrender, an event which had been anticipated on both sides as the result of the fighting about Farmville on April 6 and 7.

The closing operations from March 29 to April 9 were all in favour of the Federals, but, nevertheless, the historian counts their losses during this period at nearly 10,000 in the five corps and cavalry which constituted Gen. Grant's field army. On April 9, at the Appomattox Court-House, the two leaders exchanged formal documents by which 2,862 officers and 25,494 enlisted men were paroled, all that remained in the field of some 55,000 Confederates who were drawing rations on Feb. 20 as the army of Northern Virginia. (G. W. R.)

PETERSFIELD, a market town in Hampshire, England, 55 m. S.W. from London by the S.R. Pop. of urban district (1921) 3,934. The church of St. Peter retains some ornate Norman work. Ecclesiastically a chapelry of Buriton, Petersfield (Peterfelde) owes its origin as a borough to the charter granted by William, earl of Gloucester, in the reign of Henry II., and confirmed later by his widow, Hawise. Petersfield is not mentioned in Domesday, but it was probably then included in the manor of Mapledurham. It was a mesne borough possessing by its first charter the liberties and customs of Winchester together with a merchant gild. These grants were confirmed by John in 1198 and in 1415 Henry V. in addition freed the burgesses from all tolls. Gradually privileges and rights other than those of a mesne

borough were usurped by the mayor and burgesses, but were recovered by a suit brought against them by Thomas Hanbury, owner of the borough, in 1611. A mayor continued to be elected until 1885. Petersfield was represented in parliament from 1307 until 1885 when the representation was merged in that of the county.

PETER'S PENCE or ROM-FEOH, a tax of a penny on every hearth, formerly paid annually to the popes; now represented by a voluntary contribution made by the devout in Roman Catholic churches. Its date of origin is doubtful. The first written evidence of it is contained in a letter of Canute (1031) sent from Rome to the English clergy. At this time it appears to have been levied on all families possessed of land worth thirty pence yearly rental, out of which they paid one penny. At the Norman Conquest it appears to have fallen into arrears for a time, for William the Conqueror promised the pope in 1076 that it should be regularly paid. The threat of withholding Peter's pence proved more than once a useful weapon against recalcitrant popes in the hands of English kings. Thus in 1366 and for some years after it was refused on the ground of the pope's obstinacy in withholding his consent to the Statute of Praemunire. The tax was fairly regularly paid by the English until 1534, when it was abolished by Henry VIII.

PETER THE HERMIT, a priest of Amiens, who *may*, as Anna Comnena says, have attempted to go on a pilgrimage to Jerusalem before 1096, and have been prevented by the Turks from reaching his destination. It is uncertain whether he was present at Urban's great sermon at Clermont in 1095; but it is certain that he was one of the preachers of the crusade in France after that sermon, and his own experience may have helped to give fire to his eloquence. He was an emotional revivalist preacher: his very ass became an object of popular adoration; and thousands of peasants took the cross at his bidding. The crusade of the *pauperes,* which forms the first act in the first crusade, was his work; and he himself led one of the five sections of the *pauperes* to Constantinople, starting from Cologne in April, and arriving at Constantinople at the end of July 1096. Here he joined the only other section which had succeeded in reaching Constantinople—that of Walter the Penniless; and he crossed to the Asiatic shore in the beginning of August. In spite of his warnings, the *pauperes* began hostilities against the Turks; and Peter returned to Constantinople. In his absence the army was cut to pieces by the Turks; and he was left in Constantinople without any followers, during the winter of 1096–1097, to wait for the coming of the princes. He joined their ranks in May 1097, and marched with them through Asia Minor to Jerusalem. But he played a very subordinate part in the history of the first crusade. He appears, in the beginning of 1098, as attempting to escape from the privations of the siege of Antioch—showing himself, as Guibert of Nogent says, a "fallen star." In the middle of the year he was sent by the princes to invite Kerbogha to settle all differences by a duel; and in 1099 he appears as treasurer of the alms at the siege of Arca (March), and as leader of the supplicatory processions in Jerusalem which preceded the battle of Ascalon (August). At the end of the year he went to Laodicea, and sailed West. Albert of Aix records that he died in 1151, as prior of a church of the Holy Sepulchre which he had founded in France.

The legend which made Peter the instigator of the first Crusade, relating how Christ appeared to him in the Church of the Sepulchre, appears in the pages of William of Tyre. Raymond of Antioch caused the *Chanson des Chétifs* to be composed in honour of the Hermit and his followers, soon after 1130. It also appears in the pages of Albert of Aix, who wrote somewhere about 1130; and from Albert it was borrowed by William of Tyre.

PÉTION DE VILLENEUVE, JERÔME (1756–1794), French writer and politician, was the son of a *procureur* at Chartres. He became an avocat in 1778. In 1789 he was elected a deputy to the Tiers État for Chartres and showed himself a radical leader. He supported Mirabeau on June 23, and was elected president on Dec. 4, 1790. On June 15, 1791 he was elected president of the criminal tribunal of Paris. After the last meeting of the assembly on Sept. 30, 1791 Robespierre and Pétion were made the popular heroes and were crowned by the populace with civic crowns. Pétion was elected on Nov. 16, 1791, mayor of Paris in succession to Bailly. On Aug. 3, 1792, at the head of the municipality of Paris, Pétion demanded the dethronement of the king. He was elected to the Convention for Eure-et-Loir and became its first president. L. P. Manuel's proposal that the president of the Assembly should have the same authority as the president of the United States, was rejected, but Pétion got the nickname of "Roi Pétion," which contributed to his fall.

His jealousy of Robespierre allied him to the Girondin party. He was elected in March 1793 to the first Committee of Public Safety; and he attacked Robespierre, who accused him of knowing and keeping secret Dumouriez's project of treason. His name was among those of the twenty-two Girondin deputies proscribed on June 2. He escaped to Caen and raised the standard of provincial insurrection against the Convention; and, when the Norman rising failed, he fled to the Gironde. At last, a month before Robespierre's fall in June 1794, he committed suicide.

See *Mémoires inédits de Pétion et mémoires de Buzot et de Barbaroux, précédés d'une introduction par C. A. Dauban* (1866); *Oeuvres de Pétion* (3 vols., 1792); F. A. Aulard, *Les Orateurs de la Constituante* (1882).

PÉTIS DE LA CROIX, FRANÇOIS (1653–1713), French Orientalist, was born in Paris in 1653. He inherited in 1695 his father's office of Arabic interpreter of the French court, transmitting it in turn to his own son, Alexandre Louis Marie. At an early age François was sent by Colbert to the East; during the ten years he spent in Syria, Persia and Turkey he mastered Arabic, Persian and Turkish, and also collected rich materials. He conducted the negotiations with Tunis and Tripoli in 1685, and those with Morocco in 1687. His zeal, tact and linguistic knowledge were at last rewarded in 1692 by his appointment to the Arabic chair in the Collège Royal de France, which he filled until his death in 1713.

He published *Contes turcs* (1707), and *Les Mille et un jours* (5 vols., 1710–1712); an *Armenian Dictionary* and an *Account of Ethiopia.* But the lasting monument of his literary fame is his excellent French version of Sharaf-uddīn 'Alī Yazdi's *Zafārnāma* or *History of Tīmūr* (completed A.H. 828; A.D. 1425), which was published after his death (4 vols., 1722; Eng. trans. by J. Darby, London, 1723).

PETITION, a term meaning generally a prayerful request for redress by a person aggrieved. It may be made in Great Britain to the Crown or its officers, or to either house of parliament, or in certain cases to courts of justice.

The right of petitioning the Crown was recognized indirectly as early as Magna Carta in the famous clause, *Nulli vendemus, nulli negabimus aut differemus, rectum vel justitiam* (25 Edw. I. c. 29), and directly at various periods later, *e.g.*, in the articles of the Commons assented to by Henry IV., by which the king was to assign two days in the week for petitions (*Rot. Parl.* 8 Hen. IV., p. 585). The case of the seven bishops in 1688 confirmed the right, and finally the Bill of Rights in 1689 declared "that it is the right of the subjects to petition the king, and all commitments and prosecutions for such petitioning are illegal." Petitions to the Crown appear to have been at first for the redress of private and local grievances, or for remedies which the courts of law could not grant (May, *Parl. Pr.,* 11th ed., 522). As equity grew into a system, petitions of this kind not seeking legislative remedies tended to become superseded by bills in chancery. Statutes were originally drawn up by the judges at the close of the session of parliament from the petitions of the Commons and the answers of the Crown. Under this system of drafting it was found that the tenor of the petition and answer were not always stated correctly. To obviate this inconvenience demands for legislation came in the reign of Henry VI. to be drawn up in the form of bills which the Crown could accept or reject, but could not alter. (*See* Anson, *Law and Custom of the Constitution.*) In the same reign the words "by authority of parliament" were added to the words of enactment, and from the time of Henry VII. public legislation has been by bill and not by petition.

Petitions to either house of the legislature seem to have been later in origin than petitions to the Crown. They are not referred to in the Bill of Rights, but the right of petition is a convention

of the constitution. Petitions to the Lords or the whole parliament can be traced back to Henry III. No petition to the Commons has been found earlier than Richard II.; but from the time of Henry IV. petitions to the Commons have been freely made. The political importance of petitioning dates from about the reign of Charles I. The development of the practice of petitioning had proceeded so far in the reign of Charles II. as to lead to the passing in 1662 of an Act (13 Car. II. c. 5) against "tumultuous petitioning," which is still on the statute book. It provides that no petition or address shall be presented to the king or either house of parliament by more than ten persons; nor shall any one procure above 20 persons to consent or set their hands to any petition for alteration of matters established by law in church or State, unless with the previous order of three justices of the county, or the major part of the grand jury. And in 1817 (57 Geo. III. c. 19 s. 23) meetings within a mile from Westminster Hall for the purpose of considering a petition to both houses or either house of parliament while either house is sitting were declared to be unlawful assemblies. Up to 1688 petitions to either house usually dealt only with some specific grievance. From that time dates the present practice of petitioning with regard to general measures of public policy. Petitions to the Houses of Lords or Commons must be framed in the form prescribed by the standing orders, must be properly superscribed, and must conclude with a prayer.

Petitions to the Commons must be in writing, must contain none but genuine signatures, and must be free from disrespectful language or imputations upon any tribunal or constituted authority. They must be presented by a member of the house, except petitions to the House of Commons from the corporation of London, which may be presented at the bar by the sheriffs, and formerly from the corporation of Dublin, presented by the lord mayor. There is no means of compelling a member to present a petition. The rules as to petitions to the House of Lords are similar. Applications for leave to bring before either house bills for private or local and personal matters must under the standing orders of both houses be made by petition; and the same rule obtains as to applications for leave to be heard in opposition to such bills. (*See* PETITION OF RIGHT and JUDICIAL COMMITTEE OF THE PRIVY COUNCIL.)

See Clifford, *History of Private Bill Legislation* (1887).

United States.—The right to petition the Government for a redress of grievance is safeguarded in the United States by its inclusion in the 1st amendment to the Federal Constitution. It forms part of similar constitutional bills of rights in the various States. It is only natural that the early statesmen in the United States, enamoured with those individual liberties that they conceived to be the heritage of all free-born Englishmen, should take care to make such rights part and parcel of their fundamental law and place them beyond legislative interference. No penalties can thus attach to a petitioner as a consequence of his complaint, though immunity does not attach to scurrilous or libellous matter contained in a petition. The petition was commonly used in the early history of the United States as a means to enforce legislative action. The rise of the press has reduced its political significance. Petitions are, however, commonly presented to legislatures to influence their action on pending bills. Rules provide for their introduction and presentation by the members of the legislature.

PETITION OF RIGHT. This term is now specifically appropriated in English law to the peculiar procedure by which a subject may sue the Crown. At common law the Crown—a term which is, in constitutional law, merely an abstraction for the king in his official capacity—could not be sued in the king's courts; the king was, historically, the supreme lord of those courts, administering justice therein between his subjects, and as the supreme lord he was not amenable to their jurisdiction. His writs could not run against himself. Hence a practice arose, where a subject's real or personal property had come into the possession of the king or his servants without legal title, for the subject to "petition" the king in council praying for its restoration. The king then might or might not in his discretion, refer the suppliant's petition to one of his courts, usually the old court of exchequer, with a writ directing the judges to do what is just. Although the procedure of Petition of Right has now been regulated by statute, the discretion of the king, or rather of his ministers, is still absolute and no one can sue the Crown directly except by the Crown's grace and favour. This means that none of the Government departments—which are, in theory, merely "emanations of the Crown" and therefore bask in the shelter of its prerogatives—can be sued as a matter of right. The exceptions to this consequence are more apparent than real: a few departments such as the India Office, *i.e.*, "the secretary of State for India in council," have been incorporated by statute and thereby have become, what the other Government departments are not, "legal persons" with the power to sue and the liability to be sued. In such exceptional cases one can proceed against them directly, but even so they enjoy all the prerogatives of the Crown, mentioned below, such as immunity from actions for tort, from "Discovery," and from Execution.

Originally the scope of a Petition of Right was confined to issues of fact. Where the subject relied on some title appearing by record, such as letters patent issued by the Crown, he could proceed by what was known as a *monstrans de droit* or "manifestation of right." This was the procedure adopted in the famous Bankers' Case of 1696–1700 (14 State Trials 1) in which certain bankers applied directly to the court of exchequer for a judgment that the arrears of interest granted to them by letters patent of Charles II., in return for loans, should be paid. The court, in particular C. J. Holt, held that, their plea being "matter of record," the court could, in such a case, proceed without the leave of the king (which was essential in the case of an ordinary Petition of Right); a decision which was reversed by Lord Somers on appeal. There was another method, known as a traverse of inquest of office, by which a subject might in certain cases, such as escheat or forfeiture, challenge the king's title to land or chattels. These antiquities are of little importance to-day in view of the Petition of Right Act, sometimes known as Bovill's Act, of 1861.

The Petition of Right Act (1861) does not create any rights or abolish any old prerogatives. It merely regulates procedure. It provides that anyone seeking to sue the Crown shall file a petition, which is in effect a statement of claim, with the home secretary, who invariably refers it to the attorney-general for advice. If the latter advises that there is a substantial "cause of action," the home secretary endorses it with his *fiat*. If he refuses it, the subject is without remedy. The discretion of the secretary of State is absolute and a Mandamus will not issue to compel him to grant his *fiat* (cf. *Irwin* v. *Grey*, 1862, 3 F. and F. 635). In practice the *fiat* is rarely refused, unless the claim appear to be a purely frivolous one. The fact remains, however, that in such a case the Executive, not the courts, performs a judicial function which, in the case of litigation between subject and subject, is entrusted solely to the judiciary under the Rules of the Supreme Court, namely the function of deciding whether there is a reasonable cause of action. The grant of the *fiat* in no way prejudges the issue to be tried and the Crown is entirely free, after having granted it, to plead before the courts that the action does not lie, *e.g.*, it may "demur" on the ground that the suppliant's claim is one for tort, and it is a rule of law that the king, who "can do no wrong," can never be sued, even by Petition of Right, for the tortious acts of his servants, *i.e.*, Government departments are exempt from liability in this respect.

Once the *fiat* is granted, the proceedings enter on the stage of an ordinary action between subject and subject. The Crown must enter an appearance within 28 days. It can, however, avail itself of many prerogatives in practice and pleading at the expense of the subject. Of these the most important is the prerogative as to "Discovery" which is succinctly expressed in the words "The law is that the Crown is entitled to full discovery, and that the subject as against the Crown is not" (Rigby C. J. in *Attorney-General* v. *Newcastle on Tyne Corporation*, 1897, 2 Q.B. 384). This means that the suppliant cannot, as in an ordinary action between subject and subject, compel the other party, *i.e.*, the Crown, to produce for inspection documents which may be essen-

tial to prove his case. So too with "amendment." The Crown may amend its answer to any extent but the subject cannot amend his petition with the same freedom as a plaintiff may amend his pleadings in an ordinary action. A recent decision (*Badman Brothers* v. *the King*, 1924, 1 K.B. 24) has relaxed the hardship of this rule in favour of the suppliant to some extent but not materially. Furthermore the Crown may claim "privilege" in respect of any attempt by the suppliant to compel a witness, whether in the service of the Crown or not, to disclose "matter of State," though this prerogative is not peculiar to procedure by Petition of Right. In all these respects the Crown has an immense advantage over the suppliant. On the other hand, the suppliant has one great advantage, which the plaintiff in an ordinary action does not possess, in that his claim cannot be barred by the Crown pleading the Statute of Limitation of 21 James I. by which statute action of contract must be brought within six years—this for the curiously technical reason that the Statute only bars "legal proceedings" and a "Petition of Right" is not strictly a "legal proceeding" (this was decided in *Rustomjee* v. *the Queen* 1 Q.B.D. 487). Another peculiarity of proceedings by Petition of Right is that the subject cannot demand, as of right, trial by jury even where, had it been an action between subject and subject, he might have done so. This has been recently decided by the High Court in *Marconi Company* v. *the King* (1918) 1 K.B. 193 on the construction of certain words in the Petition of Right Act. That decision, however, inflicts no great hardship on the subject as it rests solely within the jurisdiction of the court, without interference from the Crown, to decide whether trial shall be by the judge alone or by judge and jury. The suppliant, if successful, is entitled to his costs; if unsuccessful, he is liable to pay the costs of the Crown. This is a statutory exception to the common law rule that, to use the quaint language of Blackstone, it is "beneath the dignity" of the Crown either to pay costs or to receive them.

Judgment is given in the ordinary way. But the "execution" of the judgment is quite another matter. The courts cannot decree execution against the Crown and its servants. The Act of 1861 provides, however, that, where judgment is in favour of the suppliant, it shall be "certified" by the court to the Treasury which shall then satisfy it out of the public funds. In practice the Treasury never fails to satisfy the judgment of the court. Whether, if it failed so to do, it could be compelled by the courts, by a Writ of Mandamus, to satisfy it as a "statutory duty" is an open question.

Scope of the Remedy.—It remains to consider the scope of this remedy against the Crown. For a long time it appears to have been held, although the matter is not free from doubt, that it would only lie to recover possession of real or personal property of the subject in the hands of the Crown. But in the leading case of *Thomas* v. *the Queen* (1874) 44 L.J.Q.B. 9, the courts held, relying on the somewhat doubtful authority of the *Bankers' Case*, that a Petition of Right would lie for unliquidated damages for breach of contract. This decision was really revolutionary. It has since been held that it will also lie for the recovery of duty overpaid to the Revenue authorities (*In re Nathan*, 1884, 12 Q.B.D. 461), for compensation for the requisitioning of premises for national defence (*The De Keyser Case*, 1920, A. C. 508), and for such "implied contracts" as "Quantum Meruit" and "Money had and received." Petition of Right will, however, never lie to enforce a contract or service with the Crown, whether civil or military, for it is the king's prerogative to determine such contracts at his pleasure (*see* PREROGATIVE).

On the other hand, the scope of the remedy is subject to considerable limitations of which the most important is the exclusion of any redress against the Crown for "wrongful," *i.e.*, tortious acts such as, for example, negligence, trespass or the infringement of a patent. This was long ago settled, if indeed it was ever doubted, in the case of *Tobin* v. *the Queen*, 33 L.J.C.P. 199, to go no further back. The only remedy open to the subject in such a case is to sue, in an ordinary action, the particular officer of the Crown who was responsible for the wrongful act or omission. Great play had been made by writers like Prof. Dicey with this liability of the individual officer to answer to the subject, when wronged, for his acts, even though committed in an official capacity, and they institute a comparison between this "rule of law" and the comparative rightlessness of the subject, as they regard it, in the matter of suing an official in respect of his official acts, in countries like France and Germany with their system of "administrative law." It would take too long to discuss this aspect of the matter here; it is sufficient to say that the subject is, as a matter of fact, far better protected in France and Germany; under the law of those countries the State, unlike the Crown in England, *is* responsible, and can be sued in the ordinary way for the torts of its servants. Moreover, in England the rule of *respondeat superior* by which a person wronged can sue the employer, whether an individual, a partnership or a company, for the wrongful acts of his servants does not apply in the case of torts committed by the servant of a Government department. In such a case not only can the Crown, *i.e.*, the State, not be sued but neither can one sue the immediate superior of the servant committing the wrongful act. The postmaster general, for example, is not liable for the negligence of a Post Office engineer (*Bainbridge* v. *the Postmaster General*, 1906 1 K.B. 178). Further, the servant of the Crown, although personally liable, has the advantage, as against the plaintiff, of a "Statute of Limitations" of a very peculiar and invidious kind, known as the Public Authorities Protection Act of 1893, which requires all actions for tort against "public authorities"—a term which has been held (cf. *The Danube*, 1921 P.D. 183) to include servants of the Crown as well as local authorities—to be brought not, as in the case of an action between subject and subject, in six years but in six months. This Act is peculiar in every respect: it compels the plaintiff to bring his action not, as in the case of ordinary Statutes of Limitation, within a fixed period from the date when a "cause of action" arose, *e.g.*, the resulting damage, but within six months from the date of the tortious act which caused the damage. The result of this is, often, to extinguish, in spite of all vigilance on the part of the plaintiff who has suffered injury, any right of action altogether, for by the time the damage has made itself evident he may be too late (see *Freeborn* v. *Leeming* 95 L.J.K.B. 114). And if he is a day too late in bringing his action, he not only loses it but is subjected by the Act to penalties, in the matter of special costs, not known to the common law.

Need for Reform.—It will be obvious that the state of the law as to proceedings against the Crown is in need of reform. The decision of the courts in the famous case of *Dyson* v. *the Attorney-General* (1911) 1 K.B. 410 that a subject might apply *directly* to the courts, without recourse to a Petition of Right, for a "declaration," *i.e.*, a "declaratory judgment," as to whether the Crown was illegally invading his rights (in that case the question was whether the plaintiff was bound, under penalty, to answer certain questions contained in "forms" issued by the Revenue authorities), and that the courts could declare the action of the Crown illegal, was a great victory for the rights of the subject. But that decision was specifically made subject to the qualification that no such declaration could issue where the proper remedy was by Petition of Right. The advocates of reform of the law have therefore directed their agitation to two things (1) that the subject should no longer be dependent on the grace of the Executive where he conceives himself to have what amounts to a cause of action against the Crown, but should be enabled to sue the Crown in the same way as he can sue a fellow-subject; (2) that the Crown, thus made directly suable, should be liable in tort. In some of the dominions and colonies, most notably in the Australian Commonwealth, this reform has long been effected by statute. In Scotland the law is equally enlightened. In consequence of the strong feeling on the subject, to which the courts themselves have often given public expression, a committee was appointed by the lord chancellor in 1921 to investigate the whole subject and, subsequently, to draft a Bill to reform the law. It did not report till six years later, namely in 1927, when its report took the form of a "Crown Proceedings Bill" embodying, among other things, the two main principles of reform indicated above. The draft Bill, however, is open to two serious objections:

it preserves the prerogative in the matter of "Discovery" and it applies and incorporates the vicious provisions of the Public Authorities Protection Act. None the less it marks a real advance. Unfortunately there appears, at the time of writing, no prospect of this measure being adopted by the Government and there is no doubt that the encroaching bureaucracy are bitterly opposed to it.

PROCEEDINGS AGAINST THE STATE IN THE UNITED STATES

The rule that the sovereign was immune from suit at the hands of the private citizen is an accepted principle of American law Both the Federal Government and the States, whose sovereignty had not been surrendered to the national Government, were clothed with this immunity The Constitution authorized the Supreme Court to take original jurisdiction in all cases "in which a State shall be a Party," and in 1793 the Supreme Court in *Chisholm* v *Georgia*, 2 Dall 419, held that it could take cognizance of a suit by a citizen against a State This decision, contrary to the general expectation of the framers of the Constitution, so aroused the nation that in 1798 the 11th amendment to the Constitution was adopted which re-established the original theory that the States were immune from suit by private citizens. No such procedure as the "Petition of Right" was known to American law. Claimants against the United States were originally referred to auditors of various governmental departments and, in the event of unsatisfactory treatment, were obliged to petition Congress Such petitions were ordinarily disposed of before committees who might recommend a pecuniary grant from Congress In a few instances Congress by special legislation authorized suit to be brought against the Government and the claims would be adjudicated in the courts The unsatisfactory character of this method of dealing with claims against the Government led in 1855 to the establishment of the court of claims. At first the court was simply authorized to hear claims and by appropriate bills refer them to Congress for payment In 1863 the court was authorized to give judgments subject to revision by the secretary of Treasury. The secretary was shortly thereafter deprived of this power and the court is now empowered to render final judgments against the United States subject to an appeal to the Supreme Court The jurisdiction of the court of claims illustrates that in the United States suits against the Government are governed by much the same principle that underlies the English procedure by petitions of right No liability arising out of a tort is recognized, but sovereign immunity is waived only in a class of cases where the obligation of the Government is contractual in nature. The court is given jurisdiction of all claims, except for pensions, founded upon the Constitution or any law of Congress and upon contracts, express or implied. Jurisdiction of claims sounding in tort is specifically negatived Claims arising from the taking of property for public use, for which compensation is required by the Constitution, for the return of taxes illegally assessed, for the breach of contracts, constitute the great bulk of its litigation Where the claim does not exceed $10,000 in amount the lower Federal courts are given concurrent jurisdiction with the court of claims. The grant of jurisdiction in claims upon an "implied contract" has given rise to much confusion Whether such contracts include obligations implied in law as well as in fact has been a question upon which the decisions of the Supreme Court have not been wholly uniform

A few of the States have established courts of claims upon the model of the U S. court of claims, but in most States the procedure of enforcing claims against the State Government is by petitioning the legislature.

See Richardson, *History of the Court of Claims* (1882); Crane, "Jurisdiction of the Court of Claims," 34 *Harv. L. Review*, 161 (1920); Borchard, *Government Liability in Tort* (1925); Maguire, "State Liability for Tort," 30 *Harv. L. Review*, 20 (1916). (J. M. La.)

PETITOT, JEAN (1608–1691), French-Swiss enamel painter, was born at Geneva, a member of a Burgundian family which had fled from France on account of religious difficulties. His father, Faulle, was a wood carver; his mother's name was Étienette Royaume Jean was the fourth son, and was apprenticed to a jeweller goldsmith named Pierre Bordier, with whom he struck up a close friendship. The two friends went into France, and eventually came to England with letters of introduction to Turquet de Mayern, physician to Charles I. For the king they made a St. George for the badge of the order and carried out many commissions for portraits, amongst others preparing two large ones of Rachel de Ruvigny, countess of Southampton, now at Chatsworth, and Mary Villiers, duchess of Richmond and Lennox, dated 1643, at one time in the possession of the Crown and now in the Pierpont Morgan collection On the execution of the king, Petitot left England for Paris with the royal household, while Bordier remained in England to carry out certain important commissions for Cromwell and the parliament

In Paris Petitot entered into partnership with a goldsmith, Jacques Bordier, a cousin of Pierre; probably the enamel portraits attributed to Petitot were really the work of the two partners, the actual drawing being the work of Petitot, while for the enamel process Bordier was mainly responsible. The two painters were given apartments in the Louvre, received numerous commissions from Louis XIV., and painted portraits of almost every person of importance in his brilliant court. The friendship between the two lasted for thirty-five years, and was only put an end to by Bordier's death. The enamellers rendered special political services in France for the republic of Geneva, and were practically regarded as the official representatives of the republic

On the revocation of the Edict of Nantes, 1685, pressure was brought to bear upon Petitot to change his religion The king protected him as long as possible, and when he was arrested, with his niece, Annie Bordier, sent Bossuet to convert the old man. Eventually Petitot abjured, but in 1687 he returned to Geneva, and was received back to the Huguenot communion He died on April 3, 1691

His eldest son JEAN LOUIS PETITOT (1652–*c* 1730), followed his father's profession, painting enamels which are difficult to distinguish from those of Jean the elder. He lived chiefly in London, where he executed several enamel portraits of Charles II, and died there in 1730. A portrait of him by Mignard is in the Geneva museum and another, in enamel by himself, belongs to the earl of Dartrey.

Of the works of Petitot the most important collection is in the Jones Bequest at the Victoria and Albert Museum There are many in the Louvre, sixteen at Chantilly, seventeen at Windsor, and others in the collections of Earl Beauchamp, the duke of Rutland, the duke of Richmond, the earl of Dartrey, Mr Alfred de Rothschild and the late Baroness Burdett-Coutts Amongst Lord Dartrey's examples are portraits of Petitot and of his son, and two of the wife of Jean Petitot the younger A second portrait of the artist belongs to the queen of Holland, and another is in the collection of the late Mr Stroehlin of Geneva. In Mr. Pierpont Morgan's collection there are many exceedingly fine examples, but especially three drawings on paper, the only three which appear to have survived, and the large signed miniature of the duchess of Richmond already mentioned, the largest work Petitot ever executed save the one at Chatsworth

See *Petitot et Bordier*, by Ernest Stroehlin (Geneva, 1905); "Some New Information respecting Jean Petitot," by G C. Williamson, *Nineteenth Century and After* (January 1908), pp 98–110, the privately printed *Catalogue of the Collection of Mr J Pierpont Morgan*, vol iii; *The History of Portrait Miniatures*, by G C Williamson, vol ii. (London, 1904).

PETITS-CHEVAUX (Fr for "little horses"), a gambling game played with a mechanical device consisting of a board perforated with a number of concentric circular slits, in which revolve, each independently on its own axis, figures of jockeys on horseback, distinguished by numbers or colours. The bystanders having staked their money according to their choice on a board marked in divisions for this purpose, the horses are started revolving rapidly together by means of mechanism attached to the board, and the horse which stops nearest a marked goal wins, every player who has staked on that horse receiving so many times his stake. Figures of railway trains and other objects sometimes take the place of horses

PETŐFI, ALEXANDER (1823–1849), Hungarian lyric poet, was born at Kis-Körösö, Pest county, on New Year's Day, 1823. The family received its diploma of nobility from the emperor Leopold in 1688, but the ultra-patriotic Alexander early changed the old family name, Petrovics, which pointed to a Croatian origin, into the purely Magyar form of Petőfi. He was disowned by a tyrannical father, and for three years led the wretched life of a strolling player, except for a brief interval when, to escape starvation, he enlisted as a common soldier in an infantry regiment. His first volume of original poems was published in 1844 by the Society Nemzeti Kör, through the influence of the poet Vörösmarty, when every publisher had refused his ms., and the seventy-five florins which he got for it had become a matter of life or death to him. The little volume published by the Nemzeti Kör was followed by the parody, *A Helység Kalapácsa* (1844); the romantic epic *János Vitéz* (1844); *Ciprislombok Etelké Sirjáról,* a collection of passionate elegies over his lost love, Etelké Csapó (1845); *Uti Jegyzetek,* an imitation of Heine's *Reisebilder* (1845); *Szerelem Gyöngyei* (1845); *Felhök* (1846); *Szerelme ès házassága* (1846), and many other volumes.

The first edition of his collected poems appeared in 1847. Petőfi was not yet twenty-five, and, despite the protests of the classicists, who regarded him with cold dislike, the best heads in Hungary, poets like Vörösmarty and critics like Szemere, already paid him the homage due to the prince of Magyar lyrical poets. The great public was enthusiastic on the same side, and posterity, too, has placed him among the immortals. Petőfi is as simple and genuine a poet of nature as Wordsworth or Christian Winther, and his erotics, inspired throughout by a noble idealism, have a Byronic fervour, though it is perhaps in his martial songs that Petőfi's essentially passionate and defiant genius asserts itself most triumphantly. On Sept. 8, 1847 Petőfi married Julia Szendrey. When the revolutionary war broke out, he espoused the tenets of the extreme democratic faction. He took an active part in the Transylvanian campaigns of the heroic Bem; rose by sheer valour to the rank of major, and was slain at the battle of Segesvár (July 31, 1849). The first complete edition of Petőfi's poems appeared in 1874. The best critical edition is that of Haras, 1894. (R. N. B.; X.)

PETRA (ἡ πέτρα = the rock), a ruined site, 30° 19′ N. and 35° 31′ E., in Trans-Jordan, lying in a rock basin on the eastern side of the Wadi el-Arāba, the great valley that continues the rift of Jordan southward to the Gulf of Aqaba. The descriptions of Strabo (xvi. p. 779), Pliny (*N.H.* vi. 32) and other writers leave no doubt as to the identity of this site with the famous capital of the Nabataeans (*q.v.*) and the centre of their caravan trade. Petra commanded routes to Gaza in the west, to Bosra and Damascus in the north, to Elath and Leucè Comè on the Red sea, and across the desert to the Persian gulf.

The country around is assigned by tradition to the Horites, *i.e.,* probably "cave-dwellers," the predecessors of the Edomites (Gen. xiv. 6; xxxvi. 20–30; Deut. ii. 12). But that Petra itself is mentioned in the Old Testament cannot be affirmed with certainty, although some have tried to identify it with the name Sela, which also means a rock. Eusebius and Jerome, apparently on the authority of Josephus (Ant. iv. 7, 1; 4, 7), assert that Rekem was the native name, but this also presents many serious difficulties. Others think that the reference to *petra* by Diodorus Siculus (xix. 94–97), where the expeditions of Antigonus against the Nabataeans (312 B.C.) are described, refers to Petra. But *petra,* referred to as a natural fortress and place of refuge, cannot be a proper name. The tombs at Petra offer some evidence of the early Nabataean settlement. Two types of tombs may be distinguished, the Nabataean and the Graeco-Roman. The former start from the simple pylon-tomb of pre-Hellenic age (round about the 6th century B.C.); they then pass through various stages evolving to the full Nabataean type, which retains all the native features and at the same time shows characteristics which are partly Egyptian and partly Greek. There are close parallels of this type, with inscriptions, at el Hejr in north Arabia. The next stage in the evolution of the tombs gives tomb fronts terminating in a semi-circular arch, a feature derived from North Syria, and there finally appear the elaborate façades from which all trace of native style has vanished, copied from the front of a Roman temple. This particular evolution suggests that Petra had cultural relations with many different groups at this time, as is to be expected from its position as a great trade focus. After the period of the pre-Hellenic tombs we notice a period which combined Greek, Egyptian and Syrian elements, clearly pointing to the age of the Ptolemies. Towards the close of the 2nd century B.C., when the Ptolemaic and Seleucid kingdoms were equally depressed, the Nabataean kingdom came to the front; under Aretas III. Philhellene (*c.* 85–60 B.C.) the royal coins began; at this time probably the theatre was excavated and Petra must have assumed the aspect of a Hellenistic city. It is to the long and prosperous reign of Aretas IV. Philopatris (9 B.C.–A.D. 40) that the fine tombs of the el Hejr type may be dated, and perhaps also the High-place. Then the city became more and more Romanized. In A.D. 106 Arabia Petraea ("Arabia belonging to Petra") was absorbed into the Roman empire, and the native dynasty came to an end. When the city was more prosperous than ever, at the time of Alexander Severus (A.D. 222–235), the issue of coinage came suddenly to an end. This was possibly due to a desert raid on a large scale, associated, perhaps, with the neo-Persian power under the Sassanid dynasty. Meanwhile, Palmyra was growing in importance, and attracted much of the Arabian trade away from Petra, and the latter declined. It seems, however, to have lingered on as a religious centre, for we are told by Epiphanius (*c.* A.D. 315–403) that in his time a feast was held there on Dec. 25 in honour of the virgin, Chaabou, and her offspring, Dusares (*Haer.* 51.). The chief god of Petra was Dhū-sharā (Δουσάρης), *i.e.*, the lord or owner of Sharā; he was worshipped under the form of a black rectangular stone, a sort of Petraean Ka'ba. Associated with Dhū-sharā was Allāt, the chief goddess of the ancient Arabs. Christianity found its way into Petra in early times; Athanasius mentions a bishop of Petra named Asterius, and at least one of the tombs was used as a church, with an inscription recording its consecration "in the time of the most holy Bishop Jason" (A.D. 447). The Christianity of Petra, as of north Arabia, was swept away by the Mohammedan conquest in A.D. 629–632. Under the Latin kingdom, Petra was occupied by Baldwin I.; it was held by the Franks till 1189; fragments of the Crusaders' citadel are still standing.

The present ruins are extensive and are usually approached by a track which leads round Jebel Hārūn (Mt. Hor) and enters the plain of Petra from the south. Another entrance is from the east, through a narrow gorge called the Sīk, also the waterway of the Wadi Mūsā. Near the end of the defile stands the most elaborate of the ruins, el-Hazne, or "the Treasury of Pharaoh," hewn out of the cliff. A little further on, at the foot of en-Nejr, comes the theatre. On en-Nejr is the great High-place, consisting of a rock-hewn altar of burnt offering. Not far off are two obelisks cut out of the solid rock; these were either images of Dhū-sharā and Allāt, or, more probably, marked the limits of the *haram* or the sanctuary. There are other places of sacrifice around. It seems probable that en-Nejr must have been the sacred mountain, the original sanctuary of Petra. The mountain walls around the city are lined with rock-cut tombs, in the form of towers. The city itself covered a space of about 1¼ sq.m., on fairly level ground on either bank of the Wadi Mūsā. Among the ruins on the south bank stand the fragments of a temple called Kasr Fir'aun, of late Roman date.

PETRARCH (1304–1374). Francesco di Petracco (Francesco Petrarca), the great Italian poet and humanist, was born at Arezzo on July 20, 1304. His father, Ser Petracco, held a post of notary in the Florentine Rolls court of the Riformagioni; but, having espoused the same cause as Dante during the quarrels of the Blacks and Whites, Petracco was expelled from Florence by the decree of Jan. 27, 1302, which condemned Dante to lifelong exile. With his wife he took refuge in the Ghibelline township of Arezzo. His mother, having obtained permission to return from

banishment, settled at Incisa, a little village above Florence, and here Petrarch acquired that pure Tuscan idiom which he used with such consummate mastery in ode and sonnet. In 1312 Petracco set up a house at Pisa; but he removed in 1313 to Avignon, where at that time the popes had their residence.

At Carpentras, under the direction of Convennole of Prato, Petrarch studied the humanities between 1315 and 1319, when he went to Montpellier to study law. Like Ovid and many other poets, Petrarch felt no inclination for law. There is an authentic story of Petracco's flinging the young student's books of poetry and rhetoric upon the fire, but saving Virgil and Cicero half-burned from the flames at his son's passionate entreaties. Nevertheless, after four years of study at Montpellier, he passed three years at the law school of Bologna with his brother Gherardo. In 1326, when his father died, he returned to Avignon. Banishment and change of place had already diminished Petracco's fortune, which was never large; and a fraudulent administration of his estate after his death left the two heirs almost destitute. The most precious remnant of Petrarch's inheritance was a ms. of Cicero. Petrarch took ecclesiastical orders and Giacomo Colonna, afterwards bishop of Lombez, now befriended him and partly supported him for some years.

Laura.—On April 6, 1327, happened the most famous event of Petrarch's personal history. He saw Laura for the first time in the church of St. Clara at Avignon. Who Laura was remains uncertain still. Petrarch kept the secret jealously, and the identification of her by the abbé de Sade in the 18th century with the wife of Hugues de Sade is more than suspect We may, however, reject the sceptical hypothesis that Laura was a figment of Petrarch's fancy. If we accept her personal reality, the poems of her lover demonstrate that she was a married woman who accepted the poet's homage, but refused intimate relations.

Petrarch's inner life after this date is mainly occupied with the passion which he celebrated in his Italian poems and with the friendships which his Latin epistles dimly reveal. Besides the bishop of Lombez he was now on terms of intimacy with another member of the great Colonna family, the cardinal Giovanni. A German, Ludwig, whom he called Socrates, and a Roman, Lello, who received from him the classic name of Laellius, were among his best-loved associates. He lived mainly at Avignon until 1333, when he undertook the first of many long journeys. He was a great traveller and keenly observant. He was one of the first alpinists and loved the mountains for their own sake. On this tour he visited Paris, Ghent, Liége, Cologne, making the acquaintance of learned men and copying classical manuscripts. On his return to Avignon he pleaded the cause of the Scaligers in their lawsuit with the Rossi for the lordship of Parma, and addressed two poetical epistles to Benedict XII. upon the restoration of the papal see to Rome. His eloquence on behalf of the tyrants of Verona won him the friendship of their ambassador, Azzo di Correggio. Not long after these events Petrarch made his first journey to Rome, a journey memorable from the account which he has left us of the impression he received from its ruins.

In 1337 Petrarch established himself at Vaucluse, and began his life of solitary study, heightened by communion with nature in her loneliest and wildest moods. Here he spent his time among books, meditating on Roman history, and preparing himself for the Latin epic on Scipio Africanus, *Africa*. For recreation he climbed the hills or traced the Sorgues from its fountain under those tall limestone cliffs, while odes and sonnets to Madonna Laura were committed to paper. He wrote many of his most important treatises in prose, as well as a large portion of his Latin correspondence, in this retreat. Some woman, unknown by name, made him the father of a son, Giovanni, in 1337; and she was probably the same who brought him a daughter, Francesca, in 1343. Both children were afterwards legitimized by papal bulls.

Meanwhile his fame as a poet in the Latin and the vulgar tongues increased, until, when the first drafts of the *Africa* began to circulate, about 1339, it became manifest that no one had a better right to the laurel crown than Petrarch. A desire for glory was one of his most deeply-rooted passions, and it is probable that he exerted his influence in several quarters with the view to a public coronation. On Sept. 1, 1340, he received two invitations, from the university of Paris and from King Robert of Naples respectively. He accepted the latter, journeyed in Feb. 1341 to Naples, was honourably entertained by the king, and, after some formal disputations on poetry, was sent with magnificent credentials to Rome. There, in April, he assumed the poet's crown upon the Capitol from the hand of the Roman senator amid the plaudits of the people and the patricians The oration which he delivered on this occasion was composed upon these words of Virgil.—

Sed me Parnassi deserta per ardua dulcis
Raptat amor.

Henceforth Petrarch ranked as a rhetorician and a poet of European celebrity During the spring of 1341 his friend Azzo di Correggio had succeeded in freeing Parma from subjugation to the Scaligers and was laying the foundations of his own tyranny in that city. He invited Petrarch to attend him when he made his triumphal entry in May, and for some time Parma and Vaucluse were his headquarters. The one he called his Transalpine, the other his Cisalpine, Parnassus

The events of the next six years of his life may be briefly recapitulated. He lost his old friend the bishop of Lombez by death and his brother Gherardo by the entrance of the latter into a Carthusian monastery. Various small benefices were conferred upon him; and repeated offers of a papal secretaryship, which would have raised him to the highest dignities, were rejected. In Jan. 1343 his patron Robert, king of Naples, died, and Petrarch was sent on an embassy from the papal court to his successor Joan The notices which he has left of Neapolitan society at this epoch are interesting and, it was now, perhaps, that he met Boccaccio. The beginning of 1345 was marked by the discovery at Verona of Cicero's *Familiar Letters*. But Petrarch found the precious ms. after the style of his own epistles had been already modelled upon that of Seneca and St. Augustine.

In May 1347, when Cola di Rienzi accomplished the revolution which for a short space revived the republic in Rome, Petrarch, who in politics was no less visionary than Rienzi, threw himself into the republican movement and sacrificed his old friends of the Colonna family to what he judged a patriotic duty.

In 1347 Petrarch built himself a house at Parma where he hoped to pursue the tranquil avocations of a poet and of an idealistic politician. But the next two years brought a series of calamities Laura died of the plague on April 6, 1348. Francesco degli Albizzi, Mainardo Accursio, Roberto dé Bardi, Sennuccio del Bene, Luchino Visconti, the cardinal Giovanni Colonna and several other friends died in rapid succession. Friendship with him was a passion; he needed friends for the maintenance of his intellectual activity at the highest point of its effectiveness.

We may say with certainty that Laura's death, followed by that of so many friends, was the turning-point in Petrarch's inner life. He began to think of quitting the world and establishing a kind of humanistic convent, where he might dedicate himself, in the company of kindred spirits, to still severer studies and a closer communion with God Though nothing came of this scheme, a marked change was henceforth perceptible in Petrarch's literary compositions. The death of Laura left him purified from passion, but able to realize his poetic mistress more clearly than he had ever done in her lifetime The poems written *In Morte di Madonna Laura* are of more religious tone.

At the same time his increasing renown led to fresh relations with Italian despots. The noble houses of Gonzaga at Mantua, of Carrara at Padua, of Este at Ferrara, of Malatesta at Rimini, of Visconti at Milan, vied with Azzo di Correggio in entertaining him. In vain his correspondents pointed out the discrepancy between his zeal for Italian liberties, his recent enthusiasm for the Roman republic, and this alliance with tyrants who were destroying the freedom of the Lombard cities. Petrarch remained an incurable rhetorician; and, while he stigmatized the despots in his ode to Italy and in his epistles to the emperor, he accepted their hospitality. They, on their part, seem to have viewed his political theories as of no practical importance. The patronage of art and letters which distinguished Italian princes throughout the Renaissance first manifested itself in the attitude of Visconti and

Carraresi to Petrarch.

In 1350 Petrarch made a pilgrimage to Rome, passing through Florence, where he established a firm friendship with Boccaccio. This alone of his friendships stands out with clearness. Boccaccio carried his admiration for Petrarch to the point of worship. Petrarch repaid him with sympathy, counsel in literary studies, and moral support in his effort to conquer his over-sensuous nature. It was Boccaccio who in 1351 brought to Petrarch, then at Padua, an invitation from the seigniory of Florence to accept the rectorship of their recently founded university. This was accompanied by a diploma of restoration to his rights as citizen and restitution of his patrimony. Petrarch declined the offer, and maintained his independence and his leisure. In 1351 he was again at Vaucluse, engaged on his *Epistle to Posterity*.

Early in 1353 he left Avignon for the last time, and made his way to Milan, where the archbishop Giovanni Visconti was virtually despot. He employed Petrarch on various diplomatic missions, notably as a mediator betwen Genoa and Venice in 1353. On Nov. 8 he delivered a studied oration before the doge Andrea Dandolo and the great Venetian council. His eloquence had no effect; but the orator entered into relations with the aristocracy which were afterwards extended. After Giovanni's death he remained at Milan in the court of Bernabo and Galeazzo Visconti, closing his eyes to their cruelties and exactions, serving them as diplomatist and orator. In their interest he addressed epistles to the emperor Charles IV. upon the distracted state of Italy, and entreated him to resume the old Ghibelline policy of imperial interference. Charles IV. passed through Mantua in 1354 and there Petrarch made his acquaintance but, finding him unfit for any noble enterprise, declined attending him to Rome. When Charles returned to Germany, after assuming the crowns in Rome and Milan, Petrarch addressed to him a letter of vehement invective and reproach. Yet the Visconti sent him on an embassy to Charles at Prague in 1356. In 1361, on his return to Milan from one of his embassies to France, he received news of the deaths of his son Giovanni and his old friend Socrates, carried off by plague.

Soon afterwards, in May 1362, he settled at Padua. In 1363 he visited Venice, making a donation of his library to the republic of St. Mark. Here his friend Boccaccio introduced to him the Greek teacher Leontius Pilatus. Petrarch, who possessed a ms. of Homer and a portion of Plato, never acquired the Greek language, and he could only approach the *Iliad* in Boccaccio's rude Latin version. About this period he saw his daughter Francesca happily married, and undertook the education of a young scholar from Ravenna, whose sudden disappearance from his household caused him the deepest grief. This youth has been identified, on insufficient grounds, with that Giovanni Malpaghini of Ravenna who was destined to form an important link between Petrarch and the humanists of the next age of culture. Much of this last stage of his life was occupied in a controversy with the Averroists, whom he regarded as dangerous antagonists of sound religion and culture. A curious treatise, which grew in part out of this dispute and out of a previous duel with physicians, was the book *De sui ipsius et multorum ignorantia*.

At last, in 1369, he retired to Arquà, a village in the Euganean hills, where he continued his unremitting study. All through these declining years his friendship with Boccaccio was maintained. It rested on a solid basis of mutual affection and of common studies, the different temperaments of the two scholars securing them against rivalry. One of Petrarch's last compositions was a Latin version of Boccaccio's story of Griselda. On July 18, 1374, his people found the old poet and scholar dead among his books in that little house which looks across the hills towards the Adriatic.

The Founder of Humanism.—Petrarch was the inaugurator of the Renaissance in Italy. What he achieved for the modern world was not merely to bequeath to his Italian imitators masterpieces of lyrical art unrivalled for perfection of workmanship, but also to open out for Europe a new sphere of mental activity. Standing within the threshold of the middle ages, he surveyed the kingdom of the modern spirit, and, by his own inexhaustible scholarship and study, he determined what we call the revival of learning. He was the first to collect libraries, to accumulate coins, to advocate the preservation of mss. His friends knew that the most acceptable of all gifts to him was an addition to his collection of manuscripts. For him the authors of the Greek and Latin world were living men, and the rhetorical epistles he addressed to Cicero, Seneca and Varro prove that he dwelt with them on terms of sympathetic intimacy.

Eminently religious and orthodox, he did not seek to substitute a pagan for the Christian ideal. This was left for the scholars of the 15th and 16th centuries in Italy. But he venerated the Latin orators, historians and poets as depositories of a tradition only second to revelation. For him there was no schism between Rome and Galilee, between classical genius and sacred inspiration. The latter concerned man's eternal welfare, the former the perfection of his intellect and the civilization of his manners. Whatever in literature revealed the hearts of men was infinitely precious to him; and for this reason he professed almost a cult for St. Augustine. It was to Augustine, as to a friend, that he poured forth his soul in the *De contemptu mundi*. Much as Petrarch effected by restoring a sound conception of learning, he did more by impressing on the age his own striking personality. Whether we regard him as a priest who published poem after poem in praise of an adored mistress, as a plebeian man of letters who conversed on equal terms with kings and princes, as a solitary dedicated to the love of nature, as an amateur diplomatist treating affairs of state with pompous eloquence in missives sent to popes and emperors, or again as a traveller eager for change of scene, ready to climb mountains for the enjoyment of broad prospects; in all these divers manifestations of his peculiar genius we trace some contrast with the manners of the 14th century, some emphatic anticipation of the 16th.

As an author Petrarch must be considered from two points of view—first as a writer of Latin verse and prose, secondly as an Italian lyrist. In the former capacity he was speedily outstripped by more fortunate scholars. His eclogues and epistles and the epic of *Africa*, on which he set such store, exhibit a comparatively limited command of Latin metre. His treatises, orations and familiar letters, though remarkable for a prose style, are not distinguished by purity of diction. Much as he admired Cicero, he had not freed himself from current mediaeval Latinity. Seneca and Augustine had been too much used by him as models of composition. He possessed a copious vocabulary, a fine ear for cadence and a complete faculty of expression.

In Italian poetry Petrarch occupies a very different position. In the *Rime in Vita e Morte di Madonna Laura* perfect metrical form is married to language of the choicest and the purest. It is true that even in the *Canzoniere*, as Italians prefer to call that collection of lyrics, Petrarch is not devoid of faults and affectations belonging to his age. He appealed in his odes and sonnets to a restricted audience already educated by the chivalrous love-poetry of Provence and by Italian imitations of that style. He was not careful to exclude the commonplaces of the school, nor anxious to finish a work of art wholly free from fashionable graces and from contemporary conceits. There is, therefore, a certain artificiality in his treatment; and this has been perpetuated with wearisome monotony by versifiers who chose him for their model. But, after making due allowance for peculiarities, the abuse of which has brought the name of Petrarchist into contempt, we can agree with Shelley that the lyrics of the *Canzoniere* "are as spells which unseal the inmost enchanted fountains of the delight which is the grief of love." Petrarch links the metaphysical lyrists of Tuscany with more realistic amorists of succeeding generations. He was the first Italian poet of love to free himself from allegory and mysticism, and yet he was far from approaching the analysis of emotion with the directness of a Heine or De Musset. Laura is not so much a woman as woman in the abstract; and perhaps on this account the poems written for her have been taken to the heart by countless lovers. The same criticism might be passed on Petrarch's descriptions of nature. That he felt the beauties of nature keenly is certain; yet he has written nothing so characteristic of Vaucluse as to be inapplicable to any solitude where there are woods and water. The *Canzoniere* is therefore one long melodious monody with the

indefinite form of a beautiful woman seated in a lovely landscape, a perpetual object of delightful contemplation. This disengagement from local circumstance without the sacrifice of emotional sincerity is a merit in Petrarch, but a fault in his imitators.

Petrarch's odes to Giacomo Colonna, to Cola di Rienzi and to the princes of Italy display him in another light. They exhibit oratorical fervour and the pleader's eloquence in its most perfect lustre. Modern literature has nothing nobler, nothing more harmonious in the declamatory style than these three patriotic effusions. Their spirit itself is epoch-making in the history of Europe, for up to this point Italy, as a nation, had scarcely begun to exist. To the high conception of Italian nationality, to the belief in that spiritual unity which underlay her many discords and divisions, Petrarch attained partly through his disengagement from civic and local partisanship, partly through his liberal culture.

The principal materials for a life of Petrarch are afforded by his letters divided into *Familiar Correspondence, Correspondence in Old Age, Divers Letters* and *Letters without a Title*, by the autobiographical *Epistle to Posterity*, and by the epistles and eclogues in Latin verse, the Italian poems and the rhetorical addresses to popes, emperors, Cola di Rienzi and some great men of antiquity. For the comprehension of his character, the *De contemptu mundi* is invaluable. His erudition can be shown by a brief enumeration of his most important writings In moral philosophy, we find *De remediis utriusque fortunae*, a treatise on human happiness and unhappiness; *De vita solitaria*, a panegyric of solitude, and *De otio religiosorum*, on monastic life. On historical subjects there are *Rerum memorandarum libri*, a miscellany from a student's commonplace-book, *De viris illustribus*, an epitome of the biographies of Roman worthies, *Contra cuiusdam anonymi Galli calumnias apologia, Contra medicum quendam invectivarum libri*, and *De sui ipsius et multorum ignorantia*—controversial compositions, which grew out of Petrarch's quarrels with the physicians of Avignon and the Averroists of Padua In this connection may be mentioned the satires on the papal court, included in the *Epistolae sine titulo*. Five public orations have been preserved. Among his Latin poems *Africa* takes the first place. Twelve *Eclogues* and three books of *Epistles* in verse close the list. In Italian we possess the *Canzoniere*, including odes and sonnets for Laura during her lifetime, those written after her death, and a miscellaneous section containing the three patriotic odes and three famous poetical invectives against the papal court. Besides these lyrical compositions are the semi-epical or allegorical *Trionfi*—Triumphs of Love, Chastity, Death, Fame, Time and Divinity, written in terza rima of smooth and limpid quality. Though these Triumphs, as a whole, are deficient in poetic inspiration, the second canto of the *Trionfo della morte*, in which Petrarch describes a vision of his dead love Laura, is justly famous for reserved passion and pathos tempered to a tranquil harmony (J. A. S.; X)

BIBLIOGRAPHY.—A bibliography of Petrarch's works was compiled by Domenico Rossetti (Trieste, 1828). *See* also M Vattaso, *I codici Petrarch d. Bibl. Vaticana* (Rome, 1908) and *Cat. of Petrarch coll. bequeathed by W. Fiske* (Cornell univ., 1916). The Basle editions of 1554 and 1581 form the basis for all editions of the collected works. Editions and translations of the *Canzoniere* are numerous, the most important editions being those of Leopardi (1895), of Carducci (1899) and of Moschetti (1908). *See* also R S. Phelps, *The Earlier and Later Forms of Petrarch's Canzoniere* (Chicago, 1925).

The Sonnets, Triumphs, and other poems were translated by various hands in Bohn's library (1859). Selections of the Sonnets have been translated by R. Garnett (1896), A. Crompton (1898), G Robertson (1902), J. W. Higginson (1903) and by A. Tobin (1906) Of the *Trionfi*, the best translations are those by the countess of Pembroke (*see* ed. in *Publ. of Mod. Lang. Assoc. of America*, xxvii., 1912) and by H. Parker (*c.* 1565, reprinted by Roxburgh club, 1887). Petrarch's *Letters* were edited by Fracassetti (1859–63. Eng. trans. of the letters to classical authors, Chicago, 1910, and a trans. of a selection of his letters, 1914). The *De Remediis* was translated in 1797 and the *De Contemptu Mundi* in 1911

Mazzei, *La Vita e le Opere di Petrarca* (1927).

PETRE, SIR EDWARD (1631–1699), Jesuit confessor of King James II. of England, was born in Paris, the son of Sir Francis Petre, Bart., of Cranham, and his wife Elizabeth Gage. Educated at the Jesuit College at St. Omer, he entered the order under the name of Spencer in 1652, but did not receive the full orders till 1671, when he was sent on a mission to England. In 1679 he succeeded his brother in the title and family estates. On the accession of James II. in 1685 he became confessor to the king, whom he encouraged in the policy which ended by producing the revolution of 1688. The king contemplated making him archbishop of York, as the see was then vacant, but the pope, Innocent XI., who was not friendly to the order, would not grant a dispensation to hold it, and even directed Petre's superiors to rebuke him for his excessive ambition. On the outbreak of the revolution, Petre fled, and had no further relations with James II. After a visit to Rome, he became head of the Jesuit College at St. Omer in 1693, whence he was transferred to Walten in Flanders in 1697. He died on May 15, 1699.

PETRE, SIR WILLIAM (*c.* 1505–1572), English politician, was educated at Exeter College, Oxford, afterwards becoming a fellow of All Souls College (1523) He entered public service in early life, and began his official career by serving the English government abroad In 1536 he was made deputy, or proctor, for the vicar-general, Thomas Cromwell, and as such he presided over the convocation which met in June of this year. In 1543 Petre was knighted and was appointed a secretary of state; in 1545 he was sent as ambassador to the emperor Charles V. He retained his position under Edward VI. and Mary and though he resigned his secretaryship in 1557, he took some part in public business under Elizabeth until his death on Jan. 13, 1572 His son John Petre (1549–1613) was created Baron Petre of Writtle in 1603.

PETREL, group of birds whose name is derived from their apparent habit of walking on the water as St Peter is recorded (Matt. xiv. 29) to have done. They form with the shearwaters (*q v.*) and albatrosses (*q.v.*) the order *Tubinares*, the name denoting the tubular structure of their nostrils (*see* ORNITHOLOGY). There are two families, *Procellariidae* and *Oceanitidae*.

Petrels are archaic oceanic forms, with great powers of flight, dispersed throughout the oceans of the world; some species apparently never resort to land except for the purpose of nidification During the breeding-season many of them are nocturnal in their habits, passing the day in holes in which they generally nest, the hen laying a single white egg, sparsely speckled, in a few species, with fine reddish dots Of those species that frequent the North Atlantic the stormy petrel, or Mother Carey's chicken, *Hydrobates pelagicus*, is the commonest. Other Atlantic forms are Leach's or the fork-tailed petrel, *Oceanodroma leucorrhoa*, a larger but less common bird, and Wilson's petrel, *Oceanites oceanicus*, the type of the family *Oceanitidae*, which is common on the American side In the southern ocean petrels are most abundant, both as species and as individuals. The Cape-pigeon or Pintado petrel, *Daption capensis*, is one that has long been well known to mariners, while those who voyage to or from Australia meet with many more species, some, as *Ossifraga gigantea*, as large as albatrosses, and several called by names having reference to their strong smell of musk. The colouring of petrels is sooty-black, grey of various tints, and white.

THE PETREL, AN OCEANIC BIRD THAT COMES TO LAND ONLY DURING THE BREEDING SEASON

PETRIE, SIR WILLIAM MATTHEW FLINDERS (1853–), English Egyptologist, was born at Charlton on June 3, 1853, the son of William Petrie, C.E, and Anne, daughter of Captain Matthew Flinders (*q.v.*). He took an early interest in archaeological research, and between 1875 and 1880 studied ancient British remains at Stonehenge and elsewhere; in 1880 he published his book on Stonehenge. He was much interested in

ancient weights and measures, and in 1875 published a work on *Inductive Metrology*. In 1881 he began a long series of important surveys and excavations in Egypt, beginning with the pyramids at Giza, and following up his work there by excavations at the great temple at Tanis (1884), and discovering and exploring the long-lost Greek city of Naucratis in the Delta (1885), and the towns of Am and Daphnae (1886), where he found important remains of the time when they were inhabited by the Pharaohs. Between 1888 and 1890 he was at work in the Fayum, opening up Hawara, Kahun and Lachish; and in 1891 he discovered the ancient temple at Medum. Much of this work was done in connection with the Palestine Exploration Fund. By this time his reputation was established. He published in 1893 his *Ten Years' Diggings in Egypt*, and was appointed Edwards Professor of Egyptology at University College, London. In 1894 he founded the Egyptian Research Account, which in 1905 was reconstituted as the British School of Archaeology in Egypt (not to be confused with the Egypt Exploration Fund, founded 1892). Perhaps the most important work which the School has accomplished has been the investigation of the site of Memphis (*q.v.*). Flinders Petrie was knighted in 1923.

The extent as well as the chronological order of Professor Petrie's excavations may best be shown by a list of his works.

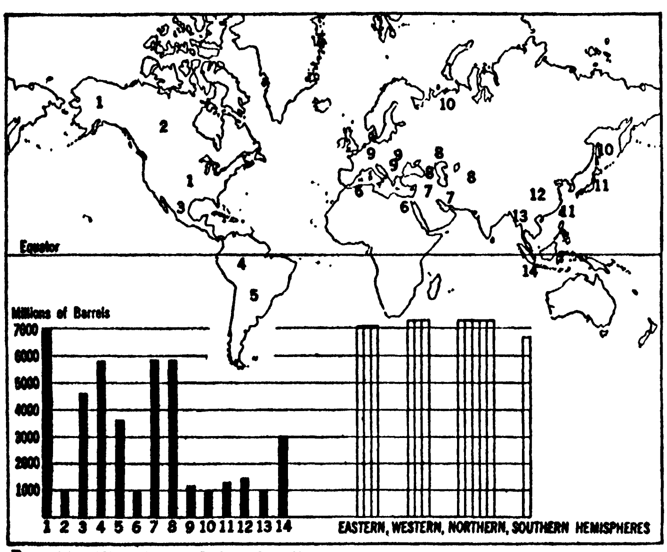
WORKS.—His chief general works on Egyptian subjects are, *Ten Years' Diggings in Egypt* (1893); *History of Egypt* (1894–1905); *Religion and Conscience in Ancient Egypt* (1898); *Syria and Egypt* (1898); *Hyksos and Israelite Cities* (1906); *Religion of Ancient Egypt* (1906); *Arts and Crafts in Egypt* (1909); *Historical Studies* (1910); *Revolution of Civilisation* (1911); *Eastern Exploration* (1919); *Prehistoric Egypt* (1920); *Social Life in Ancient Egypt* (1923); *Religious Life in Ancient Egypt* (1924); *Descriptive Sociology of Ancient Egypt* (1926). He has also written a long series of monographs on special subjects.

PETROGRAD: *see* LENINGRAD.

PETROL: *see* GASOLENE.

PETROL ENGINE: *see* INTERNAL COMBUSTION ENGINE.

PETROLEUM consists essentially of only two elements, hydrogen and carbon. The inorganic theory of its origin holds that hydrogen and carbon as elements in the rocks of the earth have been brought together under great heat and pressure and so were forced into various combinations. The organic theory, which



PETROLEUM PRODUCTION OF THE WORLD: NUMBERS AT BOTTOM OF DIAGRAM CORRESPOND TO THOSE ON MAP INDICATING LOCALITY

has in recent years been more widely accepted, holds that the hydrogen and carbon both come from remains of pre-existing plant and animal life. This organic material represents, in the main, microscopic marine and swamp life rather than true land life. Sea bottom muds and sands of ancient geological eras, squeezed by the weight of the thousands of feet of overlying muds and sands, crumpled and broken and finally thrown up above sea level by the movement of the earth's crust, finally become the shales and limestones and sandstones of to-day. The organic theory maintains that it is this organic mud containing microscopic plant and animal life which comes into the sea with the river silts, together with the much greater volume of similar tiny marine plants and animals that is the principal source material of petroleum.

Petroleum so formed and disseminated uniformly through great bodies of organic mud, is not yet available to man. It has still to be accumulated in a definitely limited reservoir such as is formed by the pore spaces between the grains in a bed of sand or, more rarely, in the cracks and cavities of a limestone, whence it can issue under pressure into the well which the oil operator drills into the reservoir. Concentration of petroleum is accomplished (1) by pressure which transforms the mud into a dense shale while forcing the oil into the more open, non-compressible sands, and (2) by water moving down through the bed from where it outcrops on the earth's surface, or rising upward along the bed under pressure from greater depths, but in either case flushing the oil ahead of it until the latter finally accumulates in the top of a fold or against the broken edge of a sand bed. These, briefly stated, are the conditions, according to the organic theory, which form petroleum fields. It is believed that the organic material which contributes most to the origin of oil is the abundant microscopic life in shallow sea water, commonly referred to as plankton.

PRODUCTION

In 1927, according to an estimate of the Department of Commerce, the production of the United States amounted to approximately 896,000,000 bbl. moved from producing properties with about 9,800,000 bbl. consumed on leases or added to the storage held by producers; making a grand total production of 905,800,000 barrels. Since the total world output is estimated as 1,254,145,000 bbl. in 1927, American production therefore represents 72·23%. The Department of Commerce's estimate by countries follows:—

	Thousands of barrels	Per cent
United States	905,800	72·23
Russia	72,400	5·77
Venezuela	64,400	5·14
Mexico	64,200	5·12
Persia	36,800	2·93
Rumania	26,100	2·08
Dutch East Indies	21,400	1·71
Colombia	14,600	1·16
Peru	9,800	·78
Argentina	8,700	·69
British India	8,200	·65
Poland	5,800	46

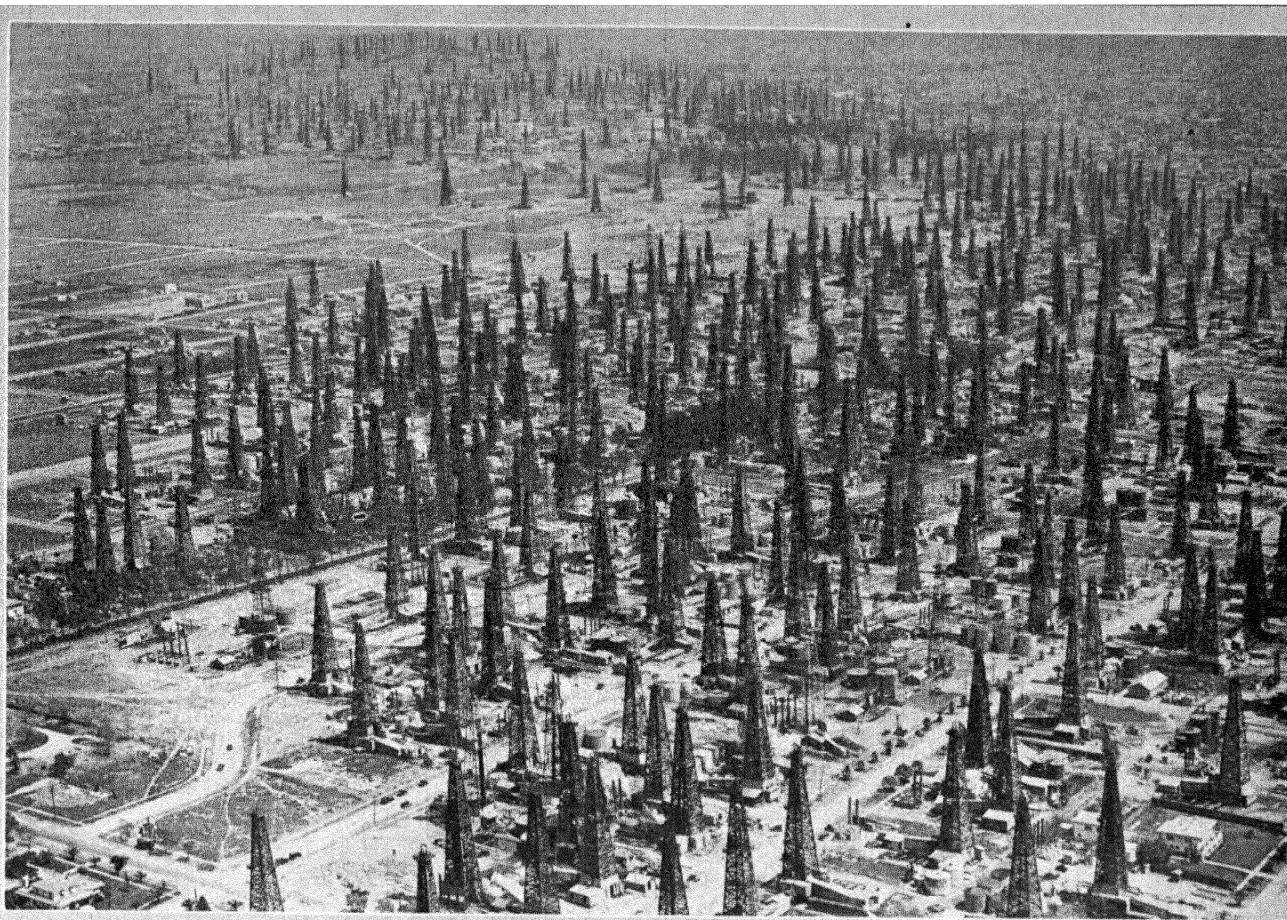
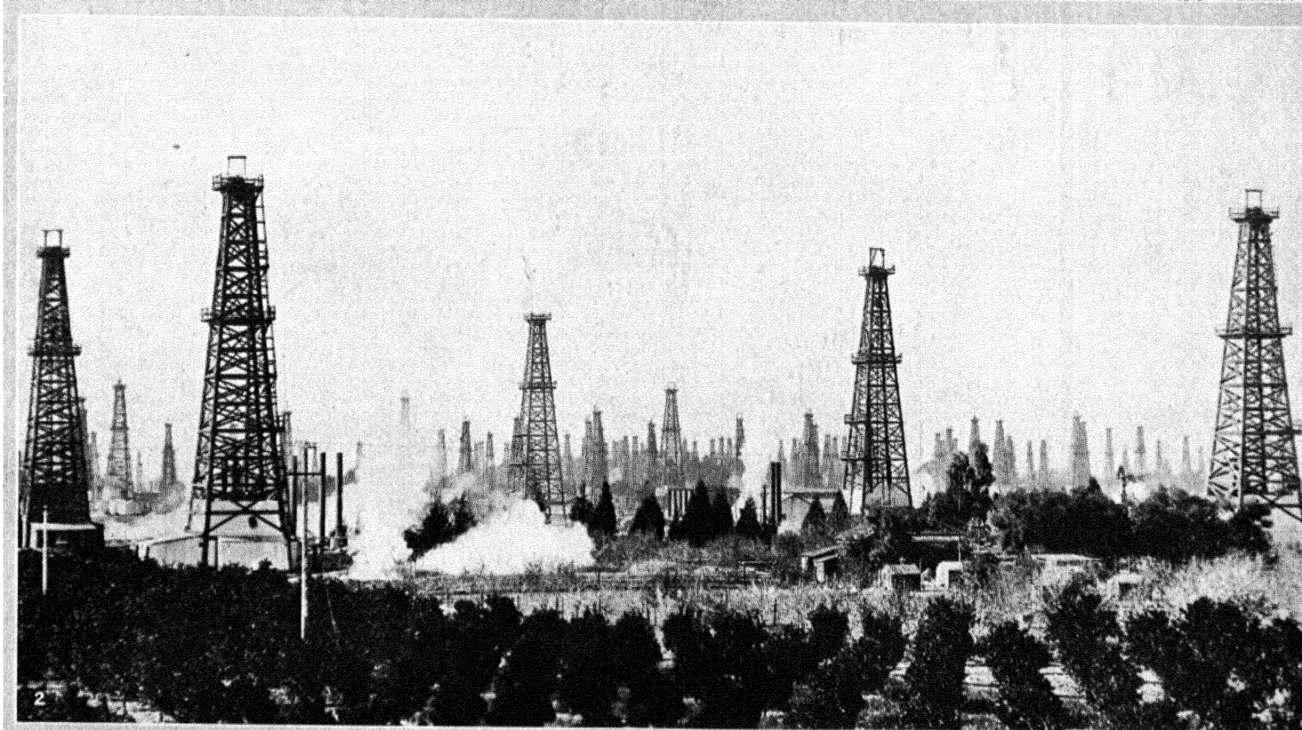
Since the first recorded production in 1857 the United States has supplied over 65% of the world's output. The total petroleum production (1857–1927) of the world was 15,811,962,000 bbl.; of the United States 10,346,346,000 barrels. Except for a relatively small production in Rumania, Poland and the Dutch East Indies, the production operations of American oil companies in foreign fields are chiefly confined to Mexico and South America, or fields relatively close to American refineries.

UNITED STATES

Because over 70% of the world's production of petroleum is in the United States, the petroleum refining industry in that country far exceeds that of all other countries combined. The United States not only consumes more oil than any other country but is also more dependent upon oil, with its oil-fuelled navy, a 62% oil-burning merchant marine and 25,000,000 motor cars. On Dec. 31,





OIL FIELDS IN CALIFORNIA

1. Aeroplane view of the great Signal Hill oil fields of the Los Cerritos district near Long Beach, California. Oil derricks are set so closely together that from a distance they resemble a great forest
2. Typical scene in Los Angeles county, California. An orange grove is seen in the foreground and a forest of oil well derricks are shown in the background. Drilling is in progress at the derricks where the live steam is seen escaping in white clouds

)27, there was in the United States one car for every 5·12 per-ons; in the United Kingdom one for every 37 persons; in France 1e for every 40 persons, and in Germany one for every 148 ersons. The total exports from the United States in 1926 (U.S. ureau of Commerce) amounted to $4,808,465,000, of which pe-oleum and its products amounted to $539,477,000 or 11%.

The total crude oil production of the United States by years, 1d percentage of United States production are shown in the companying tables.

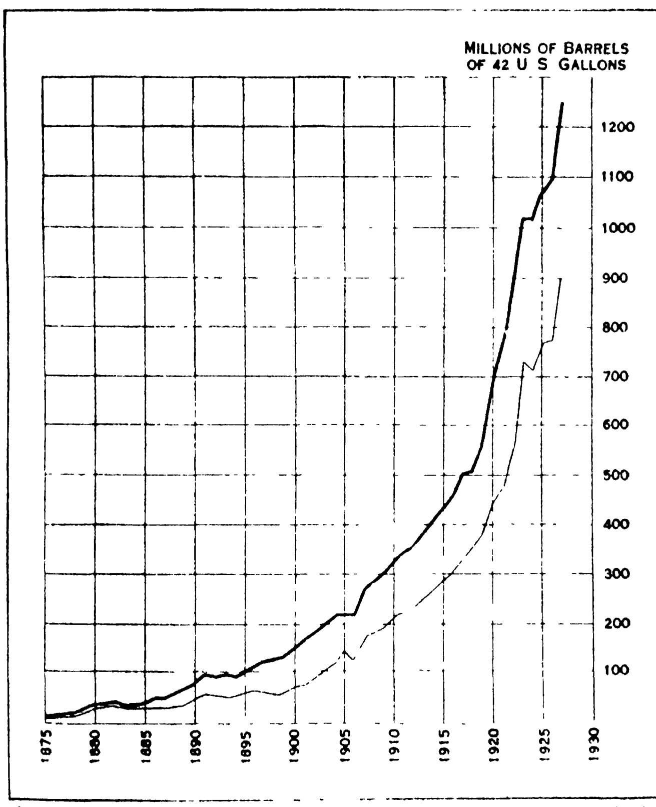
The principal producing areas in the United States are, in order of their importance, as follows: Mid-Continent, California, Gulf Coast, Rocky Mountain, Appalachian, Illinois and south-west Indiana and Lima-Indiana.

The Appalachian area includes Kentucky, West Virginia, Pennsylvania, New York and eastern Ohio. The first commercial production in America was developed in this region with the drilling in Aug. 1859 of the Drake well, on Oil Creek, at Titusville, Pa. From this, well development spread first over the eastern United States, embracing parts of northern Ohio, Illinois and Indiana, and then became general, subsequently extending to Canada and California. More recently Tennessee was added and, more recently still, Michigan began to produce oil in commercial quantities. In recent years, the Appalachian fields, while continuing to produce a large quantity of oil, have yielded primacy in quantity to the great producing areas of the Mid-Continent and Far West.

Mid-Continent.—The Mid-Continent district embraces Oklahoma, Kansas, northern, central, eastern and south-western Texas, northern Louisiana and southern Arkansas and is the principal producing area. Pools are scattered throughout this area and new pools are being constantly discovered. While oil had been discovered previously in Oklahoma, it was not until the Bartlesville pool and the Glenn pool were discovered in 1905 that the great petroleum development in that State occurred. The Healdton pool followed In 1912, the Cushing pool was discovered, reaching a maximum production (1915) of 331,000 bbl a day. In 1914, the Augusta pool, in Butler county, Kan., was opened up and, in 1915, the El Dorado pool, which, in 1917, reached a maximum production of 109,000 bbl. a day.

Late in 1917, the discovery of oil near Ranger in central Texas



GRAPH SHOWING PRODUCTION OF CRUDE PETROLEUM FROM 1875–1927
Heavy line represents the total for the world; lighter line represents the total for the United States. The aggregate for the years 1857–1874 is 70,998,000 barrels, of which 65,284,000 barrels were produced in the United States. Figures for 1927 are preliminary

brought about a sensational development which took in Eastland, Stevens and other central Texas counties, and resulted in Ranger, Burkburnett and Breckenridge area production. In 1921, production was developed in southern Arkansas In the same year, the Mexia pool, Texas, was developed.

Since that date a large number of major pools have been developed in Oklahoma, including Burbank, Bristow, Hewitt, Tonkawa and, more recently in 1926–27, the Seminole area field, which is rated as one of the largest ever developed. In 1923–24 a succession of flush pools reached their peak concurrently, among

these being the Burbank and Tonkawa fields in Oklahoma, the original Smackover development in Arkansas and the Powell field in eastern Texas, all in the Mid-Continent area. In Dec. 1924, the sensational and short-lived Wortham pool in eastern Texas came in. In 1926, the Panhandle (Texas) oil field was first developed, and large producing areas have since been added by finds in various parts of west Texas, including Pecos, Crane, Upton and Winkler counties.

Gulf Coast.—In 1901 the Gulf Coast district came into prominence when the Spindletop pool in Jefferson county, Texas, was developed. The district includes southern Texas and southern Louisiana. Among the more important pools are Goose Creek, Hull, Humble, West Columbia and Sour Lake. In 1926, deeper drilling in the Spindletop field resulted in bringing in a major pool which was responsible for a peak production of over 100,000 bbl. a day.

Rocky Mountain.—The principal producing area in the Rocky Mountain district is the Salt Creek field in Wyoming. A great amount of exploration work has been done throughout the Rocky Mountain country in recent years resulting in discoveries and commercial production in Colorado, Montana and New Mexico.

California.—California has alternated with Oklahoma as the most important oil-producing State. Before 1923, the principal producing districts were in Kern and Fresno counties, with small production in Santa Barbara, Ventura and Los Angeles counties. Subsequently the great fields in the Los Angeles basin have been developed, among them Huntington Beach, Santa Fe Springs, Long Beach, Torrance, Dominguez, Inglewood and Seal Beach. Recently production in Ventura county has reached major proportions. Commercial development of California's oil began in the early '80s.

MEXICO

Development of oil in Mexico and in some countries of South America, notably Venezuela, Colombia and Peru, has direct bearing on the oil operations in the United States because the oil developed in these countries is shipped in large quantity to the United States for refining.

The rapid rise and fall of the production of petroleum in Mexico should be noted. As early as 1901 there was a small quantity produced in Mexico, but it was not until 1910 that the Mexican production became appreciable. Within a few years the output became second only to that of the United States. In the latter part of 1910, the Huasteca Petroleum Company's Juan Casiano No. 7 well was drilled and also the Aguila Oil Company's Potrero del Llano No. 4, and both became among the world's largest producers. The two principal oil fields in Mexico are distinguished as the Northern and the Southern. These wells were in the Southern field which lies in the northern part of the State of Vera Cruz and the southern part of the State of Tamaulipas and which is known as the "Golden Lane." Starting with the Aguila's Dos Bocas No. 3—which, when brought in (1908) flowed wild, caught fire and was never controlled—a considerable number of wells estimated as coming in at over 100,000 bbl. a day were recorded. Among these are the Juan Casiano No. 7 and the Potrero del Llano No. 4, above mentioned, estimated as having produced 75,000,000 bbl. and nearly 100,000,000 bbl. of oil, respectively, before exhaustion. The Huasteca's Cerro Azul No. 4, brought in (1916) with an estimated initial production of over 200,000 bbl. a day, is credited with being the world's largest producing well.

Shortly before 1910 oil production had been developed at Ebano, 40 m. west of Tampico, in the northern part of the Tampico-Tuxpam area, and in the Tehuantepec area, the last named region extending along the Gulf coast in southern Vera Cruz and the State of Tabasco. The "Golden Lane" supplied the bulk of Mexican oil in the years 1919 to 1922, inclusive, after which production in the Southern area fell off materially and is now confined principally (except for occasional new wells) to "stripping" operations. However, the Northern field has done much to offset these losses.

The trend of Mexican production is shown in the following table:

Year	Thousands of barrels	Year	Thousands of barrels	Year	Thousands of barrels
1901	10	1911	12,553	1921	193,398
1902	40	1912	16,558	1922	182,278
1903	75	1913	25,696	1923	149,585
1904	126	1914	26,235	1924	139,678
1905	251	1915	32,911	1925	115,515
1906	502	1916	40,546	1926	90,421
1907	1,005	1917	55,293		
1908	3,933	1918	63,828	Total	1,400,927
1909	2,714	1919	87,073		
1910	3,634	1920	157,069		

Authority: U.S. Bureau of Mines.

While the bulk of Mexico's crude oil is exported to the United States, a considerable quantity is refined in Mexico and the products are, in turn, exported largely to the United States. With the decline in production exports also fell off. In 1923, exports of crude oil and refined products totalled 135,576,000 bbl., of which approximately 78,000,000 bbl. were of crude oil. In 1926 the total exports were 80,719,000 bbl., of which about 38,000,000 bbl. were crude oil. A feature of Mexico's oil production has been the decline in so-called light oil output and the increase in so-called heavy oil production. In 1923 the light oil output amounted to 61,000,000 bbl. as against 32,000,000 bbl. in 1926.

CANADA

Until recent years, virtually all of Canada's petroleum was produced in Ontario but, in the autumn of 1922, oil was struck at Wainwright, south-east of Edmonton, in Alberta. This discovery has stimulated drilling in the Wainwright-Erma district. In 1924, a well producing oil of 73° American Petroleum Institute standard, was brought in at the Turner Valley field south-west of Calgary. A small production is obtained in New Brunswick. In 1920, oil was discovered on the MacKenzie river, 150 m. south of the Arctic Circle. The well was located north-west of Ft. Norman and was operated in 1922–23 for a small production. Other wells having been drilled in 1923–24 with negligible results, the Ft. Norman operations were suspended. Active search for oil in Canada has gone on ever since 1859, but commercial production in Canada dates only from 1870.

SOUTH AMERICA AND THE WEST INDIES

The oldest producing country in South America is Peru. The country of greatest immediate importance is Venezuela. Production is also obtained from Colombia, Argentina, Bolivia and Ecuador, and other countries of South America have oil possibilities. South America is recognized as one of the world's greatest potential oil continents, and the Caribbean countries, being easily accessible both to the United States and to the world markets, are being rapidly developed for oil. Oil is also being produced in Trinidad, in the West Indies. In 1926 South America and the West Indies produced 68,059,000 bbl., or 6% of the world's total production of 1,095,934,000 barrels.

Argentina.—Argentina's commercial production dates from 1910. Oil was first discovered in 1907 when a well being drilled for water by the Government near Comodoro Rivadavia, Chubut Province, on the coast of Patagonia, produced oil. The Government having reserved part of the oil-bearing land, Argentina's petroleum development has been in large part in its hands; but, in recent years, private companies have been active both on Government and privately owned lands. From Comodoro Rivadavia the oil belt extends northward, through the territory of Neuquen and the provinces of Mendoza, Salta and Jujuy to the Bolivian border. Most of the production since the beginning of operations has come from the Comodoro Rivadavia field. The oil is heavy and of asphalt base and ranges in gravity from about 18° to 22° American Petroleum Institute standard.

Colombia.—The principal oil development in Colombia is that of the Infantas field on the De Mares concession, located on the Rio Colorado in Santander del Sur. The field is approximately 350 m. from the mouth of Magdalena river. It is entirely con-

trolled by the International Petroleum Co., Ltd., of Canada. In 1926, a pipe line, having a daily capacity of about 30,000 bbl., was completed and, in 1927, the capacity of this line was practically doubled. In 1926, Colombian oil was being shipped to the United States and other countries. There is one small refinery in Colombia. Oil from the Infantas field ranges from about 26° to 31° American Petroleum Institute standard.

Peru.—Production in Peru dates from 1900, although as early as 1896 there was a small production developed. The principal fields are Negritos, Lagunitos, Lobitos and Zorritos. The oil ranges from 32° to 48° American Petroleum Institute standard.

Venezuela.—Venezuela is considered one of the most important potential oil-producing countries. The developed oil fields are very favourably located in the Lake Maracaibo basin, since the shallow channel by which Lake Maracaibo opens into the Caribbean sea permits economical oil carriage by specially built shallow-draft tankers. Oil has been found and is being produced on all sides of the lake, and in the bed of the lake itself, but the greatest development and the largest part of the production is from the east side of the lake and adjacent areas

Large producing areas of Venezuela are controlled by single interests, and development of some of the known fields has been very limited. This is particularly true of El Mene, La Paz, La Concepción, Río de Oro and La Tarra, in which fields drilling has been largely confined to informational testing to estimate reserves There has also been extensive drilling at La Rosa, Ambrosia and Lagunillas, but this has been for the most part line drilling, the extent of which has not yet been wholly defined.

Oil produced in Venezuela varies in gravity. Lagunillas oil is about 28° American Petroleum Institute standard, Mene Grande, 16° to 17·9° American Petroleum Institute standard, and La Paz, 22° to 28° American Petroleum Institute standard El Mene oil is about 35·2° American Petroleum Institute standard. Most of the production is a so-called heavy oil, which is "topped" at refineries and from which the principal product is fuel oil. However, all Venezuelan oil carries a fair percentage of gasolene from first distillations and responds well to "cracking" processes (*q.v.*).

Except for limited refining and consumption in Venezuela, the bulk of Venezuelan crude oil is exported. There are two small refineries, one at San Lorenzo, the other at La Rosa A large refinery at Curaçao is also operated on Venezuelan oil. A substantial part of the production is being shipped (1928) to refineries in the United States The growth of Venezuelan oil production has been phenomenal In 1923 the production was 4,201,000 bbl. and in 1926 it had grown to 37,381,000 barrels

Production of Oil in Venezuela

Year	Thousands of barrels	Year	Thousands of barrels	Year	Thousands of barrels

1920	457	1924	9,042	Total	75,280

Authority: U.S Bureau of Mines

Trinidad.—Trinidad first appeared as an oil producer in 1910, although, as early as 1902, wells had been drilled north of the Pitch Lake at Guayaguayare in the extreme south-east of the island. This district became prominent in 1908 when a large well was brought in; but this "sanded up" later The oil fields of Trinidad are mainly in the southern part of the island. The oil ranges in gravity from 14° to 25° American Petroleum Institute standard and is largely a fuel oil

GROWTH OF THE AMERICAN OIL INDUSTRY

The oil industry in America within 70 years has grown from a single well of 69½ ft. in depth producing a few barrels of oil per day and representing an investment of less than $2,000, to an industry which is second only to agriculture and the railroads. Seven hundred and sixteen thousand wells had been drilled between 1858 and 1927 To-day there are 318,600 wells producing oil at the rate of about 2,400,000 bbl a day. Equipment and facilities in the industry are valued at $11,000,000,000 and more than 1,250,000 people are actively engaged in its operations in addition to 1,500,000 who are directly interested through ownership of royalty or stocks and bonds. The investment in the industry is roughly divided as follows:

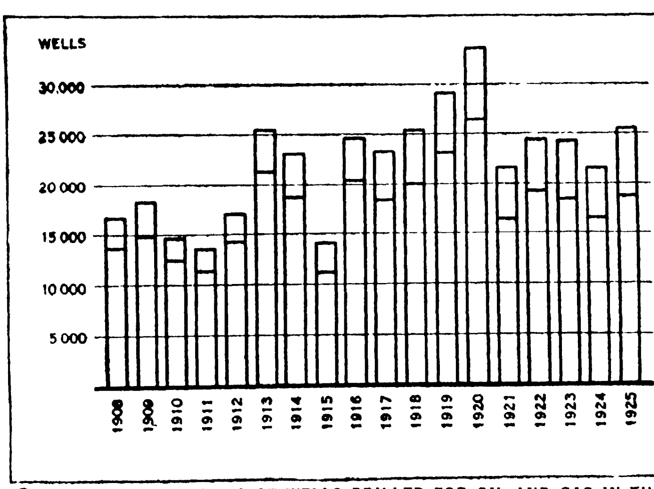
Production	$5,000,000,000
Refineries	3,000,000,000
Marketing	1,200,000,000
Pipe lines	1,000,000,000
Tank cars	300,000,000
Tank steamers	500,000,000

Drilling methods have been steadily improved and productive wells have been completed at depths below 6,000 ft. in less time than was required to complete the first shallow well in 1859 More than 90,000 m of pipe lines have been built for the economical transportation of petroleum in bulk from fields to refineries, to tidewater and to market Tankage for the storage of over 800,000,000 bbl. of crude oil and refined products has been erected in the fields, at refineries and at points of market distribution. More than 330 refineries with a daily capacity of 3,000,000 bbl. of crude oil have been built to manufacture finished products.

These products range from the lighter grade of aviation gasolene to residual coke, and include the gasolenes and distillates which have made possible the development of the automobile industry; gas oils, the base material from which homes are heated and lighted, fuel oil, which has revolutionized marine transportation, made possible the cheap operation of railway service in territory barren of other fuel and through the Diesel engine, reduced the cost of power developed in stationary plants, lubricating oils and greases of hundreds of grades and uses; medicinal oils, paraffine wax for candles; asphalt for road surfacing and roofing

HOW OIL IS PRODUCED

Petroleum is found by prospecting and the drilling of oil wells. (*See* DRILLING, PETROLEUM.) Physics, geology and palaeontology —and recently geophysics—are sciences entering into oil finding It is now known that petroleum deposits may occur in sedimentary rocks of any age from the oldest to the youngest and in any



GRAPH SHOWING NUMBER OF WELLS DRILLED FOR OIL AND GAS IN THE UNITED STATES, 1908–1925 THE UPPER PORTION OF EACH COLUMN INDICATES THE NUMBER OF DRY HOLES

The total number of wells from 1859 to the end of 1925 was 687,302, of which 287,922 were drilled in the 49 years, 1859–1907, and 399,380 in the 18 years represented in this diagram

structural position The greater part of the earth's surface is composed of sedimentary rocks, but only some of them contain oil. The aggregate acreage of all the actually producing areas in the United States is insignificant compared with the total area of the sedimentary rocks in that country There are numerous instances of test holes having been drilled in a certain region without success, the region then abandoned and, after a time, redrilled and found to contain important deposits.

The production of oil in the United States comes from hundreds of pools scattered in many States When a field is first brought in,

its production is usually derived from flowing wells or "flush" production, as distinguished from "settled" production; *i.e.*, that from pumping wells of older fields.

Areas of fields vary greatly. After a pool is discovered it is sometimes extended and not infrequently adjacent pools are developed and included in its area. There have been only about 27 oil fields of the United States which have produced approximately 100,000 bbl. (or more) a day at their peak.

Production of oil in new or "flush" fields usually increases rapidly after the discovery well is drilled in, and quickly reaches an early peak from which the decline is at first rapid and then more gradual. Factors influencing the production of "flush" fields are the size of individual leases and the number of wells drilled. Under the system of competitive leasing and drilling, the owner of the first well usually endeavours to get all the oil possible before it is drained away by other owners whose wells will draw on the same pool. In cases where a large block of land is held by one or comparatively few interests, this extremely rapid exploitation of a pool seldom occurs. The time taken in developing a field is also affected by the size of the pool, whether extensions or new pools are found and whether producing sands are found at different depths in the same field.

Only comparatively few of the 318,600 producing oil wells in the United States are yielding oil at a high rate, these being flowing wells which were recently drilled. Others are still flowing but their production has greatly declined since completion and is steadily declining to a point where the wells must be pumped to be commercially productive. Still another class of wells, and this is by far the largest in point of number, are the pumping wells with a "settled" production.

Production.—The average daily production per well in the United States during Dec. 1926 was 7·4 barrels. In the older fields where virtually all the wells are pumping wells the average production per well is in most cases less than one barrel a day. "Flush" wells supply a great amount of the current production as is indicated by the fact that 2·6% of the total number of producing oil wells are responsible for 50% of the production.

Nearly 30,000 wells are drilled annually. Over one-fourth of all wells drilled for oil and gas are failures. In addition, many wells which are listed when they come in as producing wells fall off rapidly and fail to maintain commercial production. Most of the wells that strike oil are small wells. Of the total completed in a year in the area of the United States east of the Rockies 31·7% have an average daily production of 25 barrels or less.

Cost.—Leasing land and drilling wells for oil in unproven territory are called "wild-catting." Investigations show that probably half of the purely wild-catting wells are failures. It costs on an average around $30,000 or $35,000 to drill an oil well. The cost is increasing every year as deeper drilling is required. In the Mid-Continent field the major portion of the crude oil is coming from the deeper wells which cost on the average about $65,000 to $75,000.

The producer has been constantly required to go deeper to obtain oil. Moreover, the wells increase in cost in much greater ratio than the increase in their depth. In 1915 a 2,500 ft. well could be drilled for from $20,000 to $25,000, but now a 4,500 ft. well costs from $65,000 to $75,000. A well recently completed in Logan county, Okla., to a depth of nearly 6,000 ft. cost about $190,000. Producers have spent several hundred thousand dollars on single wells drilled in remote territories.

Methods have been devised, chiefly the air or gas lift, so that deep wells, after they cease to flow naturally, are effectively pumped at much greater depths than formerly.

SCIENCE IN OIL PRODUCTION

The geologist was slow to be accepted in the oil industry. When he first appeared about 20 years ago he was placed in the same class with "oil witches" and "oil smellers." The nicknames "rock hound," "wrinkle chaser" and "pebble pup" date back to that time, not so long ago, when oil producers were either skeptical of the value of geology in oil production or quite convinced of its uselessness. To-day every producing company of any importance considers a geologist indispensable in their work. At first he concerned himself with surface geology, but more recently with sub-surface geology, which is carried on principally through study of the records or "logs" of wells, which show every formation through which the drill stem penetrates. Samples of rock from the well are reduced in size or pulverized and are carefully washed. A thorough microscopic examination of them is made. Beds are distinguished by the presence of fossils, by the presence or absence of certain minerals and, in a few regions, by the general appearance of the small particles. These fossils and minerals used as indicators are not always easily found. Often they are discovered only after long and tedious search under a high-power lens. Nevertheless, when once found and correctly identified, they become of great value in locating oil-producing horizons. The oil industry, which once smiled at the geologist, now not only accepts the geologist but welcomes the palaeontologist as well.

Instruments.—Geophysical methods have recently been successfully applied to the finding of oil. The seismograph and the torsion balance (*q.v.; see* also PROSPECTING) are the principal instruments. The seismometer (*q.v.*) is best known as the instrument which records earthquakes. In geological explorations for oil the seismograph performs a similar function, with the difference that the geologist must create his own miniature earthquake by the explosion of powder. (*See* PROSPECTING.) The waves from this explosion travel down into the earth, and if they impinge upon a rock structure, such as a dome or other fault in which the normal position of the rocks is disturbed, they are reflected back to the surface. By measuring the distance the waves have travelled the geologist can locate certain structures, thus getting a clue as to where he may find oil.

In recent years Baron Eötvös, a Hungarian professor of physics, conducted a large number of experiments in an effort to develop the laboratory torsion balance into a practical machine which could be utilized in field service to locate anticlines and other structures. The present highly developed torsion balance (*q.v.*) is the result. The Eötvös torsion balance was invented over 30 years ago and the possibilities of its application in geological work were proved some 20 years ago. Yet it seems almost entirely to have escaped the attention of American geologists and geophysicists, though an unsuccessful attempt was made in 1914 by an American geologist to secure an instrument. It was not until 1922 that the Eötvös and other similar instruments began to be used in the Gulf Coast district in this country. The results were highly satisfactory and geophysical methods in oil search are now firmly established.

Water Flooding has been successfully used in some of the Pennsylvania fields, *e.g.*, in the Bradford field, for a long time. The cost of flooding is large and the system cannot be operated economically on low-priced oil or for sands giving only a meagre yield. There is some difference of opinion as to whether the greater number of oil sands in the United States will respond to flooding, but it has been demonstrated that after a sand ceases to yield oil because of the exhaustion of gas pressures and when it fails to respond to pumping, a large quantity still remains in the sand.

The Gas Lift is a means of aiding and extending the flowing life of a well and giving some wells a flowing period when otherwise they would be started as pumpers, by furnishing externally the same kind of pressure, *i.e.*, compressed gas, that flowing wells possess naturally. The gas lift in oil wells developed from the use of the air lift (*q.v.*), which evolved from the use of the relatively old air lift for water wells. Dry gas under pressure is pumped into the head of a well and forced to the bottom. There it mixes with and is absorbed by the oil. The gas, expanding as it rises, lifts the oil to the surface in the form of a spray or froth. The gas, now saturated with the lighter fractions of the oil, is separated from the oil and as wet gas is sent through a process similar to that by which gasolene is made, and the gasolene recovered.

CONSERVATION AND STABILIZATION

While there has never been a shortage of petroleum and the

United States has been recording the greatest oil production in history, nevertheless, oil conservation is an important problem in the solution of which both the Federal Government and the oil industry are co-operating. In Dec. 1924, President Coolidge appointed the Federal Oil Conservation Board comprising the secretaries of the Interior, War, Navy and Commerce. This board has conducted and is continuing an exhaustive investigation.

The most important conservation development relates to the saving and utilization of gas encountered in oil pools. The oil in an underground pool is in the form of a gaseous mixture. In most pools there is free gas. What is called gas when it is seen at the top of the ground is, in fact, a liquid mixed with crude oil which is under high pressure. In general, the pressure is so great that the oil pool is ready to flow when any one drills a hole to it. When wells are first drilled into the producing sand the gas serves to lift the oil and the well is termed a "flowing" or "flush" well. Frequently, much gas escapes. When free gas pressure fails the oil must be brought up by pumping. New methods of production and discoveries made as to the function of gas in the oil sand present revolutionary possibilities with respect to conservation and to the stabilization of the petroleum industry.

Evidence before the Federal Oil Conservation Board indicated the general belief of oil experts that not more than 25% of the oil in an oil sand is recoverable by ordinary flowing and pumping. (*See* PHYSICAL RESOURCES OF THE WORLD: *Petroleum.*) It is believed that there will be considerably further recovery from the known sands. But the practical application of these discoveries is complicated because of the prevailing methods of oil development. Unrestricted gas pressure at the time of the opening of a new field has furnished the large "flush" wells which account for a large percentage of the production. To stop or reduce the escape of natural gas at the well would be to reduce the size of the wells in the first stages, thus eliminating the enormous production in the new fields characteristic of present practices.

Property Rights.—Under the usual system of land titles the petroleum in the earth is the property of the owner of the land above it. This system was settled before sub-surface resources, such as petroleum, were ever thought of. Laws were framed with particular reference to precious metals and solid minerals, the general rule being that he who owns the land surface holds title extending to the centre of the earth and this takes in petroleum deposits. But in furnishing oil deposits, nature disregards the law of man. Oil pools are often, so far as the surface above them is concerned, a checkerboard of ownership, and the oil well on one owner's land can draw the oil from beneath not only his own land but his neighbour's. A single well or a very few wells may drain an entire oil pool covering an area of 40 or 50 square miles.

As it is impossible to expect one owner above an oil pool to restrict his flow when his neighbour permits his well to run "wide open," the matter of property rights is involved, making necessary new methods which call for a sort of joint operation. These new methods mean the drilling of fewer wells and the recovery of a greater total of oil. But many scientific facts as to the function of gas and its effect on the rate of flow of oil and the recovery of oil must yet be determined. In the meantime, studies are being made to determine what legislative steps, if any, should be taken. The American Petroleum Institute continues to make investigations of this problem through its various committees, and the oil companies, through field experiments and laboratory research, are giving much attention to these matters.

Standardization.—Specifications have been completed on 90% of the equipment used in the drilling and producing of oil, under the auspices of the American Petroleum Institute, and its standards are becoming the international standards of the oil business and promise economies running into millions of dollars annually.

Refining.—The general principles involved in making the products that come from crude oil are simple and similar, broadly, to the distillation of water (*q.v.*). A still is filled with an average grade of crude oil having a gravity of 36° B., and weighing about 7 lb. per gallon. Most crudes are lighter than water, water weighing about 8¼ lb. per gallon. But crude oil has not a uniform boiling point, as has water. But as the temperature is raised the gasolene, which is the lightest fraction, is distilled off first, then the kerosene, followed by distillate and gas oil. Finally there is left in the bottom of the still that fraction of the crude oil, commonly known as fuel oil, which cannot be further distilled.

If the temperature in the still were maintained at about 200° F, only a small amount of very light gasolene would be distilled off. The practice is gradually to increase the temperature of the still and this results in all the gasolene being driven out of the crude oil, the last distilling at around 400° F. All of this would probably be discharged into one tank, and would be a blend of all the gasolene obtained from the crude oil. It has been found that this blended gasolene gives satisfactory operation in internal combustion engines of most types. The first gasolene that is distilled off is too light or boils at too low a temperature, and the last fraction would be too heavy, but mixture of the two gives a proper fuel.

The next product that distils over is kerosene. This is driven out of the crude oil as the temperature of the still is gradually increased from 400° to 475° F. Next is a small amount of distillate, very similar to and sometimes used in place of kerosene, but mostly utilized as fuel for domestic and other heating, which distils off between 475° to 500° F. Finally, as the temperature is increased from 500° to 575° F, gas oil is distilled off. This product is mostly used in the manufacture of carburetted or water gas for illuminating and heating. When the fire is turned out and the still allowed to cool, there remains in the bottom of the still about 36% of the original oil, which is pumped out and sold as fuel oil to railroads, steamships and many industries.

From 42 gal. or 1 bbl. of crude oil are obtained the following products: 14·7 gal. of gasolene or 35%; 3·3 gal. of kerosene or 8%; 1·7 gal. of distillate or 4%; 6·3 gal. of gas oil or 15%. We have left in the bottom of the still 15·1 gal. of fuel oil or 36%. From 1 to 2% would be lost in the operation, due largely to the evaporation losses in the gasolene friction.

If it is considered desirable, the temperature of the crude oil in the still can be increased above the 575° and more gas oil will be distilled out of the crude oil. In fact, the temperature can be increased to 700° or more until nothing is left in the bottom of the still but coke. This coke is similar to coal and is used as fuel in the same manner. A greater percentage of gas oil would be distilled, but the gas oil, however, would not be as desirable for most uses as when a smaller percentage is obtained.

Impurities.—Practically all crude oils contain impurities, the most important of which is sulphur. After distillation it is necessary to treat gasolene and kerosene to remove the sulphur and other impurities. One common method is to mix thoroughly a small amount of sulphuric acid with the gasolene and kerosene, which are then washed out with water.

Lubricating Oils.—The manufacture of lubricating oils is more difficult. There are many different grades of these oils. The general principle of manufacture may be set forth by explaining the making of what is termed "light oil." The 15·1 gal. of fuel oil left in the bottom of the still after the other products have been distilled off are heated to a high temperature, until a product which is called wax distillate comes off. This distillate contains some lubricating oil and wax. The wax has to be separated from the lubricating oil because it has no value as a lubricant and will cause the oil to congeal in cold weather. If this wax distillate is poured on a cake of ice it will be noted that the wax becomes a semi-solid and sticks to the ice. This fact is the basis for the method of extracting the wax from the distillate. The distillate is cooled to a low temperature and then pumped into wax presses which retain the wax.

After that operation, the wax-free distillate is redistilled. Then it is treated with sulphuric acid to remove impurities. Finally, it is percolated through fuller's earth (*q.v.*) to remove certain remaining impurities and also to give it the colour which makes it a marketable product. The fuel oil which is left in the still after the wax distillate is removed also contains heavy lubricating oils. The problem here is to separate this desirable lubricating oil from the asphalt, wax, sulphur and other impurities. This is done in part by treating the fuel oil with sulphuric acid and other chemi-

cals, and running the oil through centrifugal separators which operate on the same principle as a cream separator in which the lighter portion or cream is removed from the milk. In this manner the heavier lubricating oil is separated from the lighter amorphous wax.

The wax used in candles and as a sealing material for canning is made from the wax pressed out of the wax distillate; before it is suitable for use, however, it is further refined and all impurities removed.

This general description of the refining operation approximates what is known as the old "batch" method, long since obsolete at the majority of refineries but it serves to illustrate the principles of oil refining. In recent years new types of furnaces, pipe stills, fractionating equipment, many kinds of heat exchanges and other mechanical apparatus have taken the place of or supplement the old "batch" equipment.

Cracking.—"Cracked" gasolene is made by heating the gas oil or fuel oil in a still designed to withstand high pressure. The operation is controlled so that the distillation takes place at pressures which are as high as 750 lb. per square inch and at temperatures which vary from 750° to 1,200°. At these high temperatures and pressures a dissociation or "cracking" of the gas oil or fuel oil takes place. The character of the oil in the still is changed so that it is dissimilar to the original crude oil, but "cracked" gasolene looks and acts much like other gasolene.

Casing-Head Gasolene.—Whether the crude oil is flowing naturally or is obtained by pumping, gas is obtained along with the oil from a majority of the wells and, up until about 15 years ago, was wasted, being allowed to escape into the atmosphere. It was discovered that this gas contained a small quantity of gasolene, the amount varying from a fraction of a gallon per 1,000 cu.ft. to as much as 8 or 10 gallons.

The gasolene manufacturer has devised means to extract the gasolene from this gas commonly called "wet" gas to distinguish it from the "dry" gas obtained from natural gas wells which in most cases does not contain any gasolene. One method of extracting the gasolene is to compress or literally "squeeze" the gasolene out of the gas. The gas is compressed by large compressors to about 300 pounds. At this high pressure the gas is cooled and the gasolene condensed and recovered.

Another method is to bring the gas in contact with a refined oil, or perhaps with the distillate obtained from distillation operations described above, which absorbs the gasolene. Then by distilling the mixture the gasolene is recovered. A combination of these two methods is most commonly used. About 1,700,000,000 gal. or more than 10% of the total gasolene made in 1927 was natural gasolene.

This natural or "casing-head" gasolene is usually even of lighter gravity than the lightest gasolene obtained by distilling crude oil. It is not suitable for automobiles although it is now quite widely used by aeroplanes. The practice is to blend it with the so-called straight-run and cracked gasolenes previously mentioned and it is then adaptable for use in any type of internal combustion engine.

PETROLEUM GEOLOGY

There is an old statement that the requisites for occurrence of petroleum are substantially (a) porous rock to contain the oil, (b) an impervious cover to prevent it from escaping, (c) geological structure to permit the accumulation of oil from relatively large areas into a restricted area, and (d) a source from which oil has been derived. Wherever petroleum occurs in nature, natural gas is generally found in the same locality or region. Gas, however, is less restricted in its distribution than is oil, and numerous gas pools exist where no petroleum occurs in close proximity. The occurrence of oil and gas is wide-spread, no stratified rock being so young, and scarcely so old, as to preclude their existence. However, it should be understood that many parts of the world are unsuitable for oil occurrence for a variety of reasons. Geologists say, for instance, that no petroleum will be found in the immense regions occupied at the surface by rocks of Archaean or Algonkian age or in those of later periods which are entirely of an igneous or intensely metamorphosed character. These perhaps represent half of the earth's surface.

Various surface indications of the occurrence of petroleum are found throughout the world, in the form of oil and gas exudations, mud volcanoes, bituminous dikes and even lakes of asphalt; but surface indications are not essential, and in the last analysis oil occurrence is found to be independent of the existence or nonexistence of surface indications, even though these may lead to its discovery in some regions.

Occurrence.—The conditions essential to occurrence of oil may be more accurately described as follows: Presence of rocks of sedimentary origin, or in a few instances of those in proximity to rocks of sedimentary origin; absence of intense metamorphism; presence of sandstones, limestones, sands or other strata sufficiently porous to hold oil; some source from which the oil may have been formed; such water conditions as do not prohibit the accumulation of oil in pools; suitable cover to prevent the oil from seeping away or being pushed to the surface of the earth by underground waters; suitable structure or attitude of the strata to cause oil to be collected locally into pools, with the assistance of such other factors as water, gravitation, rock pressure, etc.

The relation between geologic structure and oil occurrence has been realized for several decades beginning with the advancement of the "anticlinal" theory. A marked increase in the value of geology to oil development was due to the evolution of the "structural theory" as an offshoot from the anticlinal theory. Briefly described, the structural theory holds that through some means petroleum and gas have come into or have been generated in the porous formations in which they are found. The theory of the origin of oil and gas is not an essential part of the structural theory; it is simply recognized that the oil, gas and water in the formations were at first widely diffused in the porous formations or in contiguous strata. Where beds have been folded, as in most of the oil fields of the world, the oil, gas and water have been allowed to separate and arrange themselves according to their relative specific gravities. The separation and concentration may have been assisted by rock-pressure, diastrophism, hydraulic pressure, seepage, capillarity or molecular attraction, internal heat, metamorphism or other causes; but whatever causes may account for the movement of the oil, gas and water, the law of gravitation, being ever operative, was of the greatest importance in determining their arrangement. Hence the accumulation was in the order of the densities of the substances.

The structural hypothesis agrees with the anticlinal theory, in acknowledging that, on a given anticlinal, monoclinal or quaquaversal structure, gas lies nearest the crest, oil lies lower down, while the salt water, when present, lies still lower on the flanks of the uplift. Whether the pools occur at the exact crest of the anticlines, lower on their slopes, or in the synclines, is determined by factors of secondary importance. The various structures in which oil occurs may be divided into main classes as follows, each of these classes also including special types of structures: Aclinal or sub-aclinal structures; anticlinal and synclinal structures; monoclinal structures; quaquaversal structures or "domes"; contact of sedimentary and igneous rocks; strata dipping unconformably away from old shore lines; crevices of igneous rocks; crevices of sedimentary rocks; faults; oil sands sealed in by bituminous deposits.

Composition.—Oil is at once most simple and most complex in constitution. It is simple in that it consists essentially of only two elements, namely, hydrogen and carbon; but it is complex in that hydrogen and carbon by uniting with each other in different proportions, form a veritable multitude of compounds—solid, liquid and gaseous—each with totally distinctive properties. A bewildering number of these hydrogen-carbon compounds, or hydrocarbons as they are commonly designated, are present in ordinary petroleum and are, in fact, its essential constituents.

Formation.—That oil is produced by geological forces acting generally through long intervals of time on the debris of aquatic organisms buried in the sediments is believed by most geologists. The evidence is almost overwhelming, though it is largely circumstantial, that petroleum is a geochemical result of rock pressure and earth temperatures working through long time, and possibly

under catalysing influences, on fossil organic matter, which is generally regarded as the "mother substance." The rocks in which this fossil organic matter occurs are frequently spoken of as "source rocks."

The combustible vestiges of plants, and possibly of animals, entering into the mother substance are generally those more resistant to decay in water, on account of their waxy, resinous, waxy-fatty or oil composition which characteristically imparts to the aggregate deposit relatively high hydrogen and low oxygen content. Specifically, the principal among these surviving vestiges of structure, plant secretion, etc., are (1) spore exines, (2) so-called fatty algae, (3) fragments of cuticles, (4) particles or flakes of wax and resin, the latter usually rare in the typical mother substance, and (5) the "humic" (or "ulmic") colloidal decomposition binder. All of these kinds of fossil components may be present and the "humic" binder is always present. In some cases nearly all the debris of plants or animals seems to have succumbed to bacterial action in the process of biochemical decomposition.

Some of the organic compounds in the plant or its secretions, such, for example, as waxes, spore exines and resins, doubtless pass the biochemical process and enter the unaltered sedimentary deposit with little or no chemical change. However, the organic aggregate, comprising both the fossil plant and animal debris, on the one hand, and the humic decomposition matter, on the other, is known to undergo progressive devolatilization (carbonization) as the deposit is, under dynamic (geophysical) influences, altered, stage by stage, from the organic mud (saprophile) to black slates and graphitic schists.

Most geologists believe that the primary petroleums are in the course of time generated in the buried mother substance under the influence (geophysical) of (1) intermittent pressure and heat; (2) added pressure by the generated gases; (3) heat of gravitative friction; and (4) heat of chemical change. On the other hand, there are many, especially among British geologists, who believe that either the oils were originally brought to the deposit by the organisms taking part in the sediments, or that they were generated during deposition as products of biochemical (microbian) action. In either case the oils existed, presumably disseminated, in the sediments at time of deposition of the strata. According to this view oil is at the outset deposited in most carbonaceous aquatic, especially marine, sediments. Still another, though small group, adheres to an entirely inorganic origin of oil, through generation from carbides or similar compounds of plutonic origin, coming from far beneath the sedimentary strata in which they are now found.

Another, a very large group of geologists, including perhaps, most European geologists, together with most chemists, believe that the petroleum deposits of the world are mainly, at least, the product of alteration, either in the biochemical process or subsequent to burial, of animal fats, rather than of organic matter of plant derivation. The theory of the generation of hydrocarbons from metallic carbides can be successfully demonstrated in the laboratory, but it is so incompatible with the geological occurrence of oil observed in the field that it commands little consideration.

Of great importance, however, is the question as to the primary contribution (as by diatoms) or the generation of the oil through the biochemical decomposition processes at time of deposition of the organic debris in the sediments, on the one hand, as opposed, on the other, to the generation of the oil at different times long afterwards by what might be termed natural geological distillation in the crust of the earth. The latter view implies the restriction of oil fields to areas subjected to compressive stresses.

The organic theory holds that the hydrogen and carbon that make up petroleum both come from the remains of pre-existing plant and animal life. This organic material represents, in the main, former marine life and swamp life rather than true land life; similarly it represents microscopic life, principally, rather than larger forms of life. Thus, the argument for the organic theory is written in the records of the ancient seas which ebbed and flowed across the margins of the continents. These seas periodically advanced and retreated across the land, so that, in their greatest expanse, they mingled the waters of the oceans on the opposite sides of the continents. The present Gulf of Mexico is the modern remnant of one of these continental seas. Throughout the ages, rivers flowed down to these seas and then as now carried with them great volumes of mud and sand to be spread out by currents and tides over the sea bottom. Each day and each year through millennium after millennium new deposits were distributed, layer upon layer, over the sea floor.

With the increasing load due to the weight of these new beds the earth's crust sank so that the depth of water remained about constant. Thus were built up the thick series of compacted muds and sands which characterize the formations penetrated in our oil wells. These sea bottom muds and sands of a geological yesterday, squeezed by the weight of thousands of feet of overlying muds and sands, crumpled and broken and finally thrust up above sea-level by the movement of the earth's crust around and beneath them, finally became the shales and limestones and sandstones of to-day.

It is this organic mud, the mass of microscopic plant and animal life which comes into the sea with the river silts, together with the much greater volume of similar tiny marine plants and animals, that the organic theory maintains is the principal source material of petroleum. These minute organisms, dead and settled to the bottom, buried by subsequently deposited muds, sealed from the air, and further protected from ordinary decay by the brine of the ocean itself, were subjected to a slow decomposition which finally yielded, among other products, the petroleum of commerce. Petroleum so formed, and disseminated uniformly through great bodies of organic mud, is not yet available to man. It has still to be concentrated, to accumulate in a definite limited reservoir such as the pore spaces between the grains of a bed of sand, or, more rarely, the cracks and cavities of a limestone, whence it can issue under pressure into the well which the operator drills into the reservoir.

This concentration of disseminated petroleum, again, is accomplished in part by pressure which transforms the mud into a dense shale, at the same time driving the oil into the more open, noncompressible sands, and in part by water moving down through the bed from its outcrop on the earth's surface, or rising upward along the bed under pressure from greater depths, but in either case flushing the oil ahead of it until the latter finally accumulates in the top of a fold or against the broken edge of a sand bed whence the water cannot dislodge it. These are the conditions, according to the organic theory, which make oil.

Under the auspices of the American Petroleum Institute, a scientific research in the geology, physics and chemistry of petroleum was initiated on Nov. 15, 1925, under a fund contributed by John D. Rockefeller and subsequently added to by the Universal Oil Products Company, of Chicago, Ill., and among the projects are several dealing with the study of the origin of petroleum.

PETROLOGY, the science of rocks, the branch of geology concerned with the investigation of the composition, structure and history of the rock masses building up the accessible portions of the earth's crust (Gr. πέτρος, rock). Rocks are usually defined as aggregates of minerals without reference to their state of cohesion. Loose sands, clays, gravels or soils are included among rocks as being mineral masses playing an important rôle in field geology. On the other hand, the less soluble parts of the skeletons of animals and plants may form a considerable portion of rocks as, for example, coral-limestone, lignite and chalk. Lastly rocks may be built up almost wholly of non-crystalline material as obsidian, pitchstone or tachylyte, representing liquids so rapidly chilled that consolidation has occurred in the glassy state. Rocks are the units with which the geologist deals in investigating the structure of the crust, and some varieties cover enormous areas. Granite, sandstone and schist often form whole provinces and build up lofty mountains, while other rock types are of such rare occurrence that they are known only in one or two localities in distant parts of the earth's surface.

Treatment of the Subject.—Broadly speaking, rocks are divided into three great classes, *igneous, sedimentary,* and *metamorphic rocks.* In this paragraph the subject matter of that part of the science of petrology concerned with igneous rocks is briefly surveyed; the object is to point out the headings under which particular subjects are treated (there is a separate article on each italicized item). Here we confine ourselves to a discussion of the nature, composition, classification and origin of igneous rocks, and the methods by which they are examined (for the other groups *see* SEDIMENTARY ROCKS and METAMORPHISM).

Igneous rocks occur as intrusions or extrusions. The plutonic or deep seated intrusive rocks which cooled far below the surface occur as *batholiths, bosses, laccoliths* and *veins,* and include *granite, syenite diorite, gabbro* and *peridotite:* related to the granites are *aplite greisen, pegmatite* and *schorl-rock;* to the syenites, *borolanite, monzonite, nepheline-syenite* and *ijolite;* to the diorites, *aphanite, napoleonite* and *tonalite;* to the gabbros *pyroxenite* and *theralite,* and to the peridotites, *picrite* and *serpentine.* The hypabyssal intrusive rocks occur as *sills, veins, dikes, necks,* etc., and are represented by *porphyry* and *porphyrite, dolerite* and *lamprophyre;* to the porphyries belong *felsite* and *quartz-porphyry.* The extrusive rocks are volcanic and found typically as lava flows; they include *obsidian, perlite, pitchstone* and *rhyolite, phonolite* and *trachyte, andesite, dacite* and *basalt* (with the related *spilite, tachylyte* and *variolite*), *nephelinite* and *tephrite.*

Intermediate between the sedimentary and igneous rocks comes the group of rocks known as pyroclastic or fragmental volcanic rocks. These include *agglomerate,* some types of *breccia* and *tuff* (*see* also VOLCANOES). The agencies which affect igneous (among other) rocks and modify them are discussed under METAMORPHISM, METASOMATISM and PNEUMATOLYSIS.

Composition of Igneous Rocks.—Though the number of recognized minerals approximates to 1,000, only a comparatively small number are important as rock-formers, more especially if the subdivisions into which the common species are broken up are disregarded. The vast majority of the igneous rocks are built up of less than a dozen groups of minerals. These are (1) quartz, (2) felspars, (3) pyroxenes, (4) amphiboles, (5) micas, (6) olivines, (7) nepheline, (8) leucite, (9) iron ores and (10) apatite. To this list, for sedimentary rocks, we may add chlorite, kaolin calcite, dolomite, and a few other minerals. Metamorphic rocks are built up largely of the same minerals as igneous rocks but include special species which are foreign to igneous rocks, partly on account of their composition and partly because they appear to require special physical conditions (stress) for their production. The mineralogical nature of a rock is primarily dependent on its chemical composition, but other factors are of first importance in determining the paragenesis of rock-forming minerals, principally the mode of origin of the rock or the physical conditions obtaining during its formation. Two rock masses may have very much the same bulk composition and yet differ fundamentally in their mineralogical assemblages. Thus, certain lamprophyres rich in biotite have much the same composition as certain leucite-basalts, a hornblendite as a camptonite and so on. Igneous rocks of identical chemical composition but dissimilar mineralogical constitution are said to be heteromorphous. The governing factors are the physical conditions attending consolidation of the rock.

All crystalline rocks have consolidated from solution or from fusion. A granite arises by the consolidation of a liquid at high temperatures and great pressures; a metamorphic rock like mica-schist, on the other hand represents the recrystallization-product of a clay rock under the influence of heat and stress. Throughout this conversion the rock has been essentially solid, recrystallization taking place in the presence of minor amounts of interstitial liquid. Other crystalline rocks, like rock-salt, gypsum, anhydrite, etc., have been deposited from solution in water, mostly owing to evaporation on exposure to the air. The majority of sedimentary rocks, however, consist of a mechanical aggregate of crystalline particles; such are sandstone, clay, etc. The structure of these sedimentary and all pyroclastic rocks is referred to as fragmental.

Origin of Igneous Rocks.—All igneous rocks have solidified from a state of liquidity, the liquid that finally consolidates as rock being technically referred to as magma (Gr. μάγμα from μάσσειν, to knead). Rock-magma is a complex silicate solution carrying gases, the most important of which is water, which may constitute 5–6% of the mass. The greater part of the clouds given off by active volcanoes consists of steam, with which is associated minor amounts of other gases, the chief being CO_2, CO, HCl, S vapour, oxides of sulphur, H_2S, HF, NH_3, CH_4, Cl, F, H and N. When the magma consolidates the major part of these volatile constituents usually escapes. With very rapid cooling, however, the magma may solidify without crystallization as a volcanic glass, at the same time retaining much of its water. Analyses of pitchstone show not infrequently a content of 5–6% of water, and even higher values are recorded; on the other hand unaltered crystalline igneous rocks seldom show a water content greater than 2%. Here we have almost direct confirmation of the conclusion that the water-content of the magma before crystallization is greater than the water-content of the rock formed from it.

From what source is igneous magma derived? In the older conception of the earth a volcano was pictured as a safety valve of a molten interior, but a close study of igneous action, past and present, clearly negatives any such interpretation. The active vents of Mauna Loa and Kilauea (Hawaii) though only some 20 m. apart, have the summits of their lava columns at a difference of level of 10,000 ft. Yet liquid lava is erupted more frequently and in greater quantity from the higher column. Clearly these two outlets are not directly connected with a common liquid reservoir. Again, neighbouring vents, as those of the Lipari Isles, erupt widely different products, and each may maintain its independent behaviour regardless of what is happening to its neighbour. The conclusion is enforced that each distinct eruptive centre possesses its own reservoir, and we must conceive a number of independent magma chambers underlying an eruptive region. At greater depth these are no doubt connected with some magmatic reservoir of much larger dimensions. In some such common source the close community of petrographic character revealed in the succession of liquids erupted or intruded throughout any given igneous cycle is to be traced.

METHODS OF INVESTIGATION

Macroscopic Characters.—The macroscopic (Gr. μακρος, large) characters of rocks, those visible in hand-specimens without the aid of the microscope, are very varied and difficult to describe accurately and fully. The geologist in the field depends principally on them and on a few rough chemical and physical tests; and to the practical engineer, architect and quarry-master they are all-important. Although frequently insufficient in themselves to determine the true nature of a rock, they usually serve for a preliminary classification and often give all the information

really needed. With a small bottle of acid to test for carbonate of lime, a knife to ascertain the hardness of rocks and minerals, and a pocket lens to magnify their structure, the field geologist is rarely at a loss in deciding to whât group a rock belongs. The fine grained species may be indeterminable in this way, and the minute mineral components of all rocks can usually be ascertained only by microscopic examination; but it is easy to see that a sandstone or grit consists of more or less rounded, water-worn sand-grains and if it contains dull, weathered particles of felspar, shining scales of mica or small crystals of calcite these also rarely escape observation. Shales and clay rocks generally are soft, fine grained, often laminated and they not infrequently contain minute organisms or fragments of plants. Limestones are easily marked with a knife-blade, effervesce readily with weak cold acid and often contain entire or broken shells or other fossils The crystalline nature of a granite or basalt is obvious at a glance, and while the former contains white or pink felspar, clear vitreous quartz and glancing flakes of mica, the other will show yellow-green olivine, black augite and grey striated plagioclase.

Microscopic Characters.—But when dealing with unfamiliar types or with rocks so fine grained that their component minerals cannot be determined with the aid of a lens, the geologist is obliged to have recourse to more delicate and searching methods of investigation With the aid of the blowpipe (to test the fusibility of detached crystals), the goniometer, the magnet, the magnifying glass and the specific gravity balance the earlier travellers attained surprisingly accurate results. Examples of these may be found in the works of von Buch, Scrope, Darwin and many others About the end of the 18th century, Dolomieu examined crushed rock powders under the microscope and Cordier in 1815 crushed, levigated and investigated the finer ground-mass of igneous rocks. His researches are models of scrupulous accuracy, and he was able to announce that they consisted essentially of such minerals as felspar, augite, iron ores and volcanic glass, and did not differ in nature from the coarser grained rocks. Nicol, whose name is associated with the discovery of the Nicol prism, seems to have been the first to prepare thin slices of mineral substances, and his methods were applied by Witham (1831) to the study of plant petrifactions

This method, subsequently of such far-reaching importance in petrology, was not at once made use of for the systematic investigation of rocks, and it was not till 1858 that Sorby pointed out its value. The great work of this investigator was the production of very thin sections of rocks and their systematic examination under the high powers of the microscope. To-day the densest, blackest rock can be made to yield a section of $\frac{1}{1000}$ in in thickness, so thin and transparent that fine print can be easily read through it, and transmitting light so clearly that the most high powered objectives of the microscope can be used to discern and study the minutest structures it presents with the same facility that they can be employed upon sections of organic material prepared by the microtome. The introduction of this powerful weapon of research, inaugurated a new era in petrology—that of petrography or the descriptive branch of petrology The optical study of sections of crystals had been advanced by Sir David Brewster, Nicol and other physicists and mineralogists, and it only remained to apply their methods to the minerals visible in rock sections. The pioneer workers who brought quantitative methods into the optical side of the problem were Des Cloiseaux, Rosenbusch, Zirkel, Schuster, Fouqué and Levy. At the present day optical methods for determining minerals with the petrographic microscope are highly developed.

Although rocks are now studied principally in micro-sections the investigation of fine crushed rock powders, which was the first branch of microscopic petrology to receive attention is still in use. A mineral whose optical properties are known can be accurately determined by immersing its powder in liquid media whose indices of refraction are known, and determining the optical constants. In the hands of a skilled petrographer the principal optical constants of a single grain of a mineral can be determined in half an hour The chief fundamental constants measured are the principal indices of refraction, the crystallographic orientation of the directions of light-vibration corresponding to those indices, and the amount of absorption of light vibrating in these directions, all for one or more standard wave-lengths of light. The double refraction, optical character, optical axial angle, dispersion of the optic axes and bisectrices, extinction angle and pleochroism are all fixed by the fundamental constants and can be estimated under the microscope.

The immersion media cover a range of optical refraction from that of water (1·333) to that of a selenium—arsenic selenide melt (3·17). The liquids are chiefly organic substances,—acetone alcohol, cinnamon oil, monobrom-naphthalene and methylene iodide. Most minerals have refraction constants ranging in the interval 1·450–1·870, and their refractive indices may therefore be matched by a set of liquids whose refractions cover this range. The modern rotation apparatus whereby thin sections may be tilted from the horizontal so that the axis of the microscope passes through them at different angles has been of inestimable value in measuring accurately the optical constants of a single grain in a rock slice, and is now widely used for the determination of felspar and other mineral species of variable composition A few measurements on a selected section of a mineral permit the determination of its exact chemical composition and the crystallographic orientation of the section itself. The technical methods employed for the determinations referred to above are largely founded on the use of polarized light.

Mechanical Separation of Rock Constituents.—The separation of the constituents of a crushed powder in order to obtain pure samples suitable for analysis is also extensively practised The two principal methods adopted involve either the electromagnet or heavy liquids.

By the use of an electromagnet the component minerals of a rock may be separated by varying the strength of the current. A weak magnetic field attracts magnetite, then hematite and ilmenite Silicates containing iron will follow in definite order, augite, hornblende, tourmaline, olivine and biotite being successively attracted. The degree of attraction is not however proportional to the iron content. The colourless non-magnetic minerals—quartz, felspar, muscovite, nepheline, etc.—remain

Separation by means of water is not much used in petrographic work. However, a preliminary "panning" as practised by miners is often useful as a means of concentrating rare minerals occurring in very small quantity in the rock before the application of the methods next to be described Methods of separation of minerals by which they are sorted according to their specific gravities by means of heavy fluids have an extensive application. The fluids used are those which do not attack the majority of the rock forming minerals Of the many liquids used methylene iodide (sp gr. 3·32) and bromoform (sp gr 2·86) are perhaps the most convenient. For more dense minerals Clerici's solution—an aqueous solution of thallium formate—is best adopted. By concentration the specific gravity can be raised to 4·32 at 60° C so that even the heavier rock minerals can be separated without difficulty By dilution with water, or, in the case of methylene iodide, dilution with bromoform or benzol, successive crops of minerals may be separated in appropriate separating funnels. In this way a granite may be successively fractionated into its component minerals, biotite (sp gr. 3·1), muscovite (2·85), quartz (2·65), oligoclase (2 64) and orthoclase (2 56). All these minerals float in methylene iodide: on dilution with benzol they are precipitated in the order given. Rocks like eclogite containing heavier minerals, such as ilmenite (sp gr 4·84), garnet (4·20) titanite (3·50) and diopside (3·29), may be similarly separated by means of a thallium formate-water solution.

Micro-chemical Methods.—Chemical methods are frequently of great use. Weak hydrochloric acid will dissolve calcite from a crushed limestone leaving dolomite and silicate minerals, and hydrofluoric acid may be used to extract the glassy base of volcanic and hypabyssal rocks from the pyroxenic minerals. Of much wider use however are microchemical methods for distinguishing minerals under the microscope They are of special value in discriminating alkali minerals like nepheline, haüyne, nosean,

analcime and sodalite in the ground mass of igneous rocks. The methods depend on selective attack by acids, the formation of distinctive precipitates and the staining of gelatinous residues. Quartz and felspar in fine grained rocks may be differentiated by etching with hydrofluoric acid; quartz remains clear while the surface of the felspar grain becomes cloudy, being altered to aluminium fluosilicate, and may be stained by an aniline dye. This method is particularly useful in discriminating quartz and felspar in fine grained metamorphic rocks in which the felspar is without crystal form, is untwinned and shows lack of cleavage.

Chemical Analysis.—The ultimate chemical composition of a rock is of fundamental importance in determining its nature, and the chemical analysis of rocks is now widely carried out. In rock analysis of the better class as many as 25 constituents are determined and recorded. The most abundant, or major, constituents are stated as oxides, and any rock analysis of good quality records the content of at least nine or ten of these. They are silica, alumina, ferric and ferrous oxides, magnesia, lime, soda, potash and water. These nine oxides make up about 98% of the igneous rocks. Two other oxides are usually determined, TiO_2 and P_2O_5, as they are represented in the common minor constituents—ilmenite and apatite—titanium being also present in some pyroxenes, amphiboles and micas. Such a chemical analysis is usually sufficient to determine to which of the two great classes, igneous or sedimentary, a rock belongs, and if it is igneous, the position the rock is to be assigned in any of the conventional classifications. In the case of metamorphic rocks it often establishes whether the original mass was a sediment or of igneous origin.

Specific Gravity.—By the balance and the pycnometer the specific gravity of rocks is determined in the usual way. It is greatest in those rocks rich in iron, magnesia and the heavy metals, and least in rocks rich in alkalis, silica and water. Eclogites (sp.gr. 3·5) are among the heaviest of the silicate igneous rocks, while the vitreous lavas of high silicity like obsidian (sp.gr. 2·35) are among the lightest.

ROCK SYNTHESIS

The methods of investigation described above may be grouped together as analytical, in contradistinction to the synthetic investigation of rocks—which proceeds by experimental work to reproduce different rock types and thus to elucidate their origin and explain their structures. Though the experiments of de Saussure (1740–99) on the fusion of granites and porphyries may be said to mark the earliest beginnings of experimental petrology, the era of rock synthesis must be considered to date from the time of Sir James Hall's researches on the fusion of dolerites found in the neighbourhood of Edinburgh. This investigator showed convincingly that the crystalline dolerites (or whinstones) could be fused and consolidated, according to the rate of cooling, either as black glasses resembling natural pitchstones or as crystalline aggregates of minerals much like the dolerites from which they came. Hall's most famous experiments however, were conducted with limestones. Powdered chalk by being heated in gas-tight gun barrels, was converted into a crystalline mass of calcite, thus supporting the contention of Hutton that heat and pressure had consolidated limestones and converted them into marbles. A lapse of almost 90 years occurred before the experiments of Hall were substantiated, when in 1878 the French petrologists Fouqué and Michel Lévy began their extensive researches on the synthesis of minerals and rocks by pyrogenetic methods. They succeeded in producing, by the use of a gas furnace and a nitrogen thermometer such rocks as porphyrite, basalt and dolerite, at the same time obtaining the characteristic textures—porphyritic, ophitic, etc.—by modifying the conditions under which the melts were cooled. With the more siliceous or acid rocks their experiments were much less successful. They advanced for the first time in a convincing manner the explanation that for the crystallization of these rocks the gases, never absent in natural rock magmas, were indispensable mineralizing agents (mineralizers). It is now known that the formation of many minerals is facilitated, or can only be accomplished, in the presence of volatile constituents, as water, borates, chlorides, fluorides, etc. Not only do they assist in promoting the fluidity of the liquid and facilitate crystallization, but they form essential constituents of some of the important minerals occurring in acid igneous rocks (micas, tourmaline, topaz, etc.).

Among the pioneers in synthetic petrology may also be mentioned Ste. Clair Deville, Senarmont, Berthier, Bourgois, Hautefeuille, von Chrustschoff, Doelter, Morosewicz and Vogt. To Vogt we owe the first comprehensive essay towards bringing the crystallization of igneous rock magmas definitely under the known laws of solution. Beginning a study of a large series of silicate slags, more or less comparable in composition with igneous rocks, he has brought together a large body of information throwing light on the order of crystallization, the composition of the eutectics and the lowering of freezing points of the minerals in slag mixtures, and has directly applied these results to the elucidation of the crystallization processes in natural magmas.

Up to this period the synthetic work, involving as it did the measurement of the melting point of minerals and the succession of crystallization in more or less complex mixtures, though very suggestive, lacked the strictly quantitative element. Experiments were carried out on materials always containing impurities or foreign substances, and the methods adopted for the determination of fixed thermal points as melting points, inversion points or heat changes were of doubtful precision. Since 1904, with the establishment of the Geophysical Laboratory at Washington, synthetic or physico-chemical petrology has entered upon a new quantitative era. The work of this laboratory was undertaken to enter upon a quantitative study of rock formation which should include both the minerals and rocks which are geologically important and those which are economically useful, those formed directly from the magma and those formed by subsequent alteration. The individual problems are in reality problems for physics and physical chemistry; but the delay in their attack has lain in the fact that the measured relations established by the exact sciences have scarcely been of adequate scope to meet the needs of large petrological questions. The great body of physical and physico-chemical measurements have been confined to a temperature region below 100° C, while processes operating in rocks may have extended over a temperature region extending to 1,400°, an enormous range over which to stretch the application of ordinary methods and one in which the common forms of apparatus will not only fail but are themselves threatened with destruction. The initial work of the Geophysical Laboratory has been primarily to extend the methods of accurate temperature measurement to include the entire field of rock formation from 0° to 1,600°; the electric pyrometer has reached now such precision that an error of one or two degrees is all that need be expected in measuring temperatures up to 1,600°; moreover these temperatures can be maintained quite steady for days or weeks at a time. Calorimetric measurements have been improved; specific heats can be determined with great accuracy even at the highest temperatures. At the same time petrographic methods have been advanced so that the crystallographic and optical constants of the very minute crystals obtained in silicate melts can be accurately measured. The investigation of mineral substances under high pressures and high temperatures combined, and in the presence of volatile constituents has also been a subject of study.

With these methods of precision available for the study of rock materials, examination of simple mineralogical systems has been prosecuted. An understanding of the chemistry of the common oxides of rocks and their combinations is essential to the progress of petrology. Already experimental work has been conducted on the combinations of the oxides CaO, MgO, Al_2O_3, SiO_2; the six possible binary systems have been fully worked out and the four possible ternary systems thoroughly studied, while portions of the quaternary system have been successfully explored. Much light has thereby been thrown on the processes taking place during the consolidation of igneous magmas which, though much more complex in their constitution, yet clearly show by petrographic examination closely similar phenomena, as are revealed in the crystallization behaviour of these simpler systems. The applica-

tion of these laboratory investigations to elucidate the origin and evolution of igneous rock types will be considered hereafter under the heading of physical chemistry of igneous magmas.

Classification of Igneous Rocks.—Igneous rocks according to their composition, chemical and mineralogical, their structures and textures, or their mode of occurrence, are subdivided into many groups. Between allied rocks there are, however, no hard and fast boundaries, for by increase or decrease in the proportions of their constituent minerals, they pass by every gradation one into the other. Similarly the distinctive textures of one kind of rock may often be traced gradually merging into those of another. Hence the definitions adopted in establishing rock nomenclature merely correspond to more or less arbitrarily selected points in a continuously graduated series. This is frequently urged as a reason for reducing rock classification to its simplest possible terms and using only a few generalized rock designations.

The earliest attempts at the classification of rocks on modern lines are to be found in the works of Von Leonhard (1823) and Brongniart (1827). These and other efforts, principally by Naumann (1850), Von Cotta (1855) and Roth (1861), while being built on the criteria of composition and structure of rocks, were largely developed from purely macroscopic investigation or ultimate chemical analysis. The pioneer work of Sorby (1858) in preparing transparent microsections of rocks opened the way for the unravelling of the mineral constituents and textures of the finer grained igneous rocks, and rapid advances in the knowledge of the constitution of igneous rocks followed The classifications of Zirkel (1873) and Rosenbusch (1877) were the first products of the application of the new method of petrographic research, and in these mineral constitution was accorded first place as a basis of subdivision. The effect of microscopic study was to stress the importance of mineralogical and textural characters of rocks to the neglect of other characteristics. Rosenbusch in particular, influenced by the contention principally of Lossen (who urged the significance of the geological relations of igneous rocks, their occurrence and manner of formation), further developed his classification to express the relationship of geological occurrence and texture, and introduced in the second edition of his work a fundamental change.

The new classification is based first on geological position, texture and finally mineral and chemical composition Igneous rocks are divided thus into three great groups.—(1) Deep seated rocks, (2) Dike rocks and (3) Effusive rocks Like others before it, it is still essentially a qualitative classification, and at the present day is the one most commonly adopted by petrographers. The latest exposition of Rosenbusch's classification is set forth in his *Elemente der Gesteinslehre* revised by A. Osann (1923).

HABIT OF IGNEOUS ROCKS

Igneous rocks occur essentially in two different ways, either as lavas or intrusions.

Lavas or Effusive Types.—The lavas have been poured out at the surface and have consolidated after ejection, under conditions which are fairly well understood, seeing that they may be examined at active volcanoes in many parts of the world; the intrusive rocks, on the other hand, have been injected from below into cracks and fissures in the strata and have cooled there beneath masses which conceal them from view till exposed by denudation at a subsequent period The members of these two groups differ in many respects from one another, so that it is often possible to assign a rock to one or other of them on mere superficial inspection. The lavas (or effusive rocks), having cooled rapidly in contact with the air, are mostly finely crystalline or have at least a fine-grained ground-mass representing that part of the viscous semi-crystalline lava flow which was still liquid at the moment of eruption. At this time they were exposed only to atmospheric pressure, and the steam and other gases, which they contained in great quantity, were free to escape; many important modifications arise from this, the most striking being the frequent presence of numerous steam cavities (vesicular structure) often drawn out to elongated shapes subsequently filled up with minerals by infiltration (amygdaloidal structure). As crystallization was going on while the mass was still creeping forward over the surface of the earth, the latest formed minerals (in the gound-mass) are commonly arranged in subparallel winding lines following the direction of movement, and the larger early minerals which had previously crystallized may show the same arrangement. Most lavas have fallen considerably below their original temperatures before they are emitted. In their behaviour they present a close analogy to hot solutions of salts in water, which, when they approach the saturation temperature, first deposit a crop of large, well-formed crystals (labile stage) and subsequently precipitate clouds of smaller less perfect crystalline particles (metastable stage). In igneous rocks the first generation of crystals generally forms before the lava has emerged to the surface, that is to say, during the ascent from the subterranean depths to the crater of the volcano It has frequently been verified by observation that freshly emitted lavas contain large crystals borne along in a molten, liquid mass. The large, well-formed, early crystals are generally admitted to be porphyritic; the smaller crystals of the surrounding matrix or ground-mass belong to the post-effusion stage. More rarely lavas are completely fused at the moment of ejection; they may then cool to form a non-porphyritic, finely crystalline rock, or if more rapidly chilled may in large part be non-crystalline rock, or glassy (vitreous rocks such as obsidian, tachylyte, pitchstone) A common and easily recognized feature of glassy rocks is the presence of rounded bodies (spherulites. Gr σφαῖρα, a ball), consisting of fine divergent fibres radiating from a centre, these divergent fibres consist of imperfect crystals of felspar, mixed with quartz or tridymite; similar bodies are often produced artificially in glasses which are allowed to cool slowly. Rarely these spherulites are hollow or consist of concentric shells with spaces between (lithophysae: Gr. λίθος, a stone; φῦσα, bellows). Perlitic structure, which is also found to be common in glasses, consists in the presence of concentric rounded cracks owing to contraction on cooling (*see* PERLITE)

The phenocrysts (Gr. φαίνειν, to show; κρύσταλλον, a crystal) or porphyritic minerals are not only larger than those of the ground-mass; as the matrix was still liquid when they formed they were free to take perfect crystalline shapes, not being interfered with by the pressure of adjacent crystals They seem to have grown rapidly, as they are often filled with enclosures of glassy or finely crystalline material like the material of the ground-mass Microscopic examination of the phenocrysts often reveals that they have had a complex history. Very frequently they show successive layers of different composition, indicated by variations in colour or other optical properties; thus augite may be green at the centre and various shades of brown outside this; or may be pale green centrally and darker green with strong pleochroism (aegirine) at the periphery. In the felspars the centre is usually more basic and richer in lime than the surrounding faces, and successive zones may often be noted, each less basic than those which lie within it. Phenocrysts of quartz (and of other minerals), instead of sharp, perfect crystalline faces, may show rounded corroded surfaces, with the points of the crystals blunted and irregular tongue-like projections of the matrix into the substance of the crystal; it is clear that after the mineral had crystallized it was partly again dissolved or corroded at some period before the matrix solidified Corroded phenocrysts of biotite and hornblende are very common in some lavas; they are surrounded by black rims of magnetite mixed with pale green augite The hornblende or biotite substance has proved unstable at a certain stage of consolidation and has been replaced by a pseudomorph of augite and magnetite which may be partially or completely substituted for the original crystal but still retains its characteristic outlines.

Plutonic or Abyssal Types.—Let us now consider the characteristics of a typical deep-seated rock similar to granite or diorite. That these are clearly igneous is proved by the manner in which they have burst through the superincumbent strata, filling the cracks with ramifying veins, that they were at a very high temperature is equally clear from the changes which they have induced in the rocks in contact with them. But as their

heat could dissipate only very slowly, because of the masses which covered them, complete crystallization has taken place and no vitreous rapidly chilled matter is present. As they have had time to come to rest before crystallizing they are not fluidal. Their contained gases have not been able to escape through the thick layer of strata beneath which they were injected, and may often be observed occupying cavities in the minerals, or have occasioned many important modifications in the crystallization of the rock. Because their crystals are of approximately equal size these rocks are said to be granular; there is typically no distinction between a first generation of large well-shaped crystals and a fine-grained ground-mass. Their minerals have formed, however, in a definite order, and each has had a period of crystallization which may be very distinct or may have coincided with or overlapped the period of formation of some of the other ingredients. The earlier have originated at a time when most of the rock was still liquid and are more or less perfect; the later are less regular in shape because they were compelled to occupy the interspaces left between the already formed crystals which pressed on them. The former are said to be idiomorphic (*i.e.*, having their own characteristic form, Gr. ἴδιος, belonging to one's self), the latter are allotriomorphic (Gr. ἀλλότριος, belonging to another). There are also many other characteristics which serve to distinguish the members of these two groups. Orthoclase, for example, is the typical felspar of granite, while its modification sanidine occurs in lavas of similar composition; leucite is common in lavas, very rare in plutonic rocks; muscovite is confined to the intrusives. These differences show the influence of the physical conditions under which consolidation takes place.

Intrusive or Hypabyssal Types.—There is a certain class of intrusive rocks which have risen upwards towards the surface, but have failed to reach it, and have solidified in fissures as dikes and intrusive sills at no great depth. To this type the name *hypabyssal* is often given in distinction to the *plutonic* (or *abyssal*) which formed at greater depths. As might be expected, they show structures intermediate between those of the effusive and the plutonic rocks. They are very commonly porphyritic, not rarely vitreous, and sometimes even vesicular. In fact many of them are indistinguishable petrologically from lavas of similar composition.

The attempt to form a special group of hypabyssal (intrusive and dike) rocks has met with much criticism and opposition. Such a group certainly cannot rank as equally important and equally well characterized with the plutonic and the effusive. But there are many kinds of rock which are not found to occur normally in any other manner. As examples we may cite the lamprophyres, the aplites and the porphyries. These never occur as lava flows or as great plutonic bosses; if magmas of the same composition as these rocks occur in either of these ways they consolidate with different assemblages of minerals and different structures.

Subdivisions of Igneous Rock Class.—In subdividing the plutonic, the hypabyssal and the effusive rocks, the principle is followed of grouping those together which resemble one another in mineral constitution and in chemical composition. In a broad sense these two properties are interdependent.

Chemical Characters.—Twelve elements (oxygen, silicon, aluminium, iron, calcium, sodium, potassium, magnesium, titanium, phosphorus, hydrogen and manganese) constitute about 99·6% of the earth's crust. Of these oxygen is the most abundant and constitutes 46·59% of the igneous rocks of the crust, the elements given above being placed in their order of abundance. These "petrogenic" or rock elements occur typically as oxides, simple silicates, aluminates, fluorides, chlorides and sulphides. In rock analyses they are stated as oxides. From a computation based on 5,159 analyses Washington and Clarke have arrived at the following as the average percentage composition of all igneous rocks:—SiO_2, 59·12; Al_2O_3, 15·34; Fe_2O_3, 3·08; MgO, 3·49; CaO, 5·08; Na_2O, 3·84; K_2O, 3·13; H_2O, 1·15; TiO_2, 1·05; P_2O_5, 0·3; MnO, 0·12; Inclusive 0·5.

The known igneous rocks show a wide but limited range of composition. As the most abundant and essential rock minerals are either silica or silicates, silica shows the highest maximum and the widest range of these oxides. In some magmatic ores its content falls to zero but rises to 93–96% in rare igneous rocks (northfieldite); alumina reaches a maximum of about 60% in some corundum-bearing syenites; iron oxides have a general range from 15 to under 1%, and magnesia from 25 to under 1%. In some olivine rocks (dunite) it reaches a value of 48%. Lime is highest in some pyroxenites and anorthosites (20–22%), but its general range is from 15% to zero. Soda reaches a maximum of 20% in almost pure nepheline rocks (congressite) but has a general range from 15% to nearly zero. Potash has a maximum 18% in an almost pure leucite lava (italite), but usually varies from 10% to zero. Water in fresh crystalline igneous rocks seldom reaches more than 2% but glassy lavas may contain 10%.

The commonest minerals of igneous rocks are the felspars, pyroxenes and amphiboles, quartz, and the micas. From a statistical examination of 700 igneous rocks an average composition has been calculated as follows, felspars 59·5, pyroxenes and amphiboles 16·8, quartz 12·0, micas 3·8, other minerals 7·9 (apatite 0·6, titanium minerals 1·5). This estimate however is clearly only an approximation. Rock minerals have been classified empirically into two groups, according as they are capable or incapable of existing in the presence of free silica, namely saturated and unsaturated minerals. The former group includes such minerals as the felspars, pyroxenes, amphiboles and micas; and the latter olivine, nepheline, leucite and other felspathoid minerals.

Certain minerals are as a matter of common observation not found together in igneous rocks. Thus olivine (except fayalite) and quartz do not occur in association, but are represented by rhombic pyroxene. The associations nepheline and quartz, leucite and quartz, pyroxenes or amphiboles and muscovite, are almost unknown among magmatic crystallizations; on the other hand we find certain mineral associations or parageneses to occur frequently; thus aegirine and arfvedsonite, nepheline and nosean, common hornblende and titanite, are well known as faithful com-

Igneous Rocks

	Acid	Intermediate		Basic	Ultrabasic
Commonest minerals	Quartz Orthoclase (and oligoclase) Mica Hornblende Augite	Little or no Quartz Orthoclase Hornblende Augite Biotite	Plagioclase Hornblende Augite Biotite	No Quartz Plagioclase Augite Hypersthene Olivine	Augite Hornblende Olivine (Basic plagioclase)
Plutonic	Granite	Syenite	Diorite	Gabbro Norite	Peridotite Pyroxenite Hornblendite (Anorthosite)
Hypabyssal	Quartz-Porphyry	Orthoclase Porphyry Orthophyre	Porphyrite	Dolerite	Picrite
Volcanic	Rhyolite Obsidian	Trachyte	Andesite Dacite	Basalt Tachylyte	Limburgite Augitite

panions in igneous rocks. Again some minerals are restricted to particular magmas; melanite, melilite and certain rare zirconium-titanium minerals are almost confined to the alkaline igneous rocks. By inspection of a rock analysis it is frequently possible to state approximately what minerals the rock will contain, but there are numerous exceptions to any rule which can be laid down. The minerals which crystallize from an igneous magma may depend largely on the physical conditions under which the liquid consolidates; accordingly we find rocks of almost identical chemical composition with widely different mineralogical constitution. Such rocks as already noted are referred to as heteromorphic. Some familiar examples of assemblages of this character are mica syenite and leucite basalt, minette and leucite basalt, pyroxenite and allivalite, monzonite and leucite tephrite, hornblendite and websterite.

Certain minerals are practically confined to deep seated rocks, *e.g.*, microcline, muscovite, diallage and almandine garnet; on the other hand leucite is very rare in plutonic rocks, as is also anorthoclase and the variety of potash felspar known as sanidine Some of these peculiarities are readily explicable, being dependent on the pressure, temperature, or concentration of volatile constituents in the crystallizing magma. Others still remain as a problem for solution. The subject will be referred to again in a later part of this article.

In the classification generally adopted by petrographers, the silica content of the magma forms a basis of further subdivision of igneous rocks. The division of volcanic rocks into acid, intermediate and basic we owe in the first place to Abich (1841). As applied to igneous rocks in general, those which contain most silica and which if crystallized yield free silica as quartz, are erected into a group designated the "acid" rocks in allusion to the rôle of silica in the mineral kingdom. Those with low silica percentages and rich in magnesia, lime and iron—so that quartz is absent while olivine, pyroxene or calcic felspar is usually abundant—form the basic group. The "intermediate" rocks include those characterized by the general absence of both quartz and olivine An important subdivision of the intermediate as well as the basic group contains a very high percentage of alkalis (soda or potash or both), and consequently has minerals such as nepheline, nosean, analcime or leucite, minerals not common in other rocks. This group is often referred to as the alkaline rocks. Lastly a small subgroup rich in olivine (peridotite, dunite), pyroxene (pyroxenite), or calcic felspar (anorthosite) have been called the "ultrabasic" rocks. They have low percentages of silica but much iron, magnesia or lime. With the exception of the last group, including also ultrabasic lavas as augitite and limburgite and a few related rocks as monchiquite, melilite basalt and alnoite, practically all igneous rocks contain felspar or felspathoid minerals. In the acid rocks the common felspars are orthoclase, with perthite, microcline and oligoclase, all having much silica and alkalis. In the basic rocks labradorite, bytownite and anorthite prevail, being rich in lime and poor in silica, potash and soda. Augite and olivine are the common ferromagnesian minerals of the basic rocks, but hornblende and biotite are on the whole more frequent in the acid rocks.

The classification in the two tables that follow is based essentially on the mineralogical constitution of the three great groups of igneous rocks. The alkali rocks containing nepheline and leucite are treated separately, for though they show transitions into the corresponding intermediate and basic rocks (syenites, diorites, gabbros, etc.), they contain many minerals which are unknown in other rocks. In a purely formal classification such as is outlined here they are more conveniently considered as a distinct series. Their genetic relations among themselves and with the other rock types are considered later.

Diaschistic Rocks.—Two groups of rocks not specifically included in the tables form important members of the hypabyssal division of igneous rocks. These are the aplites and the lamprophyres. The aplites are acid leucocratic differentiation products of the granites, syenites, diorites and gabbros, while the lamprophyres are basic differentiates. The two groups are together known as *complementary* or *diaschistic* rocks and usually occur as dikes or sills in association with the parent rock from which they are derived. Thus the minettes, vogesites and kersantites (*see* LAMPROPHYRE) are complementary to granitic aplites and occur in association with granitic masses. Camptonites and bostonites (syenite aplites) have a parent magma in the essexites or theralites which they accompany.

Nepheline- and Leucite-bearing Rocks

Commonest minerals	Alkali felspar Nepheline or leucite Augite Hornblende Biotite	Plagioclase (lime-soda) Nepheline or leucite Augite Hornblende (Olivine)	Nepheline or leucite Augite Hornblende (Olivine)
Plutonic	Nepheline syenite Leucite syenite	Essexite Theralite	Ijolite Urtite Missourite
Hypabyssal	Nepheline syenite—porphyry Tinguaite	Essexite and Theralite } Dolerite	Nepheline dolerite
Volcanic	Phonolite Leucitophyre	Tephrite Basanite	Nepheline basalt Nephelinite Leucite basalt

The classificatory scheme here adopted is admittedly artificial for rocks are subdivided without particular reference to their genetic relationships Even regarded as a classification for a utilitarian end there are many imperfections; the subdivisions are of unequal value and transitional types are not included. The latter however can be accommodated by further subdivision Many of them have received special names The quartz syenites may be interposed between granite and diorite, the tonalites between granite and diorite and so on

The question may be asked—When is a rock entitled to be recognized as belonging to a distinct species or variety and deserving a name for itself? It must, first of all, be proved to occur in considerable quantity at some locality, or better still at a series of localities or to have been produced from different magmas at more than one period of the earth's history. In other words, it must not be a mere anomaly. Moreover, it should have a distinctive mineral constitution, differing from other rocks, or something individual in the characters of its minerals or of its structures. It is often surprising how peculiar types of rock, believed at first to be unique, turn up with identical features in widely scattered regions; *alnöite*, for example, occurs in Norway, Scotland, Montreal, British Columbia, New York and Brazil, *tinguaite* in Scotland, Norway, Brazil, Montana, Portugal, etc. This indicates that underlying all the variations in mineralogical, structural and chemical properties there are definite relationships which tend to repeat themselves, producing the same types whenever the same conditions are present.

Various attempts have been made to introduce a quantitative element into igneous rock classification. These have followed either chemical or mineralogical lines. The principal of these is the *Quantitative chemical classification* introduced by a group of American petrographers. The chemical composition of an igneous rock is here regarded as its fundamental characteristic and a series of subdivisions is erected on this basis Other criteria are relegated to the background. The completed rock analysis is first interpreted in terms of an ideal set of minerals which constitute the "norm," but which in reality seldom corresponds to the actual composition ("mode"). The rocks are then divided into groups strictly according to the relative proportions of these ideal minerals to one another. The details of the classification need not be described here as they are fully set forth in a treatise specially devoted to this classification (*Quantitative Classification of Igneous Rocks*, Chicago, 1902; *see* Bibliography).

In other systems a quantitative element is introduced by subdividing rocks into groups by arbitrary lines based on mineral percentages: a complicated system framed on these lines is that

devised by A. Johannsen (*Journal of Geology*, 1917, 1919). In another the prime divisions are erected on a so-called "principle of silica-saturation" (Shand, *Eruptive Rocks*, 1927). In all the effect of the introduction of the quantitative element has been to increase the artificiality of the system and by this means to obscure the genetic relations existing between rock types. For this reason these systems are unlikely to supplant the qualitative classification in general use. It is indeed, largely to the influence of "quantitative classifications" that the bewildering and unnecessary multiplicity of igneous rock names must be ascribed.

A natural classification based on the genetic relationships of the igneous rocks is yet to be framed The writings of Becker and Vogt contain some essay towards this goal. As a basis, the eutectic relation has been emphasized, the eutectic mixture possessing definite properties and a fixed composition. Experimental work of recent years has clearly shown however that the eutectic relation is only one of a number of possible relations existing between the components of a magma; that its importance has been over-emphasized is abundantly shown by the experimental investigation of silicate melts, and is indeed revealed in the sequence of crystallization decipherable in igneous rocks

Petrographical Provinces.—As long ago as 1872 Vogelsang had noted that the igneous rocks of certain districts possessed textural or mineral characters in common, serving to distinguish them from the rocks of other districts. The researches of Judd (1886) and Iddings (1892) further substantiated this observation and showed that this community of petrographic character applied to the igneous rocks erupted or intruded during a particular period of igneous activity within the region. To such regions Judd gave the name *petrographical provinces* and Iddings employed the term *consanguinity* to express the genetic relationship implied in these resemblances among associated rocks. Excellent examples of such petrographical provinces or *comagmatic regions*, as they have been termed by Washington, are the Oslo region of southern Norway characterized by Devonian alkaline intrusions and extrusions, the Roman region characterized by rocks rich in potash; the alkaline province of central Montana; and the Tertiary calc-alkaline province of Hungary. On a larger scale the volcanoes which girdle the Pacific (Andes, Cordillera, Japan, Philippines, etc) and those which occur on the volcanic islands of the Atlantic, illustrate the same phenomena. The consanguinity in the igneous series of a petrographical province implies that the whole assemblage is derived from some common deep-seated magma, during a period which, while necessarily prolonged, was not of vast duration in a geological sense. The assemblages of a province may and often do show a wide diversity of rock type embracing intrusions and extrusions. Prolonged eruptions have in a few cases a somewhat monotonous character owing to the predominance of one kind of rock. Thus the lavas of the Hawaiian islands are mostly basaltic, as are those of Oregon, Washington and the Deccan, all of which form geological masses of enormous magnitude. In the Oslo district on the other hand the assemblages comprise (among the intrusive rocks) a wide range of type—hornblendite, essexite, larvikite, lardalite, nordmarkite, soda—and potash-granites.

Differentiation.—The process by which a magma is split into a variety of partial products is known as *Differentiation;* its importance from the standpoint of theoretical petrology is very great; it is in point of fact, the fundamental problem of petrogenesis. The variation expressed may appear in two ways; either as a variation in a single rock body, or in an associated series of separate intrusions or extrusions In the first case a single intrusion shows variation in different parts of its mass, the extreme varieties being usually connected by gradual transition. The contrasted parts are frequently arranged symmetrically with reference to the borders of the mass forming concentric zones in bosses or laccoliths suggestive of a differentiation *in situ* connected with the cooling of the mass. Most commonly the marginal zones are of more basic composition Excellent examples of variation of this kind are provided by the gabbro mass of Carrock Fell (Cumberland) with its basic border rich in iron ore, and the shonkinite laccolith of Shonkin Sag, Montana, in which a transition from syenite to shonkinite becoming denser outwards, occurs, the shonkinite finally passing at the margin into a fine leucite-basalt-porphyry. Variation in an associated series, is exemplified by the succession of lavas emitted from a volcanic focus. These may differ considerably from one another. Thus in the Berkeley Hills near San Francisco the volcanic succession is a repeated series of andesites, basalts and rhyolites. In other cases the lavas emitted are much more varied, and while no significant relations in the succession can be discerned, it is to be remembered that a significant order may be obscured by the overlapping of the flows from neighbouring volcanoes. In the simpler cases the order of eruption is one of increasing divergence from an initial type.

Plutonic Complexes.—A series of plutonic rocks intimately associated and localized at a centre constitutes a *plutonic complex*. Such complexes often contain a great diversity of petrographical types ranging from peridotite and gabbro through diorite to acid granite. The succession of these intrusions follows an order of decreasing basicity, the later and more acid rocks usually occupying the greater part of the complex, the earlier, and more basic being subordinate in amount and restricted to the borders of the mass Excellent examples of such plutonic complexes are provided by the early Devonian intrusions of "newer granites" of the Scottish Highlands (*e g.*, Garabal hill, Loch Lomond) What then are the factors operating which led to differentiation?

The possible processes leading to heterogeneity in a magma may be considered under (*a*) those occurring in the liquid prior to crystallization and (*b*) those occurring during or subsequent to crystallization Of the first, we may consider (i) differences of composition set up in a liquid due to a temperature gradient; (ii) differences of composition due to a pressure gradient; and (iii.) differences of composition due to the separation of distinct liquid phases. Each of these processes has in the past been appealed to to explain the variation seen in an igneous rock mass intruded singly, or in a rock series arising as a result of successive eruptions or intrusions. The type of composition-variation due to a temperature gradient is commonly known as the Soret effect and has been especially applied to explain the variation seen in a single rock body, such as the concentration of the minerals of early crystallization towards a cooling boundary. In a liquid with a temperature gradient, for dilute solutions the concentration varies inversely as the absolute temperature; and it has been thought that by the operation of this process, substances near their saturation point might accumulate at the cooler surfaces. Both theoretical considerations and experimental results clearly indicate however that the actual Soret effect is in fact negligible and such effects as are actually observed are due in reality to departures from the laws of ideal solutions, for if both solvent and solute obeyed osmotic pressure laws there would be no relative concentration of one with respect to the other The effects of a pressure gradient appear to be of the same order of magnitude and both these processes are now in effect abandoned as factors in differentiation.

The effects possible as a result of the separation of immiscible liquid phases stand on a different basis. Many liquids, homogeneous at high temperatures, separate with falling temperature into two or more non-consolute fractions, and the hypothesis that igneous magmas form such immiscible fractions has been favoured by some petrologists, notably Rosenbusch, Bäckstrom and Daly. From his own studies Vogt concluded that the rock-forming silicates are freely miscible. The only known case among magmas for which immiscibility can be claimed is that of sulphide-containing silicate melts. Such a magma unmixes at a temperature above the region of crystallization of the usual sulphides, and liquid sulphides, especially those of iron, are separated as liquid drops. These, owing to their greater density, sink to the floor of the magma collecting as a distinct sulphide layer, or, in some cases, the liquid layer may be injected into the surrounding rocks. These sulphide aggregates form important ore deposits. It is among lavas which as a group show the various stages of quenching of liquid magmas that the evidence for immiscibility might be expected; the absence of lavas containing glassy glob-

ules of composition distinct from that of the main mass of lava, goes far to reassure us that immiscibility is not an operating factor in petrogenesis. Recent experimental evidence of immiscibility in silicate liquids has indeed been obtained, but the composition range of liquids which show it is unlike that exemplified by rock magmas. This limited miscibility is found in mixtures of silica with any of the oxides CaO, MgO, FeO, Fe_2O_3, but in a region of very high silica-content. The minimum temperature for the existence of two liquids is in each case only a little below the melting point of silica, or in the vicinity of 1,700° C. The oxides Na_2O, K_2O, Al_2O_3 show no such immiscible region in their silica mixtures, and moreover it requires only a small proportion of any of these miscible oxides to render miscible with silica the oxides which are themselves immiscible with silica. No natural magmas are known which approximate in composition to the region of immiscibility in these melts. It is true that natural magmas contain in addition water, and that its effect is experimentally unknown. Nevertheless if its addition changes the limits of immiscibility so that unmixing becomes a possible factor in differentiation, its behaviour must differ from that of the oxides studied.

Of all the processes suggested as important factors in the differentiation of rocks, crystallization alone seems competent to produce important results. Indeed fractional crystallization is now believed to be the fundamental process in rock differentiation. Either the localization of crystallization or the localized aggregation of crystals is sufficient to produce heterogeneity in a rock magma. The first case, the localization of crystallization, is competent to explain those cases of differentiation *in situ* exemplified by the basic marginal phases of intrusive masses. The mechanism of the process has been much discussed. Examination of igneous rocks early showed that minerals crystallize in a more or less definite order. In general the first minerals to separate belong to a group known as the minor accessories: this includes zircon, apatite, titanite and iron-oxides; then follow in order olivine, augite, hornblende, biotite, plagioclase, orthoclase, microcline and quartz. To this rule there are many exceptions, but the succession given above holds in the great majority of cases. Expressed in this way the more basic minerals precede the less basic: it is known as Rosenbusch's law of decreasing basicity. Accordingly it is supposed that at a cooling boundary there is a precipitation of minerals of early crystallization (basic minerals), the continued growth of many crystals being maintained by diffusion. The completion of this process results in a crystalline mass with a border phase enriched in the minerals of early crystallization.

The rate of diffusion in silicate melts has been the subject of laboratory study and the results obtained show that the possible effects are exceedingly small and incompetent to account for the formation of border phases about large intrusions. The marginal phase indeed appears to represent rather a chilled phase having a composition close to that of the original magma, the more acid phase which it encloses representing a differentiate formed by much slower cooling of the remainder of the magma. The relative movement of crystals with respect to the liquid from which they separated may be of two kinds, (*a*) movement under the influence of gravity—sinking or floating of crystals and (*b*) movement by straining off or squeezing out of residual liquid by earth movement. Both of these processes can be applied to explain the more important case of differentiation exemplified by an associated series of intrusions or extrusions. In a crystallizing magma, provided viscosity does not inhibit the free movement of crystalline material, as the first formed crystals are denser than the molten material in which they form, they should sink under the influence of gravity in the liquid. The lower regions of the rock mass into which the crystals sink become enriched, the upper regions impoverished, in the constituents of which they are formed. The sinking of crystals in silicate melts has been both experimentally verified in the laboratory and observed in nature. Darwin long ago (1844) suggested that this process was a potent factor in producing diverse rock types. Turning to the evidence of consolidated rock masses themselves, we find intrusions in which such gravitational segregation is indubitably exemplified. Thus the concentration of early formed olivine crystals near the base of sheet- or sill-like intrusions has been observed in the case of the quartz-dolerite sill of the Palisades (Hudson river) and the picrite sill of Lugar (Ayrshire). Examples of this nature appear however to be exceptional, and indicate an extreme fluidity of the liquid magma. Most sheets or laccoliths show no heterogeneity throughout the vertical extent of their mass. In other cases where a variation is observed, it is to be ascribed to successive injection of magmas of varying composition.

In the magma basins of the deeper parts of the crust, the case may be conjectured to be otherwise. The retarding influence of viscosity, which appears to prevent any notable gravitative segregation in intrusive sheets cooled comparatively rapidly in those parts of the crust laid bare by denudation, is at deeper levels counteracted by the time factor. The extremely slow rate of cooling in these deeper regions may permit significant settling of crystals, giving rise to a differentiated reservoir more or less stratified according to gravity, more basic at the bottom, more acid upwards. The mechanism by which it is conceived a varied group of liquids becomes drafted off from an intercrustal reservoir and injected to form the igneous rock bodies now made visible by denudation is, of necessity, one into which the element of speculation largely enters. Remelting of successive stratified layers by a gradual use of temperature from the base upwards, together with earth movement, the straining off of residual liquid from a crystalline meshwork under the influence of crustal stress, all are processes to which appeal is made to explain not only the variety among associated igneous rocks injected as plutonic complexes but also the chronological succession of the intrusions themselves.

Assimilation.—Fragments of foreign rock frequently become incorporated in rock magmas, and the mutual reaction between solid and liquid may lead to heterogeneity or the development of new varieties of rock. This process is known as assimilation and has been claimed by some petrologists as an important factor in petrogenesis.

It seems probable that the heat effect connected with the solution of solid rock by a liquid magma is always negative, solution being accompanied by absorption of heat usually of the order of the latent heat of melting. Simple solution demands large amounts of heat which are only available if the liquid possesses great super-heat. Intruding magmas, however, can scarcely be at a temperature much above their crystallization range. Such effects of magma upon its enclosures, as are observed, must therefore be attributed to reaction and precipitation, which in some cases leads simply to an adjustment in the composition and relative proportions of the existing phases, but is also productive of new minerals foreign to the magma, especially if reaction be incomplete. Where igneous rocks have absorbed sedimentary material in any quantity they present distinctive features. Granites which have assimilated shales or slates usually contain minerals such as andalusite, sillimanite or cordierite, which are foreign to normal igneous rocks. Gabbros under similar conditions pass first into norite by the formation of rhombic pyroxene and anorthite at the expense of monoclinic pyroxene and eventually into cordierite norites. Rocks of this character are well developed in Aberdeenshire. In general it may be said that there is little reason to believe that foreign rock is essential to the production of any particular type of differentiate, or that the process of assimilation is an important factor in petrogenesis.

Geographical Distribution of Igneous Rocks.—A study of the geographical distribution of igneous rocks has shown that the earth's surface may be mapped out into more or less definite petrographical provinces, each with its own community of petrographical characters. Strongly contrasted provinces may exist almost side by side, as is seen in the Tertiary Bohemian and Hungarian provinces standing on either side of the Carpathian range, the one characterized by a suite of igneous rocks rich in alkali, the other comprising an assemblage relatively rich in lime, magnesia and iron oxide. The chain of volcanoes that fringes the shores of the Pacific from Tierra del Fuego to Alaska and thence by Japan and the Philippines to Java and Sumatra

represents a province of a larger order, characterized by rocks which have so much similarity in many important features that they are certainly of allied origin. These rocks are all of Tertiary and recent age; their eruptions began in Eocene or Miocene times and have continued with more or less frequent intermissions up to the present day. The igneous rocks of the Atlantic islands from the Azores to Tristan d'Acunha comprise an assemblage of types strikingly different from the Pacific igneous rocks. Each of these magmas has been taken as a type, and referred to as the "Pacific" and "Atlantic" magmas. Chemically the Atlantic (or alkali) rocks are characterized by high percentages of alkalis (potash and soda) in relation to silica and alumina, and mineralogically by the presence of alkali minerals, especially felspathoids (nepheline, sodalite, analcime, etc.). The Pacific (subalkali or calcic) rocks on the other hand show relatively more abundant lime, magnesia and iron oxides. Certain suites of rocks characterized by high potash, and mineralogically by the presence of leucite or abundant potash felspar and micas have in recent years been separated from the Atlantic suite, though they are perhaps not of co-ordinate importance. Rocks of this character are illustrated by the Quaternary province of the Roman region; Vesuvius belongs to a line of volcanoes (extending from lake Bolsena to the Phlegrean Fields) that have poured out lavas of this character. From their occurrence on the borders of the Mediterranean they are sometimes known as the Mediterranean suite.

When we turn to the igneous rocks of older geological periods the same contrasted suites can be recognized. The midland valley of Scotland has been the theatre of igneous action both in Lower Devonian and Carboniferous times. The igneous assemblages of the two periods show, however, a striking contrast. The earlier lavas are distinctly of the Pacific type including andesites, basalts and rhyolites, while the Carboniferous extrusions and dike rocks include trachytes, teschenites, picrites and monchiquites—an Atlantic assemblage. Petrographical provinces are therefore clearly not permanent—a point to which we shall later return.

Each of the great suites—Pacific, Atlantic and Mediterranean is characterized by a set of rock types which reflects the chemical and mineralogical peculiarities. Arranged in tabular form the typical assemblages of the three suites are as follows:—

PACIFIC:—

PLUTONIC: granites, quartz-diorites, diorites, gabbros, pyroxenites, peridotites, anorthosites.

HYPABYSSAL: granite-porphyries, porphyrites, dolerites and some lamprophyres (spessartites, odinites).

VOLCANIC: rhyolites, dacites, andesites, basalts.

ATLANTIC:—

PLUTONIC: soda-granites, pulaskites, foyaites, essexites, theralites.

HYPABYSSAL: soda-granite-porphyries, pulaskite-porphyries, tinguaites, essexite- and theralite-porphyries and some lamprophyres (camptonites, monchiquites).

VOLCANIC: pantellerites, soda-trachytes, phonolites, alkali-basalts.

MEDITERRANEAN:—

PLUTONIC: quartz-syenites, syenites, monzonites, shonkinites and missourites.

HYPABYSSAL: syenite-monzonite-etc. porphyries and some lamprophyres (minettes, alnöites).

VOLCANIC: quartz-trachytes, trachytes, latites, ciminites, leucitites and leucite-basalts.

The recognition of these three suites and their distinctive products constitutes without doubt the first step towards a natural or genetic classification of igneous rocks.

Study of the geological relations of igneous rocks clearly reveals that there is a general correspondence both in time and space between igneous action and movements of the earth's crust, whether these be simply vertical movements of elevation and depression or tangential movements of folding and overthrusting which build up great mountain chains. As in crustal movements, so in igneous action, periods of activity have alternated with periods of quiescence. The movements of compression which led to the folded mountain chains fringing the Pacific were accompanied and followed by widespread vulcanicity and the movements of depression, which in Tertiary times led to the formation of the Great Rift Valley of East Africa, were attended and followed by a great suite of volcanic eruptions. The interdependence of igneous action and crust movement is even of a still more intimate kind, for not only the distribution of igneous rocks, but the distribution of different kinds of igneous rock is seen to stand in unmistakable relation to the great tectonic structures of the earth. The examples referred to above are illustrative of this conclusion. The volcanoes of the Pacific cordillera erupted calcic andesites and basalts, and are associated with granodiorite and quartz-diorite intrusions; the eruptions associated with the African Rift valley are in contrast, being of alkaline type and including soda-trachytes, phonolites and related alkaline lavas. Whether attention is confined to Tertiary igneous rocks or extended to those of earlier date, the conclusion is enforced that rocks of the Pacific suite are closely associated with folded mountain chains and appear in regions subject to movements of compression and lateral thrust, and that the Atlantic or alkaline suites are associated with regions of subsidence, subject to tension and faulting. That a particular region at successive epochs may be the theatre of action of contrasted igneous suites plainly forbids the assumption that the distribution of rock types is due to initial heterogeneity of the crust. Rather it would appear that calcic and alkaline suites are ultimately derived from the same primitive magmas. The manner of their evolution is a problem of great complexity.

The mode of origin of the massive fringes of pegmatite mantling the "older granites" of the south eastern highlands of Scotland may perhaps provide the initial clue to the actual mechanism involved. By Barrow these pegmatite fringes are conceived to represent the acid residual liquid squeezed out from partially crystallized granite magma under the influence of crustal stress. To an analogous process operating at deeper levels, and on a grander scale, Harker has made appeal to account for the separation in a horizontal sense of alkaline and calcic magmas from some common deep-seated stock.

Physical Chemistry of Igneous Rocks.—Natural rock magmas are polycomponent systems with seldom fewer than six or seven oxides, and no adequate discussion of their physical chemistry is at present possible. It is the function of the petrologist to elucidate the nature and behaviour of these complex systems under different physical conditions. In the last 25 years much progress has been made on the experimental side and the foundation for an extended exploration of the crystallization history of silicate magmas has now been laid. The main contributions have come from the Geophysical Laboratory at Washington. Investigations initially concerned with the perfection of experimental methods of attack have been followed by a physico-chemical study of simple oxides and their combinations. As yet these investigations have been almost wholly confined to dry systems but an attack on wet systems with volatile components is already in progress. Systems have now been investigated which approach in their complexity some of the simpler types of igneous rocks and the results obtained justify the conclusion that the fusion and solidification phenomena of igneous rocks are capable of systematic treatment. Starting with pure chemical substances the melting points, dissociation temperatures and inversion points of numerous rock-forming minerals have been determined, and the equilibrium phenomena of two and three component systems involving the commoner oxides of igneous rocks have been quantitatively elucidated. This study has embraced the six binary and four ternary systems of the oxides, CaO, MgO, SiO_2, Al_2O_3, and portions of the quaternary system itself have been explored. The investigation of mineral inversions has provided data throwing light on the temperature of consolidation of igneous magma. Such of these inversions as are enantiotropic or reversible and take place without appreciable lag can be appropriately used as geological thermometers. The inversion α quartz $\underset{\longleftarrow}{\xrightarrow{575^\circ C}}$ β quartz is a striking example, as it is accompanied by a significant volume change whereby it is possible to recognize whether quartz at ordinary temperatures has crystallized as α or β quartz. The criteria

include complicated twinning and fracturing. It can thus be shown that the quartz of granites has consolidated as β quartz and therefore at a temperature above 575°. The quartz of many pegmatites and igneous quartz veins on the other hand has consolidated as α quartz and therefore below 575°. (Note: some writers use α and β in the inverse senses.) The inversion pseudo-wollastonite $\underset{\longleftarrow}{\xrightarrow{1,190°C}}$ wollastonite provides another case, from which it is concluded that wollastonite occurring in rocks has crystallized below 1,190°.

Some minerals melt with dissociation or incongruently. The most important examples are clinoenstatite dissociating at 1,557° into forsterite and silica, and orthoclase with a dissociation temperature of 1,170° yielding leucite and silica. The incongruent melting of these two minerals has important petrogenetic implications which will be noticed hereafter.

Binary Systems.—The manner of crystallization of binary systems is dependent on the mutual relations of the constituents. In the simple case of two independent components each lowering the melting point of the other and not forming solid solutions the completion of crystallization takes place at a definite temperature (the eutectic point) at which both solids separate simultaneously from a solution of fixed composition (the eutectic mixture). Many examples of eutectic crystallization are known among silicates. It frequently gives rise to a graphic texture in which there is an intimate intergrowth of the two phases. The intergrowths of quartz and orthoclase in graphic pegmatites and micro-pegmatite are believed to be eutectic aggregates This is revealed not only in their simultaneous crystallization but also in their constant relative proportions (quartz 26%, orthoclase 74%). Not all graphic textures can, however, be regarded as evidence of eutectic crystallization, nor do all eutectic mixtures form graphic intergrowths

The conception of eutectics has played an important part in petrogenetic theory, and—as already noted—Vogt has attempted to recognize in eutectics the basis of a genetic classification of rocks. The eutectic relation is, however, only one of a number of possible relations existing between two or more components of a system. Where two components exhibit perfect isomorphous relations, eutectic crystallization is eliminated and the two substances crystallize as a single phase—an homogeneous solid solution. Of rock-forming minerals exhibiting this relation the plagioclase felspars are the most important. The equilibrium relations in such a system may be illustrated diagrammatically as in fig. 1. The horizontal line represents the composition, the vertical the temperature. The pure components are albite and anorthite. Anorthite (An.) melts at 1,550° C The melting point of albite (Ab) is fixed close to 1,100°; its melts are highly viscous and crystallize only with great reluctance. The upper curve of the diagram is the freezing point curve of intermediate mixtures of the two components. It is known as the *liquidus*. The lower curve is the melting point curve, or *solidus*. Above the liquidus all mixtures are liquid, below the solidus all are crystallized. Mixtures of albite and anorthite do not melt at definite temperatures but have a melting or crystallization interval, the lower limit fixed by the solidus, the upper by the liquidus.

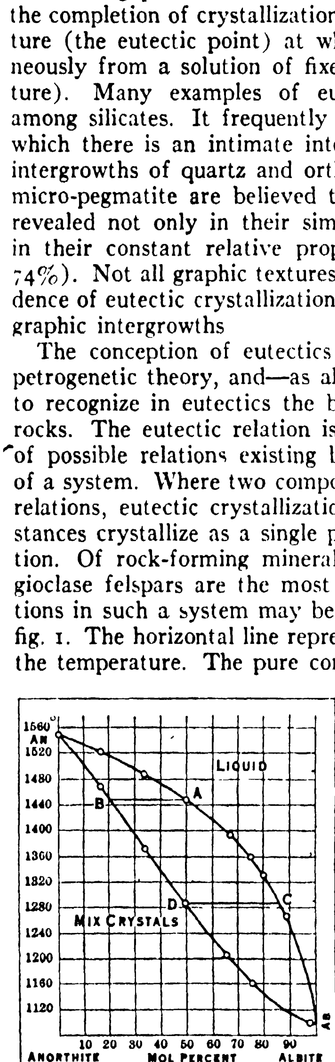

FIG. 1

Let us consider the phenomena attending crystallization of a mixture of given composition. A liquid of composition Ab_1An_1 as the temperature falls begins to crystallize at A. The crystals in equilibrium with this liquid have the composition B (Ab_1An_4), the liquid being always richer in albite than the crystals with which it is in equilibrium. As the temperature slowly falls the crystals continue to form, at the same time changing in composition along the solidus curve by continuous reaction with the liquid. Throughout the course of crystallization, this process of reaction proceeds until finally the crystals have the composition D, that of the original liquid, the last drop of liquid having the composition C. If, however, equilibrium between the solid and liquid phases is not continuously maintained, the course of crystallization is extended. At a moderately rapid rate of cooling the first formed crystals of composition B are not adjusted to the liquid, and there results a deposition of new layers upon the first formed crystals, each of composition corresponding to the temperature at which they are formed. When crystallization ceases, as the bulk composition of the crystals is that of the original liquid and the cores of the crystals are richer in anorthite, the outer layers must be enriched in albite The composition of the outer layer is represented by a point beyond D and that of the final liquid by a point beyond C The process first described is exemplified in the zonary banding or zoning of the common plagioclase felspars in igneous rocks. Either very slow cooling or very rapid cooling gives crystals free from zoning; at intermediate rates of cooling, crystallization is accompanied by zoning, and at some definite rate of cooling it might be expected that a maximum zoning would result in which case the final drop of liquid would have the composition of pure albite.

The theoretical investigations of Roozeboom have shown that five types of crystallization of isomorphous substances may occur; in three the mutual solubility of the two components is unlimited, in two it is limited, so that only mixed crystals of certain types may occur Some of these have been identified in rock-forming minerals, others are suspected though not yet proven

Ternary Systems.—Crystallization is more complicated in ternary systems than in binary Roozeboom and Schreinemakers worked out the theory of these systems To represent their behaviour resort must now be made to a solid figure All possible mixtures of three components can be represented by points within an equilateral triangle, the apices of which represent the three components. Binary mixtures appear as points on the sides of the triangle. If lines be drawn through any point within the triangle and parallel to its sides, they will cut the sides at distances which represent the relative proportions of the components represented by the point. To represent temperature, vertical ordinates are erected upon the equilateral triangle The solid figure thus obtained is a triangular prism bounded above by freezing point surfaces meeting in boundary lines. These can be conveniently represented in plane projection. In the simplest ternary systems each pair of the components form a binary eutectic and the three together a ternary eutectic, which represents the composition in the system possessing the lowest fusibility.

The crystallization course of such a simple system may be illustrated in the diagram (fig 2). A, B and C represent the three pure components, AB, BC and AC represent binary mixtures, and E_{ab}, E_{bc} and E_{ac} the respective binary eutectics. The ternary eutectic is represented by the point E_{abc} within the figure. A liquid of composition *a* when cooled to the freezing point surface separates crystals of the composition A, the composition of the liquid moving away from A towards *b* At *b*, the liquid becomes saturated for the component C which will begin to crystallize, both A and C crystallizing while the composition of the liquid changes along the boundary curve bE_{abc}. Finally B also begins to crystallize and the ternary eutectic point is reached at which the three components crystallize simultaneously in definite proportions (at E_{abc}) until the whole is completely solidified. This simple ternary system though realized among metallic alloys—for example in the system lead-tin-bismuth, where the ternary eutectic melts at 96°—has not been yet discovered among rock-forming silicates. There the relations are much more complex.

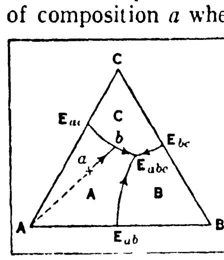

FIG. 2

Occurrence of inversion points in one or more of the components; the formation of binary or ternary compounds with congruent and incongruent melting points; the formation of isomor-

phous mixtures, limited or unlimited, among the phases, are some of the many complications in silicate systems already investigated. As an example of a very complicated system, the ternary system $CaO-Al_2O_3-SiO_2$ may be briefly noted.

In addition to the three components, there are nine binary compounds, some with enantiotropic inversions; and three ternary compounds, only two of which are stable. The fields meet three together in a large number of quintuple points eight of which are ternary eutectics. Investigation of this system has involved the undertaking of over 7,000 heat treatments and microscopical preparations.

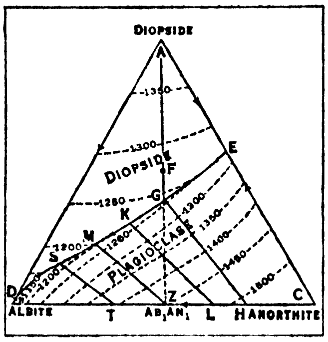

FIG. 3

Among the ternary silicate systems that have been studied three in particular are of great importance in the interpretation of the crystallization-history of rock magmas. They include those mixtures from which the phases, plagioclase, pyroxene, olivine, spinel and silica have separated. An important system is that of diopside—albite—anorthite. The equilibrium diagram is shown in fig. 3. The crystallizing phases are diopside and plagioclase. These mixtures are therefore comparable with simple basaltic or gabbroic magmas on the one hand and simple dioritic (augite-diorite) magmas on the other according to the nature of the plagioclase.

As before, consider the crystallization of a liquid whose composition is represented by the point F. (50% diopside, 50% plagioclase—Ab_1An_1). Crystallization begins with a separation of diopside (supposed to be a simple mineral and not an isomorphous mixture, as it would usually be in rocks) at about 1,275°. At 1,235° the excess of diopside (G) has separated out, and felspar begins to crystallize. It has about 80% anorthite (H). Thereafter diopside and felspar both crystallize, but as the temperature travels along the line EGD from G to M the composition of the felspar changes from H to Z (if we suppose that all the early felspar which is unduly rich in anorthite is stage by stage resorbed). The resulting rock has the mineral composition above stated; but if resorption of felspar is incomplete the last-formed felspar is richer in albite and has a composition T. The felspar crystals in that case are zonal with basic centres. If at any time crystallization is suddenly brought to an end a glassy ground-mass will be formed, which is richer in soda and silica than the original magma and contains zoned felspar crystals. This is exceedingly like what takes place in many basaltic lavas. Again, if the original mixture had been richer in felspar, so that the composition point lay below the line DE, felspar would have crystallized out first. This seems to be in keeping with the structure of many dolerites, which contain felspar partly enclosed in augite crystals of later formation (ophitic structure), while others show that the augite appears in porphyritic crystals and began crystallizing before felspar.

The separation of liquid from crystals can be accomplished not only by zoning but also by the sinking of crystals from the upper layers of the liquid. The resulting liquid is enriched in albite and, under favourable circumstances, the final liquid may approach the albite-diopside eutectic of composition 97% Ab, 3% diopside. The analogy with the differentiation course of gabbroic magma is clear. A mixture rich in diopside and anorthite-rich plagioclase, corresponding to an anorthite-rich gabbro or eucrite may pass to an assemblage rich in more acid plagioclase with subordinate diopside, corresponding to an augite-diorite. We shall see by a study of another system how this differentiation from a basic magma may be extended to the granitic (diopside-granite) stage.

The continuous reaction relation between crystals and liquid in the systems just studied is of fundamental importance in the crystallization-history of magmas. This reaction is common to all solid solution series, and such solid solutions are called *continuous reaction series.* Very similar effects, however, are produced by another type of crystallization phenomenon revealed in synthetic melts. In this case an early precipitated phase reacts at a certain temperature with the surrounding liquid and a new phase is precipitated, a reaction process of a discontinuous kind. This reaction is illustrated in the system forsterite (olivine)-silica. Here there are three solid phases, forsterite, clinoenstatite ($MgSiO_3$) and cristobalite (SiO_2). The monoclinic pyroxene, clinoenstatite, has an incongruent melting point and dissociates at 1,557° into forsterite and liquid. From all melts of composition between Mg_2SiO_4 and $MgSiO_3$, the first phase to crystallize is forsterite, which continues to separate until the temperature of 1,557° is reached, when the olivine reacts with the liquid to form clinoenstatite. When equilibrium is established the resulting crystalline mass consists wholly of olivine and pyroxene. If, however, the opportunity for reaction is inhibited, either by the sinking of olivine crystals or by their enclosure in the reaction product, the course of crystallization is extended and the third phase, silica, is precipitated giving a mass composed of residual olivine, pyroxene and silica.

A reaction relation of this type may effect a series of compounds in a crystallizing melt. These, arranged in their order of succession, constitute a *discontinuous reaction series.* The combined effects of discontinuous and continuous reaction are revealed in the related ternary system diopside-forsterite-silica. Here clinoenstatite forms a complete series of solid solutions (monoclinic pyroxenes) with diopside; they form a continuous reaction series, the crystals in equilibrium with the liquid being relatively enriched in the magnesian end member ($MgSiO_3$). The effect of hindering the reaction relations is now twofold, the residual liquid (or upper layers of the liquid if sinking of crystals obtains) is enriched in silica and the diopsidic pyroxene, owing to the offset in composition. The lowest point of formation of liquid in the system (there is no ternary eutectic) is the binary eutectic diopside-silica.

Evidence of these reaction processes in natural magmas is by no means wanting. It is seen in zonary banding of plagioclase felspars and pyroxenic solid solutions. One of the most characteristic features of olivine-bearing basic rocks is the occurrence of olivine crystals with rounded outlines—indicative of resorption—or with mantles of pyroxene formed at their expense. In the synthetic melts the unidirectional reaction-relation existing among the mineral phases results in a differentiated liquid or chain of liquids enriched in silica, from early separation of olivine, in albite from early formation of magnesian-rich pyroxene. Similar reactions proceeding in basic (gabbroic or basaltic) magma serve to explain in large measure the differentiation chain of the calc-alkaline rocks, gabbro-diorite-granodiorite, though here the presence of other oxides—K_2O, H_2O—and other volatile constituents is responsible for more complex reactions and new mineral phases not yet included in synthetic investigation.

Volatile Constituents.—The volatile constituents of magmas have a profound influence on the properties of the silicate solution. Their concentration is greatly affected by changes of pressure and temperature, and equilibria in the melt are therefore of a very mobile kind. They reduce the viscosity of the melt, lower the temperature of crystallization, and are responsible for the precipitation of new mineral phases foreign to dry melts. By fractional crystallization these constituents are concentrated in the residual liquid and become responsible for many of the after-effects seen in pneumatolysis, metasomatism and ore deposition. The formation of amphiboles, micas and many other minerals is to be attributed to their presence.

It has been shown that the phenomena associated with the reaction-relation in dry melts appear among the mineral phases of magmatic melts and can be interpreted in like manner. In the light of laboratory experiment available petrographical data permit the conclusion that the pyroxenes, hornblendes and biotites form a discontinuous reaction series, pyroxene reacting with liquid to form hornblende, hornblende to form biotite. Each of these groups in itself as solid solutions is a continuous reaction series. It is in reactions of this kind that the ordered differentiation sequence gabbro-diorite-quartz diorite-biotitegranite, character-

istic of the calc-alkaline rocks now finds explanation; the continual offset in composition of residual liquid in which water accumulates being accomplished by appropriate removal of crystals, either by gravitative settling or squeezing out or filtering of interstitial liquid by earth movement during crystallization.

Volatile constituents are believed to play a prominent part in the evolution of rocks of the alkaline (Atlantic) suite. They are responsible for the desilication of the alkali aluminium polysilicates. Both carbon dioxide and water appear to be the principal agents in this process: Thus, reactions of the type—

$$KAlSi_3O_8 \rightleftarrows KAlSiO_4 + 2SiO_2$$
$$NaAlSi_3O_8 \rightleftarrows NaAlSiO_4 + 2SiO_2$$
$$2(MgFe)SiO_3 \rightleftarrows (MgFe_2)SiO_4 + SiO_2$$

may represent equilibrium relations in a residual liquid rich in water (such as the granite stage of differentiation) If the precipitation of alkali-felspars, biotite and quartz is followed by their withdrawal, the concentration of nepheline molecules will lead finally to the separation of this constituent Assemblages of nepheline syenites, urtites and ijolites may be differentiated in this way.

The capacity of CO_2 for desilicating polysilicates is attested by laboratory experiment; and it is not improbable that carbonates, by a process of absorption of limestone in a liquid already alkaline, have been effective in the generation of some alkaline rocks, especially those containing such minerals as calcite, cancrinite, melanite and melilite.

More obscurity surrounds the origin of the potassic or leucitic rocks. Their spatial arrangement in relation to the Pacific and Atlantic suites, no less than their chemical characters reflects their intermediate position. They are characteristic of the region lying between the orogenic zones and the foreland or regions of subsidence The position of the potassic Roman province in relation to the Alpine orogenic zone on the one hand and the alkaline (Atlantic) basin of the west Mediterranean illustrates this relation very clearly The formation of leucite by dissociation of orthoclase (incongruent melting) is an important reaction in the genesis of some potassic rocks Normally in the presence of abundant water under cover, the desilication of the polysilicate would appear to proceed a stage further in the formation of the orthosilicate ($KAlSiO_4$) which is precipitated in biotite—usually at the granitic stage—and the generation of leucite would in some cases appear to be connected with a loss of water from a biotite-rich liquid (*e g.*, of the composition of minette) by its intrusion or extrusion near or at the surface Leucite-bearing rocks are rare as plutonic rocks (the leucite being usually replaced by orthoclase and nepheline). The generation of the potassic series may indeed be dependent on a prior differentiation of a magma to a stage in which biotite is accumulated, as revealed, *e g*, in mica-rich lamprophyres.

Desilication of potash-felspar appears then as a characteristic reaction in rocks of the Mediterranean suite. Their relation to the Pacific suite is provided in the equilibria existing between potash-felspar, biotite, leucite and olivine, to the Atlantic suite in the equilibria between alkali-felspars, felspathoids and quartz; in the potassic series desilication of the albite molecule playing a subordinate rôle.

The genetic relations between the three suites are amply attested and enforce the conclusion that no sharp line of division between them is to be recognized. Their source is a common stock magma. Nevertheless we appear to see in the relative distribution of the three series upon the face of the globe, the influence of tectonic processes as an external factor exerting a profound influence on the trend of differentiation

BIBLIOGRAPHY —Most text books of geology treat of petrology in more or less detail (*see* GEOLOGY, § BIBLIOGRAPHY).

Elementary books on petrology include—A. Harker, *Petrology for Students*, 6th ed (1923); F. Rinne, *Gesteinskunde*, 9th ed. (1923); J de Lapparent, *Leçons de Petrographie* (1923); L. V. Pirsson, *Rocks and Minerals*, 2nd ed. by A. Knopf (1926); G. W Tyrrell, *The Principles of Petrology* (1926); F. H. Hatch, *The Petrology of the Igneous Rocks*, 8th ed. (1926); S. J. Shand, *Eruptive Rocks* (1927).

More advanced works include:—A. Harker, *The Natural History of Igneous Rocks* (1909); J. P. Iddings, *Igneous Rocks*, 2 vols. (1909–13) and *The Problem of Vulcanism* (1914); H. Rosenbusch, *Mikroskopische Physiographie*, 4th ed vol. 2 (1907), and *Elemente der Gesteinslehre*, 4th ed. by A. Osann (1923); F. v Wolff, *Der Vulkanismus*, 2 vols. (1914–22); R. A. Daly, *Igneous Rocks and their Origin* (1914); F W Clarke, *The Data of Geochemistry*, Bull U S G. Survey, No 770 (1924); P. Niggli, *Gesteins und Mineral-provinzen* (1923).

For rock minerals:—J P. Iddings, *Rock Minerals*, 2nd ed. (1911); H. Rosenbusch, *Mikroskopische Physiographie*, 5th ed. by O. Mugge (1925–27); E. S. Larsen, *The Microscopic Determination of the non-opaque Minerals*, Bull. U S G Survey, No 679 (1921); N. H and A N Winchell, *Elements of Optical Mineralogy*, Pt. II, 2nd ed by A. N. Winchell (1927).

On the classification of igneous rocks *see* especially L. Milch, *Die Systematik der Eruptiven gesteine I. II*, *Fortschritte der Mineralogie*, vols. 4–5 (1913–14); on their geographical distribution *see* M Stark, *Petrographische Provinzen*, *Fortschritte der Mineralogie*, vol 4 (1914), P. Niggli, *Der Taveyannarsandstein und die Eruptivgesteine der jungmediterranen Kettengebirge*, *Schweiz. Min. Petr Mitt*, vol. 2 (1922); C R. Burri, *Chemismus und provinziale Verhaltnisse der jungeruptiven Gesteine des pazifischen Ozeans und seiner Umrandung*, Ibid, vol. 6 (1926)

A glossary of rock names is contained in A. Holmes, *The Nomenclature of Petrology* (1920) *See* also K H. Scheumann, *Auslandische Systematik, Klassifikation und Nomenklatur der Magmengesteine I.* in *Fortschritte der Mineralogie*, vol. 10 (1925).

The classical works on rock synthesis include F. Fouqué—A Michel Levy, *Synthèse des Minéraux et des Roches* (1882); J H. L Vogt, *Silikatschmelzlosungen*, I. (1903), II. (1904). The principal authorities on the analysis and chemical composition of rocks are H. S Washington, *Manual of the Chemical Analysis of Rocks*, 3rd ed (1919), W F. Hillebrand, *Analysis of Silicate and Carbonate Rocks*, Bull. U S G, Survey No 700 (1919); H S Washington, *Chemical Analyses of Igneous Rocks*, Prof. Paper U S G. Survey, No. 99 (1917). *See* also Cross, Iddings, Pirsson and Washington, *Quantitative Classification of Igneous Rocks* (1902), for a chemical classification of igneous rocks.

Books devoted to physico-chemical petrology, include above all H. Boeke, *Grundlagen der physikalisch-chemischen Petrographie*, 2nd ed. by W Eitel (1923). *See* also P Niggli, *Die Leichtfluchtigen Bestandteile im Magma* (1920), O H Erdmannsdorffer, *Grundlagen der Petrographie* (1924); W Eitel, *Physikalisch-chemische Mineralogie und Petrologie* (1925); R. H Rastall, *Physico-chemical Geology* (1927). For experimental work on silicate mixtures *see* especially the papers published by the workers of the Geophysical Laboratory, Carnegie Institution, Washington, principally in *American Journal of Science*, *Journal of Geology* (1905, etc)

Much information on rocks is contained in the memoirs of the various geological surveys and in *Quart Journ. Geol. Soc. of London*, *Mineralogical Magazine*, *Geological Magazine*, *American Journal of Science*, *Journal of Geology*, *American Mineralogist*, *Neues Jahrbuch fur Mineralogie* (Stuttgart), Tschermak's *Mineralogische Mitthcilungen* (Vienna), *Fortschritte der Mineralogie* (Berlin), etc. (C. E. T.)

PETRONIUS (PETRONIUS ARBITER), Roman satirist, under whose name we have some considerable fragments of a remarkable satire or satirical romance (*Petroni Arbitri Satirae*). We find various references to the author in later writers, *e g*, Macrob, *Somn. Scip*, i 2 8 "plots full of the fictitious adventures of lovers with which Arbiter occupied himself a great deal," Lydus, *De Magistratibus*, 41 "Turnus and Juvenal and Petronius who by merely pursuing abuse injured the law of satire," Sidonius Apoll, *Carm*, xxiii 155, etc, but none of these throw any clear light upon the date or personality of the writer. Modern scholarship inclines to identify him with Gaius (so apparently Tac, *Ann.* xvi, 17 and 18, though in both passages the reading is disputed: Titus is given as his praenomen in Plin. N H xxxvii. 20 and Plutarch, *Mor.* 60 E) Petronius, the one time favourite of Nero, of whose character a remarkable picture is presented by Tacitus *Ann.* xvi 18: "Regarding Gaius Petronius a few words must be said by way of retrospect His days were passed in sleep, his nights in social engagements and the pleasures of life The fame which other men attain by diligence he won by indolence, and he was not considered a debauchee and a profligate, like others who exhaust their substance, but a man of refined luxury His sayings and his acts, in proportion as they were free and ostentatious of recklessness, were so much the more gladly taken as a type of simplicity. Yet as pro-consul of Bithynia, and presently as consul, he showed himself a vigorous and capable man of affairs Then declining again upon vice, or aping vice, he was admitted by Nero among the select few of his friends—the arbiter

of elegance, those things only appealing to the jaded emperor's eyes and other senses which the approval of Petronius commended to him. Hence the jealousy of Tigellinus, as toward a rival and superior in the science of pleasure. And so he played upon the emperor's cruelty—the lust which now occupied him beyond all other lusts—charging Petronius with being a friend of Scaevinus. . . . The emperor, as it happened, had at that time started for Campania and Petronius, on reaching Cumae, was arrested. He refused to endure the suspense of fear or hope. Yet he did not put away his life precipitately, but he had his severed veins bound up and again re-opened at his pleasure, while he spoke to his friends, not in serious language or such as might win him fame for his firmness, and listened to them repeating—not anything about the immortality of the soul and the doctrines of the philosophers—but light poetry and frivolous verse. To some of his slaves he gave largesse, to others stripes. He dined too and indulged in sleep, that so his compulsory death might resemble a natural one. Nor did he, like most men in their last moments, flatter in his will either Nero or Tigellinus, or any other powerful person, but he wrote out a full account—with the names of his associates, male and female—of the emperor's excesses and of every novel debauchery. This he sealed and sent to Nero, and then broke his signet-ring in order that it might not be used presently to imperil others." This last act is paralleled by Plin. xxxvii. 20, who tells how the dying Petronius broke a precious bowl to prevent it falling into the hands of Nero.

While the identity of this Petronius with the author of the *Satirae* is perhaps incapable of definite proof (1) the cognomen Arbiter—which is not a cognomen in the proper sense, but only a nickname—strongly recalls the expression—*arbiter elegantiae*—applied to C. Petronius by Tacitus; (2) it is clear that the Petronius of Tacitus had the social experience, the temperament, and the ability to compose just such a satire; (3) the internal evidence, vague as it is, seems to suit the age of Nero better than any other. On the other hand, to imagine that the work represents the actual document which Tacitus describes Petronius as sending under seal to Nero is, of course, absurd.

The surviving portions of the work are fragments from the 15th and 16th books. The speaker is one Encolpius, who narrates the adventures of himself and his companions among the towns of southern Italy. The longest and, in many respects, the most important episode is that which is generally known as the *cena Trimalchionis* or *Dinner of Trimalchio*. The scene of the dinner is most probably Cumae (*cf.* § 53 *in praedio Cumano quod est Trimalchionis*). The giver of the feast, Trimalchio, is a fabulously wealthy freedman (§ 37 "Trimalchio's estates range as far as a kite can fly . . . and as for his slaves, I don't believe a tenth of them know their own master"), and his wife, Fortunata, is a strong-minded lady of the humblest origin. The sketch is a humorous presentation of the vulgarity and ostentation of the wealthy provincial. Next in importance is the episode of the *Matron of Ephesus*, in which, for the first time, so far as we know, that legend is introduced into the literature of the West.

In form and, to some extent at least, in manner, Petronius continues the tradition of the *Saturae Menippeae* of Varro. Thus, passages in verse are freely interspersed in the midst of the prose, the longest (295 hexameters), on the Civil Wars, being probably intended as a parody of Lucan's *Pharsalia;* another (65 iambic trimeters) describing the taking of Troy, then, and until the day of Tryphiodorus, a favourite theme of the minor poet. From the standpoint of literary history the work may be regarded as the forerunner of the novel of adventure—such as flourished in England in the 18th century—the type, that is, which Aristotle would have called "epeisodic," in which the episodes succeed one another without probable or necessary sequence (Arist., *Poet.* c. ix), and the interest depends, not on the evolution of a skilfully constructed plot, but on the convincing presentation of individual episodes.

The main purpose of the *cena* is the delineation of the rich and vulgar upstart, the *nouveau riche, repente dives, νεόπλουτος*. The type was, of course, well known both in real life and on the stage: Cic., *Phil.* ii. 65, *exultabat gaudio persona de mimo "modo egens repente dives."* Aristotle describes the state of the *nouveau riche* as "a sort of indiscipline in wealth" (*Rhet.* ii., 16 *ἀπαιδευσία πλούτου*: contrast the *erudito luxu* of Petronius, Tac., *Ann.* xvi. 18). Ostentatious display of wealth in entertaining was a characteristic feature: Plut., *Lucull.* 40, "The daily dinners of Lucullus were the dinners of a *nouveau riche:* not only were there purple-dyed coverlets, cups set with precious stones, choirs and individual artists introduced as interludes, but also he roused the envy of the vulgar with the elaboration of all sorts of meats and curiously prepared sweetmeats." The extreme type of the *nouveau riche* was the newly-wealthy freedman, the "newly-wealthy Phrygian" or Aristoph., *Vesp.*, 1309, the *νεόπλουτος ἀπελεύθερος*, who does not know either how to dress properly or how to behave at table (Lucian, *Hist. Conscr.*, 20), who, dining with philosophers, apes their subtleties by propounding the question: "Why do white and black beans alike make pale soup?": only to be silenced by a reminder of his antecedents: "Why do white and black straps alike make purple weals?" (Plut. , *Quaest. Conv.*, ii. 12), whose vulgarity reveals itself in an over-anxiety to please his guests: Plut., *Quaest. Conv.*, vii. 3. "To ask what meats and sweetmeats the guest likes best, or to question him about different wines and perfumes," is very vulgar and a mark of the *nouveau riche, cf.* Petron. 48. "If you don't like the wine I'll change it." Trimalchio is a most felicitous presentation of the wealthy parvenu in his parade of his wealth—so frankly vulgar as to become almost an engaging simplicity (§ 48 "I don't have to buy . . . everything is grown on my suburban estate, which I haven't seen yet. I'm told it joins my lands in Terracina and Tarentum. What I wish now is to annex Sicily to my little crofts so that, if I want to go to Africa, I may be able to make the whole journey on my own estates"), his cheap sentimentality (§ 35 *Eheu nos miseros, quam totus homuncio nil est, cf.* § 72), his pretence to learning (§ 48, "I've two libraries, one Greek, the other Latin"), which is only pretence (§ 71 "Gaius Pompeius Trimalchio Maecenatius lies here . . . Pious, brave, faithful, starting from a humble beginning he left a quarter of a million and never listened to a philosopher").

For the student of social manners, as for the student of colloquial language and colloquial idiom, the extant remains are of inestimable value, and, if only on that ground, the loss of the rest of the *Satirae* is one which, in spite of the indecency which mars the work, every scholar must most deeply regret.

BIBLIOGRAPHY.—*Editio Princeps*, Venice (1499). The bulk of the *Cena Trimalchionis* was unknown until Martinus Statilius (Petrus Petitus) discovered at Trau in Dalmatia a ms. (*codex Traguriensis*) containing it (pub. Padua and Paris, 1664). MA.)

PETROPAVLOVSK, (1) a town in the Akmolinsk district of the Kazakstan A.S.S.R., in 55° N. and 69° E., on the left bank of the Ishim river, where the Trans-Siberian railway crosses it. Pop. (1926) 44,272. The town is a centre for caravan trade from the Kirghiz steppe in corn, cattle, furs, tea, wool and cotton and has an Asiatic appearance.

(2) A port on the eastern shores of Avacha bay in Kamchatka, in the Far Eastern area of the Russian S.F.S.R. in 53° 16′ N., 159° E. Pop. (1926) 1,670. The inhabitants are mainly Russians, Japanese, Chinese, Koreans and natives, and the town, which has been growing rapidly recently, is a centre for the fur trade. There are summer sailings to Vladivostok and Japan, but the harbour is frozen from November to May. There is a wireless station, linking with Vladivostok and with the fish canneries in the north of Kamchatka. The Russian Pacific fleet was stationed here for a time and defeated a combined attack by the French and English during the Crimean War. It was transferred in 1854 to Nikolayevsk-on-Amur and ultimately to Vladivostok.

PETROPOLIS, a city of the State of Rio de Janeiro, Brazil, in an elevated valley of the Serra de Estrella, 2,634 ft. above sea-level and 27 m. N. of the city of Rio de Janeiro, with which it is connected by a combined railway and steamship line, and also

by a longer railway line. Pop. (1920, including the municipal district) 67,574. Petropolis is served by the Principe do Grão Pará railway, now a part of the Leopoldina system, which connects with Rio de Janeiro and Nictheroy on the coast, and with the station of Entre Rios on the Central of Brazil railway. Its favourable altitude gives the city a cool invigorating climate. The rainfall is abundant, and especially so in summer (Dec. to March) when the humidity is extreme. Vegetation is luxuriant. Its water-power and cool climate are making it an important manufacturing town.

Petropolis was founded in 1845 by Julius Frederick Koeler under the auspices of the emperor of Brazil, Dom Pedro II., on lands purchased in 1822. The Mauá railway was opened to the foot of the *serra* in 1854, and the macadamized road (now a good motor road) up the *serra* to the town in 1856. The mountain section of the railway, on the Riggenbach system, was completed in 1883. Petropolis has since become the summer residence of the diplomatic corps and Government officials.

PETROVARADIN, a town and fortress of Croatia-Slavonia, Yugoslavia, situated on a promontory formed by a loop of the Danube. Pop. (1921), 5,101. It is connected with Novi Sad on the opposite bank by a railway bridge and a steam ferry. The fortifications consist of the upper fortress, on a lofty serpentine rock rising abruptly from the plain on three sides, and of the lower fortress, rising from the river on the northern base of the rock, the two together accommodating a garrison of 10,000 men. The fortress is believed to represent the Roman Acumincum, and received its present name from Peter the Hermit, who in 1096 marshalled the levies of the first crusade here. It was captured by the Turks in 1526 and was retained by them for a period of 160 years.

PETROVSK, the name of several Russian towns, the most important being Petrovsk in the province of Saratov, on the Medvyeditsa, a tributary of the Don, in 52° 22′ N., 45° 19′ E., and on a branch railway linking with the Volga river. Pop. (1926) 19,208. It has oil pressing and flour mills, and manufactures agricultural machinery.

PETROZAVODSK, the chief town in the Karelian A.S.S.R, of the Russian S.F.S.R. in 61° 41′ N., 34° 20′ E., on the west shore of Lake Onega, and on the Leningrad-Murmansk railway. Pop. (1926) 26,344.

PETRUS AUREOLUS (Oriol), scholastic philosopher and monk of the Franciscan order, lived in the latter half of the 13th century, and died in Paris in 1321 just after his appointment as archbishop of Aix. He was one of the first to attack the realist doctrines of Duns Scotus, and is interesting mainly as the precursor of William of Occam in his revival of Nominalism. He was known as *Doctor Facundus* and *Doctor Abundans*.

PETTENKOFER, MAX JOSEPH VON (1818–1901), Bavarian chemist and hygienist, was born at Lichtenheim, near Neuburg. He studied pharmacy and medicine at Munich, and after working under Liebig at Giessen was appointed chemist to the Munich mint in 1845. Two years later he was chosen extraordinary professor of chemistry in the medical faculty, in 1853 he received the ordinary professorship, and in 1865 he became also professor of hygiene. In 1894, he retired from active work, and on Feb. 10, 1901, he committed suicide. The reaction known by his name for the detection of bile acids was published in 1844. In his widely used method for the quantitative determination of carbon dioxide the gaseous mixture is shaken up with baryta or lime water of known strength and the change in alkalinity ascertained by means of oxalic acid. His name is most familiar in connection with his work in practical hygiene and nutrition.

Pettenkofer gave vigorous expression to his views on hygiene and disease in numerous books and papers; he was an editor of the *Zeitschrift für Biologie* from 1865–82, and of the *Archiv für Hygiene* from 1883–94.

PETTIE, JOHN (1839–1893), Scottish painter, was born in Edinburgh on the 17th of March 1839. At sixteen he entered the Trustees' Academy in Edinburgh, working under Robert Scott Lauder. His first exhibits at the Royal Scottish Academy were "A Scene from the Fortunes of Nigel"—one of the many subjects for which he sought inspiration in the novels of Sir Walter Scott—and two portraits in 1858. To the Royal Academy in 1860 he sent "The Armourers"; and in 1862 he settled in London, where he joined Orchardson. In 1866 he was elected A.R.A., and in 1874 R.A. Pettie died at Hastings on Feb. 21, 1893.

John Pettie, R.A. (1908), by his nephew Martin Hardie, gives the story of his life, a catalogue of his pictures, and fifty reproductions.

PETTY, SIR WILLIAM (1623–87), English statistician and political economist, born on May 26, 1623, the son of a clothier at Romsey in Hampshire, received his early education at the grammar school there. He studied for some time at Caen, and on his return to England, seems to have entered the Royal Navy. He went abroad again in 1643, and remained for three years in France and the Netherlands, pursuing his studies. In 1647 Petty obtained a patent for the invention of double writing, *i.e.*, a copying machine. In politics he espoused the side of the parliament. In 1648 he was made deputy professor of anatomy at Oxford, and on obtaining the degree of doctor of physic, 1649, was made a fellow of Brasenose college. In 1654, observing that the admeasurement and division of the lands forfeited in 1641 had been "most inefficiently and absurdly managed," he contracted to execute a fresh survey, which he completed in 13 months. On purchasing a large estate in county Kerry, he set up ironworks in that neighbourhood, opened lead-mines and marble-quarries, established a pilchard fishery, and commenced a trade in timber. Besides the office of commissioner of distribution of the lands he had surveyed, he held that of secretary to the lord-lieutenant, Henry Cromwell, and was also during two years clerk of the council. In January 1658 he was elected to Richard Cromwell's parliament as member for West Looe in Cornwall. After the Restoration he returned to England and was favourably received and knighted by Charles II., who was "much pleased with his ingenious discourses." He obtained from the king a new patent constituting him surveyor-general of Ireland. In 1663 he invented a double-bottomed ship, which twice made the passage between Dublin and Holyhead, but was afterwards lost. He was one of the first members of the Royal Society, and sat on its council. He died in London on Dec. 16, 1687.

Petty's Irish survey was based on a collection of social data which entitles him to be considered a pioneer in the science of comparative statistics. He was also one of the first to break away from mercantilist ideas, and he exhibits a statesmanlike sense of the elements in which the strength of a nation really consists. Roscher names him as having, along with Locke and Dudley North, raised the English school to the highest point it attained before the time of Hume. His *Treatise of Taxes and Contributions* contains a clear statement of the doctrine that price depends on the labour necessary for production. Petty is much concerned to discover a fixed unit of value, and he thinks he has found it in the necessary sustenance of a man for a day. He understands the cheapening effect of the division of labour. He states correctly the notion of "natural and true" rent as the remainder of the produce of land after payment of the cost of production; but he seems to have no idea of the "law of diminishing returns." He has much that is just on the subject of money: he sees that there may be an excess of it as well as a deficiency, and regards the prohibition of its exportation as contrary to sound policy. But he errs in attributing the fall of the rate of interest which takes place in the progress of industry to the increase in the quantity of money. He protested against the fetters imposed on the trade of Ireland, and advocated a union of that country with Great Britain.

A complete list of his works is given in the *Athenae oxonienses*. The most important are: the *Treatise of Taxes and Contributions* (1662, 1667 and 1685); *Political Arithmetic*, presented in ms. to Charles II., but, because it contained matter likely to be offensive to France, kept unpublished till 1691, when it was edited by Petty's son Charles; *Quantulumcunque, or a Tract concerning Money* (1682); *Observations upon the Dublin Bills of Mortality in 1681 and the State of that City* (1683); *Essay concerning the Multiplication of Mankind* (1686); *Political Anatomy of Ireland* (1691). Several papers appeared in the *Philosophical Transactions*. See *Economic Writings of Sir William Petty*, ed. C. H. Hull (2 vols., 1899); W. Roscher, Study on Petty in *Transactions of the Royal Scientific Society of Saxony* (Leipzig).

PETTY SESSIONS: *see* SESSIONS.

PETUNIA, in botany a genus of plants belonging to the nightshade family (Solanaceae) and containing about 25 species, chiefly South American (southern Brazil and Argentina). The garden forms are derived from the white-flowered *P. nyctaginiflora* and the violet- or purple-flowered *P. violacea.* The varieties of petunia make admirable specimens for pot culture.

PETWORTH, a market town in Sussex, England, 55 m. S.S.W. from London by the S.R. Pop. (1921) 2,435. Petworth (Peartingawyrth, Peteorde, Puetewird, Pedewurde, Putteworth, Pytteworth, Petteworth) is named in a grant by Eardwulf, king of Northumbria, to St. Peter's Church, about 791. Under Edward the Confessor Petworth was an allodial manor held by his queen Edith, and in 1086 Robert Fitz-Tetbald held it of Roger Montgomery, earl of Shrewsbury. Petworth house, situated in a park, dates from the 18th century. At Bignor in the neighbourhood are remains of a Roman villa. Near Petworth are stone quarries yielding building material.

PEUTINGER, KONRAD (1465–1547), German humanist and antiquarian, was born at Augsburg. In 1497 he was town clerk of Augsburg, and was on intimate terms with the emperor Maximilian. He was one of the first to publish Roman inscriptions, and his name remains associated with the famous *Tabula peutingeriana,* a map of the military roads of the western Roman Empire, discovered by Konrad Celtes. Peutinger also edited the *Historia Gothorum* of Jordanes, and the *Historia gentis Langobardorum* of Paulus Diaconus.

The *Tabula peutingeriana* was first published as a whole by F. de Scheyb (1753); later editions by E. Desjardins (1869–74) and C. Miller (1888); *see* also E. Paulus, *Erklärung der Peutinger Tafel* (1867); and Teuffel-Schwabe, *Hist. of Roman Literature* (Eng. trans., 1900).

PEVENSEY, a village in Sussex, England, 65 m. S.S.E. from London by the S.R. Pop. (1921) 764. It was the landing place of William the Norman on his way to conquer, and was the *caput* of the rape of Pevensey, granted by William to the earl of Mortain and subsequently became the Honour of the Eagle. Some time before the reign of Edward I. the town of Pevensey was made a member of Hastings and shared the liberties of the Cinque Ports. By an act of 1883 it ceased to exist as a borough. The decline of Pevensey was caused by the recession of the sea. The outer wall, with towers, of the castle is Roman, and is generally considered to have enclosed the strong town of *Anderida.* Within are the ruins, principally of the 13th century, but in part Norman, of the castle proper, with a keep and four round towers. The church of St. Nicholas, close to the castle, is Early English. It is doubtful whether Pevensey was the scene of Caesar's landing in 55 B.C.

PEW, a term, in its most usual meaning, for a fixed seat in a church, usually enclosed, slightly raised from the floors, and composed of wood framing, mostly with ornamented ends. Some bench ends are certainly of Decorated character, and some have been considered to be of the Early English period. They are sometimes of plain oak board, 2½ to 3 in. thick, chamfered, and with a necking and finial generally called a *poppy head;* others are plainly panelled with bold cappings; in others the panels are ornamented with tracery or with the *linen pattern,* and sometimes with running foliages. The large pews with high enclosures, known familiarly as "horse-boxes," and common in English churches during the 18th and early part of the 19th centuries, have nearly all been cleared away. The church of Whitby, in Yorkshire, is perhaps the best surviving example of an unaltered interior.

At common law all seats in a parish church are for the common use of all the parishioners, and every parishioner has a right to a seat without paying for it. As against the assignment and disposition of seats by the ordinary, acting through the churchwardens, two kinds of appropriation can be set up (*a*) by the grant of a faculty by the ordinary, and (*b*) by prescription, based on the presumption of a lost faculty. Such faculties are rarely granted now, they were formerly common; the grant was to a man and his family "so long as they remain inhabitants of a certain house in the parish." The letting of pews in parish churches became common in the 16th century, but there are some earlier instances of the use, for example at St. Ewens, Bristol, in 1455.

See A. Heales, *History and Law of Church Seats and Pews* (1872); Phillimore, *Eccles. Law* (1896), ii. 1424 *sq.*

PEWTER, an alloy, the basis of which is tin. It is mixed with another metal, generally lead, the proportions varying from six to four parts of the former to one of the latter. Occasionally brass or copper takes the place of the lead. The Rev. William Harrison, writing in the time of Queen Elizabeth, a period when pewter was much in favour, says, "I have been also informed that it consisteth of a composition which hath thirty pounds of kettle brass to a thousand pounds of tin, whereunto they add three or four pounds of tin glass; but, as too much of this doth make the stuff brickle, so the more the brass be, the better is the pewter, and more profitable unto him that doth buy and purchase the same."

Of its antiquity it is difficult to speak with certainty owing to the doubtful meaning of the terms employed. It is said to have been known to the ancient Chinese, and it is claimed to have been made by the Chaldaeans, Egyptians and Greeks. As to its production by the Romans, mention is made by early writers, and all doubt has been removed by the analysis of some of the pewter of the Roman period found at Appleshaw, Hampshire, and now in the British Museum. From early days the rich mines of Cornwall were the repository which supplied the Continent with tin of fine quality: it is therefore only natural to find the use of pewter very common in England and the adjacent countries. The ordinary methods of working the metal were by casting, turning and hammering. The most satisfactory pewter is marked by simplicity, a good outline and an absence of decoration.
